- "***Let's exchange contact so I can let you know if I do X***" -where "X" is an activity you mention that you both enjoy

Also a good tip if you're interested in dating: exchange contact with many people.
That way, it doesn't look like you're "hunting".

See:

- **Social calibration**

7. Keep The Best Only: Spot Green & Red Flags

You're not reading TPM to make "some friends".

Go to WikiHow for that :).

You're here to make *high-quality* friends and connections.

Here are some quick tips on judging characters:

1. **Split of questions VS talk & self-talk.** You want friends who can listen when you want to share something
2. **Empathetic or callous?** You can do business with callous men or cooperate if interest align. But empathy is important for friendships
3. **Honorable or not?** You have no place in life for dishonorable men, aholes, and turkey

See more in:

- Toxic people
- **How to recognize takers**

> How to Spot Toxic People And "Takers"

‍♂ The Secret to Quality Friends Is…

Lucio:
People make friends both *strategically*, for evolutionary reasons (Buss, 2024), and for pleasure.
For strategic reasons, *value* matters most.
For the pleasure of it, *quality* matters. Turkey behavior repels eagles.
So the "secret" is: **YOU be a high-value, high-quality, honorable man first**. And then you get the best of both

worlds.

8. Follow Up The Day After

Here is a general rule:

⚖ **Fast progress goes places while slow-moving never progress at all**

That's an important principle of dating.
In friendships, you have more leeway. But, generally speaking, faster is better. And the more randomly you met and least you spoke, the faster you wanna go.

Here's a template for you:

1. Text "good meeting you" right after the event
2. 2 days later text if they want to join you for something

A more strategic approach is to text the day after without inviting, and see if they propose it.
But it's not strictly necessary.
Power shouldn't be your main concern if you're out to find great people.

9. Organize a second meet (1:1s or smaller group)

If you organized, you have two options:

- Organize a follow-up with a smaller group
- Meet 1:1

From a power dynamics point of view, you maintain "top dog status" with the smaller group followup.
But again, you're not out for power now.

If someone else organized, you can:

- Invite a few people you liked out
- Meet 1:1

And of course, they're not mutually exclusive and you can do both.

Example with smaller group followup:

For the 2nd meet I picked the best guys, went to my favorite restaurant, and we deepened the friendship

My general rule for 1:1 VS group followups is this:

- Cool and similar for 1:1
- Cool but different in group

⍰ Technique: the “half propose”

You may wanna tread carefully in business or at work.

In these cases, you can “half propose”.
Such as, you don’t go the full distance but instead dangle your “bait” for them to take.

Ie.:

> Cool man, thanks, it was a pleasure doing business.
> And you seem a cool guy, if you’re up for a drink one of these days, happy to invite you.

Pressure-off attitude

And I’m personally a huge fan of “pressure off”.

High power, and respectful of others.
And the polar opposite of the guilt-tripping emotional manipulation turkeys go for.

Here’s another example of “pressure off” attitude:

> **Him**: spent a little too much money these past 2 dasy. We could meet tomorrow tho
> **Me**: No pressure mate mate, if you're up for it we can find a cheap place, and if not, next time

I'm not jumping to "tomorrow" because I preferred the same day -and didn't wanna commit to the day after-. So I address his concern with a casual "cool whatever way" attitude.

And we ended up meeting that evening.

That's it, fellas.

Now you can make friends.

A few advanced moves:

10. Invite New Guys To Your Forming Social Groups

Keep up the "meet more" phase as you form your social circle.

Why?

Because:

- **Inviting people to newly forming groups is easier and more natural** compared to established groups. That's because established friends prefer to meet just you, rather than strangers
- **You're cooler and higher value** to both the forming group, and the incoming new friend. You come across as sociable and "making things happen"
- **Inviting to social gatherings is higher power and smoother compared to 1:1s**. It feels a bit "gay" to invite a random guy to a 1:1, but not to invite him to a small group

Of course, it's largely on you to present your new group as 'cool'.

Look at this example:

I put together a boxer from diner cold approach, a huge weightlifter from mall cold approach, and 2 guys from a previous meetup I organized

Bonus: Maintain Friends With Win-Win

And we go back to social exchange foundations again.

For example:

Offer advice and/or personal experience

This is where your self-development work pays out dividends.

Expertise makes your advice very valuable, while costing you nothing.

However, you don't need to be an expert.
Simply by living, you have a ton of value you can give if you just know how to look and present it.
It can be as simple as having done paperwork he's looking into, or having tried a restaurant.
Or sharing a similar experience, or a funny story.

Lend an ear

Sometimes all a friend needs is someone to talk to.

And that may be one of the most important aspects and benefits of a friendship.

Crazy enough, it's so simple, and yet *so few people can do this*.
70% of it is this:

1. Sit with him
2. Ask questions

3. Let him talk it out

That's all.
And these are bonuses:

1. Share something similar IF you have
2. Share advice IF you can
3. Help him process and reach a decision

Of course, there are levels to it.
If you can ask *good* questions, better.
If you can help me feel better, much better.
And if you can offer solutions, that's next-level gold.

But if you're beginning, just sitting down and listening makes you an invaluable friend.

Offer concrete support if possible

Machiavelli would say that the best help to offer is whatever is easiest for you.

BUT…

You may instead want a few close friends you'd be *happy* to help, *despite* the costs.

And "higher cost help" is also an honest signal of caring.

Often, it doesn't have to be anything crazy.
For example, concrete help with expats and singles can be as simple as offering food if they're sick.

Example:

> **Me**: (offers to bring some groceries if he needs it)
> **Him**: I am so so happy to hear it. Let's meet soon my friend!

Also see:

- **Practical takeaways from social exchange theory**

> Social Exchange Practical Takeaways: 10 Laws of Success

⍰ Optional Bonus: Get A Few Circles Going

It's not a must, but the benefits are:

- **It's higher value** to have "other friends" they know about, and that you can mention
  - You're naturally scarcer, and you can even play up the mystery. As a teenager, different circles of gear-heads, 'users' and schoolmates made me "cool(er)"
- **Higher confidence**. You're subconsciously clingier when you depend on one single source of anything. Options give you confidence.
- **Open-mindedness** especially if the groups are different. A great antidote to groupthink, tribalism, and various cult-like dynamics

Built From Scratch: Summary & Review

Lucio Buffalmano · 10 September 2024 · Archived copy · Original

Built From Scratch (2001) chronicles the story of Bernie Marcus and Arthur Blank, and how they went from being fired to founding the multi-billion home improvement chain Home Depot when Marcus was 50 years old.

FULL SUMMARY

About the Author:
Bernie Marcus and Arthur Blank are the two main founders of Home Depot, and they take turns writing chapters.

Learn how to sell a vision

Especially in the beginning, you don't have much to show.
So you must be good at selling a vision:

> You must stick to a vision and turn people into believers.
> We had to be psychologists, lovers, romancers, and con artists to get them aboard.

Notice the "con artist" in that list.

Be calculative in everything you do

If it serves your goals, be offensive to jolt someone and get their attention.

Says the author:

> To his face, I called him "the biggest schmuck I ever met in my life."
> That was a calculated gamble.
> I read his personality. I knew what was going to get to him. Of course he wasn't a schmuck, but nothing short of calling him one would have gotten his attention riveted on me.
> (…) what would have happened if I had said, "Mr. Hubschman, I could do a better job." Nothing would have happened. Instead, I very deliberately applied blunt trauma to his ego.

Learn political skills, & how to read people

I picked up this book mostly for the human side.
The relationships.

Their previous boss sounds like a dark triad.

Describing his former boss, they say:

> He called himself "Ming the Merciless."
> It wasn't a nickname used behind the boss's back (…) how proud Sanford C. "Sandy" Sigoloff was to be known as "Ming. (…) the villain in the old Flash Gordon movie serials of the 1930s.

Now look how this guy thinks:

> He was a nice looking, sharp-dressed man, very smooth, slick, and articulate, a chief executive who couldn't just fire an underling (…) he once told me in a coffee shop, it was very important that he affect them economically, emotionally, and physically, so that people think twice before they ever turn on him.

This is important because the authors failed to realize they needed better precautions with a snake like this.

Also see:

- How to learn office politics

Langone saw Sigoloff's red flags

Notice Langone's reaction on his first meeting with dark triad-ish Sigoloff:

> It was all handshakes and politeness on the surface, but (…) Neither liked the other and they never would.
> (…)
> "This is a real bad guy," Langone said after his first encounter with Sigoloff. "This is a guy that you can't trust and that would kill you in a second."

Langone was much better at handling that guy once they partner up

We have some articles to develop these skills:

- How to spot a value taker

Never give up your leverage against aholes

The authors were friends with Langone.

And because Langone had controlling shares, the terrible boss was kept in check.

However, this is when the authors make the mistake:

> "Do me a favor," I said. "Get Sigoloff off my back. Sell him the stock."
> "Bernie, trust me," Langone said. "You don't really want me to sell him this stock, because if I do, I am signing your death warrant. You are a dead man." <— Bernie knew the character
> "You don't know what you are talking about," I responded. "Sigoloff doesn't know this business. I know this business. He needs me to run it." <— The author naively expected Sigoloff to put the best of the company above his power

And now look how Langone predicted the future based on a correct reading of narcissism:

> As long as you are there, he is never going to be able to take credit for its success, or for the recovery of Daylin."
> (…)
> I am telling you, I can read this guy like a book. *He can't stand to see you succeed.* The more you succeed, the more pain he feels." <— this is narcissistic envy, what the author missed

With his leverage gone, the authors get fired

This is when the author realizes the power dynamics:

> (…) board member said, "I don't know why there is any question about succession here, since you have your

> obvious successor right in this room, Bernie Marcus."
> A quick glance at Sigoloff's ashen face told me that *that* was never going to happen (…) the board supporting the idea made me a genuine threat to Sigoloff. The situation between us just went from really bad to dire.

And this is how it happened:

> I was in one room, Arthur in another. It was a planned effort to divide and conquer us.
> (…)
> Sigoloff was well organized. He released a statement to the press by deadline on Friday afternoon, so that all the Los Angeles papers carried the story of our firing on Saturday morning.
> (….)
> The labor decertification proceedings were used as a tool to eliminate me and those closest to me.

In brief, Sigoloff looked hard at some fault he could find about the authors' behavior, and he himself pressed charges against them.

Sigoloff also wiped out the author's contraction options, telling him:

> Sigoloff also voided my contract, daring me to sue. "The only problem for you," Sigoloff taunted me, "is that I am going to fight you with the company's money, and you are going to have to fight me with your own money, which you don't have."

You can't say this guy didn't talk straight :).

Let toxicity be the catalyst for honorable man behavior

Luckily, the authors took some good lessons from this, and decided instead to spread the opposite vibes into the world:

> Traumatic as our experiences at Handy Dan were, they played an important part in developing Home Depot's values.
> For example, Sandy Sigoloff rewarded people who were his loyal followers with an inordinate amount of money. There are people who are for rent, and he bought their souls. We learned that love and compassion do a hell of a lot more than just buying people.

Also read:

- **How to be an honorable man**

MORE WISDOM

Dark triad technique: bamboozle everyone

This is what "the merciless" boss did:

> As contemptuous as he was of bankers, Sigoloff still needed their money to run his businesses. His oft-stated philosophy was "keep banks in the dark and feed them crap, like mushrooms." His MO was burying them in paper. And it wasn't just banks, it was anybody. In fact, he put people on his payroll whose primary job seemed to be generating those kinds of documents.
> Sigoloff's approach was to hit the banks with so many facts, so many charts, that no human being could ever go through it all. And before that, confuse them. Then when you confuse them, he'd say, you'll end up with

> somebody who you can do anything you want with.

Ensure you're properly rewarded (and get shares)

After years of great work, the author realizes after being fired:

> And we were hardly well paid. Ron, for example, was only paid in the mid-$30,000 range.
> None of us owned stock in Handy Dan; all of our hard work and innovation seemed to have enriched everyone from Ken Langone to Sandy Sigoloff, but not us.
> (…) When we left Sandy Sigoloff and Handy Dan, we had made a ton of money for them but walked away with nothing.

Keep your success secret

The authors didn't want others to know they were doing good:

> Between 1980 and '81, sales did begin moving upward, but we kept it a deep, dark secret. If we didn't, we might have encouraged competitors.

Criticism

A lot to say:

Grandiose, narcissistic-like storytelling

Let's start with a mild example from the opening:

> This book is the story of that virtually unparalleled growth and the values and culture that nourished it.

I'm pretty sure many businesses grew faster and/or more.

Next, the author first brags of his fast career progress at their previous employer, and then says:

> I ascended the ladder of success at Two Guys by learning how important the folks are with whom you surround yourself. I loved teaching people the business. Why have I been successful my whole life? Because I've always surrounded myself with people who are better than I am.

How about you let others judge whether you were successful or not?
Also because in this same book, they later complain that they were just getting by as employees without equity.
There are many more examples of how awesome he was. And he carefully lists one of his records as "unlikely to be broken" -he says, and I didn't buy it-.

And now listen to this dick move:

> One day, Glass and I were walking through one of his superstores in Georgia. I said, "You think this superstore of yours is a great invention, right?"
> "Oh, yes," he said proudly, having played a part in Wal-Mart's birth.
> "Well, we did this at Two Guys back in the early fifties," I said.

He doesn't even realize what a dumb move that was, and how dumber it is to even brag about it.
First, he lays the (5-year old level) trap with the question. Then, he let the Sam Walton feel proud of his invention.

And finally, he proceeded with the right hook. Nope, Sam didn't invent squat because HE was the real inventor of it ⍰⍰♂.

With this behavior, I don't even think he was any good friend of Walton, as he tells us.

Sometimes you can see it in the small details.
For example:

> Diller was right. I could trust Langone. But I knew that for myself. <— This is what we call here social scalping. He removes any credit from Diller.

Notice he could have said the same with a more power-protecting win-win.
For example: "Diller was right. I had the same feeling".
But nope, he had to fully invalidate Diller's advice.

There is more, but you get the gist.

Read more in:

- Manipulation: a primer
- Social exchange theory

Red flags of aggression, violence, & bias ⍰

The author seems very quick to getting aggressive.

Of course, in the book, he always had a good reason to get angry.
But once you discount the bias, I see these as potential red flags.

Let's see some:

- **Childhood gangbanger bragging**

Starting from his childhood bragging of joining a gang of black kids as the only white:

> Finally, the leader of one gang was so impressed with my ability to take what he was dishing out that he wanted me as part of the gang.
> At 11 years old, I not only ran with this gang of thirty black kids but I became its second in command.

- **Threatening customers**

Then working in a store as a young man:

> So I walked up to him, and said, "Pick a window."
> This big cigar dangling in his mouth, he looked at me, confused. "What do you mean, pick a window?"
> "Pick a window, because you are going through one of them. I want you to have a choice in which one." And believe me, he knew I wasn't kidding.

- **Challenging the boss publicly and cursing him**

And when he "nearly came to blows" with Sigoloff "The Merciless":

> (…) Sigoloff and I nearly came to blows during a board of directors meeting. When we went into another room to hash out our disagreement privately, Sigoloff told me that he was the boss. He controlled my career, and I needed to understand that. Then he demanded that I literally repeat that back to him.

> (…) I nonetheless told him to go —— himself.

Why would Sigoloff demand he calls him “boss”?

Most bosses don’t ask that without reason. Usually, it happens when someone disempowers the boss.
Then, it would be more understandable for Sigoloff to demand what he demanded.
But that would change the whole dynamics: the author may have been a disempowering, insubordinate, or outright dic*head.

- **Kicking an investor out of the car**

He tells a possible investor:

> “Get out of the car,” I said. “Get out of the G-damn car!”
> The man just looked at me. He thought I was crazy. We were in the middle of nowhere; cars and trucks were zipping by.
> “I said, get out of the car! You are a stupid son of a bitch! Do you think I would get in bed with an imbecile like you? Get out of the f-ing car. You can walk to the airport for all I care.”

The authors made the investor sound like a grinch, of course.

And, in part, they succeeded.
IF what they wrote is true, I may agree with them.
But you can STILL spot red flags.

For example, the investor had demanded a salary cut and that they don’t drive Cadillacs -a cars luxury brand-.
While I got the point of the salary cut, I agreed with the investor on the Cadillacs. It was *his* money, it was not only fair of him, but ethical, to demand they’d drive less expensive cars.

But the authors makes himself sound like tough-talking straight man, and the investor like a sneaky f*ck.

- **Threatening employee with murder**

Yeah, literally, he says:

> We told everyone, if anyone ever did that again, we would kill them. We wouldn’t fire them, because firing was not bad enough of a punishment; it had to be killing.

There are more examples.
And albeit on this one I am biased, I personally saw it as another red flag Bernard Marcus was one of Trump’s largest donors in 2016. And still backed him again in 2024.

Runs like an ad

Many autobiographies do.

And this is no exception.

If anything, *Built From Scratch* stood out for running like an ad, even among other autobiographies.

I also read several reviews online, and many mention that the customer service, at least today, is not nearly as good as the authors make it out to be.

REVIEW

Built from Scratch is a great book if you can read between the lines.

If you can't, you can still find some valuable insights on entrepreneurship, career planning, and common political mistakes.
Some of the company values may also be good. There is little denying the author built a huge chain, so they did something right.
However, I wouldn't bank on that being either 100% true, or a true differentiator for success.

Which brings me to the next point:

The most valuable insights for me were one-liners, or hidden.

If you can get to those, there is much to learn about (entrepreneurs') psychology, toxic personalities, and red flags.
For the latter you must read *twice* between the lines because… It may include the authors :).

Check the **best books** to read or **get this book on Amazon**.

Political Strategy & Childless Women: Democrats Need Power

Lucio Buffalmano · 17 September 2024 · Archived copy · Original

Why it's always conservatives who worry about birthrates?

And why is it always conservatives who shame childless women, while women resent it?

Well, you'd never guess, but the reason is power.
And we'll explain it in this article.

Contents

- Conservative Power VS Liberal Compassion
  - Tribal power Vs. group collegiality
- Children Project Power Into The Future
  - ⍰ Godfather needs a son
  - Childless women threaten Conservatives' power
- Politics & Cat Ladies
  - Elections, JD Vance, and cat ladies
- Taylor Swift: Alpha Female to Democrats' Rescue
  - Liberals need high-power representatives (& men)
- Bonus: Why Criticizing Trump Cost Us $$$

Conservative Power VS Liberal Compassion

Conservatives value power, masculinity, and victory.

Righ-wing conservatives are also closer to social Darwinism, including:

- Winners must be rewarded
- Losers should not be supported
- Life is competition

And in that competition, the strong one wins, the weak one… Doesn't.
Or… Dies.

That's how it goes, and we should not try to change that.
One, because it's the "way of nature" (naturalistic fallacy).
And two, because helping the weak ones to survive is not only useless, but harmful to all. It wastes resources, and saddles the species with sub-par specimens.

Democrats instead are more pro-social communal.

Liberals value kindness and compassion over power and dominance.
Winning is good, but not winning is OK and the losers also deserve our love and support.

Tribal power Vs. group collegiality

For liberals the group is about our fellow human beings.

Fellow human beings that we can love and support, and receive love and support back.

Conservatives place individual success above the group.

Part of it is values.
But part of it is also about confidence, early reinforcement, and personal success. And confident, successful, high-power men have less of a need for group support.
For these men, other people aren't necessarily there to be nurtured, but to compete against.

However, conservatives do value the POWER of the group.
Such as, powerful individuals band together, as tribes, to project power.

Racism & Locked Borders Keep The Group Pure

Conservatives' racism and anti-immigration stance is also explained from a group and power perspective.

Immigrants are the outgroups "from a different tribe".
They're suspicious.

And they pollute the blood covenants of our tribe.

There is no way to pacify the conservative mind.
If immigrants come with women and children, they'll replace "us".

If it's mostly men, the competitive nature of the conservative sees mating competition they'd rather not have.
From an evolutionary point of view, this is understandable.

Children Project Power Into The Future

Children for Conservatives are also about power:

1. **Heir to project power into the future**: a clone of yourself to keep operating after you lose power and eventually die
   - **Heir to keep the forefather's name & work alive**
2. **Tribal power with a larger group**: more warriors, more workers, stronger economy

You can see the first successful, empire-building men.
Kings always looked for male children.
And so do many present-day empire builders.

Example, the Godfather:

⍰ Godfather needs a son

> **Consigliere**: Kate had a miscarriage, she lost the baby
> **The Godfather**: Was it a boy?

⍰⍰ The Godfather wanted an heir to project power into the future. Keep the genetic lineage, and keep the criminal enterprise going

We also see an overlap with more dark triad-ish and psychopathic men.
Some of them also seek children as a tool for genetic power projection.

The unnamed contemporary phenomenon of the manosphere says as much here.
And look where his political affiliation lies:

You'd never guess that the dark triad seeking children for power-projection supports the power-hungry conservative candidate

And how about #2, the group power?

Well, on average liberals tend to be collegial with everyone.
That includes any form of life, and also any human being, no matter where they come from.

Conservatives instead have smaller, tighter circles around them.
Their groups also have stronger boundaries, and with more competitive "us vs them".

Finally, conservatives are also more patriotic.
But patriotic is just the positive term for "clannishness" and what we referred to here as "ego fusing".
They bask in the group's glory when it wins, and feel like losers when their group" does poorly.
So for them it's comparatively more important that their country stays powerful and strong.

Childless women threaten Conservatives' power

Women who decide not to have children are a threat for conservatives:

- **Non-traditional women are harder to date & control**
- **Childless women make it harder to reproduce** because fewer available mates means higher competition
- **Childless women disempower the tribe** because a smaller population equals less power

That's also why conservatives embrace traditional gender roles, oppose "gender fluidity" and, secretly, resent empowered women.

And it goes both ways.
In general, the more empowered women become, the more they resent being limited to child-rearing only.

Smart men get that.
Seducers get that, too.

And while red pill men *argue* with women, seducers seduce.

And smart men who want families work while, often, their women raise children. They're just smarter -and win-win- about it.
But it's let's not go too off-topic.

The cat-woman power move

Both liberals and conservatives engage in cultural wars.

And the "childless cat woman" is part of the conservatives' effort to bend the cultural norms to their liking.
Or, if you prefer, to set their "frame" for what's "good and proper female behavior", and what's not.

The "childless cat woman" is a shaming power move for women who opted out of child-bearing.

Frame her as a loser, shame her, and try to embed into the cultural fabric that childless women are despicable.
And hopefully other women won't do the same.

Cat woman combines an attack on femininity and an attack on competence:

- **The cat woman is not a "real woman"**. Or, at least, not a good one. She replaced real human beings with cats
- **The cat woman is a loser** because she failed her #1 task in life

She is the female equivalent of the lowest-status men.

Politics & Cat Ladies

The above is the reason why conservatives focus on children-promoting policies.

Mussolini wanted more children.
Orban today wants more children -and fails because everyone wants to leave his country-.

And it's the reason why it's conservatives who resent childless women the most.

Elections, JD Vance, and cat ladies

We'll discuss here the 2024 elections.

But what we say can apply to any election.

As we said:

The democrats are generally seen as kinder, but lower power.
And republicans are seen as more selfish, but higher power.

Nobody could represent the "selfish but dominant" more strongly than Donald Trump.

In the "childless cat ladies" spat following JD Vance's remarks, the power dynamics were still the same:

- **Republican JD Vance was a dominant ahole**
- **Democrats were kinder but weak**

In a way, it's the good old "too nice guy" VS a**hole" dichotomy.

You can also see these dynamics at an emotional level.
JD Vance attacked, and the Democrats got offended.

The two most popular democratic counter-offensive include:

- **Tim Walz at the DNC**: touching, but low-power
- **Jennifer Aniston**: touching, but low power

They both appealed to *already* democrats.
But in terms of gaining respect -and possible votes- from new higher power men? Total net loss.

JD Vance was an ass, but he was still higher power.
And in the competitive winners/losers view of the world, the Republicans were "offensive aholes, but winners".

This is when Taylor Swift changed the dynamics:

Taylor Swift: Alpha Female to Democrats' Rescue

Taylor Swift endorsed the Democratic candidate Kamala Harris.

And she signed herself "childless cat lady".

Swift, so far, chose not to have children.
And *chose* is the keyword.

But Swift turns the cliche' of the loser cat lady on its head.

She is the ultimate high-power "alpha female".
Stunningly beautiful, tall, thin, blonde hair and blue eyes.
And smart, talented, and uber-successful to boot.

Liberals need high-power representatives (& men)

Always at risk of being the low-power losers and whiners, liberals desperately need higher-power representatives.

Without some high-power representatives, they risk becoming the party of the also-ran.
Losers, whiners, left-behinds…

I'll go out on a limb here and say that **liberals also need high power *men***.

Women are seen as kinder and more collegial, and that doesn't help to bridge the power gap.
The hand-holding, warm smiling, and Brene' Brown style of vulnerability only get you so far.

There is a reason why the party looks back at Clinton or Obama as their golden presidents (Clinton even more than Obama).
If not super dominant, they were still high power, and *very* charismatic.

Bonus: Why Criticizing Trump Cost Us $$$

In 2016 Trump took over the Republican party.

And held on to it for years.
While some loved Trump, some said Trump turned it into a personality cult.

But I'm not in the latter camp.

It's my belief that:

- **Trump is a danger to democracy**, and that danger is *heavily* under-estimated
- **Dark narcissists make for poor country leaders**
- **Charismatic dark narcissists negatively shift the culture** into accepting more ahole, bullying, and aggressive behavior that is not good for society

Among his "merits", Trump is very good at fomenting hatred and divisiveness.

And because Trump took over the GOP, a "no" to Trump for many means denying the will to power.
Rejecting Trump means rejecting powerful men, "alpha males", and winners.

It's not all Trump's -and dumb followers- fault though.

In the same period, part of the left went *too* left.
And into stupid territory:

- Forced equality of outcomes
- Cultural determinism in social sciences
- Feminist animosity toward men
- Cancel culture
- Open border immigration in politics
- …

And just writing this article I got another example of that left-leaning stupidity:

> **Bing AI Can't Design A Busy Mother Coooking & Cleaning**
>
> >
>
> **My prompt**: a busy woman with two children in her arms while che cooks and cleans
> **Bing AI**: Content warning

This BS (also) pushes sensible people away from liberal parties
I sure can sympathize with conservatives with this level of stupidity.
These people don't even understand how this level of "unrequested sympathy" is actually *offensive* to empowered

women. As if choosing to stay at home and raising children is something to be hidden and ashamed for.

⍰ For more on "disempowering sympathy", see:
– White virtue signaling: babying black minorities
– Guilt tripping of white men

Supporting the Democratic candidate because anyone is better than Trump gets you confused with *that* type of left.

However, it's my belief it's the right thing to do.

So, I'll keep doing it.

And soon enough we can go back to talking about winning at life, without divisive politics.

How Power Dynamics & Populism Explain The Trump Phenomenon

Lucio Buffalmano · 24 September 2024 · Archived copy · Original

Populist political leaders leverage the discontent and disenfranchisement of the low-status “losers” and give a voice, conduit, and megaphone to that anger.

What changes is the type of discontent they leverage.

But, usually, it revolves around the basics of:

- Survival
- Reproduction
- Status
- Racial/inter-group dynamics

Political populism is a **charismatic leader**, often a dark triad, **channeling people’s discontent**. The leader stirs emotions for the votes and/or revolution he needs **to get in power**

We’ll use Trump and the 2024 elections as an example. But the dynamics are the same with any populist.

Intro

The Trump phenomenon has perplexed many.

Specifically, what some find most impressive is Trump's resilience.
Trump maintains a large appeal with the electorate despite his critics seeing him as a danger to democracy -and courting with racism and misogyny to boot-.

In this article, we contend that **Trump is not popular *despite* his most inflammatory rhetoric, but exactly *because* of it**.

Populism is a movement of revolt that needs two things:

1. A leader to channel its discontent into action and political and social change
2. An ideology that legitimizes anger into a more socially and psychologically acceptable ideology (Blau, 1964)

Since populism often needs to overthrow the system, populism *requires* an insurgent, radical leader who attacks and frames 'old' politics as corrupt and ineffective.
And the angrier and more incendiary the leader is, the more the followers feel represented and vindicated.

Seen from this point of view, Trump is the angry people's wrecking ball against a system that they feel is not working for them anymore.

What is it exactly that makes these people feel the system is failing them?

It's these points:

1. Low-Status Men & Mating (Intergender Power Dynamics)

What's Trump's largest voting block?

Non-college-educated white voters.

ChatGPT also confirms:

Men with lower education vote Trump

Donald Trump's biggest voting group has consistently been **non-college-educated white voters**, particularly **white working-class men**. These voters form the core of his political base. Here's a breakdown:

1. Non-college-educated White Voters:

- **Biggest Group**: This is Trump's largest and most reliable voting bloc. Within this group, men are especially supportive, though he also has substantial backing from non-college-educated white women.
- **Why They Support Trump**: Many in this demographic feel alienated by the political establishment and resonate with Trump's populist messaging, which emphasizes economic nationalism, immigration restriction, and skepticism toward globalism and elites.

It's a safe bet that **lower education = lower status** (on average, at a group level).
Lower status men support anti-establishment populism because they're failing in those establishments.

And what do gender power dynamics have to do with it?

Everything.

It goes at the core of survival and reproduction.

This is the principle:

⚖️ **The more women gain power, the more average men struggle to be attractive** dating options to these women.

And struggling men provide fertile ground for populists who offer easy -but rarely functioning- solutions.

This video is a good primer on these dynamics:

Why Women's Power Makes Men's Dating Harder

But for a quick text-based explanation, this is it:

It goes at the core of hypergamy, or "women preferring to date higher value men than they are".

Women want to date -and to look up- to a higher power man.
In societies that repress women, almost any man is higher power than women.

However, it's simple math that the more power women gain, the fewer men are higher power than women.
That means that fewer and fewer men are attractive dating options.

A society with empowered women favors high-value men because empowered women can only really lust after a high-value man.
Only a higher-power man can truly lead a woman.
And, thus, women can only be happy feminine women with a higher-power man.

At a societal level, empowered women change the dynamics of dating marketpalce.

In libertine societies with empowered women, the top men "monopolize" several women, who are "taken off the market".

And with a shrinking female population available, average and lower-value men struggle to find a mate.

Of course, unless we go really extreme, most men still pair up in 1:1 semi-monogamous pair bonds. However, the dynamics still negatively affect men, including:

- Younger lower-value men get little or no sex
- Lower-value men live in fear of never finding a mate
- Most average men must content themselves with lower-quality women
- Lower-value men in relationships fear abandonment and cuckoldry to higher value men
- Average men pay a psychological price and never get to “feel like real men” who wear the pants

This is what’s happening in the West.

Western’s Women Power Disempowers Average Men

In recent decades women have been gaining more and more power.

They gain more degrees:

And, equally if not more significantly, women are catching up in earning:

And, equally if not more significantly, they are catching up in leadership positions:

What's not in the chart is that women are *also* becoming more:

- Power-aware
- Assertive
- Demanding for social skills, "game", and "expertise"

And guess what?

These empowered **Western women don't find poorer, non-college-educated men attractive**.

Exceptions always apply of course.
But then, you better be a hunk.

And most men are *not* hunks.

Bottom line, **empowered women are a (reproductive) threat to average men**.

These men may not be consciously aware of it.
But deep down, subconsciously, they know it.

Also read:

- **Successful women dating**

Politics: Sexually Disempowered Men Vote Conservative

And how does this tie back to politics?

Simple:

- The democratic party is the party of empowered women
- The Republican party is the party of traditional masculinity

Starting from the top.
Democrats have Kamala Harris, and Republicans have Trump.
And it trickles down to their supporters. Democrats have Beyonce and Taylor Swift, Trump has Kid Rock and Hulk Hogan.

Trump (silently) embodies the ideals and values of male-dominated households.
In those households, men still wear the pants.
And in that culture, average men still find a mate.

Voting for Trump is a vote for putting men back in the lead.
And giving them a chance to date, mate, and enjoy a good man's life.

The Conservative Fantasy Household

The main dream-promise of the conservative household is 1 man : 1 woman, with a feminine woman, and a man wearing the pants.

And it's not totally wrong, either.

If Kamala Harris wins, the culture become even more embracing of empowered women.
And if Trump wins, politics would re-establish that "it's the man's job to lead".

Now you see why Trump can say the most misogynist crap about women, and still get these men's votes.
Indeed, the more misogynist Trump is, the more he'll get these men's votes.

P.S.: The Irony of Right-Wing Populism: Losers Lose Bigger

Trump IS an old-school "alpha male type".

Adn that is exactly why he won't help average men.

Trump and the men like him GAIN with libertine societies (flash news: Trump DID engage in polygyny with serial semi-monogamy).

Plus, their goal is to build empires, and make as much money as possible.

The old-school staple of right-wing and conservative economic policy is little government and few taxes.
Especially on the wealthy.

So, in truth, **Republicans only make it worse for average men**.
But, alas, they wouldn't be average and below-average men if they thought this far in advance :).

2. Men & Power (Social Power Dynamics)

Men are hardwired to admire dominance and social power.

Both right-wing populist leaders and dark triad offer dominance in spades.

And Trump is no exception.
If anything, he may be *overly* dominant to be an effective politician.

Democrat leaders are NOT as dominant.

Kamala Harris is a good woman.
But that "good" is also her limitation with some voters.

Albeit power in her role, she's not personally powerful in:

- Behavior
- Character
- Mindsets
- Body language…

More of the same for Tim Walz.
He looks like a pudgy Santa Claus. Safe and kind.

Tim Walz is the type of man women feel safe with.
Too safe, maybe.
Walz is the guy the woman lies on and calls "my teddy bear".

Compare to JD Vance:

Too Nice Guy VS Ahole**

JD Vance is also carrying some extra kilos.
But look at those eyes.
You wouldn't call him "teddy bear". More like a "possessed doll", if anything.

JD Vance is an asshole, but he's a high-power, socially dominant asshole.

High-Power Men Want High-Power Leaders

I see this every single day in your YouTube channel's comment section.

We see that **thousands of men love Trump exactly when he displays the most dominance.**

These guys somehow don't see that it's ultimately more effective to be high power and high-warmth.
And to be high power *without* being a pathological narcissist and win-lose type. Trump would be a two-time president in a row, without having to risk a third campaign if he had been less of a narcissist.

But let's not digress too much and you can just watch this video:

Melania: (displays all her dislike for Donald)

⍰⍰ Over-dominance disempowers others. They will resent you. So over-dominance poisons your close relationships and makes you lots of enemies

Back to politics instead, this is also why Democrats did best with men like Clinton and Obama.

These were charismatic, high-power men who helped bridge the gap between pro-social but low-power Democrats, and high-power Republicans.

Low-Power Men Project Onto Trump

Trump also gets many low-power men's votes.

This group overlaps with our point #1, as also suggested by Hakkar and Sivanthan's research.
They're not high-status or dominant.
But they *wish* they were.

So they do what sports fans do.

They emotionally project onto their idol-representative.
And Trump's victory becomes *their* victory.

I also see this in our YouTube comment section.
These men lash out with videos critical of Trump. Or, worse, videos showing Trump looking weak.
They can't accept their idol of strength to look weak.

Even videos that are simply not negative of Kamala Harris stoke these men's emotions:

Low-Status Men Project Onto Their Leader

> **Emotional Trump supporter**: can't wait to see your (trying to be offensive). How are you so analytical of human nature and so impaired in… (more attempts to be offensive follow)

⍰⍰ Fans always emotionally over-react when they perceive an attack to their hero

Their hero losing is worse than their own loss.
If they lose, it's just another average man losing.
If their hero loses, it's the whole cause losing. It becomes hopeless.

3. Racism & Social Privilege (Racial Power Dynamics)

> Life is always easier when you place a whole race/group beneath you.

The power dynamics are simple:

Individuals from a privileged class all gain at the detriment of the un-privileged ones.
Adn the bigger the privilege and gap between the groups, the better off the privileged individuals are.

Conversely, for a formerly privileged individual:

⚖ The more egalitarian a society becomes, the worse off the members of the formerly privileged group become.

Even “privileged lower-value men” are better off.
From a dating point of view, he may “date down” on a lower class and find a mate. But if everyone is the same, the “loser” is just a loser.

And general society-level progress does not change these dynamics.

Remember that individual status is comparative and never absolute.
So it doesn’t matter that today’s lower-value whites have a more comfortable life than a king in 1500.
Because everyone else has a more comfortable life, lower-value white men still lose with black and minorities’ empowerment.

So many whites today resent a more egalitarian society because they see equality as coming at their expense.
And they’re not totally wrong about the latter.
And about the former, that egalitarianism may be “fairer” doesn’t compute in many men’s minds. We are selfish animals, after all.

Undercover Racism: An Iceberg-Like Phenomenon

Many underestimate the true extent of racism.

Circumstantial evidence is always poor evidence.
And still, looking at the most popular comments on this video does serve as a powerful reminder -and wake up call for many-:

Racism hasn’t disappeared, only gone undercover

> If you want to see who people truly are, give them anonimity
> *– TPM Proverb* ✒

Politics: If They Can Be Racist With A Vote, They Will

Without racists in power, undercover racists have no power.

But if suddenly a racist party appears, **the racist party easily scoops up all the undercover racist votes.**

Know back to American politics.
And this shouldn't come as a shock to anyone:

Democrats are the party of equality and inclusion.
Republicans, well… Not so much.

So any white reactionary who (subconsciously) resents the loss of white privilege votes Republican.

If anything, **public repression of racism pushes even *more* racist voters toward Republicans and Trump**.
Black Republicans only serve the GOP as a convenient front to hide these dynamics.

4. Clannishness (Inter-Group Power Dynamics)

Populists often leverage humans' natural in-group VS out-group.

In-group/out-group dynamics means that people people favor their own group (in-group) and dislike, discriminate, or fear, those outside of it (out-group).

In-group/outgroup dynamics are present in most human beings as part of our evolutionary makeup.

Politics: Clannish Individual Vote Anti-Immigration

Conservatives, more focused on power, are generally more clannish than Democrats.

Plus, populist leaders do the following:

- **Make the in-group feel "superior" (over-patriotism)** to cash in on the good feeling
- **De-humanize the outgroup as evil**, dangerous, or disgusting to cash in on anger and fear

For example, something Trump said during the 2024 campaign:

- Haitians eat our dogs
- America first
- Mexicans send us the rapists

Etc., etc.

America First is dereliction of leadership

Lucio: While "America first" may seem the most benign expression of clannisshness, I see it as the most damaging.
First off, it's dumb politics because the most powerful thing you can do is to lead the world.
Furthermore, it's bad for everyone when any country removes itself from global cooperation, let alone the richest country in the world (tragedy of commons).
In a world that desperately needs cooperation to face the challenges ahead, I find this is the most dangerous of Trump's approaches.
But that's just me…

Result: both high-power clannish and fearful men vote for the populist to keep their group "pure" and safe.

These 4 Will Always Vote for Trump

People in the above categories will vote for Trump no matter what.

The reason is simple:

Survival and reproduction trump any argument.

For men in these four groups there can't be a higher priority than finding a mate, maintaining status and power, and advancing one's group over others.

These voters will SAY that Trump has better policy, they will SAY Harris has no policy.
But that's all a front.

These voters won't be dissuaded by anything Trump may say that's nonsense, racist, or misogynist.
As a matter of fact, Trump NEEDS to be inflammatory things to pander to these demographics.

These voters also won't be dissuaded if Kamala Harris spanks and emasculates Trump in the debates.
As a matter of fact, they'll support Trump harder BECAUSE **a black woman handing Trump his ass is the the worst nightmare of lower-value, conservative white men**.

Populism Isn't The Issue. Populist *Leaders* Are

"Populism" is usually in the negative.

However, populism can be a fair answer in some cases.

Elites after all can monopolize all the resources while the populace goes hungry.
And long-standing governing parties can fumble policies -EU and USA probably didn't do a great job with immigration-.

However, **populist leaders are charismatic dark triads who sell pro-people policies as a cover for their power-hunger.**
That means that, once in power, their selfish interest come first, second, and probably third and a few more spots below that.
And I haven't seen many exceptions to this rule.

Populists Stoke Anger & Anguish to Weaponize Them

General principle:

⚖ **While winners are happy with the system because they're winning, losers are receptive to anti-establishment populism because they're losing**

And the angrier and more resentful the losers become, the more power their leader can channel against the system.

In our current example, Trump weaponized the anger, fear, and anguish, of the lower-status white men.

Paraphrasing the lucid political commentator Anthony Scaramucci, to these men, Trump is their orange wrecking ball against the system.

Fascism, Nazism, & Communism: Populism Is The Common Root

Populism and fascism/communism are different.

However, they overlap.

Fascist and communist regimes need people's approval to overthrow democracy and install a new political order.

And **any despotic fascist or communist movement starts with populism** to first overthrow the old system.

ChatGPT agrees:

Fascists, Nazists, & Communists share populist roots

ChatGPT Auto

did fascism, nazism, and the bolshevik revolution in Russia start with a populist streak within them?

Yes, **fascism**, **Nazism**, and the **Bolshevik Revolution** in Russia all h populist elements in their early stages. They emerged in response widespread social, political, and economic discontent, positioning themselves as movements that spoke for "the people" against the ruling elites. However, they eventually evolved into authoritarian regimes. Here's a breakdown of how each movement began with populist streaks:

Fascism, Nazism, and the Bolshevik Revolution had differences, of course.

Fascism and nazism, as right-wing movements, included militarism and national pride (clannishness).
The nazis added racism to the mix.
And communists added land owners and industrialists to the “out-group we should hate”.

But they were all remarkably similar -and populistic- in how they rose to power.

They all promised to channel the power of the united people against perceived weak and/or fat elites who preyed on the masses and who deserved to be eliminated.

Populist Governments Always Become The New Establishment

Populism decreases over time because the revolutionaries become the new elite.

And **the populist “new” system just becomes another system with its winners and losers** (often, pretty much the same people because winners tend to win anyway).

And this is why today many don’t link fascism, nazism or communism to populism.
Because those systems changed their tone and rhetoric over time. (And if they didn’t, the gap between words and facts grew so large that most people realized it was political manipulation).

But they all started as populistic movements.

Of course, just because we saw many past populist movements turn despotic and disastrous doesn’t mean all present and future populists will do the same.

But, personally, I wouldn’t bet on any power-hungry dark triad to be the enlightened exception.

Exec Summary

- Donald's father Fred Trump was a sociopath who ruined Donald's psychological development
- Donald Trump is a narcissist at a minimum, probably a sociopath
- Trump's re-election could mean the end of democracy

FULL SUMMARY

About the Author:
Mary Lea Trump is an American psychologist and writer. She holds a PhD in clinical psychology from the Derner Institute of Advanced Psychological and she is the niece of former US president Donald Trump

Donald's sociopathic father ruined him

The author claims that:

- Donald's father Fred was a sociopath
- Donald's unsupportive mother used children for her own needs
- Donald's mother was sick and absent for a year at a crucial developmental juncture
- Fred was annoyed by his children's "needs"
- Donald was left (emotionally) unattended
- Donald adopted toxic coping mechanisms
  - No empathy
  - Care nothing about others
  - Pretend to be strong so your father doesn't hate you

These are plausible, in my opinion.

But the real question is how much they truly weighed.

And while the author implies they're the main or even only reasons why Donald turned out the way he did, I disagree.

See the criticism section.

Fred raised children to carry legacy, not out of love

This is common among power-craving men:

> Fred wasn't interested in children at all. His oldest son and namesake received Fred's attention simply because he was being raised to carry on Fred's legacy.

This is in line with both sociopathy and right-wing psychology.
See more here:

- **Right-wing psychology and children**

This is exactly what Donald Trump did with his children:

> **Ivanka**: He (Donald) was not the type of father who (mimicks kisses and child talk) or take them to a stroll in the park.
> (…)
> He did not know how to speak to them. He was able to speak to them only when they came from University when eventually was able to speak business with them

I don't think that Donald "just wasn't able".
Or at least, not only.
Mostly, he wasn't *interested* to.

Fred switched his “legacy-carrying” child from Freddie, to Donald.
And Donald then betrayed him by selling his company right after his death.

Fred raised Donald with a zero-sum game mindset of win-lose

> Financial worth was the same as self-worth, monetary value was human value. The more Fred Trump had, the better he was. If he gave something to someone else, that person would be worth more and he less.
> He would pass that attitude on to Donald in spades.

Trump is more than just “narcissist”

> In the last three years, I’ve watched as countless pundits, armchair psychologists, and journalists have kept missing the mark, using phrases such as “malignant narcissism” and “narcissistic personality disorder” in an attempt to make sense of Donald’s often bizarre and self-defeating behavior. I have no problem calling Donald a narcissist—he meets all nine criteria as outlined in the Diagnostic and Statistical Manual of Mental Disorders (DSM-5)—but the label gets us only so far.

She then goes on to list her credentials, which is a good move :).

And then her diagnosis is:

> A case could be made that he also meets the criteria for antisocial personality disorder, which in its most severe form is generally considered sociopathy but can also refer to chronic criminality, arrogance, and disregard for the rights of others.

And she goes on to list more possible traits, including:

> He may have a long undiagnosed learning disability that for decades has interfered with his ability to process information.

Finally, towards the end of the book she mentions the “sociopathic”:

> With millions of lives at stake, he takes accusations about the federal government’s failure to provide ventilators personally, threatening to withhold funding and lifesaving equipment from states whose governors don’t pay sufficient homage to him.
> (…)
> The deafening silence in response to such a blatant display of sociopathic disregard for human life or the consequences for one’s actions, on the other hand, fills me with despair

Donald has no empathy

> As the pandemic moved (…) and the death toll continued its rise (…) the press started to comment on Donald’s lack of empathy for those who have died and the families they leave behind. The simple fact is that Donald is fundamentally incapable of acknowledging the suffering of others.
> (…) for Donald there is no value in empathy, no tangible upside to caring for other people.

What’s more shocking to me is that people didn’t realize that before the pandemic.
And that many haven’t even realized it now (writing in 2024).

The same runs through the family, says the author.
And what Fred had taught his children, ti eventually turned on him when he started his mental decline:

> Fred's remaining sons had given up all pretense of caring what their father thought or wanted.
> Having served his father's purpose, Donald now treated him with contempt, as if his mental decline were somehow his own fault. Fred had treated his oldest son and his alcoholism the same way, so Donald's attitude wasn't surprising.

Donald's need for affirmation is… Endless

> His deep-seated insecurities have created in him a black hole of need that constantly requires the light of compliments that disappears as soon as he's soaked it in. Nothing is ever enough. This is far beyond garden-variety narcissism;

The author then links Donald's need to weakness and ego fragility:

> Donald is not simply weak, his ego is a fragile thing that must be bolstered every moment because he knows deep down that he is nothing of what he claims to be.
> He knows he has never been loved. So he must draw you in if he can by getting you to assent to even the most seemingly insignificant thing:

I couldn't agree more with her first quote.

But this second quote is not something I necessarily agree with (see criticism).

Donald used to be (somewhat) kinder, but got worse with time

> Donald probably thought he was being kind.
> There used to be a spark of that in him. He did once give me $100 to get my car out of impound. And after my father died, Donald was the only member of my family, other than my grandmother, who included me in anything.
> But his kindness had become so warped over time—through lack of use and Fred's discouragement—that what he considered kindness would have been practically unrecognizable to the rest of us.

Donald's psychology makes him a poor leader in crises

This was THE best insight in the book.

Something I also fully agree with (no wonder I consider it the best insight :).

She says first about Covid:

> managing the crisis in every moment doesn't help him promote his preferred narrative that no one has ever done a better job than he has.
> (…)
> In Donald's mind, even acknowledging an inevitable threat would indicate weakness. Taking responsibility would open him up to blame.

And then about the civil unrest:

> The same could be said of his handling of the worst civil unrest since the assassination of Martin Luther King,

> Jr. This is another crisis in which it would have been so easy for Donald to triumph, but his ignorance overwhelms his ability to turn to his advantage the third national catastrophe to occur on his watch. An effective response would have entailed a call for unity, but Donald requires division. It is the only way he knows how to survive—my grandfather ensured that decades ago when he turned his children against each other.

The author focuses more on division here.
However, I belive her first point is even more correct. It's impossible for Donald to acknowledge catastrophes because he wants a spotless presidency to declare the "best presidential term in history".

That's why he had a press release just to say that the Dow Jones had passed 30.000.

Anything that stands in the way of "best presidency" is a threat.
That's why he hides it, pretends doesn't exist, then pretends will go away soon.

Trump tried to steal all the inheritance money

> he seems to have come up with a plan to betray his father and steal vast sums of money from his siblings.
> (…)
> draft a codicil to my grandfather's will that would put Donald in complete control
> (…)
> My grandfather, who was having one of his more lucid days, sensed that something was not right (…) He angrily refused to sign
> (…)
> Maryanne would say years later, "We would have been penniless (…) We would have had to beg Donald if we wanted a cup of coffee."

But was equally shocking to read was this:

> Yet the siblings still got together every holiday as though nothing had happened.

And I was also surprised that the author made excuses for Donald, implying it was normal he'd so such a thing because of Fred's parenting.

Trump is not a good businessman: it's all a pretense

You heard the story:

Trump got 1 million loan from his father and turned it into billions.

Even Hillary Clinton repeated that during their 2016 debate.
Hillary said that to discredit Trump as a lucky son.

Little did she know that the reality was far worse.

Trump's start was thanks to his father:

> The real reason Donald's first two projects were acquired and developed relatively smoothly was in large part because of Fred's expertise as a developer and dealmaker.
> Neither would have been possible without his contacts, influence, approval, money, knowledge, and, maybe most important, endorsement of Donald

Fred was there to prop up Donald when he was about to fail:

> my grandfather sent his chauffeur with more than $3 million in cash to purchase chips at the Castle (…) The next day, my grandfather wired another $150,000 to the Castle, presumably for more chips

Fred's empire covered Donald's mistakes:

> Far from expanding his father's empire, everything Donald did after Trump Tower (which, along with his first project, the Grand Hyatt, could never have been accomplished without Fred's money and influence) chipped away at the empire's value.
> By the late 1980s, the Trump Organization seemed to be in the business of losing money, as Donald siphoned untold millions away from Trump Management in order to support the growing myth of himself as a real estate phenom and master dealmaker.

Over a lifetime, Trump got more than half a billion from his father:

> While my grandfather was alive, Donald alone had received the equivalent of $413 million
> (…)
> That did not include the $170 million he had received through the sale of my grandfather's empire

Even the banks propped Donald.
Why?
Because they lent Donald so much money that he was losing, that they needed him to succeed.
Says the author:

> a solution had to be found that would protect Donald's image, which, in turn, would protect the banks' money.
> (…)
> His last name was the draw: without the name there would be no new gamblers or tenants or people willing to buy bonds and hence no new revenue.
> (….)
> the banks (…) put him on a $450,000-a-month allowance—that is, almost $5.5 million a year for having failed miserably.

Finally, Trump also bumbled the sale of Fred's estate:

> In 2004, the vast majority of the empire my grandfather had spent more than seven decades building was sold to a single buyer, Ruby Schron, for $705.6 million. The banks financing the sale for Schron had assigned a value of almost $1 billion to the properties, so in one fell swoop my uncle Donald, the master dealmaker, left almost $300 million on the table.
> Selling the estate in bulk was a strategic disaster

The media is to blame for a conman's success

The author tells us:

- Gave him a platform to attract audience
- Bought the lie of the self-made man
- Treated like a serious candidate
- Never challenged him

The media allowed Trump to become a serious candidate without properly challenging him.

An attentive media would have shown that Trump is too dumb to become POTUS:

> It's easy to sound coherent and somewhat knowledgeable when you control the narrative and are never pressed to elaborate on your premise or demonstrate that you actually understand the underlying facts.
> It is an indictment (among many) of the media that none of that changed during the campaign, when exposing Donald's lies and outrageous claims might actually have saved us from his presidency. On the few occasions he was asked about his positions and policies (which for all intents and purposes don't really exist), he still wasn't expected or required to make sense or demonstrate any depth of understanding.

Personally, I'd add an extra failure:

- **In 2024 the media treats him as a political candidate rather than a high risk to democracy**

And that includes democrat-leaning media like CNN.

Trump sacrifices truth for a good (self-serving) story

Says the author:

> As usual with Donald, the story mattered more than the truth, which was easily sacrificed, especially if a lie made the story sound better.

And:

> (…) and then launched into his version of my "back from the brink" redemption story.
> "It was really bad for a while—and then she started doing drugs." "Whoa," I said, holding up my hands.
> "Really?" said Melania, suddenly interested. "No, no, no. I've never done drugs in my life."
> (…) He was embellishing the story for effect, and he knew I knew it. "She was a total disaster," he said, smiling more broadly.
> (…)

Worse yet, Trump's lies are often concocted to make others look bad, and make himself look good:

> By conflating my dropping out of college and his hiring me to write his book (while throwing in a fictional drug addiction), he concocted a better story that somehow had him playing the role of my savior.
> There was no point in setting the record straight, however; there never was with him

Good proof of that is this video:

There is no grand strategy in Trump: his ego only drives him

> I hope this book will end the practice of referring to Donald's "strategies" or "agendas," as if he operates according to any organizing principles.
> He doesn't.

I largely agree.
Donald has great power instincts, but he's no planner.
And his ego makes it impossible to follow other people's plans. Even when they know better.

See as an example his lack of preparation for the presidential debate:

Sycophants to dark triads are used and thrown away

This is a pattern I've also noticed and tend to agree with:

> Donald's chiefs of staff are prime examples of this phenomenon.
> John Kelly, at least for a while, and Mick Mulvaney, without any reservations at all, would behave the same way—until they were ousted for not being sufficiently "loyal."
> That's how it always works with the sycophants. First they remain silent no matter what outrages are committed; then they make themselves complicit by not acting. Ultimately, they find they are expendable when Donald needs a scapegoat.

The same happened to Mike Pence, and later to Rudolph Giuliani.

See here for more:

- **Trump VS Rudolph Giuliani**
- **Trump left his followers hang to dry after insurrection**

Anthony Scaramucci, a great communicator and one of my favorite analysts, confirms the same from first-hand experience (the dialogue is me paraphrasing!):

> **Anthony**: With Donald you go on an arch. You dislike him in the beginning, then you try to work with him because he's the political leader, and then you realize there is no team-work with him because there is only team Trump

Donald would never be seen with his own followers

> Donald's need for affirmation is so great that he doesn't seem to notice that the largest group of his supporters are people he wouldn't condescend to be seen with outside of a rally

Yep, 100%.

This is why we're often critical of followers and fans here.
And especially of narcissists's fans.

A risk to democracy

This was written in 2020, and it may be more relevant today than it was back then:

> If he is afforded a second term, it would be the end of American democracy

MORE WISDOM

Trump paid to pass his SAT test

And he paid someone to take the SATs for him:

> he enlisted Joe Shapiro, a smart kid with a reputation for being a good test taker, to take his SATs for him

Donald Was Poor With Women

Donald was no natural charmer:

> As the two of them were chatting, she mentioned that she had gone to a boarding school near New York Military Academy.
> "Which one?" he asked.
> When she told him, he looked at her for a second and then said, "I'm so disappointed that you went to that school."
> Annamaria, who was three years older than Donald, said, "Who are you to be disappointed in me?" That ended the conversation

We don't disagree with that :).

Let people come to you

> The tableau reminded me of one of my grandfather's tactics: he always made his supplicants come to him, either at his Brooklyn office or his house in Queens, and he remained seated while they stood.

Also see our 48 Laws of Power summary and body language of power.

Careful with lies to sound charming: smart people see through them

Says the author of Donald greeting her:

> when he saw me, he pointed at me with a surprised look on his face, then said, "I specifically asked for you to be here." That was the kind of thing he often said to charm people, and he had a knack for tailoring his comment to the occasion, which was all the more impressive because I knew it wasn't true

The power of positive thinking

The "thinking positive" movement bolstered Fred's skirting of problems.

Says the author:

> Peale was a charlatan (…)
> Fred wasn't a reader, but it was impossible not to know about Peale's (…) *The Power of Positive Thinking*. The title alone was enough for Fred
> (…)
> Peale's doctrine proclaimed that you need only self-confidence in order to prosper in the way God wants you to.
> (….)
> That view neatly confirmed what Fred already thought: he was rich because he deserved to be.

The author says that Fred was unable to empathize or deal with any personal problem in his family because problems stood in the way of his "think positive" gospel.

Don't over-apologize with killers, they'll respect you less

> Fred hated it when his oldest son screwed up or failed to intuit what was required of him, but he hated it even more when, after being taken to task, Freddy apologized. "Sorry, Dad," Fred would mock him. Fred wanted his oldest son to be a "killer" in his parlance (for what reason it's impossible to say—collecting rent in Coney

> Island wasn't exactly a high-risk endeavor in the 1950s)

Trump behaves dishonorably in everyday life

For example, putting people on loudspeakers with others present, without warning them:

> He was usually on a call, which he'd put on speaker
> (…) The person on the other end, who had no idea he or she was on speaker (…) Whenever anything outrageously sycophantic, salacious, or stupid was said, Donald smirked and pointed to the speakerphone as if to say, "What an idiot."

Ivana was arrogant, Marla was nice

> about as different from Ivana as a human being could be. Marla was down-to-earth and soft-spoken where Ivana was all flash, arrogance, and spite

I had the same feeling watching the two:

QUOTES

Very telling on Fred's "support" as a father:

> "I need to beat this, Dad. I don't think I can do it by myself. I know I can't."
> Instead of asking "What can I do for you?" Fred said, "What do you want from me?"

Mary Trump has a knack for dropping humor.
Here are some of them:

> my name was plastered everywhere, on everything: TRUMP shampoo, TRUMP conditioner, TRUMP slippers, TRUMP shower cap, TRUMP shoe polish, TRUMP sewing kit, and TRUMP bathrobe. I opened the refrigerator, grabbed a split of TRUMP white wine, and poured it down my Trump throat so it could course through my Trump bloodstream and hit the pleasure center of my Trump brain

And a little bit later, visiting the White House, another zinger towards the quality of Trump's products:

> Each of the waiters carried a bottle of red wine and a bottle of white.
> Real wine, not TRUMP wine

On Trump's initial work for his father:

> Donald's job description seems to have included lying about his "accomplishments" and allegedly refusing to rent apartments to black people (which would become the subject of a Justice Department lawsuit accusing my grandfather and Donald of discrimination).

A funny power move when Donald didn't want to be framed as "not visiting his mother enough":

> Mary's been visiting me every day," Gam said, smiling at me.
> He turned to me. "Must be nice to have so much free time."

LOL :D

CRITICISM

Unconvincing Psychological Analyses

I found the analysis of Trump's psychological development overly speculative.

And I found it overly blamed Fred, Donald's father, for how Donald turned out.

Let's see more:

Cultural Determinism

For example:

> In order to cope, Donald began to develop powerful but primitive defenses, marked by an increasing hostility to others and a seeming indifference to his mother's absence and father's neglect. The latter became a kind of learned helplessness (…) In place of those needs grew a kind of grievance and behaviors—including bullying, disrespect, and aggressiveness—that served their purpose in the moment (…) Unfortunately for Donald and everybody else on this planet, those behaviors became hardened into personality traits because (…) Fred Trump came to validate, encourage, and champion the things about Donald that rendered him essentially unlovable and that were in part the direct result of Fred's abuse

I feel this is speculative and "socially deterministic" –"tabula rasa" approach-.

I see it this way instead: **dark triads tend to have dark triad children**.
And then, icing on the cake, the 'asshole types' also provide an ahole role model for the children.

And a bit later in the book:

> Fred destroyed Donald, too, but not by snuffing him out as he did Freddy; instead, he short-circuited Donald's ability to develop and experience the entire spectrum of human emotion.
> By limiting Donald's access to his own feelings and rendering many of them unacceptable, Fred perverted his son's perception of the world and damaged his ability to live in it

I think this outweighs Fred's contributions and downplays Trump's.

Following the author's analysis, are we expected to believe that Trump would have been an altruistic saint with a better father?

Trump was likely already wired like his father from birth.

Is Trump overcompensating for low self-esteem? Grandiose VS vulnerable narcissism

The author claims Trump overcompensated for weakness and fear.

Some passages from the book:

> Donald's reckless hyperbole and unearned confidence that hid Donald's pathological weaknesses and insecurities
> (…)

And:

> Donald's growing arrogance, in part a defense against his feelings of abandonment and an antidote to his lack of self-esteem, served as a protective cover for his deepening insecurities

I'm unconvinced with the author's claim that Trump is insecure and has low self-esteem.
To be precise, she never directly claims it, but she takes it for granted (as per the above quotes).
Not only I disagree with it, but to me, that's psychologizing, not a good scientific approach.

There is some evidence supporting the idea that insecurity can lead to compensatory behaviors.
That seems to be more the case with *vulnerable* narcissism.

Grandiose narcissists may still engage in compensatory behavior (Jordan et al., 2003).
But for them it's less about masking low self-esteem and more about *maintaining* an *inflated* sense of self.

And I'm not convinced Trump is more of a vulnerable narcissist.
Not more than he is *also* a grandiose one, at least.

Indeed, to me, he is a mix of both.

Trump is afraid, still pandering to his father

To explain Trump's narcissism and grandiosity, the author says:

> the same little boy who is desperately worried that he, like his older brother, is inadequate and that he, too, will be destroyed for his inadequacy. At a very deep level, his bragging and false bravado are not directed at the audience in front of him but at his audience of one: his long-dead father.

I also see this as waaay over-reading into childhood experience.

Occam's razor principle with TPM spin:

⚖ **If there is a simpler and unproven explanation, there is no need for a convoluted, unproven one.**

And the explanation of Trump's behavior is narcissism.

"Women's psychology" trends VS evidence-based psychology

In general I see two approaches to psychology:

- Evidence-based
- Opinion and interpretation-based

The second tends to appeal more to women.

Besides the psychoanalytical "storytelling" I'm not too fond of, this passage also suggested me the author belongs to that second school:

> NYMA also reinforced Donald's aversion to vulnerability, which is essential for tapping into love and creativity because it can also expose us to shame, something he could not tolerate

Ehmm… What?
That feels like a leaf straight from Brene Brown's "*Daring Greatly*" and all her other books.
To me, Brene's approach is glorified, academic-coated pop psychology.

Limited Definition of "Success" Warps Trump's Analysis

The author doesn't differentiate between human development, human empathic bonds, and material "success".

While in my opinion a “successful” life would include all these dimensions, material success still matters to many.

Read again the sentence above:

> Fred perverted his son’s perception of the world and **damaged his ability to live in it**

So Trump has been made “incapable of living in the world?”.

How about being “effective” in that world?

I think Trump has been pretty darn effective and successful by many standards of Western -or human- “success”:

- **Money**, lots of it
- **Power**, lots of it
- **Women**, several and attractive

Doesn’t Give Trump Enough Credit

Even if you believe Trump is an egotistical wannabe despot, which I also believe he is…

You still can’t take concrete and objective achievements away.

But the author doesn’t seem to be willing to extend any credit.
For example:

> Donald’s ego has been and is a fragile and inadequate barrier between him and the real world, which, thanks to his father’s money and power, he never had to negotiate by himself

Come on, even if you wanna say it was luck, friends’ help at the right time, desperate banks or whatever… He still ended up with a much larger financial empire than he inherited.
Even if you wanna say it was white rural fragility that helped his candidacy… He still won the primaries and got millions of votes.

And even if you wanna criticize his presidency.
For example, his leadership during Covid, which I agree is an absolute disgrace and dishonor. But he also did do something OK.

For example, I disagree it’s a big merit that he didn’t start any war. In truth, Trump’s personality are more likely t start wars -remember in his early presidency when he bragged of “sending an armada to North Korea”-.
But still, data at hand, he still did not start any war.

Personal Bias Shows – Several Times

For example:

Aggrandizing father’s success, minimizing others

talking about her father:

> What Freddy achieved in the cockpit made him unique in the Trump family. None of Fred’s other children would accomplish so much entirely on their own
> (…)
> When you consider that there were no flight simulators and all the training was done in the air, the achievement was all the more staggering

OK, he became a pilot, nice.
But still… It does sound a bit aggrandizing of his father, while minimizing the others. Especially when you consider that, even if lost it all, Donald still became a billionaire.
And then *president*.

Even accounting for some family help, most people would consider those accomplishments MUCH more unique than becoming a pilot.

Denies Donald may have been better in the business

For example:

> Since my father's death, Donald has suggested that "they" (meaning he and my grandfather) should have "let" Freddy do what he loved and excelled at (flying) rather than force him to do something he hated and was bad at (real estate). But there's no evidence to suggest that my father lacked the skills to run Trump Management, just as there is none to suggest that Donald had them.

However, earlier in the book, she says:

> Trying to prove he could make executive decisions, Freddy placed a window order for one of the older buildings. When Fred found out, he was furious. "You should have slapped a goddamn coat of paint on them instead of wasting my money!" he shouted while the employees looked on.
> "Donald is worth ten of you. He never would have done anything so stupid." Donald was still in high school at the time

Frankly, this all reminded me of The Godfather's family, with Fredo being passed over for Michael.
And Fredo denying Michael was better suited for the job:

Over-blames Donald and Fred for his father's demise

The author says or implies Fred caused her father's demise into alcoholism.

And she says or implies it was, at times, under conscious attack.

That's plausible.
And several of her stories are plausible and fit with MO of sociopaths like Fred, and with emotional power dynamics.

But it seems to me the author may *over*-blame Donald and Fred for his father's descent into alcoholism:

> The only self-made man in the family, Freddy was being slowly, inexorably dismantled.

Probably Fred played a role.
It's plausible Donald did as well.

But… How about some ownership as well?

Even if that ownership only meant "not being able to throw off the father's yoke", that's still also on him.

Also, notice the frame of "the only self-made man". As if he was the only family star, brought down by jealousy and envy.

And just to highlight this point:

It's never her father's fault?

This line:

> My dad's dream of flying had been taken away from him, and he had now lost his birthright. He was no longer a husband; he barely saw his kids

No it wasn't "taken away".
He DRANK it away.

And no, there is no birthright to work at your father's company if you don't add value.

And finally, Freddy is "poor Freddy" that he can't see the children.
But grandfather Fred was bad for prioritizing work over children?

Freddy pointed a gun at the mother of his children!

Glosses over father's (HUGE) red flags

I understand she wants to defend her father.

But as a critical reader, I've seen some HUGE red flags.
For example:

> Dad was aiming a rifle at her, the .22 he kept on his boat to shoot sharks—and he kept laughing.
> Mom begged him to stop. He raised the gun until it was pointing at her face. She lifted her left arm higher and screamed again, more loudly. Dad seemed to find it funny. I turned and ran back to bed.

He was drunk, but still… What a toxic father and husband!

The abuse was even deeper than "drunk Freddie" though:

> Despite my mother's fear of snakes, Dad brought home a ball python one day and put the tank into the den, forcing my mother to pass by it any time she needed to do laundry, go into my brother's room, or leave the apartment.

What a HUGE POS move!
This is pure cruelty.

If this is not abusive, well…

It seems to me, this was a house of toxicity.
But her father was not the "weak but nice exception". If anything, he was the weak and potentially *worse* expression.

The author's mother asked for a divorce -no wonder-.
And she had to change the lock because he tried to sneak back in once again.

Political Bias Shows

For example:

> Donald was to my grandfather what the border wall has been for Donald: a vanity project funded at the expense of more worthy pursuits

I'd argue that, whether one agrees with strong borders or not, it's an important political decision, rather than a vanity

project.

Personally, I'd also be in favor of stronger border policing.

And talking about Trump's victory:

> Despite the fluke that was his electoral advantage and a "victory" that was at best suspect and at worst illegitimate, he never had his finger on the pulse of the zeitgeist; his bluster and shamelessness just happened to resonate with certain segments of the population

Trump may win again in 2024.

Is that also a fluke?

I agree Trump only resonates with a portion of voters and was, in a way, lucky to ride discontent and immigration blunders by the Democrats. He would also certainly lose without the Electoral College.

But still, he won the Republican ticket and he seems to know how to rally a crowd.
And most of all… How exactly is his victory "illegitimate?

Or talking about the USA and the economy:

> the daily corruption he has committed since January 20, 2017, have led to the impending collapse of this once great nation's economy, democracy, and health.

Really?
The DOW first passed 30.000 before the pandemic under Trump's presidency.
Health was probably pretty much the same.
And USA has never been stronger.

None of that is thanks to Trump, of course.
It would have been the same, or even better.
But I find this fake catastrophism weak, and no better than Donald's Trump approach.

Some left-leaning accusations against Trump are off

The biggest one was this for me:

> I can only imagine the envy with which Donald watched Derek Chauvin's casual cruelty and monstrous indifference as he murdered George Floyd; hands in his pockets, his insouciant gaze aimed at the camera. I can only imagine that Donald wishes it had been his knee on Floyd's neck

I don't believe that for a second.

It's also illogical.

I feel confident to deny that because it doesn't rely on believing in Trump's goodness or empathy. But it rests on Trump's craving for *good* press, not bad one.
Killing Floyd was bad press.

The "Family Must Help" Morality I Disagree With

The author sounds disapproving of how the Trump family treated her father and mother.

Part of that disapproval seems to stem from the amount of money her mother receives in alimony.

The author seems to come from this moral angle:

If you can help family, you must.

However, I disagree.
Just because one is wealthy and you're family, it doesn't follow that the wealthier person is supposed to help.

Justifying Trump Based On His Upbringing

Finally, and most surprisingly, the author also seems to excuse Trump for his behavior.

Even when she mentions Trump's pettiness caused deaths when he withheld ventilators, she ends by saying "Donald isn't really the problem after all."

I disagree.

REVIEW

Too Much and Never Enough is a great book for those who want to learn more about the Trump's family and its most famous representative, Donald Trump.

On the con side, there is some personal and political bias.
Plus, a good chunk of the psychological analysis rests on psychoanalytical interpretations that I found to lack substance and evidence.

On the plus side, the bias is limited in scope and depth, and mostly in favor of her father rather than against Donald.

Speaking of which, Donald Trump comes out of it as a rather dark, manipulative, and "not so bright" figure.
So the book is bound to receive politically-motivated reactions, both in its praise, and even more in its attacks.

However, given the situation and circumstances, the author provided us with a relatively balanced and factual account of the Trump's family.

I find it an instructive read and, on a more personal note, I'm very grateful to Mary Trump for having written it.

Check the **best books** to read or **get this book on Amazon**.

Too Much and Never Enough Summary: Trump = Narcissist?

Too Much and Never Enough (2020) provides an insider view of Donald Trump, and the Trump family. The author, who is Trump's niece, paints a dark picture of the former US president as a callous, selfish, and manipulative personality.

The Mindsets to Win At Life (& Crush the Competition)

Lucio Buffalmano · 8 October 2024 · Archived copy · Original

Winners think differently than losers.

It's a paradox of sorts.
While to win you need to beat the competition, winners don't focus on competitors.

This article explains how winners think about the competition.
Adopt these mindsets, and you too can crush the competition.

Contents

- 1. It's Always About The Game, Never The Players
  - 1.2. Take your revenge on the game
- 2. See THROUGH The Competition
  - Competition-focus ⍰⍰
  - Goal-focus ⍰⍰
  - ⍰ Shortest Guy Picks Up The "Club Queen"
- 3. Battle Scars Pave The Road to Victory
- 4. Effort Over Time Wins the Game
- The Mindsets, In One Real-Life Story

1. It's Always About The Game, Never The Players

Here's the principle:

> ⚖ Losers don't compete. Average men focus on beating individuals. **Winners focus on dominating the**

> **game**

The “game” is any ecosystem of endeavor where we pursue goals and self-advancement.

At TPM we’re interested in the “games” representing the most important life domains:

- Game of dating (example below)
- Game of career/business
- Game of power

But ultimately, **it always comes down to the game of life**.
Single domains are just pieces of the life puzzle.

The winners focus on the game, rather than on individuals.

1.2. Take your revenge on the game

A corollary of “it’s always about the game” is:

> ⚖ Average men dream revenge, while winners’s revenge is full-game conquest

And in a more detailed format:

- Bottom 40% passively acquiesce
- Middle 40% dream revenge
- Top 19% men seek revenge
- Top 1% men get revenge on the game

The game is the ultimate boss.
And it’s also your competitors’ boss.
Beat their boss, and you automatically beat them all.

I know, I know, I can already hear the complains.
“But what if I want revenge against some a**holes?”

The good news is that your success is your revenge through their envy.

If you want to rub it in further for extra measure, just parade that success in their faces.
Make sure they see it, and that they hear about you.

But for winners, **revenge against individual players is a *consequence* of winning *the game.***

2. See THROUGH The Competition

General principle:

> ⚖ Losers are scared by competitors. Average men focus on beating the competition. **Winners don’t even see the competition**

Why?
Because this is a corollary of mindset #1: winners focus on the game.

Yes, winning often entails competing.

HOWEVER…

Even from a rational point of view, focusing on competitors is often a distraction more than an advantage.

Most games have many available prizes, many winning combinations, many winners… And relatively few top contenders.

As an example, take dating.
Or business.
Or even a "vainer" goal such as becoming popular.

In all these endeavors competition only exists relative to *your* skills, value, and effort.
So you advance faster with solo effort and focus -or, sometimes, *cooperati*ng, rather than competing-.

That's why **winners focus on goals, and game dominance**.

Even when competition stands in the way, it's never personal.
Other competitors are like any other -inanimate- obstacle.
But until they're clear obstacles -or potential allies-… They really just don't exist.

What's that standing between me and her? A random richer/taller/bigger guy? I don't see him

Competition-focus ⍰⍰

Two ways it makes you ineffective:

1. Lowers your confidence

So many men have low confidence.

And I get it.

If you look around and, as many men do, you focus on who "has it better than you"… You will ALWAYS find someone better.

If you focus on what they have better, anyone has *something* better.

The alternatives are:

1. Believe you're better at everything
2. Ignore the competition with total target-focus

Both are better than negative comparisons.

However, #1 is simply untrue.
Gifted men may hold that frame with more limited reality distortions.
But the farther away you move from "total perfection", the more you distort reality.

With #2 instead, you have no need for lies.

And bonus point: you never worry about cockblockers because ghosts don't cockblock.

2. Competition-focus sidetracks you into indirect and less effective approaches

I see this all over the manosphere when it comes to dating.

Men want to get more women, but instead of meeting more women, they focus on:

Indirect	Direct
Muscle mass (impress men)	"**Looks**maxxing" (attract women)
Learn to **fight** (challenge competition)	Learn to **dance** (engage women)
Hustle for **money**	Learn **game** with practice
Be an **alpha male**	Be a **seducer**
Get **status**	Quit the social circle, **meet more women**
…	…

I was never all that much from the left column.
But I still smashed my dating goals doing more of the latter. (And if I could go back in time, I may even learn dancing).

Also read:

- Alpha male game is costing you
- Strategy beats power ⍰

Goal-focus ⍰⍰

So if you don't see the competition, what do you see then?

It means that, in order, you focus:

- **Target**, tactical level
- **Goal**, strategic level
- **Self**, and self-growth
- **Victory**, at the game level

Dating example

Let's take the example of dating.

This is how the killers approach dating:

- **Women-focus,** ignore men
- **Intimacy**, girlfriend, rotation-focus (or whatever the tactical end goal)
- **Skills-focus to get an attractive girlfriend** or a rotation whenever he pleases

Victory can be a long-lasting relationship, a family, or a life as a player.
Or dating on one's terms, or even collecting enough notches until you're satisfied.
Finally, it may also be to exit the game of dating altogether.

⍰ Shortest Guy Picks Up The "Club Queen"

"A guy I know" once picked up the hottest girl in a club.

It was a big club, too.
Right in the historical center of Prague, a place that doesn't lack attractive women.

She was one of those girls you look at and think "Wow".

That guy was one of the shortest guys in that club.
If not *the* shortest.

With a competition-focus he wouldn't have even made a move.

But… He didn't see the competition.
He only saw an attractive woman.

3. Battle Scars Pave The Road to Victory

Principle:

> ⚖ Losses diminish losers' self-esteem. Winners see losses as battles cars that build character on the way to greater tomorrows

Battle scars are the only undeniable badges of honor.

Badges and medals bestowed by others include politics. And always entail external opinions.
Battle scars are between you, and the game.
They are pure, and they never lie.

And if your competition scarred you, even better.
All extra motivation you can pour into dominating *the game*.

This mindset rests on well-known self-help principles such as:

1. Focus on learning
2. Stick through the losses
    - Use losses as motivation

Naive self-help sometimes forgets the ultimate goal though.
The goal is never to stay in the apprenticeship.
Or to keep losing and struggling just to "prove you can".

Winners never forget the end goal:

- Learn *early on* BUT *with a focus on winning the game*
- Learn while seeking *mastery*
- Losses turn into badges of honor *once you win the war*

And some relevant articles:

- Develop growth mindset
    - Don't be duped by naive growth mindset
- Pain as fuel

4. Effort Over Time Wins the Game

Winning the game requires dedication *over time*.

A long-term predisposition is helpful.
And continuous and relentless action is mandatory.

Here's a good mindset:

> ⍰ Every day I keep going, and while a weaker competitor drops out, I grow stronger

Just repeat that.

Day after day.
Loss after loss.
Learned lesson after learned lesson.
Win after win.

Until you string so many in a row, that one day you turn around and realize:

"Holy cow, I'm on the summit.
I made it"

The Mindsets, In One Real-Life Story

Oxford Handbook of Evo Psych and Romantic Relationships: Review

Lucio Buffalmano · 15 October 2024 · Archived copy · Original

The *Oxford Handbook of Evolutionary Psychology and Romantic Relationships (2023)* presents the empirical and theoretical advancements in the evolutionary study of dating and romantic relationships.

SUMMARY

About the Author:
Justin K. Mogilski and Todd K. Shackelford are the editors, both holding a PhD in evolutionary psychology.
As it's often the case with handbooks, each chapter is written by different authors.

Selection Is Intrasexual & Intersexual

The two processes are:

- **Intrasexual selection**, where members of one sex compete with one another for greater sexual access to members of the opposite sex.
- **Intersexual selection (AKA preferential mate choice)**, where one sex chooses a mate from the opposite sex based on certain traits they prefer

However, the two are interlinked:

> First, if men compete with each other in physical contests (…) the informative variance produced can create or amplify women's preferences for athletic prowess (…).
> Second, the mate preferences of one sex can dictate the domains of intrasexual competition in the other sex.

Such as, for example, if women prefer bravery and generosity, that creates selection pressure on men to display honest indicators of bravery and generosity, likely leading to male competition for out-doing each other.

Dimorphism is a cue of sexual selection

The larger the difference between the sexes, the more evolution was because of mate choice, rather than survival:

> When such large sexual dimorphism of a trait is observed, it typically means that there has been sexual selection driving the exaggeration of the trait (in contrast, viability selection, which is concerned with survival, tends to act more equally on the two sexes than sexual selection, since a trait useful for survival in one sex is typically also useful for survival in the other

This also means that mate choice may act *against* survival:

Parental Investment & Trivers' Theory

An important sex difference among genders comes to who invests the most in child-rearing.

One of those key gender differences is which sex chooses.

Trivers originally explained why with the theory of parental investment and sexual selection:

> The sex that invests more than the other, he argued, does the choosing, so the intersexual selection component applies mainly to that sex.
> The sex that invests less, in contrast, is more competitive with members of their own sex for mating access to the higher investing sex.
> Trivers's theory was based on the work of Bateman (1948), and the key principle is termed the "Bateman gradient," the steepness of the slope between mating success and reproductive success. Sexual access to additional mates (one form of mating success), according to Bateman and Trivers, pays more reproductive dividends for the low-investing sex than for the high-investing sex

And how about humans?
Well, women choose more, but… For long term, both genders choose.

Let's see why:

Parental Investment & Choosing In Humans

In brief:

- **Most men invest in their children**, thus
- **Men are also choosy for long-term partners**
- **Men are less choosy for short-term** and uncommitted sex, but most men still are not completely undiscerning
- **Women also compete with each other for high-value men**: *robust evidence also supports female–female mating competition for prospective mates (e.g. , Benenson, 2014; Buss, 1988; Buss & Schmitt, 1993; Campbell, 2002; Krems et al. , 2016; Vaillancourt, 2013; Vaillancourt & Krems, 2018)*

In most animals, mate choice is mostly the female's prerogative.

But in humans, both sexes exert strong preferential mate choice, so the causal process applies to both women and men.
However, a key difference comes down to whether we're talking about long-term mating, or short-term sex.

In short term, men are less choosy than women.
However, Buss later explains, that because both sexes invest heavily in long-term mating contexts, we expect both sexes to be extremely choosy for long-term dating and relationships.

And later he says:

> **In long-term mating**, both sexes typically invest heavily in offspring, so **both sexes are predicted to be choosy** or discriminating. And both sexes compete with members of their own sex for desirable members of the other sex.

And a little later:

> Although **men** are not physiologically bound to invest in ofspring via gestation and lactation, they have **evolved to provide resources given** that ancestral environments were often harsh and **that men's resources and protective presence likely contributed to offspring survival** (Buss, 1989; Buss & Schmitt, 1993; Geary, 2000, 2015)
> (…)
> Thus, **men also evolved to be selective and cautious when considering long-term relationships** (Kenrick et al. , 1990; Li & Kenrick, 2006)

Indeed, whenever I hear a guy who "wants a girl with a degree" or something similar, I know I'm in the presence of someone who's thinking long-term and who is family-oriented.
Furthermore, I know he's more likely to be more of a "modern" and egalitarian type of man for expecting his wife to work and contribute.

Women care more about his investment

Since:

1. Men do invest in their children, BUT
2. Not all men invest or can invest
3. Men's investment is important for the wellbeing of women and children

Women may have adapted to care more about men's investment.
And indeed:

> Investment by a partner is linked to satisfaction, but only for women; this pattern is similarly observed for self-disclosure, as well as the ability to elicit a partner's disclosures (Hendrick et al. , 1988)

Sexual Strategies Theory

Important premises of SST include:

1. **Humans have evolved distinct mating-specific adaptations** for specific problems. Solving them provides fitness benefits and avoiding them the fitness costs of pursuing each sexual strategy
2. **Sex similarity in mating psychology**. In domains in which the sexes confront similar adaptive challenges, such as solving the commitment problem in long-term mating, they have evolved a similar sexual psychology
3. **Sex differences in mating psychology** when the sexes have confronted different adaptive challenges (ie.: assessing the fertility or social status of a potential mate) they evolved distinct features of their sexual psychology
4. **Common long-term mating challenges faced by both sexes**. Ie.:
   - Identifying a partner able and willing to commit
   - Assessing long-term mate attributes such as an altruistically skewed welfare trade-of ratio (i.e. , one in which the partner makes decisions that reflect valuing your welfare more than their own) (Tooby et al. , 2008)
   - Identifying mates with similar mate value trajectories over time
   - Identifying mates who are not overly encumbered with costly commitments such as children from prior mateships or in the modern environment great financial debt
5. **Male-specifc long-term mating challenges**. Ie.:
   - Identifying potential partners high in reproductive value
   - Solving the paternity uncertainty problem.
6. **Female-specifc long-term mating challenges**. Ie.:
   - Identifying men who can acquire resources consistently over time
   - Identifying men willing to invest those resources in her and her children without diverting them to other women and their children
   - Identifying men able and willing to protect her and her children from harm and exploitation
7. **Male-specifc short-term mating challenges**. Ie.:
   - Desiring/finding a larger number of partners
   - Letting less time and commitment elapse before sex
   - Minimizing entangling commitments
8. **Female-specific short-term mating challenges**. In short-term mating, women have evolved to reap several potential fitness benefits, including immediate access to resources, obtaining high-quality genes, and mate switching to divest themselves of a cost-inflicting partner or to trade up to a superior partner (Buss et al., 2017).
9. **Context-specificity of sexual strategies**. Humans have evolved mating adaptations to implement different sexual strategies depending on features of condition and context such as operational sex ratio, mate value, social norms surrounding sexuality, culture-specific mating system, and ecological variables such as parasite prevalence, sex-specific mortality, food scarcity or abundance, and individual resource demands driven by the number of dependent children (e.g., Gangestad & Buss, 1993; Prall & Scelza, 2020; Schmitt, this volume).
10. **Sexual strategies are evolved psychological solutions and their behavioral manifestations**. Sexual strategies are evolved solutions to common and sex-differentiated mating problems. They include psychological design features sensitive to multiple features of context that activate or suppress them, information-processing procedures and decision rules, and manifest emotional, cognitive, and behavioral outputs that include attraction, sexual arousal, tactics of attraction, derogation of competitors, mate guarding, and many others.
11. **Humans have little conscious awareness of their mating psychology**. No conscious awareness about origins, nature, or evolved functions of sexual strategies is implied by SST. Nonetheless, humans may possess partial insight into some aspects of sexual strategies either through observation of others or through introspection about

the self, partially driven by the degree to which this awareness facilitates navigating the complex maze of mating challenges posed by the processes of sexual selection.

Women Short-Term Strategies Explained: mate switching VS dual-mating strategy (good genes)

On first glange, women don't gain nearly as much as men engaging in short-term, no-strings attached sex.

However, there is still plenty in it for women.
Currently, the theory of women's short-term sexual behavior include:

- **Immediate resources**
- **Good genes (AKA dual mating strategy)**: obtaining investment and resources from one regular committed partner and obtaining superior genes from an affair partner.
  Historically this hypothesis rested on the "ovulatory shift" -ie.: women prefer more masculine men during their ovulation window-.
  But "*The empirical evidence for these mate preference shifts is mixed. One large meta-analysis (…) found some support for the predicted preference shifts, although the effect sizes were small (Gildersleeve et al., 2014)*" and "*Based on the studies conducted thus far, empirical support for the hypothesized good genes function of women's short-term mating is weak or mixed (Jones et al. , 2019)*"
- **Evaluating short-term mates for long-term possibilities**
- **Mate switching**, such as starting to have short-term sex with a better man, and then move to him for a committed relationship

Buss tends to favor mate switching and he says:

> Mate switching may be the most frequent or primary function of female infdelity

There is much talk by some present-day red pill (2024) gurus about mate switching VS dual mating strategy.
Not that red pill folks like Rollo Tomassi have any high authority on these issues, but in my opinion, it's a nonsense debate since the above hypotheses are NOT mutually exclusive.
ALL above hypotheses can apply to different women, different situations, or may all apply to the same situation, with only different weights each.

My note: mate switching is the #1 option IF the higher value man is available

I believe that mate switching is women's #1 goal when a higher mate man is available because that's what makes the most sense for women: best genes, best provisioning, best relationships.
However, since higher value men may only be available for the short term, the "good genes" is the #2 option for women.

Finally, I'd personally add a 5th hypothesis:

- **Exaptation/spillover of pleasure**: women engage in short-term sex because it's pleasurable. Sexual pleasure evolved to increase copulation and the number of offspring. And that applies indiscriminately to both long-term, and short-term.
  So, sometimes women have sex because it's fun, without any deep motive (duh moment)

Culture & environment: they matter

Humans are social animals.

So it would be surprising if culture did *not* matter a lot.

However, the authors made a great point that I often suspected as well:

In general, culture matters increasingly more with society's complexity and opulence, while survival becomes less of a worry -and quantity of reproduction as well-.

Say the authors:

> The infuence of biological, ecological, socioeconomic, and cultural factors varies between and within types of societies. In isolated tribal, subsistencebased societies, biological and ecological factors play major roles. In traditional societies, besides these factors, socioeconomic and cultural factors play important roles. In modern societies, socioeconomic and cultural factors become dominant, with decreasing infuences for biological and ecological factors

The authors provide this evidence in support:

> The findings of Buss and colleagues (Buss et al. , 1990) about mate preference conform to this interpretation (…)
> India, China, Iran, and Nigeria were on one end, with high value on resource provisioning, domestic skills, chastity, home, and children, and the Netherlands, Great Britain, Finland, and Sweden on the other end with low value of these traditional qualities

I have personally noticed the same.
Poorer societies value money more than richer (and more socialist) ones.

Humans are also very good at adapting to different environments.
And that adaptation can be triggered by childhood experience, or also simply by moving and changing environment:

> When ecological and social conditions of life change, people adjust their norms of attractiveness due to exposure to new cultural environments.
> The example of Zulu people of South Africa, who moved to the UK, have demonstrated such capability for adaptation (Tovée et al. , 2006).

This is also why some men recommend to be careful with moving your mate from one country to another because… I can't write this publicly, sorry :).
See our programs or book a consultation.

The environment matters: earning example

For example, women in poorer ecologies place a premium on men's earnings:

> Notably, our mating psychologies are highly responsive to changing environmental challenges and demands, and evidence suggests that greater competition for resources and greater resource demands in one's local ecology upregulates women's preference for earning capacity and downregulates women's preference for emotional stability and compatibility of interests and values when evaluating potential mates (McGraw, 2002)

Childhood environment matters: life history examples

> People who faced **greater childhood adversity are more likely to develop faster life history strategies, which are associated with earlier sexual maturity and greater sexual motivation** relative to people with slower life history strategies.
> Dinh et al.(2017) found that women with faster life history strategies demonstrated a robust, positive association between conception risk and sexual motivation (…) Women with slower life history strategies, however, demonstrated a negative association between conception risk and sexual motivation.
> Thus, women who experienced unstable and harsh early environments were more likely to maximize reproductive opportunities, and this resulted in a closer coupling of ovarian hormones with sexual motivation compared to women who experienced more stable and plentiful early environments

Of course, these different approaches are only antithetical in the, shall I say it, lesser minds of extremists and biased individuals.
In truth, they're all just part of the mix -and part of the explanatory mix-.
It means that both ecology, culture, and genes (both shared among most people or exceptional to the individual) contribute to adjusting and changing the general trends of mating preferences.

Culture and individual needs matter: jealousy patterns example

The evolutionary headline on jealousy is that "men fear sexual infidelity, and women emotional infidelity".

In truth, it's more complex, and it depends largely on culture and the male parental investment:

> drawing on cross-national data from a two-part survey administered to 11 populations (3 urban, 8 small-scale societies), Scelza et al.(2019) suggest that the standard evolutionary psychology perspective of highly charged emotional responses to female infidelity by males might be somewhat simplistic
> (…) these researchers found that when sex and culture were considered in tandem, men and women in most of the focal populations were more upset by sexual infdelity. By contrast, in a small number of other populations, both sexes were more distressed by emotional infdelity.
> The key insight (…) is that sociocultural factors (e.g. , paternal investment and norms for extramarital sex) are potent "contributors to cross-cultural variation in jealous response" (p.23). Specifcally, the greater paternal investment and the lower frequency of extramarital sex, the more severe the jealous response. It is noteworthy that this recent work does indeed conform to the evolutionary prediction that the intensity of jealousy should depend on the male's level of investment

People change & adapt: condition-dependent mating strategies

People's taste in the opposite gender changes depending to personal, social, ecological, and cultural context.

This also means that mate value changes depending on:

- **Sex ratio**. Men shift to brief sexual encounters when many women are sexually available because the sex ratio is in their favor and they are therefore better able to satisfy their desire for variety (Pedersen, 1991)
- (potentially) **Ecological parasite prevalence**. higher parasite prevalence means greater value on physical attractiveness (Gangestad & Buss, 1993).
  Note: the importance of this variable is in question, awaiting further research
- **Individual autonomy**: attractiveness matters more in independent cultures, such as American society, and matters less and implies different expectations in interdependent societies, such as Korea in Southeast Asia and Ghana in Africa
- **Gender equality and cultural stereotypes**: sex differences in mating preferences for attractiveness are smaller in societies with greater gender equality (the Netherlands), compared to cultures with more conventional gender norms (ie.: Germany) (Buss et al. , 1990; De Raad & Doddema-Winsemius, 1992)

- **Opulence/resources**: substinence-based societies prefer mates with higher fat percentages (e.g. , Anderson et al. , 1992; Brown and & Konnor, 1987)

But don't go to extremes: why evolutionary models beat socio-cultural models

> Sociocultural models have considerable appeal and have characterized social psychology for several decades. However, **these models may be inadequate at dealing with the fact that (a) preferences are remarkably similar around the world** (Buss, 1989; Tomas et al. , 2020), **(b) preferences often look the same in diferent species** (Wroblewski et al. , 2009), and **(c) preferences are consistent across age groups and time** (Kenrick & Keefe, 1997)

Mate Value

Mate value is a measure of attractiveness.

People differ in their mate value, and high-mate value also means the ability to give and make others better off, as per social exchange:

> People vary in their mate value, or the degree to which they would promote the reproductive success of those who mate with them (Buss & Schmitt, 1993; Symons, 1979, 1995)
> (…)
> it makes sense that humans have evolved not to mate indiscriminately but have evolved psychological mechanisms to evaluate and prefer mates who possess greater, as opposed to lesser, reproductive value

Evolutionary psychologists largely believe that what we find attractive is in good part shaped by evolution:

> with attraction being understood as an evolved psychobehavioral mechanism for identifying and pursuing healthy, fertile, high-quality mates (Lee et al. , 2008), and attractive cues understood as valid cues to underlying physiological or psychological quality (Coetzee et al. , 2009; Stephen & Tan, 2015)
> (…)
> Individuals who are able to identify cues to mate quality (…) enhancing their reproductive success and providing a selection pressure which favors genes that enhance successful identification of a partner's quality

High-quality mates provide two benefits:

- **Direct benefits to the chooser**, such as *protection from violence; gifts such as money, food, or access to high-quality territory; or investment in offspring (Luoto, 2019a; Trivers, 1972)*
- **Indirect benefits to the offspring**, such as good genes (Fisher, 1930; Jones & Ratterman, 2009)

My note: women's preference for the two may vary
I suspect different women also value those two differently.
For example, some selfish "gold digger" may prioritize direct benefit to them, rather than to their children.

Cues of genetic quality

The cues to mate genetic qualities can be divided into 4 categories, but then the authors

- **Health during development**
  - Symmetry, albeit *there is limited evidence that it refects aspects of health during development or in adulthood (cf.Borráz-León et al. , 2021)*
  - Sexual dimorphism (AKA: "sex typicality" or "masculinity/femininity"). Sexual dimorphism is thought to be

largely fxed by the end of puberty, so it is may act as a valid cue to hormone levels during development (Luoto et al. , 2019; Swift-Gallant et al. , 2020).
Exceptions apply though, the authors later say that "for long-term relationships and in harsh environments men prefer more masculine female partners (e.g. , Little et al. , 2007, but see Pereira et al. , 2020)"

- **Current condition**
  - Adiposity *faces near the average level of apparent facial adiposity were perceived as healthiest and most attractive*, but slightly contradicting: *asked to manipulate them to appear as healthy as possible, participants chose faces corresponding to lower BMI and lower adiposity* (Stephen et al. , 2017)
  - Skin Color and Texture smooth (Fink & Matts, 2008), yellow-orange (i.e., a combination of yellow and red; see Foo, Rhodes, et al., 2017), reddish (Re et al., 2011) and darker (Fink et al., 2001) skin
    - Yellowness and redness for Carotenoid concentration (see Foo, Rhodes, et al. , 2017; Stephen, Law-Smith, et al. , 2009). The authors also mention it comes from fruit and vegetables in the diet (Alaluf et al., 2002; Stahl et al., 1998)
    - Reddish skin pigments for blood vascularization and oxygenation (visually detected in reddish skin pigments; Re et al. , 2011)
    - Darker skin pigments for melanin concentration (Chung et al. , 2010) are all positively associated with immune system functioning (see Chew & Soon Park, 2004; Lakaye et al. , 2009; Re et al. , 2011; Smith & Tiboutot, 2007)
      My note: many exceptions always apply, see women's endless fascination with vampires

- **Genetic quality**
  - Major Histocompatibility Complex, thought to be detectable via (largely unknown) cues in individuals' odor and facial appearance (Lie et al. , 2009)
  - Height, but mostly for men, because *"women's height does not appear to strongly afect men's perceptions of women's attractiveness*". Height heritability is also larger in men, than women.
    Even here though, there is an "optimum balance": *The relationship between male height and reproductive success may be curvilinear, decreasing after an optimal height has been reached (Sugiyama, 2015). Even though taller men are favored by women, taller men have lower reproductive success than average men in some populations (Stulp & Barrett, 2016)*
  - Muscularity, especially upper-body strength explains most of the variance in women's perceptions of men's body attractiveness (Sell et al. , 2017)
  - Body odors: people find odors linked to superior immune functioning more attractive (Rikowski & Grammer, 1999).
    Body odor is also linked to men's masculinity and trait-level dominance (Sorokowska et al. , 2012; Sorokowska et al. , 2016), in turn related to elevated androstadienone (a testosterone derivative) levels, and women seem to be attracted to androstadienone-based odors (Saxton et al. , 2008)

- **Psychological traits**. *there is some evidence that individuals who express a preference for certain personality traits in a romantic partner find the faces of opposite-sex people who report that personality trait more attractive (Little et al., 2006). There is also evidence that intelligence (Zebrowitz et al., 2002) may be visible in the face*
  - Competence
  - Compassion, including kindness, agreeableness, generosity, and altruism.
    When physical attractiveness was paired with altruism (i.e. , high physical attractiveness/low altruism in one condition and high altruism/low physical attractiveness in another condition), women desired a long-term mate with high altruism/low physical attractiveness condition. (Farrelly et al., 2016).
  - Compatibitily, *both men and women place greater importance on compatibility of interests with a long-term mate (Treger & Masciale, 2018)*
  - Intelligence: *For women, a mate's intelligence appears to be a nonnegotiable psychological characteristic in any*

relationship, regardless of involvement (Jonason & Antoon, 2019; Jonason et al. , 2019)
  - Humor, posited to be an indicator of intelligence. Consistent with this hypothesis, both men and women prefer their partners to have a sense of humor (Li et al. , 2002), with women specifically preferring humor-producing men, and men preferring humor appreciating women (Hone et al. , 2015)
- **Non-bodily traits**, such as indicators of status, creativity, clothes, etc.

For sexual dimorphism, we have for women:

- **Facial femininity** may act as a valid cue to fecundity, higher estrogen (see Law Smith et al. , 2006) and superior immune function (Foo et al. , 2020)
  - Small jaw
  - Small nose
  - Reduced interocular distance
- **Lower waist-to-hip ratio** (WHR)
- **Lumbar region curvature** of around 45.5° would be best for pregnancy and men men's attraction to women peaks as women's lumbar curvature approaches this angle (see Lewis et al. , 2015)
- **Breast**,
  - Medium and large breasts seen as more attractive, healthy, young, and fertile than small or very large breasts (Furnham et al. , 1998; Havlíček et al. , 2017; Pazhoohi et al. , 2020; Singh & Young, 1995; Swami et al. , 2009; Valentova et al. , 2017);
  - Breasts with a 45:55 upper-pole (i.e. , distance from the nipple to the top of the breast) to lower-pole (i.e. , distance from the nipple to the bottom of the breast) ratio (Mallucci & Branford, 2012, 2014)
  - Symmetrical breasts are more fecund (Møller et al., 1995) and at lower risk of breast cancer (Scutt et al. , 1997), again suggesting that breast symmetry may act as a valid cue to health

However, **women's preference for masculinity is much less straightforward.**

To begin with, it's on a spectrum, and more isn't always better:

> However, studies asking participants to choose between masculinized and feminized versions of men's faces typically find either no preference for masculinity (Scott et al., 2010; Stephen et al., 2012; Swaddle & Reierson, 2002) or a preference for feminized faces (Mogilski & Welling, 2017; Perrett et al., 1998; Stephen et al., 2018), possibly because high testosterone levels and masculine facial shapes are associated with personality traits that are detrimental in long-term partnerships (e.g., aggression and infidelity; Lee et al., 2017; Mazur & Booth, 1998; Perrett et al., 1998).
> This hypothesis suggests that **women's mate selection mechanisms may be performing a trade-off** between masculine men who may have "good genes" but personality traits that are undesirable in a long-term partner and father, and feminine men who may be less prone to aggressive behavior and are more suitable as husbands and fathers

The authors further explain that both the preference for masculinity in socioecologically harsh conditions and and during peak fertility may need to be revised because of weak or contradictory findings.

Whichever the reason, it seems clear that "more isn't always better" and it's more a question of personal preferences, culture, and circumstances.
And it's more about "hitting the right balance".

This is something we have already mentioned in our article "the law of optimum balance":

- **The law of optimum balance**
- **Optimum balance in dating**

Also see:

- **Mating value practical analysis**

Hormones

In general, higher testosterone makes for less relationship commitment and satisfaction (e.g., Edelstein et al., 2014; Gray et al., 2002; Julian & McHenry, 1989).

The authors even say that "T is incompatible with the maintenance of nurturant relationships" (Edelstein et al., 2014, p.401).
This is because testosterone is more associated with (shor-term, uncommitted) mating, rather than relationships:

> T functions in ways that promote mating behaviors in a manner that may also compromise investment and maintenance in long-term relationships

Testosterone and its effects

This chapter was somewhat confusing with several seemingly contradictory findings:

- **The link between testosterone and men's consummatory behavior is tenuous** (Schmidt et al. , 2009)
- **Testosterone levels and sexual behavior are not correlated for men**, or future research is needed to examine moderating variables (ie.: life history)
- More consistently, **testosterone seems to be associated with mate-seeking behavior**
- **Men's testosterone levels are higher when single**, and lowest when they have children, BUT
- **Partnered but non-monogamous men have higher testosterone than single men** (van Anders, Hamilton, & Watson, 2007). The authors note that these men do not experience a reduction in mate-seeking motivations
- Similarly, **monogamous men who maintain interests in alternative partners have higher levels of testosterone** than monogamous men without interest in alternative partners (Edelstein et al. , 2011; McIntyre et

al. , 2006; van Anders & Goldey, 2010).
The author suggest that men who are seeking mates have higher testosterone albeit, I add, correlation is not causation

- **Number of partners has been positively linked to testosterone levels** (Peters et al. , 2008; Pollet et al. , 2011), **particularly for dominant men** (Slatcher et al. , 2011)
- it appears that **men with higher testosterone have higher mating and reproductive success**
- Men's testosterone increases in the presence of an attractive woman *who is a possible mate*, and when competing with other men (especially if there are possible mates in the audience)
  - Cortisol also increases

Estrogen and progesterone

Female mating behavior is closely connected to ovarian hormones such as estrogen and progesterone.

Estrogen peaks before ovulation and progesterone peaks during the luteal phase.

- Research supports the hypothesis that **men perceive women to be more attractive when they are ovulating**
- Women reported greater sexual activity, sexual desire, and sexual fantasies around ovulation and their sexual initiation activity was highest in the three days leading up to ovulation (measured as LH surge, Bullivant et al. , 2004)
- Single women reported stronger feelings of loneliness in the early follicular phase. The authors say that may motivate women to seek out potential partners around ovulation
- **Ovulating women reported being more assertive, having higher mate value**, and were more likely to implicitly associate themselves with sex-related words (e.g. , seductive and sexy).
  These results support the fertility-assertiveness hypothesis: women seek higher control on their environment when conception risk is high (in both opportunities and threats)
- **Ovulating women are more risk-averse**: decrease in their total number of risk-taking behaviors such as going to a bar or walking in a dimly lit area, more likely to sit far away from a suspicious man in the study waiting room (Guéguen, 2012) and were more likely to judge men as more sexually coercive (GarverApgar et al., 2007)
- **Hormonal contraceptives disrupt these results**: Exotic dancers on hormonal contraceptives received a consistent rate of tips across their menstrual cycles while naturally cycling women got more around ovulation (Miller et al., 2007).
- Women on hormonal contraceptives did not demonstrate increases in autosexual and female-initiated couple behavior around ovulation (Adams et al., 1978)
- **Life history mediates hormonal changes**, with "faster life history strategy women" seeking sex during ovulation, while slower life history strategy women avoid it
- **Women have higher testosterone when aroused**. Ie.: watching romantic scenes from The Notebook (Lopez et al. , 2009), viewing photographs of men's faces (Zilioli et al. , 2014), imagining a sexual interaction with an attractive partner (Goldey & van Anders, 2011), and during the early stages of a relationship (Marazziti & Canale, 2004),
  BUT…
- **Testosterone fluctuations across the menstrual cycle do not predict sexual motivation** (Roney & Simmons, 2013)
- **Women in happy relationships have lower testosterone** (Edelstein et al. , 2014) which, I'm guessing here, may also mean lower risk of infidelity
- **Women (and men) have higher cortisol when meeting possible relationship candidates**
- **Testosterone and estradiol increase orgasms**: testosterone seems positively associated with women's psychological orgasm whereas estradiol appears linked to more pronounced physical sensations during an

orgasm (e.g. , flooding and flushing) (van Anders & Dunn, 2009)

Market-like dynamics of dating

To begin with, dating also functions just like any other market:

> Whenever people have the ability to choose partners and partner quality varies, we should expect competition for more desirable partners.
> This competition for the "best" partners occurs in a biological market (e.g. , Barclay, 2013, 2016; Noë & Hammerstein, 1994, 1995). In any market, supply and demand afect the value of a good (e.g. , a romantic partner), and anything afecting supply and demand can also infuence the mating market

And some of the market variables that influence the dating market include:

Sex Ratio

- **People become more competitive and aggressive with more men**: people primed with unfavorable (vs.favorable) sex ratios, become more intrasexually competitive (Arnocky et al. , 2014; Griskevicius et al. , 2012; Xing et al. , 2016) and more aggressive toward attractive same-sex, probably because they are potential threatening rivals (Moss & Maner, 2016).
- **Women become more competitive with more women**: women are more wary of same-sex others (Vukovic et al. , 2019) and desire to maximize their relative gain over other women (Xing et al. , 2016)
- **Women seek a career**: women enter the workforce in higher numbers and seek more lucrative careers, perhaps not to be overly-reliant on men (Durante et al. , 2012; Guttentag & Secord, 1983)

Mating Systems

- **Polygyny increases competition** because fewer "winners" monopolize women to get all the (genetic) success, so many losers scramble for fewer available women.
  This is true both historically (for review, see Henrich et al. , 2012) and across nations (Schmitt & Rohde, 2013)
- **High male parental investment increases women's competition**, even in polygynous species

Income Inequality

Intrasexual competition includes competing for resources (ie.: career and business success).

- **Higher income inequality increases competition** because it exacerbates the difference between the haves, who gain more dating power, and the have-nots, who may end up without a mate.
  This may also apply to women, who post more sexy selfies (Blake & Brooks, 2019a; Blake, Bastian, et al., 2018)
- **Some women may drop out of the dating scene** with higher income inequality. I quote the authors: "Other women, however, may opt out of this competition, pursuing briefcase over baby (see Durante et al., 2012).
- **Financially empowered women care less about men's resources**

- **Mating market dynamics**
- Mating market hacks

People adopt the values of their best interest

Patriarchy VS Feminism

Something we often noticed and contended here at TPM :).

This example shows that it's not necessarily aboud individuals, but about "inclusive fitness":

> Concerning parents' competition on behalf of their children's mating success, evidence suggests that parents' ideological support may be an instance of motivated reasoning, with parents supporting ideas and practices that beneft their ofspring. For example, families with single, adult daughters are more likely to support women's reproductive rights, whereas families with more adult men are likely to oppose those rights (Betzig & Lombardo, 1992)

And a specific example:

> (…)
> Blake, Fourati, and Brooks (2018) somewhat similarly fnd that mothers with sons (vs.daughters) are more supportive of practices that suppress female sexuality (i.e. , Muslim veiling), which might serve to control female sexuality and beneft male ofspring

It's pretty wild if you think about it.

A corollary of this finding is that a certain degree of intersexual conflict and/or competition is expected and, at a social level, potentially unavoidable.
And as the example shows, it's not like some people think of a clear-cut case of men vs women, but more of "male-aligned interests VS female-aligned interests".

It's pretty wild if you think about it.

On this topic, see our latest video:

Consensual non-monogamy is repressed by those who can't have multiple partners

first off, the authors say consensual non-monogamers tend to be socially unrestricted.

But, also, potentially, by those who can afford multiple partners:

> That is, CNM may be preferred by those who are well-suited or motivated to compete with others for access to romantic/sexual partners, while those who are not might attempt to publicly enforce monogamy to restrict intrasexual competition.

And then, interestingly, that "repressing non-monogamy" may make sense from a social perspective:

> Restricting intrasexual competition is a reasonable moral aim.
> Higher rates of intrasexual competition may lead to public and personal health risks, such as higher rates of mortality and homicide (Daly & Wilson, 2001; Kruger, 2010), anabolic steroid use among men (Harris et al., 2019), interpersonal antagonism and/or social ostracism (Vaillancourt & Sharma, 2011), problematic eating habits among women (Li et al., 2010), and risky medical procedures (Dubbs et al., 2017). In this sense, those who condemn CNM may be attempting to curtail the harms caused by rivalry within multipartner mating systems.

In general, non-monogamy seems most interesting to people who are more interested in short-term mating:

> people in CNM compared to monogamous relationships reported higher social and ethical risk-taking, along with several other traits that are characteristic of a “fast life history” (e.g. , earlier pubertal development, less aversion to germs, and greater interest in short-term [and less interest in long-term] relationships) (reviewed in Figueredo et al. , 2006; see also Del Giudice et al. , 2016

Same-gender attraction and reproductive fitness

Historically gay men and lesbian women reproduced at lower rates.

But that difference decreases with modern societies, and may even go to zero for women:

> At least in some modern Western societies, such as the United States, almost 40% of individuals who identify as LGBT report to have biological ofspring (e.g. , Gates, 2013). Other nationally representative studies, such as from New Zealand, show that in modern societies non-heterosexual women reproduce with the same frequency as heterosexual women, although non-heterosexual male reproductive success is signifcantly lower (e.g. , Wells et al. , 2011)

Homogamy VS hypergamy

In simple words:

- **Monogamy = same status couples for compatibility**. Prospective mating partners are selected from the same or similar social circles with comparable economic and power standing, social status, and educational background
- **Hypergamy = higher status for self and offspring enhancement**. in the upward-mobility model, AKA hypergamy, lower social, economic, and educational classes prefer dating higher economic status, while higher economic status can “get something in return”

The authors say that the prevalence of homogamy VS hypergamy depends on gender equality and the distributions of educational and social attainments of men and women (Blossfeld & Timm, 2003).
So with increasing education and equality, hypergamy decreases and homogamy increases.

This is exactly what we said in one of our first articles on female hypergamy.

Intra-gender competition

Humans are not a species where mating depends only on intra-genders and male competition.

Instead, women’s choice matter in humans.
However, intra-sexual competitions may still weigh also in human mating:

> Anthropological evidence suggests that winning direct physical competition can be efficacious for winning in mating competition. Among the Yanamamo, men who have killed have more wives and children than those who have not (Chagnon, 1988). Indeed, men’s physiology seems to reflect such competition (e.g., men’s size; Arnocky & Carré, 2016; McElligott et al., 2001).

Chagnon has been heavily criticized and, in my opinion, for good reasons.
However, that doesn’t mean that all his work or anecdotal evidence are invalid.

The other claim that “men’s physiology reflects competition” is also dubious in my opinion because stronger men are also better hunters or better at surviving, or simply more attractive.

But its'also not to be excluded.

Finally, most men know that they tend to be more deferential towards bigger and/or aggressive men, and that may also lend credibility to the efficacy of intra-sexual competition.

Ultimately though, in our modern dating environment and for practical purposes, I'm convinced that men who focus on women are more successful than men who focus on the competition.

Each Gender Competes Based On The Other Gender's Preferences

For women's competition:

> Men tend to place greater value on partners' reproductive potential and related characteristics than women. Thus, women tend to compete intrasexually over linked dimensions such as youth, physical attractiveness, and sexual fdelity

And for men's competitions:

> As women tend to place greater value than men on a mate's resource provisioning ability, men often compete more than women over resources and status (Buss, 1989; Conroy-Beam & Buss, 2021; Walter et al. , 2020)

But since women are the choosers, we can generally expect stronger competition among men:

> when mating motivations are made salient, men (but not women) engaged in increased intrasexual (but not intersexual) aggression (Ainsworth & Maner, 2012). Men also report greater distress when a rival exceeds them on these characteristics (Buss et al. , 2000)

And, men being more aggressive and higher testosterone and competing in a fiercer contest, we can also expect more aggression:

> evidence suggests that, compared to girls and women, boys and men enact more physical, violent, and face-to-face tactics of intrasexual mating competition (e.g. , Archer, 2004; Benenson, 2014; Björkqvist, Lagerspetz, & Kaukiainen, 1992; Campbell, 2002; Vaillancourt, 2013)

Men compete for status, women for beauty

As cliche' as that may sound to some, there is at least some truth to it:

> Consistent with evolutionary theorizing, it was found that in samples of students as well as adults, men experienced more jealousy than women when their rival was more socially or physically dominant or had a higher status than themselves, whereas women experienced more jealousy then men when their rival was more physically attractive

There is no evidence that testosterone is linked to mate jealousy, albeit prenatal exposure to male hormones seems to be.

Interestingly, shorter men taller men reported jealousy in general, and especially with socially and physically dominant and attractive rivals.
Instead, *average* height women reported less jealousy than short and tall women, and especially in response to physically attractive rivals.

Gender divide in covert aggression

Women tend to compete more covertly.

For example:

> Social exclusion is one form of intrasexual mating competition (Buss & Shackelford, 1997), and girls and women exclude same-sex others more than men do (Benenson et al. , 2009, 2013), with social exclusion potentially achieving separation of romantic partners from prospective rivals, and thus efective protection against rivals

Women also use more facial expressions, something I've also noticed with women being more expressive in both the positive and the negative:

> women's aggression toward one another often takes the form of subtle facial expressions (Simmons, 2002; Underwood, 2003), with some suggesting that such nonverbal expressions may have special meanings for girls and women (Brown & Gilligan, 1993; LaFrance, 2002; Underwood, 2004)

And women seem to be pickup more subtle negative expressions (e.g. , Geary, 2010; Goos & Silverman, 2002).

The authors suggest this is because direct aggression is more costly for women (I have some doubts here, see below), and because men don't prefer women who outcompete other women.
I agree with the latter, and I've personally always been turned off by "nasty women" who excluded or attacked other women.

However, engaging in more direct aggression doesn't mean that men don't also engage in (more) covert aggression:

> Both sexes engage in indirect aggression (e.g. , gossip) and social exclusion (Benenson, 2014; Campbell, 1999, 2002; Crick & Grotpeter, 1995; Hess & Hagen, 2006a, 2006b, 2019; Underwood et al. , 2001)
> (…)
> … some work suggests that indirect tactics might be especially useful when women or men compete with their ingroup members (Hess & Hagen, 2019)

And in our modern society, covert aggression is more widespread than ever, and probably increasing at the expense of more direct aggression.
Also see:

- **Covert power moves**, all examples of indirect aggression
- Passive aggression, a communication style all based on covert aggression
- Office politics, where competition is all indirect and covert

> Covert Power Moves: 4 Ways Men Lose Status & Attraction, Without Realizing

Reputational attacks may work best against women

Because, the authors suggest, some of the traits men value are less easily observable:

> Reputation manipulation might be especially effective for harming female mating rivals because **some features that men desire in women—particularly reputations for sexual fidelity—are difficult to assess**, easy to impugn, and once denigrated, difficult to defend (Hess & Hagen, 2006a, 2006b). This is in stark contrast to men, as much of what women desire in men can be directly observed and/or objectively measured

> (e.g., if one man could best another in a fight or income)

This seemed like a plausible guess to me.

Women compete more when (single) mothers

Women seem to be competing more:

- For friends
- On behalf of the offspring
- (potentially) as single mothers because mating is harder and competition stronger for them

More attractive = more attacks

> Krems et al.(2020) reviewed evidence supporting this hypothesis: physically attractive women are considered mating threats and are disproportionately aggressed against (Arnocky et al. , 2012; Fink et al. , 2014; Leenaars et al. , 2008).

This is something I've sadly noticed myself when bringing an attractive date to a mixed group.
It's funny how I don't mind too much men playing their games on me, but I find it much sadder when women exclude or attack another woman (especially if my date).

Itersexual competition (& cooperation)

First off, the authors say that men and women have more scope for cooperation than competition:

> Despite the often too prevalent perception of a war between the sexes in the social sciences (see special issue of Sex Roles, e.g., Vandermassen, 2011), to a large degree interdependent reproduction promotes cooperation rather than confict (Buss, 2017; Mikulincer & Shaver, 2007)

They even add later on that the large overlap in common interests makes it difficult to pinpoint areas of conflict (something I don't necessarily agree with):

> One of the complicating aspects of considering sexual confict in long-term relationships is the high degree of overlap in interest between the sexes. Men and women have a higher degree of similarity in long-term partner preferences, such as for healthy, kind, and agreeable partners (e.g.Buss & Barnes, 1986; Tomas et al. , 2019).

However, stopping there would be a mistake.
First of all, even in the common interests, the authors rightfully point out that there are measurable differences even in the overlap of common interests (Walter et al. , 2020).
There are more diverging interests as well , including the different "sex optima" for each gender.

For example, as the authors of the last chapter shrewdly point out:

> Traits favored by one sex (e.g. , multiple mating by males) are sometimes costly to members of the other sex who have traditionally had primary responsibility for prolonged periods of ofspring dependency) (Chapman et al. , 2003, p.41)

So, in truth, men and women have much to gain from cooperation, but also potentially from cheating and/or controlling their partner or imposing their best preferences.
Think of it as a largely cooperative relationships, punctuated by smaller instances of conflict, compromise, and

potential cheating or manipulation.

Conroy-Beam et al.(2015) introduced three factors that infuence relationship satisfaction, and we add more from the book:

- **Cost and benefits**, with continuous evaluation if the relative benefits of staying with a partner outweigh the relative benefits of leaving
- **Manipulability of partner investment**, or how well one can elicit a partner's investment in the relationship (Walter et al. , 2020)
- **Signaling of relationship problems**, especially harmful when public
- **Mate value** infuences how satisfed one is with a partner and relationship. Higher mate value partner = higher satisfaction (Conroy-Beam et al. , 2016).
  However, even here it's often a question of balance: too big a discrepancy may make the lower value partner insecure or overly jealous

Conflict and dangers to the relationship may also change or increase over time as the factors above also change over time:

> the confict between sexes might increase with relationship length because cues of youthfulness decrease and social status may change (e.g. , due to job loss).
> These changes might trigger relationship termination. One possible example of this is serial monogamy among highly attractive, high-status men

AS a last note, this is true for most average men and women.
The **conflict between higher-value men and women may be larger** because **the interests of higher value men diverge much more strongly from women.**
Ie.: higher mate value men have less to gain from entering any relationship.
See here for example:

Also read:

- **Evolved adaptations of intrasexual competitions**

> Sexual Conflict: How Men & Women Fight The Sex War

Evolved mechanism for cooperation: suppression of alternatives

Both men and women in relationships seem to have mechanisms to decrease the risk of a breakup by ignoring potential alternatives:

> Overall, men without a partner rated the confederate as more attractive—suggesting that attraction is suppressed by the presence of a long-term partner.

And what also gives as insight that this may be an evolved mechanism is that while single men were more attracted to ovulating women, partner men were less attracted.
The same bias was seen when it came to remembering potential alternatives.

Infidelity

Infidelity is not the norm, but not too uncommon either:

> ranging from 22–25% of men and 11–15% of women having had extramarital afairs during their lifetime (e.g. , Atkins et al. , 2001; Labrecque & Whisman, 2017; Wiederman, 1997)

The desire for infidelity is even more common:

> Hicks and Leitenberg (2001) found, in a diverse sample of university students and employees ages 18 to 70 years, that 87% of their respondents (98% of men and 80% of women) reported having had extradyadic sexual fantasies in the past two months. In a substantial number of cases, such fantasies

Infidelity is also one of the most common reason relationship breakup crossculturally (Betzig, 1989; Amato & Previti, 2003), albeit some people stay together even after infidelity.

Most people generally dislike infidelity, but many may still engage in it in the right circumstances.

Infidelity makes evolutionary sense

In the end, people cheat because it's good to keep a long-term partnership, while trying to sneak something on the side:

> Humans have evolved a collection of mating strategies whereby benefts can be gained both from investing in a long-term partnership and from defecting from that partnership to gain benefts from an extra-pair partner

This is explained mathematically and with game theory:

> Certainly, there are advantages to long-term cooperative partnerships in which each individual sacrifces a personal optimum for a relatively higher net collaborative yield (i.e. , positive-sum relationships; Axelrod, 1997), such as when children are aforded security and environmental stability by multiparent care (Abraham & Feldman, 2018; Geary, 2000).
> But the greater net individual beneft of defecting in a trust game (i.e. , when one partner cheats but the other does not) suggests that human's evolved mating psychology is confgured to motivate calculated deception (i.e. , infdelity) (see McNally & Jackson, 2013; Mokkonen & Lindstedt, 2016)

Infidelity may have little to do with love, affection, or caring for the cheated spouse

Something the authors say and I agree with:

> People may have an evolved preference for monogamy and deep socioemotional attachments with particular individuals.
> On the other hand, individuals are also motivated to engage in strategies that ancestrally propagated genes

The same generally goes for ethical or "good behavior".
People may truly prefer being "good" or ethical, but may still cheat or backstab when the payoff is high.

Sex differences around infidelity

Both genders engage in infidelity.

But while men may find sex with a new partner enticing no matter what, women may be more discerning and, I quote, "be especially inclined to be unfaithful if an existing partner is of poor quality, if the partner is not a good means of emotional support, or if a male who offers more emotional fulfillment or higher gene quality becomes available (Buss, 2000)".

- **Women's main strategy is always long-term**

While women most certainly cheat, their primary strategy tends to be long term:

> women have been selected to compete with one another to develop and maintain a pair-bond with a high-quality male and to take steps to reduce the risk of being abandoned (e.g. , Gallup et al. , 2012).

- **Men underestimate emotional infidelity**

Interestingly, the authors say that men are more likely to fall for emotional infidelity because they're more likely to under-estimate it:

> Men more than women fail to notice the underlying threat of infdelity that does not involve sex. This sex-diferentiated bias represents a sexual confict that presents a clear threat to relationship maintenance

But emotional infidelity can often lead to sexual infidelity and breakups.

- **Women suffer more**

> Women in general reporting more intense grief ("heartbreak") reactions than men.
> Despite women more often taking the initiative in the breakup, women reported higher intensity of anger, anxiety, and fear and all forms of physical reactions than men, while no sex diference was found for numbness, lost focus, and inability.

The authors say this is because of men's higher propensity to focus on short-term liaisons rather than long term, coupled with a stronger inclination to rebound and seek new partners.

- **Men and women hide infidelity to match their partners' preferences**

> men spend more money on and display emotional investment in existing partners, while women initiate more sex with existing partners and maintain their physical appearance in order to avoid suspicions regarding infdelity

Cultural differences of infidelity

There are large differences in the prevalence of sexual infidelity:

> For example, extramarital sex is more prevalent in African than in Asian and Western countries.
> One study showed that estimates of extramarital sex in the past year range from 38% for men and 19% for women in Guinea Bissau (e.g. , Caraël et al. , 1995), compared with 11% for men and 4.5% of women in China (Zhang et al. , 2012).
> The incidence of extramarital sex seems especially low in Muslim countries, probably due to the severe sanctions on this behavior (Adamczyk & Hayes, 2012)

Of course, the authors preferred to mention "cultural" rather than potentially "something else".

Anti-cuckoldry evolved defenses

Men evolved several psychological adaptations that are not present in women, including:

- **Paternal resemblance preference in offspring**

For example, with recognizing and preferring children with facial similarity (redacted for brevity):

> (…) 90% of the males but only 35% of the females selecting the child whose face had been morphed with their own
> (…)
> Platek et al.(2004) found sex diferences in the brain by viewing self-morphed baby pictures (…) Wu et al.(2013) also showed a stable male advantage in child face processing

- **Olfactory similarity**

> Alvergne et al.(2009) found that paternal investment was positively related to both face (visual) and odor (olfactory) similarities between fathers and children.

- **Emotional proximity to similar children**

> Alvergne et al.(2010) also found fathers reported the highest emotional proximity to children who displayed greater resemblance, but this relationship was not observed in mothers

- **Higher satisfaction with child-father resemblance**

> For high parent–child resemblance both parents exhibited high levels of well-being, but for low parent–child resemblance the well-being of mothers was higher than fathers. Thus, the literature overwhelmingly implicates a male-specifc efect of resemblance on child investment

Women took (evolutionary) note and tell fathers that the children are like them, even when external raters disagreed.

Predictors of infidelity

Predictors of infidelity include:

- Sexual excitation, strong for men (Mark et al., 2011)
- Relationship dissatisfaction/unhappiness, stronger for women (Mark et al., 2011)
- Extroversion, openness to new experiences (Altgelt et al., 2018; Orzeck & Lung, 2005; Yeniceri & Kökdemir, 2006)
- Sensation seeking (Lalasz & Weigel, 2011)
- Poor impulse control (Brady et al. 2020)
- Antisocial/low agreeableness
- Dark triad
- High sexual permissiveness
- Unrestricted sociosexuality is a powerful predictor of infidelity (Barta & Kiene, 2005; Rodrigues et al. , 2017)
- Low religiosity: less religious people were more likely to be unfaithful (Whisman et al. , 2007)
- Avoidant attachment style (DeWall et al., 2011)
- Declining in sexual-relational adjustment (Scott et al., 2017)
- Revenge for partner's infidelity: Warach et al.(2018) found that sexual betrayal was the single best predictor of sexual infidelity of the personality dimensions they examined
- Belief in the availability and availability of higher-quality mates: Emmers-Sommer et al.(2010) found that, among 220 students in the United States, men and women were more likely to be unfaithful when they had higher-quality alternative partners.

Read more in:

- **How to pick a loyal girlfriend**

Higher mate value men may incur "defensive" infidelity

> Buss and Shackelford (1997) found that women who believed they were of lower mate value than their husbands also believed that their husbands were more prone to infdelity, which prompted these women to report a higher likelihood that they, themselves, would be unfaithful to their husbands

However, I would have liked to see the incidence of these cases.
Plus, it would be interesting to see how many of those higher value men were indeed cheating. I suspect, a higher percentage than the average.

Jealousy

There are two types of jealousy:

- **Possessive**, a *preventive* reaction that involves mate guarding in order to avoid infidelity, also related to cultural and environmental factors such as:
  - Parental control of mate choice: more common in cultures of arranged marraiges and/or culture that downplay freedom of choice and love. Instead, as the author say, "freedom of mate choice seems to make possessive jealousy less necessary".
  - Life history (in particular attachment style and father absence)
  - Domestic violence: possessive jealousy & mate guarding are linked to domestic violence among men
- **Reactive**, a *response* to an actual or potential threat

Jealousy motivates mate-guarding

Both jealousies evolved to be attentive and active against infidelity.
And for good reasons, say the authors:

> Mate guarding among males has evolved because it is essential to guarantee paternity certainty: males who did not allow their partners to mate with other males were evidently reproductively more successful than males who did not pay attention to their mate's extradyadic sexual behavior.

In any species with high male parental investment, thus including humans, women also have an incentive to be jealous and to mate guard.

Men Who Invest More Are Also More Jealous

> both sexes report high levels of jealousy (Buss, 2013; Scelza et al. , 2020).
> Moreover, this is particularly evident in societies with high levels of paternal investment; **when high investment is expected from men, men are more concerned with women's sexual infdelity and women are more concerned with the potential diversion of resources to a male's new mate**—thus high jealousy (Scelza et al. , 2020)

This is also why, in general, **"player types" are less jealous**.
And it's also why we often say here that most red pill gurus, obsessed with faithfulness and partners' count, are truly relationship men at heart who long for a "good woman" to stick with them.

Jealousy also depends on mate value

The authors also say that "jealousy implies that one feels threatened by the loss of a partner's sexual or romantic exclusiveness".

Couple that with the fact that love makes jealousy less necessary, and you see why too much jealousy is poor self-signaling that lowers your value (and attraction).
This is why from a strategic and effectiveness point of view we recommend caution when dealing with men approaching a partner:

- What to do when someone makes a move on your girlfriend

Intimate partner violence

- **IPV is associated with insecure attachment styles**: violent men are more insecure, anxious, and preoccupied in their attachment style and reported more dependency on and preoccupation with their wives (Holtzworth-Munroe et al., (1997)
  - Avoidant men are also relatively jealous: less self-evident is that also avoidants are often relatively jealous (Buunk, 1997). A possible explanation is that avoidants are dependent on their partner but feel that they are not meeting their partner's needs with their distance and are concerned with losing their partner.
- **Possessive jealous men are more violent**
- **Intrasexually competitive women are more violent**: *only intrasexual competitiveness was associated with intimate partner violence (Buunk & Massar, 2019)*
  - Women's IPV peaks at around 20, when they are also the most intrasexually competitive
  - Fertile women may be more violent, depending also on cycle, and other women's cycle (my note: albeit I think it may be true, I'm not too convinced seeing how many similar studies have shown little or nul effect in more recent, better studies)

Dark triads and religious men are more likely to mate guard

> people who score high on the dark triad traits of Machiavellianism, narcissism, and psychopathy are more likely to engage in mate guarding, including both beneft-provisioning and cost-inficting behaviors (Chegeni et al. , 2018; Jonason et al. , 2010)

However, dark triads are also more likely to escape mate guarding:

> women who are most likely to find value in attempting to gain benefts from both a long-term partner and a short-term partner simultaneously, such as high Machiavellian women, are similarly more likely to resist a long-term partner's mate-guarding efforts (Abell & Brewer, 2016)

And, I'm sure many won't like this:

> Evidence has similarly related costinficting mate-guarding behaviors to high levels of religiosity. That is, at least among men, increased religiosity is associated with an increased tendency to use cost-inficting mate-guarding tactics (Chaudhary et al. , 2018)

I think this may be mediated by conservatism.
And indeed, as we contended on this website:

> As religion may function as a strategy to restrict women's mating opportunities, this may explain why the same relationship between religiosity and cost-inficting mate guarding was not identifed among women

Similar as we contend in the beginning of this video:

Mate guarding sometimes is motivated by a “risky” partner

> men are more likely to guard their female partners when those women demonstrate low relationship commitment (French et al. , 2017) and when those female partners engage in behaviors that men interpret as sexual receptivity (Prokop & Pazda, 2016).
> Overall, when it seems as though a partner may be interested in alternatives to the ongoing relationship, people are more likely to engage in mate-guarding behaviors to prevent that defection.

In other sources I’ve seen that men are more aggressive, mate-guarding, and violent when indeed the partner is having affair(s).

My note: cheating spouses attracting partner’s violence – personal experience
This is something I’ve experienced personally.
I know of an asbolute violent ahole to his girlfriend. Everyone righteously condemned him, and most thought he was imagining things.
But I know that he wasn’t imagining things.

Higher value partner = more mate guarding

The loss of a lower-value partner is a smaller loss, so people spend less resources mate-guarding them.

Instead, the loss of a higher-value mate partner is a major loss.

Thus, we see that higher mate value partners call for more mate guarding:

> we see that men, for example, are more likely to engage in mate guarding, particularly benefit-provisioning mate guarding, when their current partner is high value (Miner, Starratt, & Shackelford, 2009; Starratt & Shackelford, 2012).

However, higher mate value partners are also more likely to escape guarding:

> people are more motivated to resist a partner’s mate-guarding efforts when the value of the potential extra-pair benefits are high. For example, women are more likely to resist a partner’s mate guarding when they perceive themselves to be more attractive than their partner (Fugere et al., 2015)

And, just as we’d expect, people engage in more mate guarding when there are few available good partners around.

My Note: women escaping controlling men – personal experience
I also know for a fact that a man installing tracking apps on her attractive and sensual partner’s phone had good reasons to try and track her (but she was smart enough to avoid detection).

Attachment Styles

This part was the clearest explanation of attachment styles I’ve ever read.

Thanks to this book it finally clicked how attachment styles relate to people and people’s psychology.

So let’s start.
First of all, attachment styles are phenotypes that we develop to increase reproductive fitness:

> From an evolutionary standpoint, the attachment behavioral system refects an organized set of physiological and psychological mechanisms that encode and process early life experiences with attachment fgures to

> produce phenotypes (i.e. , attachment styles) that are more likely to increase ftness in particular environments (Simpson & Belsky, 2008; Szepsenwol & Simpson, 2019).
> In this respect, attachment styles refect the adaptive calibration of life history strategies (Szepsenwol & Simpson, 2019)

Albeit most pop psychology books like the "secure attachment style" as the "best" of the pack, an evolutionary lens looks instead at what's most effective to survive and reproduce.
Secure is best for stable environments and other secure partners, but avoidant is best for harsh environments and short-term mating:

> Although secure attachment is typically viewed as the most optimal and adaptive style within the developmental literature, an evolutionary perspective suggests that attachment security has an adaptive advantage in safe and predictable environments but not in harsh and unpredictable environments (Simpson & Belsky, 2008; Szepsenwol & Simpson, 2019)
> (…)
> insecure attachment may have adaptive advantage over secure attachment in more harsh and unpredictable environments (Szepsenwol & Simpson, 2019).

From an evolutionary perspective then, the secure attachment is related to parental investment and a "slow life strategy":

> Hazan and Zeifman (1999) suggested that the primary evolutionary function of secure attachment in adult relationships is to increase the likelihood of stable and enduring pair-bonds. Enduring pair-bonds are inferred to enhance the reproductive fitness of both parents and their ofspring. Thus, attachment security is thought to align with a slow life history strategy and long-term mating strategies that emphasize quality rather than quantity of investment in ofspring when environment dangers and threats are low and predictability of future events is high (Geary, 2015; Hazan & Zeifman, 1999).

Indeed, attachment security is consistently linked to more committed and long-term romantic relationships (Mikulincer & Shaver, 2016; Szepsenwol & Simpson, 2019).
That, in turn, has many psychological and even physiological advantages for the secure partners.

And avoidant attachment instead is related to short-term, uncommitted dating:

> Attachment avoidance is assumed to refect a relationship commitment minimization strategy (Del Giudice, 2019; Karantzas et al. , 2019), in which parental investment is traded off against reproductive investment (…) (Szepsenwol & Simpson, 2019).
> (…) aligns with a fast life strategy and short-term mating strategies (…)

Indeed, research found avoidants to have lower relationship commitments, less parental investment, and less partner support and provisioning -especially during parenthood- (Szepsenwol et al. , 2015).

Finally, attachment anxiety may seek a relationship commitment maximization with chasing and turning towards their partners.
However, I'm unconvinced here because as the authors themselves say, too much attachment anxiety makes for dissatisfying and potentially short-lived relationships.

Emotional Intensity Theory

Emotional intensity theory was a wholly new concept for me.

And a little mind-blown.

The theory states that motivational intensity is determined by the importance of reaching an outcome (i.e. , the goal) and the challenge.
The importance of the goal sets the maximum effort one is willing to exert to overcome the challenge, while the perceived challenge magnitude determines the actual effort.

However, to conserve energy people only invest in what is likely to provide returns.

Meaning that emotional intensity (and, possibly, action), will be highest with:

- **High effort with unknown challenges**
- **Low effort with weak challenges** because these challenges don't pose a threat
- **High effort with strong challenges** because these challenges do require lots of effort
- **Low effort for too big challenges** because the goal is unreachable anyway so people resign themselves

In chart (not the clearest probably):

This theory explains why in dating, often, the sweet spot is a balance between the extremes.
Take reciprocation of attraction or investment for example. Too much, and there is no challenge. Too little, and there is no point in putting effort into someone.
But give moderately, and you hit the sweet spot.

In a study:

> Reysen and Katzarska-Miller (2013) (…) tested whether the manipulated degree of reciprocation of a potential partner acted as a deterrent to romantic feelings by producing cubic efects of deterrence on the intensity of attraction (Reysen & Katzarska-Miller, 2013).
> To test their hypothesis, the researchers asked participants to imagine a potential romantic partner who reciprocated either a strong, moderate, weak, or unspecifed personal feeling of attraction (this latter condition instantiating the control condition of "reciprocation unmentioned").
> Results revealed that potential partners' reciprocation of attraction acted as a deterrent to participants' actual intensity of attraction to the potential partner. Specifcally, the intensity of attraction varied as a cubic function of increasing degrees of reciprocation: it was intense when reciprocation was unspecifed; paradoxically

> reduced when participants' feelings of attraction were highly reciprocated; intense, again, when attraction was only moderately reciprocated; and eventually substantially reduced when attraction was, instead, only scarcely reciprocated.

The authors conclude that certain obstacles and barriers to romantic feelings can be motivating and beneficial for in-pair feelings.

Of course, what the authors don't mention but I suspect is the case here is that personality also matters.
People with high self-esteem and/or who relish a challenge may be more motivated to pursue the "almost impossible" partner/challenge.
But lower self-esteem and or men and women with other priorities will instead let go sooner.

Dual sexuality & ovulatory shift: a myth?

The ovulatory shift hypothesis postulates that women are more attracted and receptive to high mate-value extra-relationship men during their peak fertility days.

The extended hypothesis also includes the "dual sexuality hypothesis", such as:

> women have two functionally distinct sexualities: (a) extended sexuality—expressed during the nonfertile phase and which functions in attachment to the primary partner, and (b) estrus—expressed during the fertile window and which functions to increase the likelihood of conceiving with genetically high-quality men (Gangestad & Tornhill, 2008; Tornhill & Gangestad, 2008)

In the manosphere this is referred to as "alpha f*cks, beta bucks".
Such as, women want to be impregnated by a high-mate-value man who's more of a player type, and then seek a "nice guy" to take care of her and the children.

Also see our main article on this:

> Lover VS Provider: How to Pick Your Best Strategy

Masculine men not more attractive during peak fertility

The findings of more appreciation for masculinity during peak fertility are contradictory.
Overall:

> Overall, these fndings show little support for the idea that cyclic changes in mate preferences are adaptations to enhance the likelihood of short-term mating with men possessing markers of genetic quality during the high-fertility period.

Ovulatory shift disproven by current evidence

So, what does the evidence say?

The evidence suggests that the ovulatory shift is dubious, small or null.
And the dual sexuality is equally dubious because in many studies attraction increases for the partner as well:

> Studies on mate preferences provide limited evidence for robust changes across the cycle. In contrast, there appears to be subtle but systematic increase in sexual desire and behavior during the high-fertility phase. Nevertheless, these changes are similar for in-pair and extra-pair sexual desire, thus contradicting the ovulatory shift hypothesis

There were studies showing that women with men “lacking putative markers of genetic quality” were more attracted to extra-pair men.
However, I’d have to wonder how this could not be the case, since other men are simply more attractive.

The ovulatory shift was an important part of the dual mating strategy, so the authors suggest the dual mating strategy is also questionable.

BUT…

My note: I’d be cautious jumping to conclusions -and writing off the dual-mating strategy

The book is very recent.

But there has been some even *more* recent research by Macken Murphy on 254 individuals -not huge then, and including men as well-.
And the research showed that unfaithful people -men included- found their extra-dyadic partner more physically attractive, but not better overall, and also not better for parenting.

These results are consistent with dual mating, but not with mate switching.
However, the same applied to men.

Murphy also released an even better podcast.
I listened twice to it, and he was even more convincing there.

So, what gives?

In my opinion, both mate switching and dual strategy are valid, which would confirm and conform with humans’ -and women’s- plurality and adaptability of sexual strategies and approaches.
I’ve also experienced both in life.
And I’ve ever experienced women who slept on the side with the guy who wouldn’t even provide better genes -on external physical appearances at least- to the official boyfriend.

I believe attractiveness also plays a role.
Higher mate value women may be more able to secure a high mate value man who commits and invests, thus reducing the need for ‘ovulatory shift strategies’.

Breakups

Breakups and how people react to them seem to be highly variable and depends a lot on who initiated it, and what they think their prospects are.

Some evidence findings include:

WOMEN:

- Report consideration for both themselves and their partner when initiating a breakup, while men only consider themselves (Helgeson, 1994)
- Often involved or invested partners (Hill et al., 1976)
- First to fall out of love (Rubin et al., 1981)
- More likely to move to alternative mates (Blau, 1964)
    - UNLESS it was divorce with children, in which case they’re more likely to focus on their and their children well being, and future partner’s quality (Hetherington & Kelly, 2003; Symoens et al. , 2014; Tavares & Aassve, 2013; Wu & Schimmele, 2005)
- Rebound quicker *when they had initiated the breakup* (Buss et al., 2017; Helgeson, 1994; Rubin et al., 1981),

BUT

- Non-initiating women reported more sadness, confusion, and fear in comparison to males who reported feeling more happy or indifferent following the dissolution (Perilloux & Buss, 2008)
- Initiate more breakups and unilateral breakups (Baumeister et al., 1993; DeLecce & Weisfeld, 2016; Sprecher, 1994; Tong & Walther, 2010)
- Blame men more than themselves and have more negative attitudes of their partners (Athenstaedt et al., 2020; Sprecher, 1994)

MEN:

- Breakup less often, and more often react to women's breakups
- Claim to not know the cause of the breakup
- Experience more negative emotional reactions from breakups (Rubin et al. , 1981), probably also because they fall in love more, and more often
  - More depressed, lonely, unhappy and less free after the breakup and engaged in more harmful behaviors following breakups (Athenstaedt et al. , 2020; Rubin et al. , 1981) BUT
- Initiators retain a sense of confidence in the ability to acquire a better mate (Perilloux & Buss, 2008)
- Less willing to break ties, also because they have more positive views of their partners
  - Denigrate their ex less often

Divorce isn't bad per se, it's the bitter fighting that harms children

> there is compelling evidence that it is not divorce per se but a constellation of mutually reinforcing factors pre- and post-separation (e.g. , poverty, family violence and abuse, parental mental health and substance use, reduced parenting capacity, and separation-related confict) that drive many of the negative consequences of relationship breakdown for children (Pryor & Rodgers, 2001)

What's most dangerous instead is the "obsessive hatred" that seeks to harm the partner no matter the costs to oneself, and the children:

> Like love however, hatred tends to have an obsessive element that makes letting go difficult. Obsessive love sees only the good in someone (Fisher, 2000); hatred sees only the "bad. " For Demby (2009, p.477) (…) "pathological hatred" can be seen as "an efort to destroy while at the same time desperately needing"—the co-existence of desire and destructive urges.

Later the authors talk of this type of hatred as a "reunion behavior" through aggression and harm.
Something that seems to make sense to me.

PRACTICAL TIPS

Use fragrances if very un-masculine

> Allen et al.(2016) suggested that men who already have desirable levels of masculinity may not derive much beneft from fragranced products, but men low in masculinity/dominance may be able to apply scented products to elevate perceptions of their masculinity/dominance and, in turn, their attractiveness.

Quit meowing

Meowing, or the practice of doing exercises for a stronger jawline, may not be needed by all:

> several studies have found that women are attracted to masculine facial features (see DeBruine, 2014; see also Little, Connely, et al. , 2011). Other research, however, has shown that women are attracted to men with feminine facial features, which may infuence perceptions of warmth, kindness, and paternal investment (see Marcinkowska et al. , 2019)

And later:

> Women seem to vary more in their preference for masculinity-femininity. Such variation is partly due to genetic effects, and is also influenced by conditional factors, including personal and environmental characteristics (Zietsch et al., 2015).

Rebounds to help with heartbreaks

> rebounds may have positive effects. Brumbaugh and Fraley (2015) found that people who entered into rebound relationships had more confidence and felt more at peace with their previous relationships relative to people who did not.

Pick similar partners for long-term satisfying relationships

> large body of literature suggests that partner similarity is critical to relationship satisfaction, maintenance, and longevity.

Especially when you or your partner rate that dimension important, and on dimensions such as:

- Religiosity
- Personal interests
- Likes and values
- Sex drive
- Personality
- Relationship standards

Avoid game players

> General relationship satisfaction (…) is negatively correlated with game-playing, uncommitted love, and manipulative sexuality (Hendrick et al., 1988).

Also read:

- Games women play
- Games men play
- Nasty games women play

Quit the gym, join a band

> Testament to this sexual appeal, a young man carrying a guitar (i.e., indicative of creativity) can solicit more

> phone numbers from young women compared to a young man carrying a sports bag or nothing (Guéguen et al., 2014)

Edit:
The study has been retracted since its publication.

Share food on dates

> Consistent with the notion that food sharing is a courtship tactic, it appears to be associated with higher mating success (Alley et al. , 2013). Recent analyses of outcomes from 792 dinner dates from the restaurant-based TV reality show "First Dates" found that couples who shared food were highly likely to agree to a second date: 93% of couples who shared food agreed to go on a second date, compared to 43% of couples who did not share food (Hendrie & Shirley, 2019)

My personal tip here is to first tell her to make you try a bite a of her food -or help yourself with a fork if you're worried she may have a low disgust threshold-.
And then give some of yours to her.

Personally, I take an even simpler step forward: I say that I like trying different things, and propose/tell to order several different dishes that we will share.

Powerful women better be strategic for maximum dating success

> Physical dominance, size, muscularity, and wealth are traditional cues or instantiations of status.
> These features are unlikely to help women attract men and may even render women less attractive as prospective mates.
> For example, being too tall can harm women's mating prospects; men typically prefer shorter women, and women typically prefer taller men (Pawlowski, 2003). As such, a taller woman (e.g. , 6'4″) must compete with shorter women (6'4″ and below) for the few men taller than herself (6'4″ and up).
> Similarly, being too intelligent, educated, or high-earning—other markers of what we typically think of as status—might also be considered potentially harmful to women's success in mating competition (Bertrand & Kamenica, 2015; Folke & Rickne, 2016)

However, as we often also expect here at TPM, reality is complex adn the author also found out that it's more nuanced and exceptions apply.

It's not like men *completely* write off high-status women.

For example, men are less attracted to *moderately* physically attractive women with a high status job, but more attracted if she's *highly* physically attractive women (Fisher & Stinson, 2020)

This is something we discussed a long time ago already (and were heavily criticized for):

- **Dating for successful women**

Pick sperm donors looking like the father if conceiving with sperm donors

Because of men's evolved adaptation to favor children who are similar to them, it's best to:

- **Give the adoptive father's name to the child (e.g. , John Doe, "Jr.")**: naming the child after the putative father was a strong predictor of long-term supportive and close relationship when born out of wedlock (Furstenberg and Talvitie, 1980)
- **Pick sperm donors who look like the father** (some sperm banks allow to match donors with pictures)

Interestingly, when couples picked sperm donors, father wanted a skin color like theirs, while mothers wanted the "more advantageous skin color" (which the authors don't mention, but chances are it was white)

Do consensual non-monogamy if you want to enjoy casual sex and relationships

> When those with greater interest in having sex with multiple partners engage in CNM, they report higher relationship satisfaction (Rodrigues et al. , 2017; Rodrigues, Lopes, Pereira, et al. , 2019).
> This suggests that people who form CNM relationships may avoid the fallout of infidelity by choosing a relationship structure that better matches their (and their partner's) mating motives and personalities

MORE WISDOM

Major theories can take hold even without much supporting evidence

The author describes that even science sometimes follows fads.
Describing the now much less supported menstrual cycle fluctuations and "dual strategy":

> Finally, the story of research on cyclic changes convincingly shows how well-formulated theories may become a mainstream view, even though their empirical support is weak and their assumptions unrealistic (e.g. , the role of extra-pair copulations).
> Relatedly, it shows how science often operates in waves of fashion, following a pattern of sporadic interest followed by introduction of an influential theory, an outbreak of empirical activity, and then gradual decline and sporadic interest. This is not restricted to menstrual cycle studies. Other areas such as research on fluctuating asymmetry, waist-to-hip ratio, and second-to-fourth digit ratio (to name just a few) have followed a similar pattern

It's not so surprising, after all.
Science is done by scientists, and scientists are humans.

Love is a fundamental human emotion

Something we already mentioned on this website:

> Despite widespread views in the social sciences over the past century that love is a European phenomenon of recent origin (e.g. , Bloch, 2009), love is prioritized as a preference in long-term mating in countries ranging from Brazil to Zambia (Buss et al. , 1990).

And a bit later:

> Romantic love appears to be a part of the shared human experience—with nearly all studied cultures evidencing intimate and romantic pair-bonding

The authors rightfully add that pair-bonding makes even *more* sense in ancestral and under-developed societies because of the benefits it provides to the couple and the offspring.

That being said though, in general it seems like individualistic cultures have more idealized and romantic beliefs of love, while collectivist cultures a more pragmatic one.

And men may fall in love more and more often than women

> Conversely, males appeared to initiate romantic overtones more often, fall in love easier, and (…) often

> reported having been in love more often (Kephart, 1967; Sprecher, 1994) suggesting that they are afforded more opportunities to pursue the luxury of love since they commonly incur fewer costs with commitment (Rubin et al., 1981).
> (…) Consequently, males fall in love faster and experience more emotional reactions from breakups (Rubin et al., 1981)

Poaching and infidelity make for poorer relationships

> individuals who had been poached by existing partners tended to have poorer-quality relationships, including less satisfaction, commitment, and investment.
> Poached individuals also reported being more attentive to alternative partners, perceiving their alternatives to be of higher quality, and engaged in more infidelity relative to nonpoached individuals

And:

> while evaluating a partner during infdelity may result in a more informed mate switch, relationships that start as infdelity may be less gratifying and more tumultuous (e.g. , characterized by poorer satisfaction and commitment and more infdelity).

Men probably solved the question of "paternity uncertainty"

Says Buss:

> Because fertilization occurs internally within women, men cannot be certain that they are the genetic father of a woman's child. Men who failed to solve this problem would have risked investing valuable resources in the offspring of intrasexual rivals. To compound these costs, the mates of those men would have also devoted their investments into offspring of their rivals. Unless ancestral men were able to solve this problem, it is unlikely that men would have evolved a long-term high-investment mating strategy

Muslim's veil may be a tool of male power

> A cross-cultural study on veiling reported that in all of the 25 countries included in the analysis, men supported veiling more than women. Veiling may thus serve men's ftness interests more than those of women (Pazhoohi & Kingstone, 2020), for example by reducing women's attractiveness to men who are not their husband.

Evolution is very imperfect

A theoretical background:

> **many psychological (and physiological) mechanisms** are now processing inputs that they did not evolve to handle, thereby **leading to maladaptive cognitive, afective, and behavioral outputs** (Li et al. , 2018; Li, Yong, van Vugt, 2020; Maner & Kenrick, 2010)

An example:

> The male beetles took such a liking that they would continue attempting to copulate with a bottle despite being attacked and having their genitalia dismantled by predatory ants

Also see our video:

Some degree of homosexuality is common

> Some studies show that a substantial proportion or even a majority of men and women do have also some level of same-sex attraction despite considering themselves heterosexual (Santtila et al. , 2008; Savin-Williams & Vrangalova, 2013).

And it's not true that one is either straight or gay:

> Moreover, non-heterosexuality does not mean only exclusive homosexuality but rather a spectrum of non-heterosexual attractions and preferences (Valentova & Varella, 2016b)

The authors also say that homosexuality is highly heritable and linked to psychological, neurological, hormonal, developmental, and anthropometric specificities (Bailey et al., 2016).

Bisexuality is linked to dark-triad and sex drive

> Bisexual women (Luoto & Rantala, 2022) have been demonstrated to display elevated sex drive and desire when compared to both heterosexual and homosexual women (Lippa, 2006, 2007; Schmitt, 2007; Stief et al. , 2014), and they also engage in more sexual behavior (Fethers et al. , 2000; Hayes et al. , 2011)

My experience with bisexual women confirms the same.

And as for dark triads:

> Semenyna et al.(2019) showed that this heightened sociosexuality observed in bisexual women is associated with personality traits known as the Dark Triad (Machiavellianism, sub-clinical narcissism, and sub-clinical psychopathy) and sexual competitiveness

The author of "Confessions Of a Sociopath" also says that, in her experience, bisexuality may be the most defining trait of sociopathy.

Masculinity & sociosexuality: a complex relationship

- **More masculine women have more sexual partners**: *a number of studies reported that more masculine women have more sexual partners than more feminine women (cf. Bártová et al. , 2020; Mikach & Bailey, 1999; Varella et al. , 2014)*. BUT
- **Gay men don't have lower sociosexuality**, albeit they're on average less masculine than heterosexual men (Bailey & Zucker, 1995)
- Bisexual women are more feminine than lesbians, but have a more unrestricted sociosexuality (Flanders & Hatfeld, 2013); (Schmitt, 2005, 2007)
- **Gender non-conforming heterosexual and homosexual individuals are more sexually unrestricted** (Bártová et al. , 2020)
- **Non-heterosexuals engaged in more consensual nonmonogamy** (Valentova et al. , 2020)

Modern societies naturally move towards more inclusion, tolerance, & humanity

> Inglehart and colleagues (Inglehart 1997, Inglehart & Baker, 2000; Inglehart & Welzel, 2005) in their modernization theory distinguished traditional and modern societies based on social, economic, and cultural characteristics. Cultural norms of traditional societies place high value on survival and security, while cultural norms of modern societies place high value on self-expression and tolerance of minorities

I disagree that's a given.
Modern societies can move towards far more repressive systems. The difference though is that poorer societies cannot even afford inclusivity, self-expression and tolerance because they must prioritize survival.

Richer societies instead can afford to think beyond survival to include more progressive values and welcoming stances.
Richer societies *can* do that, and probably *tend* to do that. But it doesn't necessarily mean they *will*.

But it's still a good point.
Similarly, subsistence societies value child-bearing and having many and healthy children. Richer societies also value fathers' involvement, and they value humanity and kindness for their own sake:

> In traditional societies, continued childbearing affords higher reproductive rates, but parental investment in existing children is more important in modern wealthy societies (e.g., Mace, 2000). Due to increasing overpopulation in some societies (and on the global scale), the modern culturally evolved norms frequently discourage extended reproduction of offspring and tolerate unhealthy offspring more than traditional societies. Subsequently, the norms value less the number of individuals but rather promote humanity and survival of everyone, regardless of their health perspective.

Status matter, but not for women

In general, men compete with other men to acquire higher status, which in turn allows for better dating.
This holds true even in modern societies, but not for women:

> In Western societies high-income men have more biological children than low-income men, whereas among women the opposite is true (Hopcroft, 2005; Nettle & Pollet, 2008)

Antisocials may try to poach more, but are only successful if they're high-quality partners

This is the same we said in our articles "the myth of psychopath's mating success":

> antisocial people (…) are not the most frequent targets of these attempts. Instead, highly extroverted, open, attractive, and loving people are the most sought-after targets of poaching (Schmitt & Buss, 2001) (…).
> Further, although they attempt poaching frequently, antisocial people are also not the most successful poachers. That recognition goes to people who are self-described as open to new experiences, sexually attractive, and sexually unrestrained

QUOTES

On "why infidelity exists (and makes sense)":

> From an investment perspective, simultaneously investing in a long-term partnership and one or more short-term partnerships is akin to diversifying one's portfolio

Oral sex as effective mate guarding (a strategy of giving value and make your partners want to stay, instead of restricting freedom):

> people who engage in sexual behavior that is more likely to lead to partner orgasm—such as oral sex (Richters et al. , 2006)—may be employing a particularly valuable mate-guarding tactic (Pham & Shackelford, 2013;

> Sela et al. , 2015)
>
> Note: of course, that is only true as long as that “extra” sexual behavior is wanted by your partner and that oral sex is better than other types of sex -including “normal” penetrative sex-.

On relationships as “unspoken deals” (redacted for brevity):

> One line of thinking with respect to (…) relationship dissolution is (…) that marriage-like unions involve females conferring some exclusivity of sexual and reproductive rights to a male in exchange for his commitment to invest in and protect her and their offspring (Daly & Wilson, 2000).
> However, should either not fulfill their end of the bargain (e.g. , either party is unfaithful, “freeloads,” or becomes undependable), the relationship may dissolve.

⍰⍰♂ Lucio’s Analysis

Sometimes ad-hoc explanations weren’t plausible

Ad-hoc explanations undermine the rigor of evolutionary psychology.

In general, good evolutionary psychologists don’t do it much and, fortunately, they were the exceptions in this book.

However, there were passages where certain explanations felt more speculative, and not very plausible.

For example, the authors suggest that women compete less physically than men because injuries are costlier to women:

> By contrast, injury related to physical aggression may be costlier for women e.g., injury could make a woman unable to care for offspring, causing them to expire; Campbell, 1999, 2002) further facilitating this sex difference in overt and direct intrasexual mating competition

The author does well to use the words “maybe”, and “could” -that’s how you recognize a good scientist-.

But a little bit later the same hypothesis, with fewer hypotheticals:

> physical competition would negatively afect a mother’s ability to provision for herself and her (grand) offspring, and as a result of this selection pressure, women have evolved to be more risk-averse than men (e.g. , Cross & Campbell, 2011; Massar, 2018)

The hypothesis itself still strikes me as an ad-hoc explanation.
It lacks sufficient depth and fails to address counter-arguments.

Why?
Because injuries aren’t exclusive to women in terms of reproductive costs.
Injured men also face equally reduced reproductive success.

If injury alone were the key determinant, we’d expect both genders to be similarly cautious, if not men even more so, given their external reproductive organs make them particularly vulnerable in physical conflict.

Plus, since top men also reproduce more than women, the cost of physical aggression for top men should be even higher, and their risk aversion equally higher.
That doesn’t seem to be the case to me, since higher-status men may be even *more* aggressive.

Now I am going to make an hypothesis: some men may (subconsciously) like this hypothesis because it reinforces the frame of women as weaker -and men handling “tough business”-.

Sometimes fails to mention confounding variables or alternate explanations

For example, making the case that men discriminate more against children that are not theirs, the author say that (compared to women):

> Daly and Wilson found that children are 100 times more likely to be killed by their nonbiological parents, and nonbiological fathers are far more prone to engage in killing and other forms of child abuse than nonbiological mothers.

However, men are also more violent, so it's not possible to make a direct comparison with women, unless one shows that men are less than 100 times more likely to kill anyone.

In another case, to prove that parents care more for their biological children:

> families with both adopted and biological children, Gibson (2009) found that biological children were less likely to be arrested, less likely to be on public assistance, and less likely to require treatment for substance abuse or other mental health problems

Adopted children are more likely to have issues of their own.
Including: being abandoned by addicts or psychopathic parents (genetic), or having spent time early childhood in harsh condition (environmental).

Misunderstands the lover/provider (short term/long term) male strategy

The authors say:

> The second major assumption of the dual sexuality hypothesis is that men who can provide indirect benefts (i.e. , men with high-quality genes) pursue mainly a short-term mating strategy (…) As a consequence, their willingness to provide direct benefts (e.g. , in the form of paternal care) is low. This assumes that qualities responsible for direct benefits are of different origin than qualities of indirect benefits.
> In other words, men who can provide paternal care lack cues of genetic quality. Such an assumption is, however, likely to be unfounded.

That's not the case though.

The player/provider theory is based on the idea that many men who can sleep with many women prefer sleeping with many women, rather than committing.
These men *could* provide paternal care, but do not want.

The other side of the coin is that men who present themselves as committed partners and doting fathers may also be of a high mate value. But, as a group, they are likely lower mate value than the players (because if they were the same, many father would be players instead).

I do agree with the author though that many people over-generalize and mistakenly imply that all father-types are lower mate value, and all player types are of higher value.
Indeed, it was one of our early posts here:

- It's about mate value, not the role

> Lover, Provider & Friend: The Truth of Men's Sexual Roles

Sometimes a bit PC (but I can understand it)

For example:

> Some divorced individuals may remain single because they possess undesired traits that make it difcult to form and maintain a romantic relationship, such as having high levels of neuroticism, narcissism, and attachment-avoidance (Amato, 2000; Wang & Amato, 2000).

Narcissism is often attractive. Avoidant attachment can facilitate a "player" style that's also effective in early dating. I think more likely and common issues for struggling divorcees include: poor, older, overweight, or saddled with children to take care.

And another example later that also felt to come from a somewhat "off" naive/pc perspective:

> Men are signifcantly more likely than women to repartner after separation (…) and are more likely to have children with that new partner (…).
> From the narrow perspective of the success of a single-family unit, such behaviors seem difficult to reconcile with theories of evolutionary adaptation. From a broader perspective of survival of the species, however, it could be argued that the more important outcome lies in the chances of "superior" mate selection the second time around

What's "success of a single-family unit" has to do with evolutionary adaptation?

Either I completely misunderstood this part, or the authors seemed to bring some strange personal value that single-family units are "good" -a moral take- or "good for evolution" -a claim lacking evidence-. Both seem off.

Still too many studies low in ecological validity

Several studies felt to me over-relied on what people say.

For example:

> one study explored sex diferences and mate preferences in a booty-call relationship, finding that only women, not men, consider the kindness of a booty-call partner a necessity (March et al., 2018).

Well, the study, called " Netflix and Chill? What Sex Differences Can Tell Us About Mate Preferences in (Hypothetical) Booty-Call Relationships", is based on an *online questionnaire*.

I wouldn't overly-trust this study.

Some feminist, left-leaning claims?

For example:

> is incontestable that women, in the immediate cultural past (e.g. , last 500 years), have been discriminated against, and in many developing nations major discrimination still occurs.

It could be true indeed, but it would be better to define that discrimination.

And how "incontestable" is it?

How about some advantages women have also enjoyed?
Many soldiers who perished in war would love not being forced to go to war.
And many men who did NOT find a mate may envy the comparatively ease with which women can find one.

Sometimes I wished for more numbers

For example:

> Buss and Shackelford (1997) found that women who believed they were of lower mate value than their husbands also believed that their husbands were more prone to infdelity, which prompted these women to report a higher likelihood that they, themselves, would be unfaithful to their husbands

However, I would have liked to see how many more said that.

Some hypotheses are based on weak effects and left me unconvinced

For example, the authors list "coitus-induced uterine contraction" to interfere with another man's embryo implantation:

> Should these mechanisms fail and the woman is impregnated by another man, the third category of paternal assurance strategies involves pregnancy termination, which can include pregnancy-induced domestic violence (Burch & Gallup, 2004) and coitus-induced uterine contractions that interfere with embryo implantation (see Gallup & Burch, 2006, for details)

However, as far as I know -and i double checked before writing this, sex is generally pretty safe for an embryo.
So this felt to me more like a case of "looking for an item to add to the list of paternity-ensuring mechanisms.

Evolution is not a perfect, deterministic machine

Just like libertarian extremists (mistakenly) believe in free-market perfection, some people think as if evolution is a deterministic, nearly perfect machine.

As an example:

> If either of these hypotheses is correct—if masculine facial structures in men cue immune robustness or if they confer an advantage in intrasexual competition—selection should have shaped psychological mechanisms in women to be attracted to masculine facial shape

Not really.
Masculine facial features may confer an advantage in intrasexual competition, but it doesn't necessarily follow that women will be attracted to masculine facial shapes.
It MAY be the case. It may LIKELY be the case. But it doesn't *necessarily* follow.

Evolution is complex and messy, with an endless list of traits to select for or against.
So it's not a given that women would develop an adaptation to prefer a trait that helps in intrasexual competition.

Traits that help in physical combat may spread only because of survival and better reproduction via higher social status, without necessarily becoming more attractive.

Also, the "law of balance" applies again.
And developing exaggerated masculine facial features may come at a cost in other areas.

Just as an example, bigger testicles may make reproduction more efficient.
But they likely make combat less efficient -and cost more to develop and maintain-.
And it doesn't seem that women have strong preferences for balls' sizes.

Again, see this video:

Some claims felt off (and probably were off)

This paragraph didn't add up to me:

> In general, heterosexual men find women with feminine sex-typical traits to be more attractive (e.g. , Fraccaro et al. , 2010), although there are exceptions, indicating that for long-term relationships and in harsh environments men prefer more masculine female partners (e.g. , Little et al. , 2007, but see Pereira et al. , 2020)

While I could understand the case for "harsh environments", the "long-term" claim didn't add up for me.

So I asked Chatgtp.

My input before quoting the paragraph above was: "*from this paragraph from an evolutionary handbook, can you confirm or disprove with other studies that for long-term men prefer more masculine women?*
while i can understand the case for "harsh environments", it seems odd to me that men would prefer more masculine women as long-term partners".

Chatgtp confirms that long-term men prefer feminine women as long-term partners:

3. **Contradictory Findings:** However, other research, such as Pereira et al. (2020), challenges this idea. Pereira et al. found that men still tend to prefer femininity even in harsh environments, as feminine traits are consistently linked to reproductive potential, which is critical in long-term mate selection from an evolutionary perspective.

Conclusion:

The idea that men prefer more masculine women as long-term partners is not universally supported. While some studies (like Little et al., 2007) suggest this might be the case in harsh environments, others (e.g., Pereira et al., 2020) contradict this, reaffirming that men generally favor femininity, even for long-term relationships. The preference may be context-dependent, but the overall trend leans toward femininity being more desirable in long-term mating strategies.

And here is another example:

> Other research, however, is less consistent and indicates diferential effects depending on contexts and moderating variables. Meta-analysis of results across many studies (Langlois et al. , 2000) showed no sex diferences in the importance of attractiveness, with both men and women preferring physically attractive partners (e.g. , Fletcher et al. , 2004; Kenrick et al. , 1993; Regan & Berscheid, 1997)

This was my question to Chatgtp before quoting the above paragraph: "*I was surprised to read this because in most research and handbooks I've seen, men and women do differ in how they value and weigh attractiveness compared to other traits when it comes to mate selection. Based on academic consensus and the results of most studies and meta-analyses, is this true that men and women don't differ in how much they value attractiveness? this is the paragraph that raised some question marks for me*:"

And Chatgtp agreed:

> Other research, however, is less consistent and indicates diferential efects depending on contexts and moderating variables. Metaanalysis of results across many studies (Langlois et al. , 2000) showed no sex diferences in the importance of attractiveness, with both men and women preferring physically attractive partners (e.g. , Fletcher et al. , 2004; Kenrick et al. , 1993; Regan & Berscheid, 1997)

The claim that men and women don't differ in how much they value attractiveness in mate selection, as suggested by the paragraph you cited, contrasts with much of the academic consensus on evolutionary psychology and mate selection. Most research indeed supports the idea that men tend to place a higher priority on physical attractiveness compared to women, especially in long-term mating contexts. Here's a breakdown of the research and meta-analyses on this topic:

REVIEW

The *Oxford Handbook of Evolutionary Psychology and Romantic Relationships* is a well of wisdom.

Even after going through many handbooks and studies in this field, I still learned a lot from this book.

The book is also well-structured and seems thorough.

Even the criticism listed above refers mostly to single instances, and not trends.
Sure, like most other handbooks, it could gain with some streamlining and synthesis. That's because different authors sometimes revisit similar and/or foundational concepts with slightly different angles and studies (in this review for each chapter I combine parts from different chapters).

But overall, it was one of the most TPM-enriching books we've ever reviewed.
I took copious notes, and updated and improved many, many articles thanks to this handbook.
And I could even confirm or add some extra insights for our products.

For that, I am very grateful to the authors.

Video Review

FULL SUMMARY

About the Author:
Michael Steven Ovitz co-founded Creative Artists Agency in 1975, which went on to become the most successful talent agency in Hollywood.
Ovitz later served as president of The Walt Disney Company for only 16 months in what he considered to be a trap.

Display Power, To Never Use It

Couldn't agree more:

> I taught our agents to reach for the club every day, but to never—or almost never—pick it up. Power is only power until you exert it. It's all perception.

However, the author made the mistake of:

1. **Using that power in the negative**, value-taking, or even threat
2. ***Embodying* that negative power**

So he became the Grinch to many of his customers (and friends).

But don't be the bearer of threats -use power in the positive, or let someone else threaten-

Later the author says or implies his mistake was to embody that club.
Right after that line, he says:

> I was that club.
> The most persuasive point our agents could make to a stubborn exec was "I don't have the authority to close the deal at that number, so you'll have to talk to Michael." (…) he knew I'd ask for even more (…)
> (…)
> And once I left CAA, when it became safe for everyone to vent, I became the most hated.

The author let his partner be the "good guy":

> Ron Meyer, my partner and closest friend, was standing ten feet away. Ron was the soul of CAA, to hear everyone tell it, and I was the ass-soul.

Become Who You Need To Become To Achieve The Goal

Says the author:

> My clients played characters on-screen; I played them offscreen.
> Ninety-nine out of a hundred people, their act is who they are. But anomalies like me manufacture their characters from bits and pieces of those they're with. I was a chameleon, becoming whomever I needed to be to make everyone comfortable and close the deal.

And he adds:

> My basic character was buttoned-up, omniscient, wise, loyal, indomitable.
> But I could be a sports car aficionado with Paul Newman just as easily as I could discuss fiscal policy with Felix Rohatyn, the banker, or dive into the specifications of the Walkman with Akio Morita, the head of Sony.
> So to those I worked with I was a control freak. A shape-shifting machine. A Terminator.

But the private Ovitz was more like this:

> Yet the private me, the one only my closest friends saw, was ultrasensitive to every slight and constantly concerned about threats from every direction.

"Ultra sensitive to slights" tells you a lot about someone's character and his relationship with power.

Be Like The People You Want To Be Close To

> Paul ordered four dozen littleneck clams and began scarfing them down. He loved eating clams, talking about clams, exploring every nook and cranny of the vast and fascinating culture of clams.
>
> I happen to hate clams. But if Paul Newman loved clams, then I loved clams. In full chameleon mode, I mimed tossing some back and then slurping up the liquor, the liquid residue in the shell—when in fact I was dumping the whole mess beneath the table.
>
> An hour later, after a good chat, we shook hands and parted. I raced to the nearest deli and got myself a nice, safe tuna salad sandwich.

Strive For Total Control, But Never *Need* Total Control

Says the author:

> I felt you could never be too paranoid, because our competitors were out to get us and our clients were weak and easily wooed.
> Though my ruling desire was for complete control, I often felt at their mercy. I had little knowledge of what went on in their homes, production offices, and dressing rooms, but I hated the rumors I occasionally heard.

I believe a better attitude is to strive for that same level of control and power in the sense of you do the best you can.
But then to be OK with whatever happens, strong on the knowledge you've done your best, and that was your main job.

This attitude is stronger and more resilient because it mixes the best of both worlds: maximum effectiveness, with better mental health and a superior quality of life.

Give Back, Express Your Gratitude: It Means A Lot To People

Ovitz deep down wanted human recognition and emotional validation.

But he never got it.
And, I suspect, it's also why he took it so personally when who he thoughts were his friends, turned out not to be friends.

He says:

> Part of the reason I let the rumors slide is that I had a powerful need to take care of my clients; I thought of

> them as a very large, very fractious family.
> (…)
> So, for the most part, I gave, and people took. (…) It's a thankless business, but you can't say that. You're getting paid, and that's your thank-you.

It's debatable that you gave and others took when you became a powerful multimillionaire.
But it's understandable if you look at it from the point of view of a man who wanted human recognition.

And later, how grateful he is for a grateful man::

> He cleared his throat. "I have something I wanted to tell you," he said. "Um . . . I was in a bad place, and you're helping me get to a good place. You're really saving my life." He went on in that sweet, generous vein for three or four minutes, a long time for such a reserved guy.
> I was stunned. After saying good-bye, I sat alone for a while. In my twenty-five years as an agent, through thousands of transactions, I had never heard so much heartfelt sincerity and gratitude. This—this—was what I had always secretly hoped the business would be like.

If that worked with a more Machiavellian guy, imagine how well it works with most people.
That's why you want to learn how to bond and connect with people.

See here:

- **How develop deep human connections**

> How to Build Deep Emotional Connection

Never fire your future competition. Keep them close instead

The author and a few friends started as employees in the showbusiness.

They wanted to start their own business, and that was going be in competition with their original employer.
Once that surfaced, it got them in trouble with their employer.

However, their employer made a mistake.
He could have "pardoned" them and let them stay. Or he could have fired them, and accelerated the start of its fiercest competitor.
That's exactly what he did, and paid the price:

> We were officially fired that day, but Sam wanted to see me
> (…)
> he'd given me my first break and treated me with respect. Had he told me that he was hurt and that he wanted me to stay, there's a very good chance I'd have backed down and asked Ron to do the same. I felt no obligation to Bill and Mike and Rowland. If Sam had played it smart, he might have broken up the whole thing before it started.
> Instead, he fixed me with an arrogant stare and said, "You've really screwed yourself this time.

Share Your Extra Shares With Your Bro, Or You'll Lose Him

Ovitz negotiated more shares for himself:

> I said that if I didn't get more than the 16.67 percent that each of the six partners owned, I'd have to consider

> other options.
> I knew Ron wouldn't want to jeopardize what we'd built. He often acted as my agent with the others (…) so I was confident he'd deliver on my ask. And, indeed (…) they took the obvious point that I had clearly become the firm's leader.
> Professionally, mission accomplished. Emotionally, though, I had just hit the self-destruct button

Ovitz then says how he should have handled it:

> I never suggested to Ron that his stake also be increased—I wasn't emotionally aware enough to realize that he'd feel slighted if I moved up and he didn't.
> (…)
> What I should have done for Ron was give him some of my own allocation of shares, and then figure out how to handle Bill. To really be his blood brother, I should have behaved as *his* agent.

MORE WISDOM

Assess people with a first quick glance

> As I shook Dave's hand, I did a rapid scan. I always scanned people head to toe. Was their hair dyed, did they wear a wig, did the elements of their outfits match? Were they clean-shaven? (This was before the scruffy look pervaded the business.) Someone with hair curling out of his ears or dirty fingernails wasn't someone I wanted to cultivate. If a guy walked in with a huge gold chain and gold watch, he'd better be a hip-hop artist. Otherwise, he was announcing his insecurity.

But don't make it too easy to read you.
Says the author commenting on David Letterman:

> One reason I became so determined to help Dave was that he reminded me of myself. Of course, he was more trusting than I was, easier to read, and much, much funnier.

Secure your clients by telling them in advance of the poaching attempts

> Walking him to his car, I said, "There will be times when you'll want to jump ship.
> Lots of people have a grudge against me and will do anything to work with you. They'll say we're destroying you—they'll try to put a wedge between us. If you think they could get to you, don't take this step."
> I always tried to instill the negative in advance, inoculating my clients against the worst things our competitors and buyers would say about us. It was like vaccinating them against the flu.

Analyze your losses to win at life, develop relationships and make friends:

> As a ninth-grader at Portola Junior High, I got clobbered in an election for class historian.
> Losing this extremely insignificant contest depressed me for months. I could have accepted my shortcomings as a politician and folded my tent. Instead, vowing never to feel so humiliated again, I analyzed the loss and realized that I had no constituency. I needed to expand my relationships beyond the nerds who haunted the library and the ne'er-do-wells who snuck into RKO.

Again, it tells you a lot about someone's character that such a small thing struck such a deep chord with him.

Predatory men have always existed in the showbusiness

> I was repulsed when I learned the methods of one of our agents: he'd sign aspiring actresses just to screw them, then toss the contracts.

Pick a persona that fits you, that you can easily embody

> Believe it or not, in those days I was affable and considerate, with never a bad word about anyone. But you need to pick a persona you can inhabit without strain, and I knew I'd do better as the opposite of Ron—as the all-business tough guy who'd protect you. I could see that that's what the biggest stars and directors wanted. So my persona became the "I'll make your dreams come true" guy, mixed with the "I'll fix your problems" guy. Ron was the good cop and I was the bad.

Make your closing process personable

Ovitz describes his "signing machinery":

> Let's say you were a promising screenwriter and I met you at a dinner at Morton's. I'd call you the next day for a quick chat—not about wanting to represent you, but about the virtues of your work (which three of our literary agents would have briefed me on).
> I'd casually toss in the names of a few well-known actors and directors who'd be a perfect fit with your sensibility.
> Ninety-nine percent of the time, you'd want to talk some more, and I'd suggest lunch or a drink.
> There we'd talk further about your work and your hopes and dreams. The killer move, as you got up from the table or were handing your parking ticket to the valet, was to say, "Why don't you come in and meet our crew?"
> A few days later, when you drove in, one of our parking concierges (who'd been given a photo of you) would open your car door, greet you with a big smile, and say, "Mr./Ms. X, great to see you. Really hope you join the family!" or "Hope you have a great meeting!" (They switched up the patter to keep from going stale.)
> An assistant would escort you to the conference room, where five to ten poised, well-dressed agents would be waiting. They'd already have had a premeeting to script the ideas we'd be presenting
> ….

In a culture of truth... Let of go social power dynamics and dominance

A funny quote:

> John brought two of his senior engineers to the meeting, and they began picking the code and the technology apart, asking nasty and insinuating questions.
> Accustomed to protecting my directors when studio execs got rough, I finally stood and told my guys, "They can't talk to you like this! We're going." The engineers stared at me and said, "What are you talking about? It's totally fine."
> I sat back down; eBay ended up buying the tech. And as we walked out, John Donahoe put his arm around me and said, "You've just learned something very important about the Valley. There are no manners here, just brain challenges. It's about getting to the truth of the idea any way you can."

Practical Techniques

Some interesting life-hacks and techniques isolated from the book:

Stay as long as the big boss in the office

> I planted myself at a cubicle where he could not help but notice me, spreading out my files so he'd see them. A week later, around nine p.m., came the call I'd been waiting for.
> "Can you do me a favor?" Sam said. It was just a clerical task, but we were the only two people in the building, and he sure wasn't going to do it.
> My play was totally calculated and manipulative. I'm sure Sam knew exactly what I was doing. He also knew that calculation and manipulation are prerequisites for the job. So three months after starting at William Morris, I became Sam Weisbord's guy.

Turn the conversation on them

> I sat up straight, I was sympathetic, and I focused intensely on you, always turning the conversation away from myself. As I discovered by seeing my persona reflected in the eager eyes of my clients, that focus drew them in. And the contrast between the relaxed demeanor and the humming engine underneath, which people felt subconsciously, was comforting if you were on my side of the table, and curiously alarming if you were across from me. It suggested untapped power.

And later in the book:

> I came to the campus to interview Martin Scorsese about creativity, and afterward, at a table with the school's trustees, I did what I always do—asked questions of everyone, getting them talking about themselves so they'd give me a clue or two that would enable me to pretend I knew of them, even if I hadn't the faintest idea who they were. Kim, who was at my table, watched these exchanges carefully. Afterward, she told me, "That was a great lesson—how you made everyone feel comfortable and important, while you were learning everything you needed."

Control your employees with love

Absolute genius, marrying caring, with business success and nudging people to be at their best:

> I viewed our people as my children, and for the first ten years I'd call every employee who didn't show up at work to make sure they were okay and to see if they needed anything, from chicken soup to a good divorce lawyer.
> I did it out of concern, but I also wanted them to know I was keeping a watchful eye. Our idea was to make everyone feel that our building was a comfort zone—and to balance that with a little anxiety should they step outside the building.

Chase the prospect in action, but deny the chase verbally

> A lot of agents preyed on people's anxiety and desperation, pitching themselves as a golden ticket: "You can't make it without me!" To me, that went against the grain of human nature.
> If a potential client was reluctant, I'd say, "You should take all the time you need. No pressure." And by "no pressure," I meant, "No pressure until the next time I'm in touch, which may be in an hour." I tried to avoid coming across as a nudge, while making myself ubiquitous and inexorable. The smarter clients could see what I was doing, see how it worked, but it worked nonetheless because everyone wants to be wanted

Look omniscient with claims that nobody can verify

> Another move I developed, almost unconsciously, was ground shifting.
>
> If someone on the other side of the table very confidently asserted a number that was confidential or that was plausibly in dispute—the budget of a rival studio's competing film, for instance—I would instantly say "It's higher" or "It's lower," depending on which served our interests.
>
> That assertion would throw the other guy off balance, and suggest that I knew everything (…) At the very least, it would give me a gauge of how solid their information was, and how confident they were. If they fired right back with "No, you're absolutely wrong," I'd just say, "That's not what I'm hearing from the highest levels," or something equally ominous, then change the topic.

Hide your ownership, say you're borrowing it

… So people won't bug you to use it.

> One of Ron's complaints was that I didn't let him use it enough, and he was right.
> But the last thing I wanted was for CAA to become Warner Bros., which ran a wasteful fleet of five planes, and I knew that if anyone but Ron and me realized we had a plane, they'd all want to hop on it.
> So when I booked it for any of our other agents to fly to a set for an emergency, I always said that it was Sydney's plane, and that he was just letting us borrow it. The Young Turks were furious, later, when they found out about it. But I always felt it was none of their business.

You can also use this technique if you're worried someone may sue you.

Lessons Learned

The main lessons learned for a high-quality life:

Don't teach others to be fake & expect "True Friendship"

Look at this sentence.

I could sense the reason for Ovitz's failed friendships in just these short lines:

> I always told our agents, "Make your clients think they're your friends—but remember that they're not." Yet it would be my clients who'd stay loyal, for the most part, and my friends who'd betray me.

How do you expect your friends to be loyal, if your communication is 100% cynical?
And, as we shall see, if also your behavior is Machiavellian and, at best, "strictly business first".

Read characters for who they are, not for what you wish

The author seemed to be great at reading people… As long as they weren't close to him.

Then he'd let his preference, his ideals of brotherhood, and his personal liking get in the way of good judgment.

Let's see some examples:

Ron the best friend

Look at what Ovitz says about his (supposedly) best friend:

> Ron wanted Bill's shares, and he wanted him gone.
> (…)
> Bill never had an inkling of Ron's animus. I was amazed at how well Ron hid his true feelings from someone he saw every day.

Obviously, Ron is a guy who keeps his true feeling not just guarded, but inscrutable.
Why would you think he'd never do the same with you, the guy with the most power over him, and the guy who more than anyone else impacts his financial income?

Another huge sign is that Ron had a gambling problem, but never shared it despite the close friendship -or what the author thought was a close friendship-:

> One morning in 1987, Ron came into my office, shut the door, and said, "I've got a problem."
> (…)
> "I lost a lot of money in a poker game, and I can't pay up."
> I was shocked, but I said, "Okay, we'll take care of it." I figured it was a hundred thousand dollars or so. "How much?"
> "Over five million."
> As I strove to underreact, Ron told me he'd been going to Vegas several times a week
> (…)
> I was unable to process this.

If a close friend kept that away from me, I wouldn't consider him *close* anymore.

And that wasn't even the only time it happened.
It happened once again after, with an even *bigger* sum:

> For the next year and a half, Ron and I worked harder and more closely than ever. Then one morning, he closed my door, took a seat, and looked at me with a funereal expression. "You're not going to believe this," he said, "but . . ." Another poker game, an even bigger loss: $6.5 million.
> I felt like he'd smashed me with a baseball bat. Who was this man?

Jay Maloney the star employee

Later, talking about Jay Maloney who'd later also betray him, he says:

> When he told me he'd graduated from USC, I gave him $10,000 to buy some suits so he could work for us as an agent. It turned out he hadn't quite graduated from USC, but minor details like that didn't trouble him.

To me, this is a failure to properly assess a character who'd just proven to you to be a consummate liar.
Plus, he pocketed your money with that lie.
Huge red flag.

Little later he says about Maloney:

> He was constantly using my name with clients, saying I'd said things that I hadn't, pushing, overreaching. Almost every day I heard something about him that annoyed me, momentarily, before I let it go, because I, too, was nothing if not an overreacher, and because manipulating people was a big part of the job. If he was agenting me, then it meant he could become a great agent. I held him to a lower standard than anyone else—and I dearly wish I hadn't.

I feel Ovitz liked Maloney because it reminded him of himself.
And Maloney became very close to him and even his family, spending much time at Ovitz's place.

That liking, closeness, and mentor/mentee relationship blinded Ovitz to the truth.

Watch the small signs: they signal bigger issues

Talking about his closest business partner and friend Ron Meyer:

> Ron used to introduce himself as my keeper, my agent—half in jest, but with a buried, wounded sense that he was born to be a number two.

Jokes are often signals of deeper motives.
And in hindsight at least, Ovitz notices that Ron resented being his number two.

If you can see that and interpret that, you can then do something about it.
Including something to improve your relationship into a more genuine and win-win one.

Treat your friends... *Like friends* if you want them as friends

After the first poker loss, the author says:

> I don't know where he got the rest of the money, but he eventually paid our loan back. I put my concerns to rest, happy to sweep it all under the rug. And I never did tell him, "Hey, I'm worried about you. What's going on, and what can I do to help?"

He correctly identifies the issue here.
It seems like his friend hand a gambling addiction. A good friend must address it and ask about it.
It seems like Ovitz didn't even care if he could survive financially -he says he doesn't even know how he get the rest of the money-.

Don't put a leash on your friend and don't expect resentment

Remember that Ovitz got more shares, but gave none extra to Ron.

After Ron's gambling issues, they put him on a tight allowance:

> Bob said, "All we can do is try to control his spending—cancel his credit cards, put him on an allowance."
> We budgeted Ron enough to sustain his standard of living and not penalize his children, but no more. (…)
> But he did not strain visibly against our leash. He said, "You guys are right, I screwed up, I'm going to fix this."

It's good he said that, he's being a professional.
But "professional" doesn't make for "good friends".

If you're in a similar situation, you can at least expect that the person you put on a leash doesn't see you as a great ally and "friend".

The author also seems to almost appreciate the hiding of the feelings, instead of expecting better:

> I wish he'd fought with me about it so we could have gotten to the bottom of it. Instead Ron did what he did best. He handled me.

Maybe you can say he handled you.
But one could also say that it's fake cowardice to never speak up.

Don’t fight your former friends. It only gets worse

Orvitz, Ron and the other later fall out.

No fallout starts well, but you can certainly make it worse.
The author, probably reeling from the pain of rejection, made it worse.

I even feel the book glosses over this part, and it may have been worse than it shows.
For example, the author ends up buying the house Ron wanted to buy, which feels a terrible spiteful move.

But there is a happy ending.
Many years later, they meet for a public chat.
They both admit to their mistakes, Ron owns up that he should have spoken up about his resentment -yes he should have-.
And the author says:

> What we were both finally realizing, onstage, was that we’d each unwittingly sacrificed our relationship in order to save CAA—whereas if we’d just focused on making sure we were both happy, CAA would have done even better.

Keep a few good, close friends (outside of work)

… Especially if you’re calculative, strategic, and Machiavellian.

I believe the author made the mistake of:

1. Mixing friendships with cut-throat business
2. Expecting friendships while not being a great friend himself
3. Picking the wrong people as close friends

And then he came emotionally undone once he realized he had no good friend.
I believe that especially more Machiavellian people need good friends they can be genuine with. It helps you maintain your humanity and your “goodness”.

QUOTES

On keeping business and friendship apart:

> I’d always thought it was vital to mix business and friendship. I was learning, painfully, that it was better to keep those realms far apart. Business always gets personal.

On insincere flattery:

> I’m glad you’re involved,” he said heartily, which was probably untrue.
> There’s nothing sincere in entertainment: every call has at least one agenda, and usually two or three. Insincere flattery was actually more flattering than sincere flattery, because it was a tacit acknowledgment that I had power and had to be propitiated. But understanding that dynamic did make it hard to trust anyone.

Insecurity and ambition are a powerful cocktail:

> I always felt one step inferior to the people around me, and one step superior. I wasn’t as creative or cultured as

> they were, but I was a lot smarter and more hardworking than most of them. Insecurity and ambition make a powerful cocktail

On always looking like you work harder than you do:

> We worked insanely hard, but we fostered the illusion of working impossibly hard. I believed momentum was everything—once a company relaxed, it was done for.

On business manipulation and pretending you're all the same:

> The lack of hierarchy was a myth, of course, a management tool. Nothing happened that Ron and Bill and I didn't want to have happen. We were democratic dictators.

On being the mysterious puppeteer instead of the famous frontman:

> Mystique is ten times better than publicity; it's much better to be thought of as the great and powerful Oz than to be revealed as merely another schemer behind a curtain.

CONS

I only have on thing:

- **The intervention leaves us wishing for more details**

the author talks about an "intervention" was sort of cornered into at a dinner. His reaction is very telling and he says that "I spent my life solving other people's problems and steering the conversation away from myself. But that night I was trapped."

However, that intervention seemed to be very useful.
BUT.. He doesn't share the content. I wish he did.

REVIEW

Who Is Michael Ovitz? is a fascinating read on a professionally uber-successful Machiavellian man.

The book is a page-turner, and what I appreciate most is the opportunity to learn about the limitations of over-Machiavellianism.

I got this book from David Senra's podcast "Founders".
David didn't like the book, and quoted this passage to justify his :

> After being a chameleon all day at work, it took me an hour or so to figure out who the fuck I was when I got home.

But that's *exactly* why I wanted to get that book.
And exactly why I liked it.

I have a very different take.
Why rejecting that one unique guy who speaks honestly, instead of writing a fake PR autobiography?

Senra is awesome, but sometimes I feel he may be too naive in believing that the biographies and autobiographies he shares are reliable accounts of characters and events.

Ovitz instead gifted us with the real deal of what goes beyond the upper echelons of the entertainment business -and business success in general-.

Exec Summary

- **Relationships make people happier and healthier**
- **Self-monitors, or people who care about self-presentation, are most successful in socialization** (albeit sometimes at the cost of genuineness)
- **Gender roles and expectations in dating are still the same**, despite all the cultural changes

FULL SUMMARY

About the Author:
Various authors and the editors are Susan Sprecher, Amy Wenzel, and John Harvey.

The formula that tells you when men will approach

The equation is:

$V = f (A \times P)$

V or "motivation to approach" depends on two main factors:

- **A (Attraction)**: the individual's level of interest or attraction toward the other person.
- **P (Probability of Acceptance)**: the person's estimate of how likely the other individual is to reciprocate positively (accept rather than reject the overture).

Other personality traits such as self-esteem moderates the odds of approaching

> People who have a secure attachment style are likely to read cues of acceptance or rejection accurately and to calibrate their interest according to the prospect of success (Hazan & Shaver, 1987).
> In contrast, people who are fearful (Bartholomew & Horowitz, 1991), those who have low self-esteem (Baldwin & Keelan, 1999; Leary, 2004), and those who are particularly sensitive to rejection (Downey, Freitas, Michaelis, & Khouri, 1998) are less likely to make an overture because they are slow to entertain the hypothesis that others are interested in having a relationship with them. Such people read ambiguous cues negatively.
> People with a "dismissing" or "avoidant" attachment style also often appear to give up hope of attracting another's interest.

Conversely, men who are (or think themselves) as high value are more likely to go after attractive partners.

This confirms that the more calculative social exchange model also apply to dating dynamics.

Men don't go for the most beautiful women

The two-factor model of affiliation listed above explains why men don't go for the most beautiful women since these women are more likely to reject them.

This was the study that first showed it in a more naturalistic context, with higher ecological validity:

> The two-factor model of affiliation was first tested by Huston (1973), who asked men interested in dating to choose a date from an array of six women varying in physical attractiveness from beautiful to above average in looks. In one condition, the men were led to believe all six of the women had expressed an interest in dating them; in a second condition, the women's interest was left to the men's imagination. When men believed that all of the women wanted to date them, nearly all of them picked either a beautiful (78%) or a highly attractive (19%) woman, whereas when the men were not provided any information about whether any of the women would accept them, most chose one of the less attractive women.

Attraction also increases partner's attraction

As per above, knowing that the approach is well received increases the odds of being approached.
But attraction also increases attraction:

> A study conducted by Curtis and Miller (1986) complements Snyder and colleagues' (1977) findings and

> provides further support for the notion that attraction begets attraction.

This is one of the reasons why I've never been into paid sex.
I just didn't find it exciting to know that someone is there for a payday.

Self-disclosure & interest work to build rapport

There have been many studies on what builds rapport, and for both initial and long-term relationships:

> Among the most effective of these strategies are self-disclosure (particularly emotional disclosure), attentiveness, and clearly expressing interest in the other (Clark et al., 1999; Hess, Fannin, & Pollom, 2007; Kenny & La Voie, 1984).

However, as usual, it's not that simple.
One study found that self-disclosure had the opposite effect with women:

> For the women, interestingly, there was a negative correlation between their attraction for the male partner and how much they disclosed to him, but there was no correlation between their attraction and disclosure when no future interaction was anticipated.
> Shaffer and Ogden (1986) speculated that the women who expected future interaction may have been more concerned than the men about maintaining a "professional relationship" during the acquaintance exercise and in the follow-up study in which they were both participating. The women, compared to the men, may have reduced self-disclosure during the acquaintance exercise to maintain an emotional distance with a future work partner.

I agree with the author's speculation.
Women who shared too much felt their partner knew too much, had taken too much from them.
And so they ended up disliking him as a taker of personal information.

But they wouldn't have disliked him if, say, they ended up romantically involved soon after the disclosure.

Indeed, when a woman self-disclosed too much but we didn't get intimate, I consider the interaction ended.

Men Brag, But It's Not Very Effective

Men "embellish" their quality when they're interested, but are unsure she's interested in them.

However these "ingratiation tactics" aren't effective:

> In situations where a strong incentive to engage in strategic self-presentation exists, to be successful, would-be ingratiators must cultivate the other's interest in them while appearing to be genuine.
> This may be more easily said than done.
> Gordon's (1996) meta-analysis of ingratiation found that the more obvious the stake a person has in attracting a prospect's favor, the less effective an ingratiation tactic is in securing the other's interest.
> (…)
> he found evidence that obvious self-promotion, in the service of whatever positive impression, generally boomerangs.

People brag on dates when they're unsure they're attractive

> Figley (1974, 1979) demonstrated that when people are highly attracted to a prospect, but are provided with only moderate assurance of the other's interest, they are likely to embellish their positive qualities and

> minimize their shortcomings.
> This tendency to enhance one's image was not found in situations where individuals were not attracted to the potential partner or when they were informed that there was no chance of acceptance by the other.

Indeed, bragging is a skill that must be learned.
And, as usually, socially and power-aware men have the edge.
See:

- **How to brag**

> How To Brag Without Bragging: The Covert Brag Technique

Self-esteem is an important indicator of value

Men higher in self-esteem had more mating opportunities and more partners:

> Another potential indicator of mate value is the social barometer of self-esteem (Kirkpatrick, Waugh, Valencia, & Webster, 2002). Similar to the results with mating opportunities, men who score higher on self-esteem scales tend to choose and to successfully engage in more short-term mating relationships (Baumeister & Tice, 2001; Walsh, 1991)

But the opposite is true for women:

> The same relationship was usually not evident, and was often reversed, among women in modern nations.
> That is, women with high self-esteem were more likely to pursue monogamous, long-term mating strategies.

Also see:

- Signs of low-value women

Self-Monitors: social chamelons, without darker intent

The parts on self-monitors were the most interesting to me in the whole handbook.

It even inspired me to write an article (coming soon).

My only main doubt is that, to me, self-monitor basically ended up being more a trait of Machiavellianism than its own category.

Here are some key passages.
On chameleon-like qualities:

> (…) high self-monitors behave in a chameleon-like fashion during dating initiation, strategically changing their self-presentation in an attempt to appear more desirable to the person they wish to date.

On better approaches and initiations:

> Given the highly scripted nature of relationship initiation and the normative expectations regarding positive and negative emotion displays, it is not surprising that high self-monitors are skilled initiators.
> (…)
> This may explain their ability to initiate romantic relationships more readily than low self-monitors. Thus, the difference between high and low self-monitors' ability to regulate emotional expression by attending to

> appropriate social and emotional scripts may account for their success or failure at initiating relationships. (…)
> date almost double the amount of low self-monitors

Also better initiators because they present themselves better (more positively, in this case):

> In a study examining the relationship between self-presentational goals (ingratiation and self-promotion) and the expression of emotions during social interactions for individuals high and low in self-monitoring needs, Levine and Feldman (1997) found that across goal type, high self-monitors displayed less negative emotion (i.e., fear, anger, and disgust) and more happiness than low self-monitors and were rated by judges as more competent and likeable.

However, the authors posit that their appeal may set the stage for a future "fatal attraction".

They're also better manipulators:

> Leck and Simpson (1999) studied the phenomenon of "feigning romantic interest" in a potential romantic partner, defined as the ability to "send more convincing and believ-able messages expressing their 'intentions,' even when their intentions do not reflect their underlying attitudes and feelings" (p. 72). Results indicated that high self-monitors successfully conveyed their feigned interest through verbal and nonverbal channels significantly more than did low self-monitors. In addition, high self-monitors believed they would be better at, and derive more enjoyment from, feigning romantic interest than low self-monitors.

Of course, as we know here, manipulation comes at a cost.
In relationship, that makes for less genuine and more toxic relationships:

> Although high self-monitors are charming when charm is required (…) their relationships lack the trust and intimacy seen in those of low self-monitors (Snyder & Simpson, 1984).

At this point, it's unsurprising they're more player types, and more calculative:

> They have an uncommitted orientation toward relationships (Snyder, Berscheid, & Glick, 1985) and have a higher desire than low self-monitors to "trade in" their current partner in favor of another (Snyder & Simpson, 1984).

> Due to their ability to adapt to different situations, high self-monitors prefer "segmented" and "non-exclusive" social networks, including romantic partners (Leone & Hawkins, 2006, p. 741). This allows self-monitors to choose partners who are appropriate for a given situation. Often, this choice is dependent on situational or extrinsic factors such as physical appearance (Snyder et al., 1985), social status, and approval from others (Jones, 1993).

By contrast, low self-monitors pick partners more based on character than beauty and go for quality of relationship over quality.

The earlier it is, the more indirect communication is

Few people have the skills and assertiveness to speak straight:

> Planalp and colleagues' investigation of responses to uncertainty-increasing events in close relationships also

> shows a preference for indirectness (…) Events such as an unexplained loss of contact, the discovery of a competing relationship, or a change in personality were typically followed by efforts to seek information by "talking over" or "talking around" the issue, hardly direct strategies.

And it seems to be the case especially among younger folks:

> Bell and Buerkel-Rothfuss (1990) supported and extended this work. Their study of 226 college students in romantic relationships showed that this population frequently engages in secret tests (participants averaged 4.5 secret tests in their current relationship) and confirmed Baxter and Wilmot's (1984) finding that the number of secret tests generally decreases over the stages of courtship.

And early on:

> (…) direct and nonsecretive information-seeking strategy, increased across courtship stages for both males and females. In other words, we become increasingly direct in our information-seeking efforts as we move from initial to late stages of relational development.

Men's dominance increases their attractiveness

Something here at TPM we made clear from our very first articles:

> from an evolutionary psychology perspective, men gain their attractiveness to women through their social status and resources, and dominance is a contributor to both. Dominance is expressed behaviorally, and such behavior presumably reflects an underlying disposition.

As expected, a set of four studies by Sadalla et al. showed that dominance makes men more attractive, but not women.

As we also always highlighted here, it's dominance, NOT aggressive, domineering, or "as*hole types":

> The effect was specific to dominance as an independent variable and did not occur for related constructs (aggressive or domineering). This study also found that manipulated dominance enhanced only a male's sexual attractiveness and not his general likeability.

And even more specifically, studies showed that our concept of high power and high warmth maximizes attraction:

> Jensen-Campbell et al. (1995) experimentally manipulated behavioral expressions of both male dominance and prosocial orientation.
> Conceptually, the design was a 2 × 2 matrix of male behavior, crossing factorially dominance (high versus low) with prosocial tendencies and agreeableness (high versus low). Female college students evaluated the men for overall attractiveness, subjective physical attractiveness, sexual attractiveness, and dating desirability. The researchers also manipulated male physical attractiveness and the target of dominance—another man or a woman. Results showed that in each case, low-agreeable men were not attractive sexually, physically, or as dating partners. Adding or subtracting dominance did not alter that outcome. For men who were high in agreeableness, however, dominance enhanced their attractiveness significantly. Of the four male personae generated by the 2 × 2 design, the high-agreeable, high-dominant man was the most attractive to women.

See more here:

- Dominance in dating

- Dominance in socialization
- **High power, high warmth**

> Social Strategy 101: High-Power / High-Warmth

Another study showed that pro-social accounted for more than dominance:

> In another paper, Graziano, Jensen-Campbell, Todd, and Finch (1997) replicated and extended Jensen-Campbell et al.'s work. They explored the phenomenology of both men's and women's attraction to persons of the other sex using 372 college men and women. Both men and women reported that high-agreeable targets of the other sex were more physically attractive. When considered as a direct effect on attraction, agreeableness had almost six times the impact of dominance in predicting women's attraction to men. Mediation analyses showed that dominance had less direct (and indirect) impact on women's attraction to men when they expected a long-term relationship than when they expected a short-term relationship (see also Miller, Niehuis, & Huston, 2006).

⚠ **Author's note: all studies based on paper evaluations**
Unluckily, all these studies are based on paper evaluations.
I'd personally guess that women's responses on paper over-estimate the importance of agreeablness and underestimate the importance of dominance.

Exchange VS communal relationships: differences

> The Clark and Mills team proposed that distinctly different norms apply to communal relationships, which are concerned with feelings of responsibility for another's well-being.
> (Exchange relationship) benefits are provided to others in return for benefits received (e.g., Walster, Walster, & Berscheid, 1978). Exchange relationships are more common among strangers and among persons anticipating short-term relationships.

For example, people expect to be repaid in exchange relationships, but do NOT want to be repaid in communal ones:

> Clark, Mills, and colleagues found that in the exchange condition, the men liked the woman more when she repaid him for helping her. In the communal condition, the men liked the confederate more when she did not repay him.

Fatal attraction: why we hate those we loved

Fatal attraction refers to the phenomenon of disliking someone for the exact same qualities that attracted us:

> The qualities that individuals come to dislike in their partners can be an exaggerated version, or a negative interpretation, of those that first drew them to their partner in the first place. A confident partner, for instance, may eventually be seen as "too confident," or arrogant. This process is referred to as "fatal attraction" (Felmlee, 1995).

This phenomenon is relatively common, with studies placing its occurrence at between 30% and 67% of couples. And it's more common when people are attracted to dissimilar or extreme traits:

> fatal attractions are significantly more frequent when individuals are attracted to extreme partner qualities

> (Felmlee, 2001; Felmlee et al., 2006), or those described in an exaggerated manner (e.g., unusually confident). They also occur more often when individuals report being drawn to partner qualities that are dissimilar or different from their own (e.g., unique; Felmlee, 1998a, 2001) and are less frequent when similarities, or common interests, are the source of attraction (Felmlee, 1998a; Felmlee et al., 2006). These findings underscore the argument that although dissimilarity between partners may be initially alluring, it also is liable to serve as a source of subsequent relationship discontent.

Romantic love is universal

> Romantic love is a universal or nearly universal phenomenon, appearing in every culture for which data are available (Jankowiak & Fischer, 1992), in every historical era (Hatfield & Rapson, 2002), and in every age group (Tennov, 1979).

Interesting related findings:

- **Romantic love is distinct from attraction or sexuality**, albeit sexual attraction plays a role
- **Preoccupied attachment styles fall in love most often** and most intensely (Hazan & Shaver, 1987)
- **Low self-esteem people fall in love harder** (Dion and Dion, 1975)
- **The gender difference is small**, but men are more variable and are more romantic and passionate *on average*
- **Culture mediates how love is enacted** within a cultural context
- **Romeo and Juliet effect is bogus**. Despite what Greene suggests in *The Art of Seduction*, most studies find parental approval to be a positive factor (Sprecher, Felmlee, Orbuch, & Willetts, 2002).
- **Men said "I love you" first** in 70% of Booth-Butterfield and Trotta (1994) analysis <— But it didn't share the sample size :S

Satisfaction in marriages tend to decrease over time

> In summarizing research on marital relationship satisfaction in both cross-sectional and longitudinal studies, Berscheid and Regan (2005) noted that newlywed couples are typically very satisfied with their relationship. This satisfaction decreases during the first year of marriage but is still solid. Satisfaction continues to decline, albeit more gradually, for another couple of years and then levels out for a few years, at which time it may begin declining more. Yet absolute levels of satisfaction remain in the "satisfied" range. Wives and husbands seem to have similar satisfaction trajectories. Finally, satisfaction levels decrease more rapidly for people who are less satisfied at the beginning of their marriage (see Berscheid & Regan, 2005, for a review).

Crucially, passionate love may lessen over time in a relationship, but a variety of research has shown that it's not inevitable.

These were the most reliable:

> The best predictors of relationship satisfaction were ultimately positive love (a combination of passionate, altruistic, and friendship love) felt for the partner, the absence of game-playing love, the perception that one did not use aggressive conflict tactics in the relationship, and the perception that the partner was able to take one's perspective.

Gender role expectations in dating are immutable

The authors first note the typical gebder-based expectations in dating.

And then comment:

> Despite what we might assume to be a lessening of rigid sex-role scripts in romantic relationships, the expectations noted above for men and women on a first date appear to be relatively unchanging. For example, the male role as initiator and the female role as recipient and sexual gatekeeper reported in 2000 were similar to those reported in 1993 (Laner & Ventrone, 2000), and those reported in 1993 were similar to those reported in the 1950s (Rose & Frieze, 1993). In fact, these scripts are apparently so prescriptive that men and women find it difficult to deviate from them even when instructed to do so.

Crazier still, men and women found it challenging to let the woman initiate a first date even after being instructed to do so:

> Gilbert, Walker, McKinney, and Snell (1999) instructed college student (stranger) dyads to enact the initiation of a first date and then suggest a move to greater sexual intimacy.
> In those dyads where assigned gender roles were reversed, 31% of the men initiated the date even when his female partner was assigned the initiator role. Likewise, only about half of the women were able to initiate moves toward sexual intimacy.

Successful male daters use the “seductive voice”

Contrary to what most men think, the seductive voice isn’t all lower pitch.
Instead, it varies from higher pitch, to lower pitch, to higher again:

> Of interest for our purposes here is Anolli and Ciceri’s (2002) interpretation of the vocal variations during the course of the seductive sequence.
> The beginning of the sequence is marked by higher pitch, elevated intensity, and faster rate of articulation. The middle phase shifts gradually to a lower, weaker, and warmer voice, which the authors referred to as the “self-disclosure voice.” The third phase moves back to a higher pitch, higher intensity, and accelerated rate when actually making the request for the woman to meet him again.

Then the researches hypothesizes why that work, but ultimately they didn’t know for sure.

People differ in their level of romanticism

“Romanticism” wasa a new trait of people’s psychology that this book introduced me to:

> Those high in romanticism believe that love is possible at first sight (love at first sight), each of us has only one true love (one and only), true love will find a way to overcome any obstacle (love finds a way), and true loves are perfect (idealization).

And, unsruprisingly, people high in romanticism also fall in love more and more often:

> higher romanticism scores, both in general and for specific facets (except love at first sight), were concurrently related to greater reports of love, satisfaction, and commitment for both men and women (Sprecher & Metts, 1999).

In dating, people rate other on 3 main categories

> dimensions: (a) warmth and trustworthiness, (b) attractiveness and vitality, and (c) status and resources (see

> Fletcher et al., 1999). Each dimension may reflect a different route—focusing on good investment or on "good genes"—to obtain a mate and, ultimately, to promote one's reproductive fitness (cf. Buss & Schmitt, 1993).

At least on paper, people *say* they prefer warmth over status:

> when warmth and trustworthiness were pitted against status and resources, gender differences virtually disappeared, with most men and women preferring partners who were poor and warm to those who were cold and rich.

And when it came to attractiveness:

> In contrast, when warmth and trustworthiness were pitted against attractiveness and vitality, partner preferences were strongly affected by long-term versus short-term relationship goals. For instance, when selecting a partner for a "permanent" relationship, nearly everyone chose a warm and homely person over a cold and attractive person.
> When choosing a partner for a short-term fling, however, virtually everyone chose a cold and attractive person over a warm and homely one.

Expectations impacts relatioship satisfaction

People tend to have ideal standards for partners and relationships.

And the flexibility of those standards and how their current partner and relationshpis match them determines their satisfaction with the relationhip.

However, lack of flexibility is not necessarily bad, as long as the partner matches them:

> individuals who report having less flexible ideal standards typically report the highest relationship quality when their partners match their ideals. Relationship quality is lowest, on the other hand, when individuals are less flexible and partner discrepancies are large. Thus, less flexible ideal standards can either enhance or diminish perceptions of relationship quality, depending on ideal partner–current partner discrepancies.

Narratives of relationships reveal couples' insights

For example:

- **Couples who coordinate their story have better relationships**

> research suggests that those couples who are able to smoothly coordinate their stories show better relationship well-being.

- **Couples who agree with the story their partner shares have better relationships**

> Women who disconfirmed their partner's view of events during the joint narrative showed lower DAS scores, and both men and women who disconfirmed their partner's views scored higher on a 45-item measure of perceived relational instability.

- **Conflict during storytelling predicted relationship happiness 2 years later**

> newly married couples who were coded as displaying some conflict while telling their courtship story had lower marital happiness 2 years later (controlling for Time 1 marital happiness), compared to those who were coded

> as telling their courtship story without conflict.

Socially anxious individuals create their reality

Socially anxious people tend to think lowly of themselves, and especially of their social skills.

They expect not to be liked, and to do poorly with others.
When they approach others, they approach them defensively, as if they have to make up for a personal lack:

> As a coping mechanism, those who are fearful tend to use affinity-seeking strategies that are self-deprecating, assuming that others will provide reassurances and show positive feelings toward them (Vorauer, Cameron, Holmes, & Pearce, 2003). Unfortunately, such self-deprecating messages during a first meeting are less likely to evoke positive regard from others than are self-positive or other-positive strategies.

These issues are particularly problematic in relationship initiations, either social or romantic, and especially so for men:

> shyness in men appears to be more problematic during initial interactions than is shyness in women (Crozier, 2001). This differential effect is no doubt linked to the nature of the initiation script, which prescribes more assertive moves for men and more reactive moves for women.

People who believe they're not likable set off a self-fulfilling prophecy

> When people believe that others in general (Downey et al., 1998), or a particular other (Curtis & Miller, 1986), will not like them, they tend to behave cautiously and defensively. They are also less forthcoming and more disagreeable than individuals who believe that they are likable. Accordingly, these initial expectations set up an interpersonal dynamic that is self-fulfilling, leading them to behave in ways that actually induce the awkward social situations and rejection that they fear.

And it's also challenging to then change people's opinions because, yes, first impressions are sticky:

First impression are indeed lasting impressions

> Research has shown that first impressions tend to be lasting impressions.
> That is, it is rather difficult to get past our first impressions (e.g., Fiske & Taylor, 1991) because people tend to selectively focus on information that confirms rather than disconfirms their initial judgment when they interact with these same people again (e.g., Higgins & Bargh, 1987).

Hookup culture can be costly to youth

The handbook had an interesting chapter on hookups and hookup culture

One man said he grew disillusioned with relationship after his hookups -talking about a guy with naive/"blue pill" expectations :)-.

Some youth may also get mired into a string of hookups, chasing their next "fix" in the next hookup:

> there is other evidence that casual sexual experience begets more—and riskier—casual sexual experience. For example, Lindblade, Foxman, and Koopman (1994) found that successive sexual partnerships were more likely to occur in an informal setting with an unknown partner, had a briefer presexual phase, and were less likely to involve condom use. Thus, once embedded in a repeat pattern of hookups, it may be difficult for youth to

> extract themselves and move toward more emotionally intimate relating.

And it can be even more a risk for depression:

> Moreover, Grello, Welsh, Harper, and Dixon (2003), in a study of the mental health correlates of sexual and relationship trajectories of non-dating-experienced virgin adolescents, found that transition to casual sex (quite pervasive in their sample) was associated with greater depressive symptoms and problem behaviors. Transition to dating or sexual intercourse in the context of a romantic relationship was not associated with negative psychological or behavioral outcomes.

The line between stalking and pursuing can blurry

First off, it depends on *who* is pursuing:

> Third, a person's persistence threshold can differ across relationship pursuers, such that more persistent pursuit is accepted from one pursuer whereas less persistence is tolerated from another pursuer.

And there is also some ambivalence in the victims:

> some research indicates that victims of unwanted relationship pursuit often view the experience with considerable ambivalence, perceiving it as simultaneously threatening and romantic, aversive and positive, and frustrating and flattering (e.g., Dunn, 1999, 2002; Haugaard & Seri, 2003, 2004).

And the fact that some stalking case "end" with the couple rejoining does suggest that this dynamic is not always what it's taken to be.

Stalking can be driven by revenge-seeking & power

> When rejection leads an obsessive pursuer to abandon pursuit of intimacy, the desire for revenge can perpetuate stalking activity.
> Cupach and Spitzberg (2004a) explained, In these cases, the underlying motivation for stalking transforms from seeking a relationship to salving the wounds of humiliation. Such transformations may be gradual or sudden, and it is not uncommon for desperate relationship pursuers to intersperse messages of both affinity and venge-fulness as manifestations of their own dialectical struggle with the competing motives of rage and romance.

This is one of the reasons why on this website we sometiems caution for a strategic approach when rejecting people or offers.
See:

- How to reject a date invite
- How to postpone intimacy
- How to say no
- How to manipulate a manipulator

And, in general, how to power protect and save face.

The feminist relationship perspective is about power

Something we often mentioned here, that feminism and "reactionary patriarchy" are about power:

> The feminist perspective is important because it directs us to attend to how power and authority are distributed in new relationships

Interestingly, the authors suggest that women start lower power in early relationship but demand/get more power in successive ones as they learn:

> there is reason to believe that power is distributed more equitably in subsequent committed romantic relationships than it is in earlier ones.

MORE WISDOM

Younger women are more obvious, older women more subtle

> In a study of 100 females ages 13 to 16 in a mixed sex setting, Moore (1995) reported that the younger girls used many of the same solicitation signals commonly exhibited by women. But, girls made more frequent use of play and teasing behavior, and displayed an exaggerated form of many signals. No doubt, the girls learned subtlety with time

Also see:

- **Signs that she likes you**

Dating follows market-like dynamics

Something we showed plenty here at TPM:

> Why don't people pursue the perfect mates (…)?
> To begin with, there are very few people who fit such a description.
> Second, most individuals would not be able to attract such a person(…).
> Third, (…) would be quite difficult to retain him or her (…)
> In short, people are often forced to form realistic standards and make trade-offs (Regan, 1998).

Also see our article on mate value:

- **Sexual market value**

Short-term dating is more deceitful

> Cunningham and Barbee (this volume) found that individuals who are seeking short-term relationships are particularly likely to be disingenuous—if need be—in order to attract another's interest.
> In contrast, individuals who have a long-term orientation are more likely to try to attract a partner through supportive ingratiating behaviors, such as helping a potential partner accomplish something, being honest, and providing sincere compliments. Such partner-oriented individuals typically eschew the use of deceptive, manipulative ingratiation tactics, seeing them as illegitimate ways to elicit the other's attraction.

Women in relatioships are interested in powerful men, rather than attractive ones

> Kenrick and his colleagues (1994), for example, demonstrated using the "contrast effect" that experimental exposure to physically attractive women tended to lessen a man's commitment to his current relationship

> partner.
> However, exposure to physically attractive men had no effect on women's commitment to their current partners. Conversely, when women were exposed to targets who had high status- and resource-related attributes, this lessened women's (but not men's) commitment to their current romantic partners.

Also see:

- Female hypergamy

> Stop Whining About Hypergamy (& Do This Instead)

Women who care more about looks are more promiscuous

> In numerous studies, Gangestad and his colleagues have shown that women who seek short-term mates place special importance on the physical attractiveness of their partners, and that physically attractive men are more likely to pursue short-term

Women are more influenced by peer choice

> Females were more influenced than males by levels of peer attention, especially by negative information, supporting the social attributes hypothesis.
> Thus, peer esteem can be a personal asset that is as desirable as physical attractiveness or wealth, a result that we call the celebrity effect.

Conservative whites prefer white women

> White conservative participants experienced more romantic desire for White speed-daters compared to racial minority speed-daters, whereas White liberal participants (i.e., those low in conservatism) experienced more romantic desire for other-race speed-daters compared to White speed-daters.

In online dating looks matter most

> users of dating sites routinely select potential interaction partners to contact based on the pictures in their profiles: If the picture passes muster, they then look at the other attributes listed in the profile (e.g., Hitsch, Hortaçsu, & Ariely, 2006; Whitty & Carr, 2006). That is, physical attractiveness is the first and most important factor in their selection of potential partners.

Waist to hip ration is not straightforward and includese other variables

WHRs is related to evaluations of attractiveness, but the mechanism is not yet clear:

> Tassinary and Hansen (1998) noted that Singh portrayed WHRs with line drawings. Singh's stimulus material had a built-in bias in that WHRs were confounded with perceived weight. That is, differences in attraction that Singh attributed to WHRs could be as plausibly attributed to the well-established negative evaluation of overweight women (e.g., Crandall, 1994; Graziano et al., 2007). Tassinary and Hansen constructed stimuli that systematically and independently varied weight, waist size, and hip size (WHR). College students individually ranked drawings of women, once for attractiveness and once for capability of bearing children. Results show that judgments of attractiveness and fecundity can be either unrelated or related, positively or negatively, to the

> WHR depending on waist size, hip size, and weight. Tassinary and Hansen concluded that WHRs are inconsistent with the evolutionary argument that human physical attractiveness is fundamentally a sign of mate value.

The book then mentions Swami & Tovee, 2005 casting doubts over the evolutionary link between WHR and evolution.
I've noticed Swami was generally critical of some evolutionary claims, but I disagree here. Of course you never jump to conclusion, but the evolutionary logic in explaining several attraction cues, including WHR, seems pretty solid to me.

White women with children are more likely to remarry

And that may suggest that children is not such a huge handicap in the sexual market place.
However, it doesn't say of course anything about the quality and value of the next partner:

> for White but not African American partners, having children following divorce increases the likelihood that one will remarry, as single women who give birth to children after divorce are almost twice as likely to remarry as are divorced women who bear no children (Suchindran, Koo, & Griffith, 1985).

High socio-economic status women also have higher odds of remarriage, and women in women from nonmetropolitan areas have a 48% higher probability of remarriage (National Center for Health Statistics, 2002).

Practical Applications

Be expressive because it's more attractive

A long time ago I wrote a post about low-expressivity men, saying that their low expressivity made them less attractive to women.
And I hypothesized that Mediterreanean men in Europe tended to have a reputation for attractiveness also because of their higher expressiveness.

In our product we also recommend and provide examples on how to use more nonverbal body language to communicate.
So I'm glad that scientific evidence backs it up:

> Empirical and theoretical scholarship suggests that emotional expressivity contributes to interpersonal attraction.

However, it's important to keep it positive and balanced, without overdoing it in either extremes:

> The attractiveness of the emotionally expressive person that Boone and Buck (2003) identified arises from a moderate or socially appropriate level of expressivity, in terms of both frequency and intensity.

As we also wrote here: balance is a law of the universe.

Avoid pick-up lines

> But in general, research shows, appear to be those that are not seen as "lines" by women: Confident, direct, or innocuous overtures are more likely to get a conversation off to a good start than are indirect, cute, or clever gambits (Clark et al., 1999; Cunningham, 1989; Kleinke & Dean, 1990).

Also see here:

- **Best pick up lines** (and which ones to avoid)

Reciprocate self-disclosure

> it is also important for disclosures to be reciprocal. If Person A reveals something intimate about herself, Person B needs to reciprocate with an equally intimate disclosure.
> Reciprocity is considered important in establishing trust in a relationship (Altman, 1973).

Early conversation and information follows social exchange dynamics. If you only ask and never share, it feels like you're a taker.

On the otherh hand, you don't need to keep reciprocating once the relationship is more well-established.

Don't over-share too much, too soon

Reciprocal and gradual self-disclosure increases intimacy and is associated with closeness and liking.

But over-sharing too much too soon does the opposite:

> there is evidence that disclosures that are too intimate—revealing "too much too soon"—are not likely to be reciprocated and can result in dislike for the discloser (e.g., Archer & Berg, 1978; Archer & Burleson, 1980; Cozby, 1972; Rubin, 1975; Wortman, Adesman, Herman, & Greenberg, 1976).

Have people introduce you

If you're unsure how to meet women, consider having someone introduce to you:

> Research suggests that two individuals are more likely to pursue a dating relationship when third parties bring them together than without third-party intervention (Parks, 2007).

QUOTES

Even researchers know that dating is a game :) :

> to be successful, would-be ingratiators must cultivate the other's interest in them while appearing to be genuine.

On monogamy being best for lower-status men:

> Among the more important sex-specific features that affect mating strategies are men's overall mate value and women's ovulatory status.
> (…)
> Given an equal sex ratio of men and women in a given culture, this results in other men—namely, those with low status and prestige—being limited to monogamy in the form of one wife.

And on mate value being a crucial factor:

> Whether a man follows a more short-term- or long-term-oriented mating strategy depends on other factors as well, many of which relate to the man's overall value in the mating marketplace (Gangestad & Simpson, 2000).

On researchers speaking their language (and the argument itself is a great point):

> In sum, the unidimensional conceptualizations of attraction raised fundamental questions about discriminant validity and, ultimately, the construct validity of attraction itself

On the "curse of the successful player" being awaken from his previous naive ideals:

> Consider the following concern, echoed by many youth, expressed by a 20-year-old young man: My hookups have made me concerned about future long-term love relationships and whether I can trust anyone. Several girls that I've hooked up with, even had sex with, have had boyfriends.
> Knowing this will most likely make me very jealous throughout a long-term relationship.

Good to know I wasn't the only one using Sex and The City as example of dating dynamics :D :

> In an episode of Sex in the City, the four main protagonists (i.e., attractive professional women in their 30s) sit in a bar in New York bemoaning the lack of available men in New York. In fact, the establishment is stacked with young, reasonably attractive men—busboys, doormen, barmen, water waiters, and so forth. These men, however, are not mateworthy (and are almost invisible to the four women) because they fall well below the minimum criteria of status and resources that such women will normally possess

⍰⍰♂ Lucio's Analysis

None of these take anything away from this book, and they're also common notes of mine for most handbooks.

So take them as "Lucio's notes as he read through":

- **Still too many studies based on paper evaluations**

For example, when reviewing the studies on dominance I grew suspicious when agreeablness accounted for "6 times more than dominance in women's attraction".

As I suspected, it was based on paper evaluations, not interactions.

And I'm skeptical about it.
Bring me a super nice guy who's low in dominance and leadership, and I'll show you a guy who's *not* maximizing his dating potential.

- **Ovulatory shift is far from consensus**

When this book was written several successive studies seemed to confirm the "ovulatory shift" and increased attraction for more masculine men during the fertile window.

There is more mixed evidence now.

- **Sometimes tautological**

The Italians say that one "discovered" warm water to to poke fun at common sense "discoveries".
Science sometimes is like that, and this made me smile:

> Skills at initiating interactions (e.g., introducing yourself) were most important in the early stages.
> In the words of Buhrmester et al. (1988), "[I]nitiation competence may be important in the beginning of relationships, but may lessen in impact once a relationship is well-established;

Ie.: skills at initiating interactions are more important during the early stages that *include* initiation.

Yeah, surprising :).
And, I'd bet, skills at maintaining interactions are more important during the maintenance phase :).

- **Some cultural determinism**

For example:

> Because men and women are socialized to see one another as potential romantic partners rather than friends, cross-sex friends may be confused by their feelings of intimacy and closeness.

I wouldn't necessarily say that's because of socialization.

And:

> This reinforces the importance, however, of articulating "definite" messages of disinterest or obvious messages of disaffinity, and these are tactics that interactants often shy away from because of the cultural imperatives of politeness (Brown & Levinson, 1987).

I wouldn't call that a "cultural imperative" either.
I wouldn't be surprised if people who cushioned their rejections with some politeness simple fared better in life (and survived and reproduced more).

- **Would modern men be interested in non-fertile women?**

Write the author:

> Parenthetically, it could be argued that the opposite would be plausible, namely, that modern men in industrialized societies would be interested in cues showing that a woman was not fertile. For now, we follow the evolutionary logic

It may be an interesting take on possible new directions of evolution, but put it like that it misses the whole point of how evolution works -and on what timescales it operates on-.

- **Should share the sample size more often**

This is a complaint I often have and wished authors shared the sample size more often.

Instead, they seldom do, and I'm often left wondering how generalizable a single study may be (and I often ask AI for more info and similar studies).

For example, in this case:

> Booth-Butterfield and Trotta (1994) analyzed dating couples' written descriptions of the circumstances surrounding the first expression of love (…) 70% of the sample reported that men said, "I love you," first.

Interesting.
And exactly because it's interesting I wanted to know how many couples were in that study.

REVIEW

The *Handbook of Relationship Initiation (2008)* is a valuable resource for anyone interested in socialization, relationships, and dating.

I took away many new insights.

It allowed me to improve and strengthen with empirical evidence several articles for our website. And it gave me the idea and resources to write new ones.

Strengthening TPM with empirical evidence is very important to our approach and mission.
And hence I'm very grateful to the authors for their work.

From Simps to Empowered Women: Why Men Hate Simping

Lucio Buffalmano · 26 November 2024 · Archived copy · Original

Simping refers to excessive or unreciprocated emotional or material investment in women.

The term, often used pejoratively, mocks men are overly eager or submissive in pursuing women.

In this article, we explain the underlying dynamics of this phenomenon, how it changed dating, and we'll shed new light on the true drivers of simp ridiculing.

Namely, we contend that "simp ridiculing" is a form of competitor derogation, manipulation, and reactionary politics.

- The female equivalent of simp-shaming
- Summary

Intro: Simps are no quitters

Simps are not in an enviable position.

They chase women who neither respect nor desire them.
When these women do reciprocate, it's typically transactional—and expensive.

However, simps are no quitters.
Instead, they're some of the most passionate and engaged pursuers of women.

That already leads to an interesting observation.
Men don't ridicule the quitters -those who drop out of the dating game-.
But they ridicule simps.

Why?
Because, unconsciously, these men know that simps make dating harder for them.

Similar dynamics apply to more submissive men and the more popular "alpha male VS beta male" dichotomy.
But in this article we focus on "simping".

Simping: a new outlet for an old drive

In our evolutionary past, simping wouldn't go far.

A lower-status guy would crush on the attractive lady of the tribe.
But with nothing to give, he would get nothing back.

If he insisted, he'd be driven out of the tribe.
And if he had any self-preservation instincts, he'd settle for a more homely companion.

Modern civilization changed that.
Today's simps provide likes, comments, followers, and low-risk gratification.

Plus, they can be high-income programmers, gamers, or heirs.
And they have something their ancestors didn't have: money.

Heck, in modern days even a welfare recipient living in mom's basement could simp.
Send 1k a month to his crush, and she makes his month with a flying kiss back.

The Internet then took it to yet another level.
It connected attractive but previously unknown women to millions of worldwide simps.

And that changed the game.

How simping made dating harder for all

> **Her**: (learned from simps that free meals exist and now tries to do the same with everyone)
> **Me**: (pays the "simp tax" with wasted time)

Simps rarely make attractive options.

Even a physically attractive simp wouldn't make for an attractive option.
Total disregard for basic interpersonal power dynamics principles means he'd soon lose any respect and attraction.

However, attractiveness isn't required to change dating dynamics and women's psychology.

Here's how it works:

1. Simps empower women financially

Financially empowered women don't need male providers.

It's a seemingly small but large shift.

An attractive but poor woman still needs a man to raise a child.
But the attractive female recipient of simp largesse doesn't need a provider.

She may *want* one.
Or she may want a more dominant partner -she probably does-.

But the dynamics fundamentally change.
Wealth gives her more negotiation power.

Take a successful Only Fans woman as an example.
Even if she craved family and a relationship, it's still easier for her to walk away when she has her job and income.

So these wealthier women are more empowered and independent.

And that bothers and frightens many men.
Especially the more controlling ones who'd rather have women poor and dependent.

2. Simps make women more "strategic"

Doting simps incentivize women to learn games and manipulation.

It's simple logic:

- Better manipulation = higher income = higher incentive to manipulate.

The bad news for men is this:

3. Simps empower women with advanced social skills

We know that here at TPM.

Skills in persuasion, manipulation, and interpersonal power dynamics empower people.

We're all for empowerment here, including women's empowerment.

But when that empowerment includes the "darker arts", we urge caution.
As the famous Nietzche quote goes "if you stare into the abyss, the abyss stares back at you".

That can come at a relationship cost because some people struggle to "switch off" their manipulative side that works so well in business.

Some people of course learn the dark arts but can put them aside.
These people are even more empowered.

But here's come the kicker:

Deep down many men fear empowered women.

Not only are empowered women harder to attract, but they're also harder to keep attracted.
Higher risk of straying and heartbreak.

The truth is, a more naive woman is a much safer option for most men.
Especially for the relationship-minded men.

4. Simps turn more women into "working girls"

And that shrinks the dating pool for relationship-minded men.

In many ways, I get it.
If I wanted a "serious" relationship, I'd also prefer a woman who's not selling soft pornography.

Of course, it's not like simping can turn saints into devils.
Certain characters are more attracted to that line of work to begin with.

But it works both ways.

The more simps to milk, the more women are tempted to sell attention, pictures… And sometimes bodies.
And even girls who may have dreamed of a loving marriage may gradually shift toward a more transactional worldview.

5. Simps inflate women's self-esteem

There is a saying among men:

The best girl is an 8 who thinks she's a 6.

I think that any man saying that may want to re-assess his public statements and what they sub-communicate.
But I get their point.

And that girl doesn't exist anymore with the simping phenomenon.
If anything, now there is an army of women who are the *opposite*.

Try putting yourself in women's shoes for a second.
Imagine you had hundreds of women throwing themselves at you.

Don't you think your confidence and self-esteem may grow?
Or, at least, your perceived mate value?

And don't you think that you'd approach women differently, including the more attractive ones?
And that you'd be less willing to put up with their demands or quirks?
Of course you would.

Speaking of which:

6. Simps make women more demanding & entitled

There are studies on this.

When the ratio of men to women changes, people's psychology changes -both men's and women's-.
And all the more so if you make those extra men extra doting.

Here is how that can translate into a simple daily man-to-woman interaction:

> **Her**: Meet me close to my place
> **Me**: I invite you, I choose the place
> **Her**: Not a gentleman, bye

One could argue she wouldn't say that if I was super attractive.
Or famous.
Or if time hadn't put me in the age bracket where investing may be more expected.

All fair interpretations.

One may even say she's right.
And that I was an as*hole to stick to my guns.

Maybe.

This isn't a recommendation on how anyone should date.
It's an analysis of interpersonal dating dynamics.

And she dug her heels because *simps* taught her she can expect to be wined and dined on her terms.

Without simps, that expectation and demand wouldn't even exist.
At the least, I'd have far higher leverage if simps didn't exist.

How about top men being in a different category?

It's true:

"Women make rules for low-status men, but break rules for high-status men".

But population-level dynamics still affect individuals.

Ferrari isn't *directly* competing with Stellantis either.
It's also different than Porsche.
But if, say, the world's roads changed, they change for all.
And if all those other carmakers disappeared, Ferrari still gains.

The simp's tax is smaller in person.
But it's much larger online (not an accident both our examples here were from online dating).

Now you can understand why…

Why Men Shame Simps

So, this is why men mock the simps:

1. Value-signaling

To sub-communicate they're "better than simps".

We've seen this behavior already.
See for example leaders' social climbing, alpha male posturing, and covert bragging in general.

While criticizing others can be a valid strategy to signal higher value, it's easy to come across as nasty.
Plus, being better than a low bar isn't exactly 'top-1% signaling' either.

So, if that's you: quit it.
It's bad enough to "show value" with nasty social climbing.
But it just gets pathetic when you show off that you're one rung above last.

Learn better in **Power University**.

2. Shame simps into giving up dating

The more simps drop out of dating, the easier for those who stay in the game.

3. Shame other men into NOT spending and courting

It works like this:

The fewer men who court and spend on women, the less women can expect from men, the easier dating becomes for men.

4. Envy from lower-status men

Simps monopolize some of the most attractive women's time.

Sure, simps get little for an inordinate amount of time and investment.
It's a sucker's trade that we'd STRONGLY advise against.

But most guys get *nothing* from attractive women.

So when even a simp gets more action than you… You know you will lash out :).

5. Lower women's expectations with the "losers' frame"

The simp-taunting seeks to insulate women against courtship expectations.

This is what the simping derogation tries to sub-communicate:

> Ladies, these guys who splurge on you are losers. See how little we "real" men respect them?
> So don't use them as comparison please

Traditional relationship-minded men lead the shaming

I suspect that it's mostly more traditional men who shame simps.

More conservative men are more at odds with:

- **Women's sexuality**, including a stronger incidence of Madonna-whore dichotomy
- **Women's empowerment**
- **Libertine dating culture**

Traditional Western men support the "one man, one woman" monogamous ideal.

The 1950s dream of a supporting housewife baking apple pies grows even more distant with simping.

Simps undermine the monogamy ideal with devoted and submissive women.

So simps are the relationship-minded men's enemy.
These men shame simps for shaming, and shame women for gaining from simps.

The female equivalent of simp-shaming

The manosphere equivalent of women has a term for the female simple equivalent:

“pick me”.

The “pick-mes” are women who actively seek and want a man, adhere to traditional gender roles, and give their full selves to the relationship.

And they get mercilessly shamed and mocked.

Why?
Same principle, but inverted.
They make it too easy for men, raise men’s expectations and demands, and make dating harder for other women.

See the patterns?
The more these women can shame the “pick me” ladies, the easier it is for them.

But if a great guy showed up at their door, guess what the smartest ones would do?
They’d make it easier for them to get together, of course.

Summary

Simping is a modern evolution of an age-old phenomenon.

While it empowers some women and reshapes dating dynamics, it also raises expectations, incentivizes competition, and sparks shaming from other men.

We cast no blame but encourage men to abandon pointless shaming—and invite simps to read more here or join Power University.

Acknowledgments of Uncertainty
This analysis is an educated hypothesis based on established underlying dynamics and logical reasoning, but not yet supported by empirical data.
For more practical and empirically sound self-development, see Power University.

10 Powerful Tips for Women to Exude Confidence at Work

Lucio Buffalmano · 17 December 2024 · Archived copy · Original

Want to exude confidence and command respect at work?

Confidence isn't just about how you feel; it's about the signals you send.
At TPM, we specialize in decoding power dynamics and teaching how to adopt confident nonverbal communication so you can thrive—whether in the boardroom, meetings, or casual interactions.

These **10 powerful tips** will help you project confidence, avoid common pitfalls, and leverage your presence to advance your career.

Let's dive in.

Contents

- 1. Keep Your Head Straight
- 2. Limit Your Smiling
- 3. Ban the Word "Girl", Use "Woman"
- 4. Beware of The Nurturing Trap
- 5. Speak Louder (If You Speak Too Softly/Airy)
- 6. Avoid The "Hair Behind Ear"
- 7. Play the Banter Game…
- 8. Display Competence In Social Power Dynamics
- 9. Look Straight In The Eyes
- 10. Cut Preambles, Go Straight to The Point
- Bonus: And If A Man Stares at Your Breast…

1. Keep Your Head Straight

Tilting and chin lowering convey vulnerability.

Good for dating and looking 'cutsy' maybe.
But it also convey powerlessness, so avoid this pose at work.

Cute, friendly, and approachable. In a 'girly' way. Not execetuive material.

Of course, as for everything, there is a time and place to do something.
You can use the head tilt strategically when you want someone to open up or when you want to encourage someone to keep speaking.

Practical Advice:

- **Keep your head straight when speaking**: when speaking, especially when conveying an important message, keep your head straight
- **When listening to someone talking about personal matters, feel free to tilt**: it helps people open up, and it conveys you're empathetic and you understand
- **When people are sharing something difficult, searching for words, tilt**: it helps to bridge an uncomfortable silence, it communicates "take your time, I understand it's difficult"

Also read:

- Vulnerability is NOT power

2. Limit Your Smiling

Smiling is great.

Unless you're smiling too much, or out of nervousness:

> **Him**: (curtly drops a stack of paper)
> **Her**: (turns around and forces a smile)

People, and women more often, smile excessively when they are nervous, self-conscious, or vulnerable.

Become more aware of your smiles and keep them only for:

- Entertaining situations
- When you truly feel like smiling
- Strategically, to appear more welcoming and kind

3. Ban the Word “Girl”, Use “Woman”

At work, never allow anyone to introduce you as a “girl”.

And the same is true for any woman in your team.
You can correct people indirectly, for example:

> **Colleague**: That girl you sent me was super
> **You**: Glad to hear, she’s one of the most competent women in my team

What if all else fails?
Then you can explain that it’s demeaning to call a professional a “girl”. To help grasp the concept, you can tell them “*How would you feel if referring to you I’d say ‘That boy did a good job?*”.
With that, they should get it.

4. Beware of The Nurturing Trap

Be aware if someone introduces you or recommends you with typically feminine traits, such as:

- Helpful
- Caring
- Kind

These are all good traits to have, but the receiver might subconsciously think “oh, here is a nice girl who will make a good supportive role”. And that’s not what you want them to think if you are ambitiously aiming at the top spots.

Also, be even more careful with adjectives such as:

- Self-effacing
- Humble
- Anything that resembles “nurturing”

The more feminine you look, the more you might want to be introduced with adjectives that highlight skills, drive, competence, and leadership qualities.

Don’t deflect praise!

Praises bump people up a notch in the hierarchy.

But women schooled in “power dead even” culture are uncomfortable with that, and will knock themselves back down by deflecting the praise or minimizing.
For example: *“It was nothing,” “Mark did all the work*,” or “*It didn’t take all that much work*.”

Or they might change the subject right away, for example: “*Well, you did a great job on your project too!*”

While sharing credit can be good, and it’s the best thing to do in certain situations, women need to be careful not to overdo it.
Especially to men, this might look like poor self-esteem -and no executive material-.

A better way to extend praise is to give credit, while taking some of that credit for yourself, too.
For example:

> **You**: Thank you. The team did a great job, too. The data was much more difficult to analyze than expected, but they pulled a couple of all nighters. And yes, I'm glad it turned out so well.

5. Speak Louder (If You Speak Too Softly/Airy)

As a rule of thumb:

Soft and hairy voices are high in femininity but low in power.

Volume also impacts body language.
The louder you speak, the more gestures you tend to naturally use. By combining appropriate volume and gestures, you immediately convey a sense of authority.

As an example of too soft voice, listen to Marilyn Monroe:

> **Monroe**: (speaks softly, airy, and 'girly')

Monroe's style works great in entertainment and dating. But NOT to gain status, respect and influence in corporate and business environments

6. Avoid The "Hair Behind Ear"

You probably already know that lipstick and makeup should only be done in private.

What you might not be aware of are the subconscious "hair-flick" and "hair be the ear move".
They both make you look more girly and less authoritative.

Now that I said "hair behind ear" you probably know what I'm referring to. If not, here is an example:

> **Her**: (brushes her hair behind her ear after meeting an attractive man)

7. Play the Banter Game...

Men use banter and power moves to test each other and play the game status.

Albeit it's mostly younger men who do it, many older men in corporate have not left their pimply adolescent selves behind.

Plus, they may resume the banter game just to test if 'she' can play with the boys.
You don't necessarily need to play that same game. In frame control techniques for example we share the ignoring or shaming techniques, both of which work great.

However, if you show you can banter back, and maybe even put them back in their places, you will gain immediate respect.

8. ... But Don't Get Drunk With the Boys

Yes, the boys might order a pitcher of beer or do the rounds with the cocktails.

But you joining then makes you come across as a potentially loose woman. The night might end with nothing happening, but the rumor mill starts anyway.

So join them in the beginning and have one or two drink maximum, then leave early.
Or stay longer, but remain sober -and still leave if things may get inappropriate-.

8. Display Competence In Social Power Dynamics

Some men will touch women more freely than they do other men.

And some men will purposefully do it to one-up women.

Touching him back right away might betray that you're out for power, and make you less liked.
A good way then is to make your touch a bit more feminine. Instead of a pat behind the back, touch the outside of his forearm.

Another option if he overdoes the touch is to highlight his impudence with social grace -and maybe throwing him under the bus-.
Looking at his hand, stop talking to draw attention to him, or reply "Hey, hello" with a tonality that says "What was that".
The flinch is another option.
Angela Merkel tried the flinch when Bush sneaked on her from behind:

> **Bush**: (sneaks from behind and places both his hands on Merkel's shoulders, mimicking a massage)
> **Merkel**: (flinches and raises both her hands) <— The over-reaction sub-communicates she's not a passive recipient of men's power moves

It wasn't the best flinch, but the idea is good: draw attention to the touch being out of place, and sub-communicate you're not passive or submissive.

9. Look Straight In The Eyes

Example with Doctor Birx:

> **Her**: Not as a treatment (and looks around)
> (…)
> But not as, I have not seen… (looks to the side and points to someone else) <— ⍰⍰ Help me out, back me up, I'm not sure

♟ **Bridge, power protect, but disagree**
It's understandable she didn't want to contradict the boss.
To maintain professional integrity, say: "*For a non-doctor it's an interesting speculation, Mr. President. Unfortunately applying heat to the body doesn't seem to be feasible as a treatment for Covid*"

10. Cut Preambles, Go Straight to The Point

A preamble is a concoction of words and nonwords used before getting to the main point.

As a rule of thumb:

> Preambles serve to soften your message, and the more words you use, the "softer" your message will be.

Women are more likely to use preambles in fear of appearing too direct or aggressive, but some men fall for it as well.

An example of using too many preambles, adapted from Lois Frankl:

> **Preamble Speaker**: You know, I was thinking about this issue. In fact, I've been talking to my colleagues, too.

> A lot of us share the same concerns over reduced productivity during the last two quarters, so I'm not alone in this.
> Come to think of it, it might be even more than just those two quarters. It's something we've known about for a long time but haven't measured. Anyway, we've all been trying to find a way to address it and I think I may have come up with an idea. I'm not saying it's the best idea or the only idea—just that it's one idea.
> Now, my idea involves…

That whole speech screams "defensiveness" and "fear of saying something stupid".

> **Confident Without Preambles**: Productivity has been an issue we've struggled with for some time. In the last two quarters, we measured it, so we've been able to quantify it. The numbers are in your brief, page 5.
> The good news is: I have studies the issued, and I have two proposals for fixing this problem.

Again, preambles can be used strategically. A good preamble is like a good starter. It strokes people's appetite for more, and it's part of storytelling. But you must know what you're doing.
When you're not sure, cut to the chase.

Bonus: And If A Man Stares at Your Breast...

When you're speaking and a man stares at your breast, stop speaking.
It's like a wake-up call to move his gaze up.

If he goes down again, stop speaking again.

And if he does it a third time, you can more directly tell him "up here".
Like Nicole Scherzinger did to Conan:

> @the_power_moves
> Join this channel to get access to perks: https://loom.ly/JfvX7bM
>
> ♫ original sound – The Power Moves

> **Conan**: (stares at her breast)
> **Her**: Conan (points at her breast, then up to her face) up here

But please note this only works when you dress professionally. Otherwise, it will be used against you (like Conand did in the same skit).

Self-Promotion Strategies: Maximize Your Efforts With the Visibility Quadrant

Lucio Buffalmano · 24 December 2024 · Archived copy · Original

Self-promotion is a critical career skill, but doing it right requires strategy.

This guide explores when, how, and why to promote yourself for maximum impact.

Learn how to balance bragging with performance, adapt to different roles, and tailor your approach for career advancement.

- Calibrate to The Target
- SUMMARY

Calibrate to Visibility

Career coach Marie McIntyre proposes the “visibility quadrant”.

It’s similar to Stephen Covey‘s time quadrant of effective management, but it applies to how visible your work is:

The 'visibility' quadrant for career advancement

Not Important – Not Visible: Move

Tasks in this category: data entry, document filing

Your goal with non-important and invisible is just to make sure it won't break and attract negative attention while you seek to move out of this quadrant ASAP.

Not Important – Visible: Network to branch out

Jobs in this category include: secretaries, receptionists, project coordinators, support staff.

Visibility means that you get lots of people's interaction and/or your work gets lots of visibility from management.

This is a great opportunity to network and get your name around.
Social skills and political acumen are key here so you can make the most of that visibility.

And it's the reason why smart secretaries can have some good careers.

Build a reputation for someone who delivers, and then use the visibility to demand more challenging work.

Important – Not Visible: Make your work visible

Jobs in this category: account management, IT support

It's not bad being here.

You can't be easily fired because they need, and the non-visibility often comes with lower stress and easier corporate life.

You can also learn a lot, and if you're interested in moving upward, you can improve your odds with self-promotion and seeking more visibility.

A good idea can be to look for interesting facts and figures in your tasks and make a report with it.

Plus, as we've explained in self-promotion techniques, romanticizing your work also helps.

Another option, as we explain in career strategies, is to move into organization where your work is more visible. For example, if you're in IT, that's important in most companies, but often low visibility. But if you move to an IT company that bills for IT, then your work is highly visible.

Important – Visible: focus on delivering

Jobs in this category: sales, management consultants, turnaround specialists, private equity.

You're in the right spot.
Now it's time to deliver.

Just ensure that you will be rewarded for the delivery.
So it can be a good strategic move to negotiate what you will get before you deliver.

Logic of Promotion Strategies

The logic is simple:

if your work is highly visible, it makes more sense to spend comparatively less on promotion, since the work is already visible, and more time on work, since the results will matter a lot.

If your tasks have little visibility to your boss and/or to upper management, then it follows that *you* must promote that work.

The logic, again, is straightforward: low-visibility work is not going to get you noticed and it's not going to help you network.
So you have to put in extra effort to get noticed and self-promote. Enter the romancing your work, "kitchenette moments", elevator power moves, strategic networking, after-hours cocktails, etc., etc.

Case Studies

Let's see two case studies as examples

⍰ Keep quiet and let visible action speak louder

In my graduate programme we were assigned 'buddies' from previous batches.

I had a real G -at least for that corporate environment-.

He was a doer who spoke little, but delivered.
And everyone spoke highly of him.

One day I asked how he got that reputation.
And he told me:

> Keep your mouth shut and impress your boss with the projects you deliver. When he sees projects coming left and right from you, trust that he will noticed

That worked for him because the boss had to sign off on any project, and each project ended up in various team reports (high-visibility).
Each project completed was also extra points for the team (high-importance).

Of course, as a junior guy, it was smaller projects.
But as a freshman who never asked anything, he was deeply impressive indeed.

This same strategy though wouldn't work if his work was *low* visibility.

⍰ Reverse of the rule: President Trump

WARNING:
Leave politics aside, this is an apolitical example.

As the president Trump had natural high-visibility.

People *automatically* give credit to the president for the economy and stock market -mistakenly so in large part, but that's another topic-.
There was no need to make a press conference for Dow Jones 30.000.

COVID also presented a great opportunity for strong leadership.
People crave good leaders in time of turmoil.
Yet, seeing Covid as a stain on his presidency, Trump never stopped fighting the press and spent more time on defending and self-promoting than on leading.

That reeked of poor leadership and putting 'me' before the country:

Trump's excessive self-promotion in a high-visibility role that required 'us leadership' likely cost him the second successive term.
⍰ More bad press

Self-Promotion for Career Level

The effort you put into self-promotion changes depending on career stages.

See this table for an overview:

Managers need the most self-promotion, CEOs the least

Employees: Focus on Work

Individual contributors are often promoted based on technical skills and work output.
They are also close to their direct managers, which helps their case when it comes to visibility.

Managers: Focus on Promotion

Research has shown that those who get promoted the most among managers are not the ones that spend a lot of time with their team, but those who spend more time networking *outside* their teams.

Source: itusng.com

Executive: Deliver Results, & Promote With CEO

The exec can spend relatively less time on self-promotion because he only has one person to promote to: the CEO.

And the ‘quality of work’ often relates to bottom-line results or strategic initiatives that make the CEO look good.

Also see:

- How to exude executive-level confidence

CEO: Let Your Team Promote For You

Everyone knows you in the industry, so networking is less critical.

And your business results, often highly visible, provide the backbone for your self-promotion.

The Machiavellian approach is to leverage your team for promotion while you look humble, hard-working, and magnanimous.

Calibrate to The Target

Self-promotion must be calibrated to the target.

Says Kelley Reardon:

> This is where political savvy comes in. As they say, when in Rome do as the Romans do. If your boss doesn’t overtly self-promote, you shouldn’t either.

This is one of the mistakes I made with my first mentor.
He was demure low-key, and he came to see me as ‘cocky’.

On the other hand, when I presented in front of more outgoing senior managers, they loved it.
One of them raved about me to our HR coordinator. He called me ‘the sales guy’, but with admiration.

Read more on social calibration:

- **How to learn social calibration**

SUMMARY

Self-promotion is essential for advancing your career, but it’s not one-size-fits-all.

Using the visibility quadrant, you can calibrate your efforts based on the importance and visibility of your tasks.

High-visibility roles often benefit from focused execution, while low-visibility roles require more deliberate self-promotion.

Career stage also matters: employees should focus on delivering results, managers benefit from networking and visibility, and executives can rely more on their teams.
The key is balancing self-promotion with actual work and tailoring your strategy to your goals, role, and audience.

We teach how to become politically skilled, strategic and influential in all areas of life in **Power University**.

The WEIRDest People in the World: Summary & Review

Lucio Buffalmano · 2 January 2025 · Archived copy · Original

The WEIRDest People in the World (2020) by Joseph Henrich explores how unique historical developments made Western societies more individualistic, pro-social, and cooperative, fostering a WEIRD psychology that drove commerce, innovation, and expansion.

- PROS
- REVIEW

Exec Summary

- **Individualism and weaker family ties enhance societal progress** by fostering larger cooperation, impartial institutions, democratic governance, universal moral norms, long-term thinking, conscientiousness, and hard work.
- **Clannish cultures with strong family ties impede progress** by prioritizing in-group loyalty at the detriment of universal justice, trust, and broader cooperation.
- **Culture profoundly shapes psychology** in as many disparete areas like spatial reasoning, memory, patience, risk tolerance, and fairness norms, with WEIRD populations occupying the extreme end of these spectrums.

In one picture:

FULL SUMMARY

About the Author:
Joseph Henrich is an American anthropologist and professor of human evolutionary biology at Harvard University. Henrich is also a former engineer by trade and education, and former professor of psychology and economics at the University of British Columbia.

He also wrote '*The Secret of Our Success*', which grabbed a top spot in our popular 'best evolutionary psychology books' list.

How the West got weirder, richer, & dominant

The West advanced faster by breaking family ties and 'clannishness' to become more individualistic and more cooperative with larger networks of strangers.

That connected larger pools of men while increasing commerce, innovation.
These larger societies could explore the world, raise larger and better-equipped armies, and expand.

The author says the main contributors to that shift were:

1. Catholic Church's Marriage Policies Broke Kinship-Based Clans

The Church discouraged cousin marriage, polygamy, and arranged marriages, which weakened extended family ties and reduced reliance on clans.

This shift promoted nuclear families, creating a more individualistic society where people had to rely on institutions rather than kinship, and monogamy that decreased intrasexual conflict among men.

> The longer a population was exposed to the Western Church, the weaker its families and WEIRDer its psychological patterns are today.

Later, Protestantism embodied the blossoming individualistic culture, and accelerated its spread, together with the ethics of literacy and hard work.

2. Market Economies

Economic interactions with strangers decreased kinship reliance, and fostered *impersonal* prosociality.
Such as, people learned to cooperate with non-kin for mutual benefit.

People's psychology changed with motivations for trust, fairness, patience, cooperation, and punishment of free-riders.

This is why in various economic games we see WEIRD people cooperate more than rational game theory would suggest, while we don't see as much cooperation in other populations.

Greater market integration increases impersonal prosociality, fosters the creation of voluntary associations, and supports more effective formal and non-kinship-based institutions.

2.2. Urbanization

European urbanization was different, driven by commerce and the creation of voluntary associations such as merchant guilds, cities, stock market trading, and universities that spurred innovation, growing wealth, and progress.

3. Changing Psychology to Individualism & Larger Cooperation

Larger societies free of clans slowly changed people's psychology to our current WEIRD psychology.

A self-reinforcing cycle of psychology, impersonal institutions and growing commerce led to ever-accelerating progress.

How Westerners differ

WEIRD people are:

- **Highly individualistic**: Focus on ourselves—our attributes, accomplishments, and aspirations—over our relationships and social roles. We see ourselves as unique beings, not as nodes in a social network that stretches out through space and back in time
  - Ownership of ideas to the first who stated them
- **Self-obsessed:** We aim to be "ourselves" across contexts and see inconsistencies in others as hypocrisy rather than flexibility
  - **Self-esteem** based on honoring our values and 'staying true to ourselves'
  - **Self-enhancement**, learning and progress
- **Control-oriented**: we prefer a sense of control and the feeling of making our own choices
  - **Belief in free-will**
  - **Democracy premium**, with people working harder when they contributed to a resolutino

- **Nonconformist**: we are less willing to conform to others when this conflicts with our own beliefs, observations, and preferences
  - **Less obedient** to authorities
- **Analytical**: look for universal categories and rules with which to organize the world, and look for patterns trends. We simplify complex phenomena by breaking them down into discrete constituents and assigning properties or abstract categories to these components—whether by imagining types of particles, pathogens, or personalities.
  - **Less holistic**: We often miss the relationships between the parts or the similarities between phenomena that don't fit nicely into our categories. That is, we know a lot about individual trees but often miss the forest.
  - **Endowment effect**—overvaluing our own stuff
- **Overconfident** (of our own valued abilities)
  - **Positive-sum thinking** and having the potential to win-win
- **Patient**: with self-regulation, we can defer gratification—in financial rewards, pleasure, and security—well into the future in exchange for discomfort and uncertainty in the present
- **Hard-working**: WEIRD people sometimes take pleasure in hard work and find the experience purifying
- **Law-abiding**: WEIRD people tend to stick to impartial rules or principles and fetishize abstract principles over context, practicality, relationships, and expediency.
- **High impersonal prosociality**, including norms, expectations, and motivations for impartial fairness, probity, and cooperation with strangers, anonymous others, or even abstract institutions like the police or government.
  - **Honest, fair, & cooperative**: trusting, honest, fair, and cooperative toward strangers or anonymous others. Show relatively less favoritism toward our friends, families, co-ethnics, and local communities than other populations. We think nepotism is wrong
  - **Less inclined to revenge** for personal slights
  - **Punishing cheats** Impersonal prosociality also includes motivations, heuristics, and strategies for punishing those who break impartial norms of fairness or honesty, even if the violation isn't directly against themselves.
    In turn, punishment of cheats increases cooperation and trust in institutions and cooperative networks
  - **Emphasis on intentions and mental states**, not just on behavior and results.
    So if someone had bad intentions, he is bad. If he had good intentions but he made a mistake, he is less 'bad'
  - **Less (nasty) ingroup-outgroup**: more individualistic countries are less inclined to distinguish in-groups from out-groups, more willing to help immigrants
- **Guilt instead of shame**: Guilt depends on one's own standards and self-evaluation, while shame depends on societal standards and public judgment.
  Shame is group-related, when we, our relatives, or even friends fail to live up to the community's standards.
  Guilt is failing to live up to culturally inspired, but largely self-imposed, standards and aspirations (ie.: skipping gym or indulging sweet food)
- **Open to new experiences and friendships**, with new people and strangers, rather than 'remaining stuck' with the clan
  - More calculative in relationships, also readier to end those new relationships if they don't serve their mutual interest

Clannish psychology

By contrast, clannish psychology tends to be:

- **Tradition and custom-centered**
- **Conforming** to fellow in-group members

  - **Autocracy premium**, contributing more when a law is externally imposed
- **Deferring to authorities** like elders or sages
- **Policing kin's behavior**
  - **Not policing strangers**
- **Avoidance-oriented**, closed to new friendships outside the in-group
- **Sharply distinguishing your in-group** from everyone else
- **Promoting your network's collective success** whenever possible, which the author doesn't say but comes at the detriment of everyone else and society at large, including justice and progress for all

My Note: I love WEIRD psychology because it powers effective and ever-improving societies
To me this is not a case of being 'different', these are traits that propel civilization forward and can make for a better society for all.
This is something the author doesn't expressly say, but his conclusion shows:

> More individualistic countries are also richer, more innovative, and more economically productive. They possess more effective governments, which more capably furnish public services and infrastructure, like roads, schools, electricity, and water

And on impersonal prosociality:

> Countries where people show more impersonal prosociality have greater national incomes (GDP per capita), greater economic productivity, more effective governments, less corruption, and faster rates of innovation.

What else do you need?

The Weirder -and most individualistic- countries

The Hofstede's s scale aggregates several elements in the individualism package and the rankings are:

- Americans 91
- Australians 90
- Brits 89
- EU, especially North and West
- Canada 80
- New Zealand 79

Social-cultural evolution spreads the winning models

So, how did the West dominate the world and influence the world's culture?

With cultural evolution:

> those with the best combinations of institutions and technologies expand and gradually replace or assimilate those with less effective cultural packages.

Intergroup competition operates with 5 different processes:

1. **War and raiding**: as groups with more competitive institutions drive out, eliminate, or assimilate those with less competitive institutions
2. **Differential migration**: from less prosperous to more prosperous ones and more successful communities grow at the expense of less successful ones
3. **Prestige-biased group transmission**: as people learn from the more powerful and prestigious groups
4. **Differential group survival without conflict**: more effective groups survive and thrive, less effective ones disappear or shrink
5. **Differential reproduction**: fertility-friendly culture, beliefs, and religions can boost a group's expansion

The author reminds though that we must put this into perspective and realize that intergroup competition is just one force among may.

Central authority provides an advantage

> authorities allow societies not only to respond decisively to changing circumstances, such as encroaching neighbors, dwindling resources, and natural disasters, but also to strategically pursue the conquest of other societies. Any society that managed to centralize authority could potentially have an advantage in intergroup competition

Powerful Gods promote cooperation

Religions with powerful Gods that punished miscreants and cheats increased cooperation.

Adding a contingent afterlife with heaven or hell also discouraged violence and improved societies' cooperation.

And these more God-driven cooperative societies became more successful than other societies.

Tribes lose against individualistic societies

Says the author:

> Clans provide a psychologically potent means to generate solidarity among members, in part by reducing internal conflicts. But (…) clans often can't get along, so scaling up to larger societies requires either unifying them or dissolving them.

That is key for me and our TPM values.
And clans and tribalism stand in the way of higher progress:

> In fact, the more effectively norms galvanize cooperation within subgroups, the more challenging it can be to unite them and scale up.

Kin-based institutions increase conflict

> (…) tribal populations with segmentary lineages still experience significantly higher rates of violence and civil war (…)
> chronic conflict in Africa are (…) populations organized by segmentary lineages
> (…)
> researchers have argued that the character of "Islamic terrorism" may be best explained by the honor psychology fermented in segmentary lineages.
> (…) their kin-based institutions may have shaped the particular religious creeds adopted by these groups.

Even proto-states fall apart when they're built on clans

Without individualistic psychology and impersonal pro-sociality kin-based premodern states tend to fracture and fall apart under the constant tension among the different clans:

> Once intergroup competition wanes, which often happens when states or empires manage to eliminate their competition, things slowly fall apart.
> Without the looming threats (…) competition among ruling families will intensify and gradually tear the state-level institutions apart.
> Cracks (…) appear even in the best institutions (…) as lineages, clans, and sometimes entire ethnic communities devise ways to exploit state institutions for their own ends.

But proto-states built on top of several clans are always shaky because the clans never fully cooperate with each other and can resume conflict at any time.

Small doses of competition are good

Both mild inter-group and intra-group competition can be beneficial within certain limited, or within certain regulation of conducts:

Inter-group competition foster pro-sociality & maintain healthy markets

'Domesticated', non-destructive inter-group competition in the form of businesses *increases* interpersonal trust.

Says Henrich:

> When properly yoked, moderate levels of nonviolent intergroup competition can strengthen impersonal trust and cooperation.

The author even shows that more competition in deregulated markets *increases* interpersonal trust.

Hover, it must be balanced and elevated levels of intergroup competition are harmful at a humanity level:

> Of course, elevated levels of intergroup competition are also what drive firms to exploit workers in foreign lands and trash the environment.
> (…)
> Unregulated and unmonitored, firms facing intense intergroup competition will start violently sabotaging each other while exploiting the powerless. We know this because it has happened repeatedly over many centuries, and continues today

So healthy integroup competition presented an optimum balance.
And, I guess, it must be tempered by respect for impartial norms of 'fair competition' and a sense of belonging and loyalty to humanity as a whole.

The author adds that inter-group competition may be necessary:

> This means that modern companies, like ancient societies and chiefly institutions, eventually implode in the absence of intergroup competition.
> Norms and institutions, of course, provide some stability and can inhibit or suppress rampant self-interest for a time. But, eventually individuals and coalitions within firms or other organizations, especially monopolies,

> devise ways to exploit the system to benefit themselves.

My note: Not convinced that collapse is unavoidable without inter-group competition
I agree with the general principle and tendency. But I don't think that collapse without inter-group competition is unavoidable.
I'd be curious to hear more from the author on this topic.
For example, I don't see modern European nations competing with other nations, but collapse isn't imminent.

The West developed faster than other geographical areas because it harnessed the benefits of nonviolent intergroup competition.

Political inter-group competition maintains effective democracy

The same is true in the political sphere, says the author:

> multiparty democracies also harness the power of intergroup competition.
> All political parties, were they to become the single governing party, would eventually fall into corruption, collusion, and cronyism.
> (…) However, faced with competitors and well-functioning democratic institutions, political parties must vie for members and votes (…) competition among parties will tend to spread practices, beliefs, and values that promote a party's success in attracting members and votes.

The author adds that of course that's no guarantee of healthy politics, but it at least inhibits the inevitable slide into despotism.

Intra-group competition increases individuals' output

Regulated within-group competition can increase cooperation within the group, but also benefit the larger group - and society- with increased creativity and perseverance:

> Similarly, extreme forms of within-group competition encourage selfish behavior, envy, and zero-sum thinking. Yet when disciplined by intergroup competition, moderate levels of within-group competition can inspire perseverance and creativity.

How to Increase Impersonal Trust & Cooperation

This section is more of a note to self:

- **Abolishment of kinship-based clans**
  - Greater relational mobility, which covers all the factors that constrain or promote the formation of new relationships or the dissolution of old ones
- **Impersonal institutions**
- **Punishment of free riders** & cheats
- **Regulated inter-group competition**
- **Regulated intra-group competition**, or mild competition if unregulated
- **Moving geographically** – '*residential moves strengthen people's preferences for egalitarianism (…) flattens the in-group vs. out-group distinction and shift people away from relying too heavily on their long-enduring social networks*'
  - Greater geographical mobility

Practical Applications

Quit the democratic leadership in conformist countries

This was a new wisdom nugget that got into Power University:

> some populations will contribute more to the group and stick more strictly to the group's rules when they have had a say—typically a vote—in decision-making.
> (…)
> however, a couple of recent studies failed to find a democracy premium in Mongolia and China.
> (…)
> Psychologically, those with stronger inclinations to defer to authority and less desire for control cooperated more in response to externally imposed laws and less with the results of democratic votes.

The 'democracy premium' is an emergent piece of psychology when the conformists are few.

MORE WISDOM

Cultural Evolution 'Beats' Genetic Evolution

> by adaptively "fitting" people—psychologically—to their institutional environments, cultural evolution will often (but not always) deplete the strength of natural selection acting to address the same adaptive challenges

The author mentions lactose-digesting genes.
The genes developed after the cultural diffusion of animal herding (cows, goats, etc.).

But populations that culturally learned to make cheese and yogurt never had to develop any genes.

Two more examples of culture beating genes are school attainments/IQ and urbanization:

> studies in both the United States and Iceland reveal (…) That genes that make people less likely to continue their schooling have increased in frequency (…).
> This genetically induced push against schooling, however, was rolled over by cultural evolution, which was speeding in the opposite direction.
> Over the same period, culture drove up people's educational attainment by 25.5 months (and IQ by 6 to 8 points) per generation.
> Over the entire 20th century, culture has raised Americans' educational attainment by 9 to 11 years, while natural selection has lowered it by less than 8 months

Early urban centers were disease-ridden graveyards.
Natural selection would have been *operating against* a psychology adapted to dense populations, impersonal markets, individualism, specialized occupational niches, and anonymous interactions.
But they all won -so far, I'd add-.

Poverty Impairs People's Prosociality & Intellect

> Shocks like famines and food shortages, if they occur before about age five, inhibit the development of self-control, positive-sum thinking, and the acquisition of mental skills related to abstract problem-solving and pattern recognition.

Promote Literacy to Advance Humanity

> The impact of Protestantism on women's literacy is particularly important, because the babies of literate mothers tend to be fewer, healthier, smarter, and richer as adults than those of illiterate mothers.23

Polygyny's Math Problem Creates Social Tension

> Polygynous marriage tends to generate a large pool of low-status unmarried men with few prospects for marriage or even sex. Responding to this situation, men's psychology shifts in ways that spark fiercer male-male competition and, under many conditions, foment greater violence and more crime.

Individualism Increases With Education & 'Westernization'

Hard to say which one matters more, but I suppose it may be a mix of both, plus students' self-selection bias and aspiration to be 'more Westerner':

Personal identity across diverse populations. (A) Using the "Who am I?" task, the upper figure the average percentage of responses between the focus on their roles and relationships vs. their personal attributes and achievements. (B) the average percentage of socially-relationally answers

Why Japan, South Korea, & China Quickly Caught Up

These three countries had a 'culture of hard work' and their stronger centralized governments could more quickly copy and impose Western customs:

> these societies had all experienced long histories of agriculture and state-level governments that had fostered the evolution of cultural values, customs, and norms encouraging formal education, industriousness, and a willingness to defer gratification. These are, in a sense, preexisting cultural adaptations that happened to dovetail nicely with the new institutions acquired from WEIRD societies.
> Second, their more powerful top-down orientations permitted these societies to rapidly adopt and implement

> key kin-based institutions copied from WEIRD societies. <— Note: likely a mistake and meant 'kin-bashing' or similar
> (…) the Chinese Communist government initiated a program in the 1950s to abolish clans, polygyny, arranged marriages, unions between close relatives, and purely patrilineal inheritance

However, both Japan and Korea are still rather insular and 'clannish', which raised some questions for me.

Why Some Societies Struggle To Catch Up

Because they're still 'clannish' culturally and psychologically:

> populations with particularly long histories of agriculture, like those in Egypt, Iran, and Iraq, haven't fully integrated with the modern formal political and economic institutions that first arose in Europe. These societies have maintained quite intensive forms of kinship, probably for religious reasons.

Self-esteem Work & Benefits Depend On Culture And Context

Consistency does matter, but it matters much more in the West:

> the correlation between personal consistency across relationships and measures of both life satisfaction and positive emotions was much stronger among Americans than among Koreans. Overall, being consistent across relationships—"being yourself"—pays off more in America, both socially and emotionally

The Koreans, smarter in my opinion and just like the Machiavellians, know that there is no pay-off in 'consistency'.

And says the author:

> Such evidence suggests that the immense importance assigned by the discipline of psychology to notions of self-esteem and positive self-views is probably a WEIRD phenomenon.
> (…) non-WEIRD societies (…) having high self-esteem and a positive view of oneself are *not* strongly linked to either life satisfaction or subjective well-being (…) it's *other-esteem* ("face") that matters, not self-esteem rooted in (…) unique personal attributes that capture one's "true self."

My Note: But you can be successful or unsuccessful in both cultures and that still feeds into self-esteem
I think the author may miss here that having 'high *other*-esteem' is still a marker of success just like *self*-esteem is. That probably affords high status and makes the individual feel better and more confident.

Cognitive Dissonance Is WEIRD

> Individualists see behavior as anchored in personal traits -dispositions- across all contexts (dispositionalism). That makes individualists uncomfortable with inconsistencies and forces individualists into mental gymnastics to reconcile the inconsistencies -cognitive dissonance-.

As mentioned above, Machiavellians don't experience much cognitive dissonance instead because they don't fall for that trap.

The Big 5 Is Not Universal Psychology, It's WEIRD

The author claims that Westerners developed more personality sub-facets to better the growing niches of more complex societies.

However, societies with less occupational specialization and fewer social niches will show higher intercorrelations

among the WEIRD-5 dimensions until some dimension will cease to exist.

Inter-group Competition VS Within-group Competition

> intergroup competition favors beliefs, practices, customs, motivations, and policies that promote the success of groups in competition with other groups.
> (…) (it) often promotes trust, cooperation, and the efficient allocation of pay to employees (e.g., CEOs aren't overpaid).

As per above, it must be a milder and regulated competition, or it turns destructive.

Within-group competition instead:

> within-group competition is the competition among individuals, or small coalitions, that occurs within firms, organizations, or other groups. This form of competition favors the spread of behaviors, beliefs, motivations, practices, etc., that promote the success of individuals within a firm *relative* to others at the same firm. These are practices that benefit some employees at the expense of the firm.

However, even here, there is an optimum balance:

> within-group competition is also not entirely unproductive. At moderate levels, it can inspire diligence and productivity.

Patience & Gratification Delay Is Crucial To Civil Society & Progress

Patient people are willing to wait longer to earn more

Impatient people focus on the short-term, even if it costs in future earning.

The most patient countries are:

- Sweden
- Netherlands
- United States
- Canada
- Switzerland
- Australia
- Germany
- Austria
- Finland

Global distribution of patience across 76 countries. Darker shades indicate greater patience. Hatched regions indicate a lack of data

Greater patience is associated with better economic, educational, and governmental outcomes and among individuals.

Immigration Policies Should Note That 'Clan Psychology' Is Persistent

> The effect of kin-based institutions on people's psychology is culturally persistent. The adult children of immigrants, who grow up entirely in Europe, still manifest the psychological calibrations associated with the kin-based institutions linked to their parents' native countries or ethnolinguistic groups.

Inalienable Rights Are Weird Psychology

> Claims about "unalienable rights" seem self-evident if one (a) tends to analytically explain or justify things with reference to internal and enduring attributes (not relationships or descent) and (b) prefers impartial rules that apply broadly to *distinct* categories or classes (e.g., "landowner"; "human").
> By contrast, from the perspective of most human communities, the notion that each person has inherent rights or privileges disconnected from their social relationships or heritage is not self-evident.

I experienced this first-hand.

A woman in a kinship-based society wanted to conceive my child to gain a respise from the oppressive obligation to support her family -something that left her poor and drained-.

Of course, she hadn't thought that within that culture her child would then inherit the same obligations.

No wonder some cultures have many children: it's like producing free workers and future income.

Wars Make Us More Clannish -Unless You're Already WEIRD-

> War strengthens people's egalitarian motivations, but only toward their in-groups

However, the author says war had a different effect in Europe because Europe had already moved beyond clans. So wars coalesced people into more impersonal institutions instead.

QUOTES

The obvious truth that many of the critics of farming seem to miss:

> early farming spread not because rational individuals prefer to farm, but because farming communities with particular institutions beat mobile hunter-gatherer populations in intergroup competition.

On Christian genius contribution to Western dominance:

> The accidental genius of Western Christianity was in "figuring out" how to dismantle kin-based institutions while at the same time catalyzing its own spread.

On kin-based societies and mafia organizations:

> Corruption and Mafia activity reflect the same patterns seen for blood donations and impersonal trust. The greater the rate of cousin marriage in a province, the higher the rates of corruption and Mafia activity. There's a reason why the Mafia is often referred to as "the family" or "the clan" and the boss is sometimes called "the godfather." The strength of in-group loyalty and the power of nepotism in societies with intensive kinship create precisely the kind of psychology and social relations that foster graft and fuel organized crime.

On women gaining with polygyny:

> the evolved psychological push toward polygynous marriage doesn't come just from men (…) In a world with polygynous marriage, young women and their families get a much larger selection of potential husbands (…) The best move (….) in a hunter-gatherer society might be to become the second wife of a great hunter instead of being the first wife of a poor hunter;

On the need to rely on institutions, not people:

> Visionary founders, like great national leaders, might prevent this for a time, but the unfortunate persistence of death guarantees that their influence is constrained in the long run.

CONS

- **Sometimes wished for more data directly stated**

For example, in sentences such as 'he higher the percentage of X residents, the higher the murder rate is today', I'd like to know how much higher.

But generally speaking Henrich does a great jois presenting his data, including the possible limitations.

- **I may have streamlined the book under its main thesis**

I believe this book is so good that it deserved even more time spent on editing.
I'd have streamlined and removed some tangents just to leave the book denser around its foundational concepts.

CRITICISM

To first accept something, I seek all possible faults in logic and data.

But Henrich made that job difficult for me.

First off, he addressed a large chunk of my objections himself.

I sometimes thought about a criticism, and he raised it himself little later in the book.

Second, he brings a ton of data, examples, and case studies.
To properly criticize Henrich's thesis one should go through the data.

And lastly, many of his theses logically added up.

I did have some notes left standing though.
But since I haven't gone through the data, consider these more like my personal doubts, based on my preconceptions:

Roman & Greek civilizations contradict Christian contribution

Civilization's timelines don't square with the church's role in Western success.

For example:

- **Rome had an advanced civilization *before* Christianity**. Many consider the Roman civilization the foundation of the West
  - Civic duty was a high virtue in Rome, despite it was a supposedly kinship-based society
- **Athens developed democracy *before* Christianity**, despite the author suggesting democracy is a WEIRD institution.
- **The Church accompanied Europe *into* and through the Middle Ages**. If the church was such a driver of progress, it certainly did take some time to warm up its engine
- **Urbanization started long before WEIRD psychology**, starting with the first walled cities like Jericho. And Rome was a large urban center long before the church

The author says:

> with their growing willingness to break with tradition, the intellectuals of the early modern period started to realize that the great ancient sages, like Aristotle, could be wrong

But those ancient sages were so willing to break with tradition that they created new traditions.
That was long before the Church laid the groundwork to break traditions.

I'd love for the author to comment on this.

Update:
Simon who recommended this book later also pointed me to Richardo Duchesne who had similar reservations both around Greco-Roman civilizations, and the general role of the Church.
I later found more (here, here, here, here) who had similar reservations about either the outsized role of the church or the difficulties in reconciling Greek and Roman civilization.
It means this may be a valid criticism.

> https://t.co/ksiaCbT38J
>
> Hello Lucio this is to add to one of your criticism that European were already WEIRD
>
> — Gold (@simono91) January 19, 2025

Religion's effects may be over-estimated

I wasn't too sold on the effect size of religion for some simple reasons:

The religious explanation for cooperation clashes with self-interest, but cooperation doesn't require religion

The author seems to come from a frame that religion had to overcome selfish drives to foster cooperation.

And while that may be the case, cooperation could evolve and spread even with perfectly self-interested individuals.
Matt Ridley explains that in *The Origins of Virtue*.

The most productive people are least affected by religion

The author says that various elements of religions "deepen the faith of (…) especially children and adolescents (…) and women."

But it's adult males who produce and commerce the most.
Exactly the group that is *least* impacted by religion.

And I wouldn't be surprised if we found out that the top 1% who drive the most progress and commerce are high-IQ (for new inventions) and "alpha male types" for commerce, business, and political power.

Religion had a small effect in some studies

For example:

> a perfectly unbiased person will allocate 15 coins (…) people who thought their Big God was the fire-and-brimstone type allocated 14.5 (…) Meanwhile, people who thought that their Big God was an all-loving softy allocated only about 13
> (…) agnostics (…) with average allocations dropping to between 12.5 and 13 coins.

So we go from 14.5 to 13 or slightly below for agnostics.

It's an important effect.
And it may add up.
But it's not a *huge* effect.
Especially when you consider that religion seems to have been primed -the author used the word "coreligionist" for the allocation-. If they controlled for words such as 'fellow tribesmen' or 'fellow hunters' I suspect the gap may even narrow.

Charity giving doesn't seem like a good marker for trust & cooperation

Charity was sometimes used as a proxy for God's effect on behavior.

And while I believe indeed it can drive up charity, charity does not equal the trust and cooperation that are most central to the book's main thesis.

From a purely analytical point of view, Christian charity may even waste productive men's resources for unproductive ends.

Overall, commerce as a force for trust and cooperation seems a potentially better explanation to me than the church.

Culture's effect may be over-estimated

Culture over genes

For example, the author says:

> Intergroup competition has also embedded itself in society through team sports, religious groups (e.g., churches), and other voluntary associations. Participation in team sports such as ice hockey and soccer provides many children and adolescents with their first experience of intergroup competition, which may have lasting psychological effects.

However, in my opinion, it's the other way around.
It's genes that drive the formation of 'sense of belonging' to team sports, especially in their fanbase.

And I doubt it's team sports that have lasting effects on psychology. The psychology for tribal banding together *was already there*.

When the explanation could go both ways, the author seemed to prefer culture.
For example:

> cultural transmission can perpetuate a clannish psychology for generations, even after clan organizations have vanished.

How can you be sure it's cultural transmission, though, and not, at least in part, genes?

Cultural *over*-relativity

> The result is that textbooks that now purport to be about "Psychology" or "Social Psychology" need to be retitled something like "The Cultural Psychology of Late 20th-Century Americans."

I think this may be an exaggeration.

There are plenty of commonalities among most populations.
It's disciplines like inter-cultural communication that stress the differences.

The author himself, for example, says that polygyny is the norm and polyandry a rare exception. That's only but one example of culture *following* genes and biology.

And often cultural impact is a matter of degrees, rather than presence or absence.

For example, says the author:

> People's inclination to conform to the incorrect answer goes from about 20 percent in societies with the weakest kin-based institutions to 40–50 percent in societies with the most intensive kinship

That's a large jump, but it's still an incremental change of an underlying tendency.
Also, looking at the chart, it seemed even closer.

People Don't Always Copy Successful Culture to Succeed, But To Brag

For example, the author says about people copying the more successful groups:

> Since people often cannot distinguish what makes a group successful, this also results in the transmission of many norms and practices that have nothing to do with success, including things like hairstyles and music preferences.

I don't think that comes down to a failure of 'understanding what works'.
It's mostly younger people who copy the culture, and it's not because 'it works', it's because it's 'cool'.

The dominant culture is attractive because it's subconsciously attractive. So it's 'hip' for many to eat McDonalds

because it represents America.
But also because they produce better culture. You learn English because they produce better movies and songs.

We copy successful groups's culture because of soft power, not because of 'copying errors'

Capitalism may be under-estimated

Logically, I find any explanation that aligns with self-interest more compelling.

Contrary to the church's effect, capitalism didn't have to fight human nature.

Capitalism *harnesses* selfish human drives to service the collective.

Similarly, I'd logically expect urbanization to play an important role in breaking kin-based institutions.
I look at my own life for that, and the people around me.
Had we stayed in our small villages, we'd still be tied to family customs and traditions. In bigger cities, we're freer individuals.

Speaking of which:

Community *size* may be under-estimated

And it may be confused with underlying and more lasting psychological traits.

The author describes his experience of kinship ties undermining market efficiency:

> The density of these interpersonal relationships constrained market competition in Chol-Chol.
> Their decisions were embedded in bigger and more important enduring relationships. Of course, buying and selling did occur, but this was more interpersonal exchange than impersonal commerce.

In my opinion, this comes down largely to the size of the community.

It's very similar in the middle-of-nowhere place where I grew up in.

You shop locally sometimes even if the prices are higher because they're your neighbors.
And you avoid some if there are past grievances.

For example, we didn't buy homemade pasta locally because they didn't use our photography services. And I agreed with that boycott because, to me, it was a personal affront.
Even today, decades later, I still think it was a 'b*tch move' -and consider I'm a deeply WEIRD and individualistic man-.

However, as soon as I move to the city, I immediately shop rationally.

Some just-so explanations raised questions

- **Hot-heads fared better in kinship-based societies?**

The author suggests that murder rates dropped with more individualistic societies because the costs for violence raised:

> In this expanding individualistic world, a reputation for sudden, violent, and undisciplined responses to minor insults or simple misunderstandings didn't pay anymore. Who wants to defend, marry, or do business with a hothead? In an open market of strangers where people are shopping for relationships, you can just find another friend, fiancée, or employee, one with better self-control.

This part raised some questions.

How is a violent cousin so much better in a kinship-based society?

Because that violent cousin could defend the tribe?

But then shouldn't that violent cousin make a great state soldier?
The author himself then says Europe was constantly at war…

- **Kinship-based institutions require contextual behavior, but modern societies don't?**

To explain how the Big 5 fails to replicate in certain populations, the author states:

> intensive kin-based institutions demand that individuals behave in a range of different ways depending on their relationships to other people. Some relationships explicitly call for joking, while others demand quiet submission. By contrast, the world of impersonal markets and relational mobility favors consistency across contexts and relationships

While the overall theory of niche adaptations adds up, the reason why was less compelling.

Are we really expected to behave the same way with a boss, child, in-law, at a funeral, or in a club?
One could just as easily argue that larger, individualistic societies introduce a broader range of contextually distinct relationships and situations, which may demand even greater behavioral adaptability.

How about Korea and Japan?

They're wealthy, clean, and safe.

But they're not very 'weird' and they're both 'clannish' in many ways, not very open to immigration or not very welcoming of foreigners -players who visited Korea know that Korean men are the biggest coc*blockers ever, but *only towards foreigners* :)-.

The reason could be that their clans are as large as nations.
And that to develop, they mostly copied, rather than innovate.

However, this was left unexplained by the author.

Did conflict accelerate civilization, or slow it down

The author states that European wars accelerated the progress towards larger societies:

> England alone was at war about half of the time from 1100 to 1900.
> This relentless intergroup conflict had the driving effect on societal evolution discussed in Chapter 3: European societies grew bigger, more powerful, and more complex; if they didn't, they got wiped out or swallowed up.

These wars intensified nationalism.

But an important consequence that's missing in my opinion is that **war increases INTERNAL prosociality to the detriment of human-level cooperation.**

The two work as a seesaw: one goes up, the other goes down.

The author knows this, and in my opinion, it was an important note to add -even just to avoid war apology-.

So one could equally say that national conflicts slow the progress towards even larger supra-national bodies, and global trade.

Which is what happened after WWII.
The West said "We're done with war", and the EU and many international bodies sprung up.

Is the weirdest people correct?

Henrich is likely correct at the macro level, particularly about the tension between small-scale kinship structures—rooted in tribal and familial bonds—and individualistic societies that foster the psychology and behaviors of broader cooperation, trade, personal freedoms, democracy, innovation, and rapid progress.

THAT, to me, is the core, deep, invaluable insight.
And humanity better learn it, in order to manage our progress as a species and civilization.

While largely correct at the macro level, Henrich was less convincing—and potentially less accurate—at the micro level with causes, connection, and relative impact of each specific factor.

The good guys over at Lesswrong claim the author is 80% correct.
I'd say the author is 50% correct at the micro-level, but 90%+ correct at the far more important macro-level.

PROS

- **High critical-thinking skills**

Talking about WEIRD, Henrich maybe the perfect example of why 'WEIRD is good'.
I wish everyone worked with the same level of analysis and critical thinking that Heinrich displays here.

- **A dots-connecting book**

The Wikipedia editors categorize *The Weirdest People* as a work of 'Big History' similar to *Guns, Germs, and Steel* and *Sapiens*.

I can see some links indeed.
But I find Urari's *Sapiens* to be more "compilation", lining up facts in an interesting fashion, but bringing little new insight.

Diamond's work does seek new insight with its novel emphasis on geography, but by missing on psychology it's less encompassing and not as enlightening when it comes to human nature -including future developments and possible policy repercussions-.

But because of its wider applicability and higher relevance to psychology and civilization dynamics, *The Weirdest People in the World* stands above these.

REVIEW

The Weirdest People in The World is a paradigm-shifting read that refined how I view and understand psychology, socialization, and human civilization and progress.

I must thank Simon from our TPM community for recommending this book ⍰⍰:

S

Sep '24 in General

The WEIRD (non clannish) vs clannish spectrum

Lucio posted a great video yesterday on YouTube, it talks about the difference in psychology towards having children between republicans and democrats.

It made me think of one of the most interesting concept I've comme across recently. That is the WEIRD vs clannish spectrum.

WEIRD stands for: western, educated, industrialised, rich, democratic

Clannishness is defined as: « clannishness is a set of behaviors and innate behavioral traits and predispositions which, when found in a population, result in the members of that population strongly favoring, in all areas of life, themselves, their family members — both near and extended, and even closely allied associates (esp. in clannish societies which are not arranged into clans), while at the same time strongly disfavouring th Jump to latest comment and all unrelated, non-allied associates. »

Simon linked this book to a video on how some conservatives view children as tribal/national power-projection tools, linking it to 'clannish psychology'—a view I share.

And second I want to thank the author.

Henrich's work helped me refine and improve the values and mission of this website, and I'm forever grateful and indebted to him for that.

For example, this is what I wrote in our 'TPM values' on the Start Here page encouraging men to develop and look at themselves as individuals before joining or psychologically relying on groups' belonging:

> Tribalism is the enemy of civilization and progress because it splinters larger, complex, and rights-based societies into warrying factions based on kinship.
>
> *TPM Start Here page*

Now Henrich provided the data -and a much better explanation- of why that's exactly the case.

Check the **best psychology books** or get this book on Amazon.

Why Aggressive US Foreign Policy Undermines Its Hegemony

Lucio Buffalmano · 14 January 2025 · Archived copy · Original

Trump's rhetoric has become increasingly combative toward former allies.

For instance, he has hinted at ambitions involving Panama, and Greenland.
Or making Canada a US state.

That approach has some advantages.

It might secure concessions, showcase America's dominance, and resonate with nationalist and power-seeking voters at home.
But long term it *diminishes* American global influence.

This article explains why.

Contents

- Machiavellian Leadership Principles
  - 1. Keep Your Enemies Close… & Hide Your Guns
  - 2. Coddle Your Subjects to Keep Them Happy… And Dependent
  - 3. Combine Dominance & Prestige For Maximum Effect
  - 4. Keep your friends close, to keep your enemies isolated
  - 5. Keep your friends close, to keep them divided
- Over-Dominance In Global Politics
  - The dominance boost
  - The costs of over-dominance
  - Why leaders' over-dominance is lose-lose
  - Some good may come out of this all

Machiavellian Leadership Principles

We long emphasized on this website that dominant behavior ≠ power.

They overlap most certainly.
But they're not the same.

And we also made the point that *strategy* beats dominant behavior.
Including a video here:

> **Lucio**: 3 examples of strategy beating dominance in everyday life

U.S. foreign policy, past and present, provides a good example of this principle.

Let's dig deeper:

1. Keep Your Enemies Close... & Hide Your Guns

Principle:

⚖**The higher the tension, the more their motivation and preparation**

Your enemies shouldn't even know you're an enemy.

Think about it, if you call the North Korean leader 'Rocket Man' and threaten China, are they more likely to ally and prepare, or chill and

This is especially true for dictators.
Dictators already have maximum power. Without threats, they focus on maximizing power, squashing dissent, siphoning off money, and generally keeping their countries poor and weak (de Mesquita, 2003).

But external threats are a threat to their rule -and life-.
And an enemy galvanized internal support into productive endeavors.

You don't want them productive.
You want them fat and chill.

Keep them close, hide your guns, and pretend you're friendly.

2. Coddle Your Subjects to Keep Them Happy... *And Dependent*

The effective Machiavellian top dog doesn't bully the small dogs.

Instead, he *coddles* the small dogs to keep them content, submissive, and dependent.

Why?

Because the small dog who feels safe under the big dog protection has no incentive to empower himself.
Instead, his incentive is to suck up and sidle-up to the big dog.

But the incentives invert when the big dog turns on the small dog.

In one sentence:

Small dogs stay obedient and fragmented under the top dog's lead, but seek power in unity to defend against a dangerous big dog.

This is basic social dynamics, transferred almost 1:1 to global politics.

Followers and smaller players gladly follow a more powerful but benevolent leaders -and he stays in charge for as long as he wishes

3. Combine Dominance & Prestige For Maximum Effect

Crucially, the little dogs also *look* up to a protective and friendly top dog.

After all, it makes sense: the big dog is a magnanimous giver.
He pulls up the smaller dogs, and makes everyone better for it.

And we're wired to love powerful but magnanimous men who lead *for us all*.

The friendly top dog is BOTH dominant and prestigious

Psychology research shows us that dominance and prestige are two different routes to status and influence.

They're both powerful.

But there is a key difference:

- **Dominance *browbeats* others** into compliance -but does not make others *agree* with you.
- **Prestige makes others WANT** to emulate and follow you -it gets 'buy in'-

Thus, prestige is the only approach that affects true change.

Of course, it may be better to be *both*.
It's no coincidence that one of our first articles was 'mix power with warmth', which reflects a similar approach.

It's also similar to what a smart American strategist said a long time ago:

> Speak softly and carry a big stick

And that's what the US has long done.

Prestige allowed US cultural hegemony

Joseph Henrich explains that prestige evolved to facilitate group learning.

Such as, the lower-status individuals look up and follow the most skilled and higher-status members to learn from them.

This perspective also sheds light on the dynamics of soft power.
It may not be a coincidence that America's power projection and exports greatly benefited from soft power and cultural hegemony.

America was a prestigious leader.
And everyone was happy to learn from, buy from, and *be* more American.

US-European Relations: Good Leader-Happy Followers

The USA has led the West with 'benevolent leadership' since WWII. The win-win lasted because it's good for all

Until now US and Europe -plus Japan and South Korea- had a relationship of prestigious top dog, and a pack of smaller-sized happy followers.

Cooperative and win-win USA policies started with the Marshall Plan.
It kept key European and Asian allies friendly, aligned, and *happy* with America's leadership and military 'protection'.

This fostered a surge in American cultural export and trade that benefited both sides.
And it solidified America's leadership of the West -and the free world-.

4. Keep your friends close, to keep your enemies isolated

For decades America spoke softly to Europe, and put the big stick on the service of its allies.

It was an incredibly effective strategy.
Tending and befriending the wealthiest nations in the world, America effectively isolated and disempowered its few

other enemies.

It's another key strategy we champion on this website:

Make friends, not enemies.

It's not necessarily to be 'nice', albeit that's also a bonus for us, but because it works.
When you have many friends and few enemies, you can focus your undivided attention -and firepower- on them.
Additionally, you can enlist the support of your allies.

That's exactly what NATO did.

It's not surprising that URSS was doomed to lose.
The US combined the wealthiest and most powerful countries into one single alliance.

A web of powerful allies is what maintains long-term global hegemony

And now the Machiavellian bent of this approach:

⍰ 5. Keep your friends close, to keep them *divided*

US foreign policy had a second crucial advantage:

It kept Europe fragmented.
Why worry about being friends with historical competitors like France and Germany, when you can sidle up to the US?

Plus, there was no need.
In the world of complex and slow-moving international politics, things change only when they absolutely *must*.

The European project drudged along at snail speed because it never *had* to move quicker.
What for?
America was there.
Who needs a common EU army when you have US-led NATO protecting you?

Edit:
After writing this article, *The Routledge Handbook of Great Power Competition* confirmed to me this was a premeditated move indeed:

> In the early 1990s, eforts to "Europeanize" European defense gained steam.

> France wanted to turn the Western European Union (WEU), the nascent military arm of the European Community (the forerunner of the European Union), into a full-fedged security organization. Policymakers in Washington viewed this as an attempt to lever the Americans out of Europe.
>
> The Clinton administration thus decided that NATO (in which the USA played the dominant role) ought to remain the lynchpin of European security.
>
> In other words, NATO enlargement served two central objectives of American foreign policy: to promote democracy and to sustain US infuence over European security and political affairs (Layne 2000; Shifrinson 2020; Schake 1998

But things may be changing…

Over-Dominance In Global Politics

Now let's take a look at contemporary US politics.

As mentioned, it's in many ways the opposite of what the US has done for decades.
But it's not *all* bad.

Over-dominance, which we also call 'value-taking dominance' and in common parlance overlaps with 'bullying', has pros and cons.

The dominance boost

The pros include:

- **Faster compliance gaining**, no need for influence and any semblance of democracy and fairness
- **Send a stronger message**: a single act of dominance, unopposed, instantly establishes you as the top dog
- **Grab a larger portion of the pie**, since you don't have to pretend to be 'fair' to remain friendly and prestigious, follow the law of the jungle, and dictate the terms
- **Momentarily boosts internal cooperation**, especially among power-sensitive and nationalists, as the aggressive stance heightens inter-group competition
- **Psychic and hormonal benefits**

As little as feelings matter to a good Machiavellian, over-dominance makes the big dog feel strong and omnipotent.

In the short term, it also boosts testosterone, leading to a short-term reinforcing cycle of increasing bullying and increasing spoils.

Unfortunately, this may be one of humanity's biggest bugs, but pro-social dominance does not have nearly the same endorphin-releasing effects.

- **Internal politics boost**

Aggressive leaders may also gain some points at home.

Supporters enjoy America's dominance because they project their identity into the nation/tribe.
And they 'borrow' America's dominance to boost their own self-esteem and pride.

It's a *costly* shortcut to confidence, though.
Psychological power-borrowing from the group *replaces* (a lack of) personal achievements.

And this is why we encourage men to develop themselves as *individuals* first, rather than tribe/group-members.

- **Dominate against divided smaller dogs**, including your former allies

The little dogs are still shell-shocked, still fragmented and extra disempowered

The costs of over-dominance

In an admittedly more moralistic take, Simon Sinek's best-seller *Leaders Eat Last* says that selfish leaders are 'betraying us all'.
I agree: it's a dereliction of leadership responsibilities.

But let's analyze the dynamics more dispassionately.

By turning the big stick on its allies, America first loses prestige.

Only other bullies admire value-taking dominance -and nobody likes it when it's used to take from *them*-.

And it would soon start losing dominance as well.

Focusing on the European effects:

- **Top dog can't rely on small dogs anymore** to isolate and sanction enemies.

Ie.: If the US wants to sanction China but United Europe doesn't, China maintains a large export market

- **Small dogs may start biting back** -hopefully not, but politicians' first main task internationally must be to avoid lose-lose-

- **Small dogs coalesce** into an opposing pack

While the US could pressure a single EU state -ie.: Denmark-, it can't with United Europe

Aggressive American foreign policy *forces* Europe to unite

Domineering Alphas Bully Small Dogs... And *Coalesce Them* Into A Pack of Enemies

The former benevolent leader turning aggressive is a shocking wake-up call.

As the lost puppies look around, the mistake becomes clear: how can you guarantee a lone big dog to always remain friend?

And the solution also becomes clear: let's ally, and become a top dog through small-dog unity.

That's how hyenas outplay lions.
And unlike hyenas, European nations can unite into a whole, forming a big top dog themselves.

This is exactly what power dynamics would predict.
So I was glad, but not surprised, to see this at play:

European leaders vow stronger European unity and self-reliance after Trump's election

A new global superpower must not necessarily antagonize the US.

Hopefully and likely it won't -what a lose-lose tragedy that'd be-.
But nonetheless, **a strong united Europe is a comparative loss of global influence for the US.**

It's simple math: one single top player has outsized influence on the world.
But global influence dilutes as the number of top players increases.

Why leaders' over-dominance is lose-lose

First off, the leader pays a long-term price.

Just like financial borrowing, over-dominance boosts short-term power creating a long-term liability.
The costs of value-taking dominance include the loss of prestige, allies, soft power, influence, etc.

Most damning, several experiments show that a prestigious pro-social leader makes the pie bigger for all because he fosters *cooperation* from all.
But an overly dominant leader does the opposite.

Over-dominance and uncooperativeness by the leader make the pie smaller for all.
It undermines global cooperation, including trade and organized responses to global issues -a price humanity all, pays-.
We all go backward when civilization regresses into tribalistic squabbles, undoing millennia of progress and cooperation.

I'm confident cooperation will eventually resume.
But even momentary setbacks cost us momentum loss.

But just like with financial borrowing, dark-triad leaders don't care if future generations pay the costs.

Some good may come out of this all

Overall, it's better for all when leaders are prestigious.

And that's also true for world politics.

But… There may be silver linings.

1. Europe stops being a dependent, disempowered puppy

Personally, I always felt that European reliance on US 'protection' was bad both practically, ethically, and psychologically.

First, if you can't protect yourself, it's your duty to *look* for ways.

And if you have the means to, it's embarrassing and unethical to expect 'help'.
It's mentally disempowering for you, and it's a beggar and value-taker approach towards the world.

2. Shared power provides checks and balances

And you never depend on a single country to elect the right people, or to keep moving the world forward.

Speaking of which:

3. Shared power is an insurance policy for humanity

2 leading powerhouses and beacons of freedom are better than 1. And if more join, all the merrier

A wake-up call may shake Europe from its torpor.

And nudge it back to being a leading powerhouse of progress and innovation.

That's great news for the world: more superpowers advancing civilization equals more pulling power for humanity. And an insurance policy in case an engine sputters -as they all do, over the long term-.

4. Local politics negotiated for win-win

Politically, Europe may be better placed to improve local relations.

A European war for the US is a distance issue in a foreign land.
And an opportunity to export gas, and weaken Russia.

But a lone Europe has more incentive to maintain its win-win.

It was a colossal geo-political mistake to allow US 'defensive' missiles in Poland, or push for extended NATO membership -and Merkel knew that-.

A smarter and win-win foreign policy would have prevented a war, with much to gain for Europe, Russia, and the human race.

Ben Altman vs. Charlie Houpert: Power Dynamics Analysis of the Charisma on Command Founders Fallout

Lucio Buffalmano · 21 January 2025 · Archived copy · Original

Charlie Houpert and Ben Altman built **Charisma on Command** into one of YouTube's biggest channels on charisma and social skills improvement. Millions followed their breakdowns of leaders, celebrities, and social dynamics.

But in 2022, the partnership collapsed. The podcast ended, Charlie walked away from the channel, and fans started asking: *What happened between charisma on command founders*?

In this article, we'll break down the story of Ben and Charlie's fallout—the friendship, the business split, and the power dynamics behind it all—plus the lessons ambitious men can apply to their own lives.

Contents

Intro: Charisma on Command Story

Charlie Houpert and Ben Altman are the founders of Charisma on Command, with a 50/50 ownership split.

They had been close friends since high school, staying in touch daily even while attending different colleges.

Eventually, after reading *The 4-hour Work Week*, they quit their job and moved to Brazil looking for adventures and a digital business to enjoy a life of freedom.

Charlie and Ben were best friends sharing business and having fun

YouTube Success

They blogged first, but switched to videos when they noticed better traction for their early breakdowns.

It was good timing for YouTube and viral videos on Conor McGregor and Trump's 2016 campaign helped the channel blow past one million subscribers.

They monetized ads in different languages with a 50/50 split with local translators, and then later launched their course *Charisma University*.
Later Charlie released *Emotional Mastery*, but *Charisma University* remained their main draw.

Things were going great for Charisma on Command and in 2019 they launched a podcast as a side project originally called 'Ben and Charlie Podcast'.
Watching their podcast I learned more about the interpersonal power dynamics between the two, and the business side of things.

The Split

Charlie and Ben had a major fallout in 2022 -Sep 10, 2022 was their last podcast together-.

On Nov 19, 2022, Charlie released an updated video announcing their split.

After listening to many interviews and 'reading between the lines', I concluded that Charlie thought he was

contributing more, while some of Ben's projects didn't deliver.
However, he couldn't get Ben to agree or budge on the topic.

They both kept ownership of Charisma on Command -no mention of the split, but probably 50/50-.
Charlie said that 'Ben would keep working on Charisma on Command'.

Charisma on Command Without Charlie

Charlie made what seemed to be his last voiceover on Apr 25, 2023 -albeit those may have been pre-recorded-.

After that, Charlie stopped working on the main channel and all voiceovers are from Ben.

Several of Ben's videos had many views, passing the 1 million and 2 million mark at times, but Charlie confessed he rarely even watched them as it they didn't align with his preferences.

We can speculate Ben wasn't happy either to do most of the work without Charlie's contribution and with a 50/50 split.

The channel then ground to a halt in November 2023.

Expressions like '*BFF*', '*meeting you was one of the best things that has ever happened to me*,' and '*the next 30 years will be even better*,' may suggest some **anxious attachment**, **dependence**, and **idealization**.

Charisma on Command Is Back Without Ben

On Jan 7, 2025, Charlie published a new announcement video on Charisma on Command.

Charlie and Ben couldn't find an agreement for a long time as Ben demanded more than Charlie was willing to pay and Charlie was negotiating with safety guarantees.

Eventually though Charlie dropped the guarantees requests, and was coached to go for a 'shotgun' approach where both cofounders wrote a price they'd be willing to sell for.

Now that Charlie wasn't chasing the purchase anymore, Ben came down in price and Charlie was finally able to purchase Charisma on Command.

Charlie is now back as the sole owner of Charisma on Command.

This post analyses Charlie's announcement video for power dynamics, and lessons learned to navigate friendships

and business relationships.

Why Charlie Left Charisma On Command

This is Charlie's original video.

Below we quote relevant parts and in blue we add our 'read between the lines' comments.

> **Charlie**: I was actually feeling (…) under supported in work
>
> ⍰ **Charlie felt he was doing all the work**

> **Charlie**: (…)
> a deep lack of alignment and how we felt we'd each contributed to the business
> (…)
> To add up responsibility for something that didn't go well, we would not add up to 100%
> (…)
> And if there was credit to be taken (…) was greater than 100%
>
> ⍰ **Charlie felt he was driving the business**, potentially as the 'socially aware' mind behind the analyses.
> Something we noticed here and with some teacher frames

> **Charlie**: I started noticing something about myself that I didn't like (…) I was being unkind (…) resentments from business issues and things I hadn't addressed in our friendship were surfacing
>
> ⍰ **Charlie bottled up resentment without speaking up, leading to aggressive and passive aggressive behavior**. This is normal when you bottle up
> Potentially, they were different and started growing further apart

> **Charlie**: I allowed that resentment to build inside of me until I just snapped and said I don't want to talk anymore and that was about two years ago
>
> ⍰ **Charlie broke the friendship 'cold turkey',** and that possibly precluded better win-win resolutions

> **Charlie**: I stopped making videos in an attempt (…) to like let him catch to the contribution that I felt I had (…) kneecapping my own creative instinct
>
> ⍰ **Charlie stepped back to 'send Ben a message' and rebalance the power dynamics**
> Charlie felt he gave too much and wanted Ben to make amends and re-empower him. That would also give him negotiation leverage.
> It's understandable: when you feel like the 'sucker' in a win-lose situation, you seek re-negotiation. However, this approach led to a lose-lose.

Good & Strategic Statements

Charlie is not a social beginner.

And he sprinkled in some 'power protecting' elements to respect Ben, and some 'hedging statements' to avoid being

an as*hole.

For example:

- ***Without saying that my perception is objectively correct*** <— Allows him to share he felt he did most of the work, without sounding like he's badmouthing Ben ⍰⍰
- ***I'm very very happy for him*** <— Empathic statement ⍰⍰

In some other cases Charlie may have been more careful:

Possible Power Moves

> **Charlie**: he started living a life that was much more in line with what I think he would have gone without my influence
>
> ⍰⍰ **I was more influential, HE adapted to me, not the other way around**

Probably Charlie wanted to self-deprecate and suggest he was a *negative* influence.
But it still disempowers the receiver if you suggest that he let others sidetrack him from what he wants.

> **Charlie**: he may decide to make something (…) I will tell you guys I want you guys to be able to find him (…) just because I don't necessarily want to do it with him anymore does not mean that I don't want the world to hear his voice
>
> ⍰⍰ **I ended it (because I didn't want to work him) and bought him out. He has no audience now, *he* needs *me* to have his voice heard, which I magnanimously will allow him to** (but if I don't, you'll never hear from him)

I'd have avoided this.
The 'just because I don't necessarily want to do it with him' can feel dismissive.
And the 'charitable' give almost always disempowers others because you only direct charity to those struggling and (far) below you.

Just for you to understand the power dynamics, the empowered mindset would think: what if Ben instead doesn't need Charlie's shout-out because he'd do awesome work, succeeding by his own merit?
Or start something totally different because he has many talents?

Lessons Learned

Some lessons learned from this:

In Friendship & Business

To keep positive and win-win friendships and partnerships:

1. Speak up early to avoid stewing

We had long noticed Charlie's passive-aggression towards Ben.

For example, here, here, and in this video:

View this post on Instagram
A post shared by The Power Moves (@the_power_moves)

> **Charlie**: (laughs at Ben) <— Possible passive-aggressive behavior
> **Ben**: (effectively self-defends)

2. Speak assertively

Speak early, speak up, speak respectfully but assertively.

Also see ‘how to be assertive‘.

3. Respect your friend, especially publicly

Don’t share news that frames them poorly and they must defend against.

For example:

View this post on Instagram
A post shared by The Power Moves (@the_power_moves)

> **Charlie**: When I broke up with a girlfriend, we remain friends, but you, you do scorched earth <— This undermines Ben
> **Ben**: Not really true <— Forced to defend himself

Instead, DEFEND your friends -you act honorably, and they’ll love you for it-.
 Example here

4. When you can’t agree, buy out early

Withdrawing from a good business you love is lose-lose.

Not unlike children and divorce, you keep it civil *both* for you, and for the children.

Buy your partner out early.

How to Release Announcements

Overall, Charlie did a great job.

For business, he was well-spoken, used a catchy title, and seamlessly promoted his products without sounding like he was selling.

For social dynamics, he was optimistic, framed the mistakes as lessons learned, and ended on a positive note.

In Ben’s shoes though, I may not consider this a step forward towards a good friendship and mending of the relationship.

So some suggestions here:

1. Share the script with your friend first, let him greenlight it

This is the only honorable and respectful approach towards your friend.

It preserves and improves the relationship, and potentially prevents future legal troubles with more litigious men.

2. Thank your partner for his contribution

Sol in our community pointed this out first.

Even if you think you contributed more, something like this is still likely true:

> Despite how I feel about our business relationship, Charisma on Command wouldn't be where it is today without Ben

Or, at least, find something you can be grateful and thank them for.

3. Remove details that make your partner look bad

Don't share that you both took more credit and gave the other more blame.

That's just how human psychology works.
But when you say that in an announcement, it feels like you think *your partner* was the POS.

4. Remove details that make *you* look bad

Charlie said this:

> **Charlie**: *Until I just snapped and said I don't want to talk anymore*

How does that sound to you?

Some may feel that a more grounded, strategic, and, shall we say, 'mature' approach was needed.
Especially considering the long-standing friendship and partnership.

Pick your words carefully because that's all people have to form opinions.
Who knows, Ben struck me as a great guy, but it's possible he may not have fully appreciated Charlie's perspective and unwittingly pushed him over the edge.

But from Charlie's shared story *HE* doesn't come out of it too well for 'snapping' and going cold turkey.

Instead, say this:

Charlie: *I didn't feel the relationship could continue to be mutually beneficial* <— Self-respecting, mature, and empowered

and I decided it was time for at least a momentary clean-break <— High power, assertive, and masculine

This is part of a self-framing strategy.
Such as: ensure that what you say sub-communicates high-value.

Welcome Back Charlie & COC

While this analysis focuses on learning opportunities, we admire Charlie's sharp eye for social dynamics.

We were thrilled to see his video announcement, glad to know both he and Ben are doing well, and excited that

Charisma on Command is back in the game.

We believe that a rising tide lifts all boats, and Charlie and Ben significantly contributed to our niche of advanced social skills.
Their work has motivated many men to learn and work on themselves, and indirectly also benefited TPM **–many alumni and readers found us via Charisma on Command–**.

And it's great that we can learn from and inspire each other. We especially appreciate creators who uphold good values, and going forward, we hope we can all give each other due credit ⍰⍰⍰.

We wish Charlie continued success, we hope to hear from Ben soon, and hope to collaborate or join Charisma on Command again for future breakdowns on YouTube.

P.S.
For a taste of our different style, check out our latest breakdown:

If you're looking for advanced tools to master social dynamics, influence, and leadership, Power University may work for you.

It goes beyond charisma tips to deliver comprehensive training for personal empowerment.

While Charisma University focuses more on high-energy social skills, Power University dives deeper into men's power, gaining status and attraction, and strategies to succeed in life.

Here's what alumni said in our forum:

In the past I tried Charisma University but while I thought the content was good I didn't feel like it worked well for me for three reasons: 1) I found it difficult to turn the action guides into habits that stick, 2) the high energy style of charisma is quite exhausting for me, and 3) I feel like being quick to laughter and speaking through a smile etc makes me come across as low-power and makes people respect me less.

> **Alumnus**: I tried Charisma University, but the high energy style is exhausting (…) makes me come across as low power and people respect me less

And:

#2 - May 30, 2023, 7:34 pm Delete Edit Quote

Hi Jack,

I first found TPM when I looked for reviews of Charisma University. I didn't look through anything else on the site though until months later.

After going through CU and realizing it wasn't for me I stumbled back here by accident and decided to join PU.

Needless to say, that was one of the best decisions I ever made.

How to Inspire People: 8 Leadership Strategies from Psychology

Lucio Buffalmano · 28 January 2025 · Archived copy · Original

Most leaders stop at transactional exchanges: salaries, bonuses, or punishments.

But the best leaders go beyond.

They inspire people, craft shared identities, reach goals, and make their teams thrive.

This guide dives into transformational leadership strategies—with our expertise in psychology, power dynamics, and strategies—to make you an influential and successful leader.

Contents

- Start With the Foundations: Yourself
- Build Identity
  - 1. Craft a “sense of us” (social identity)
  - 2. Be “one of us” (‘prototypical’)
  - 3. Differentiate “us” from “not-us”
  - 4. Do it “for us”
  - 5. Make “us” proud
- Build Commitment
  - 6. Care personally
  - 7. Empower them to be role models
- Inspire
  - 8. Minimize transaction-talk
  - 9. Frame your goals as meaningful
- Sustain Performance

- 10. Keep “us” effective
- Case Studies
  - Kennedy: Transformational Request
  - Andrew Bailey: Transactional Request

Start With the Foundations: Yourself

Leadership is both the pinnacle and natural consequence of an effective process of self-empowerment.

On the other hand, that self-empowerment is also a *requirement* because **to be an exceptional leader, you must be an exceptional man.**
See:

- Traits of high-value men
- Alpha male traits
- Honorable man approach

Build Identity

1. Craft a “sense of us” (social identity)

Researcher Haslam calls it “entrepreneurs of identity”.

It includes:

- **Values**
- **What you stand for**
- **‘What it means to be ‘us’**

It’s especially important for group formation or when changing direction.

Once you have a social identity, you then want to align your policies with the group identities and they will be far more persuasive.
Alternatively, you must adapt the identity to fit the policies.

⍰ Example: Bush & the ‘leader’s burden’

When Bush sought support for the Iraq invasion, he often referred to ‘the world’.
It was a persuasive move to dominant ‘revenge’ motive with warmth.

He framed the operation as a duty of the world leader, leveraging Americans’ identity as champions of global freedom and democracy.

Some passages from the war announcement:

> **Bush**: (…)
> Disarm Iraq to free its people and to defend the world from grave Danger
> (…)
> Armed forces now in the Middle East: the Peace of a troubled world and the hopes of an oppressed people now depend on you
> (…)
> my fellow citizens the dangers to our country and the world will be overcome

P.S.:
Don't judge late Bush, who failed the 'character' and the 'deliver' test with lies and a non-victory.
Bush at this point had sky-high ratings.

1.2. Facilitate friendships among team members

Team of friends are happier to meet and naturally contribute and cooperate more.

And best of all if it's you to connect them so you maintain 'host power' and reinforce prestigious value-adding leadership.

2. *Be* "one of us" ('prototypical')

Studies show that people perceive power much differently if it comes from "within the group" or from outsiders. Power and influence from outsiders feel oppressive. But **power and influence from an ingroup member is more positive or even uplifting**.

Be similar to the team in its key features to increase leadership acceptance. And influence those virtues to align with your goals.
For example, a commander should display the value of courage.

Being prototypical allows leaders to:

- Receive more support
- Receive higher ratings on effectiveness
- Drive change more easily
- Be excused more readily for mistakes (even when behaving unfairly)

Be similar, but exceptional

There is a dichotomy of leadership here and you must strike the right balance.
Says leadership researcher Alexander Haslam:

> Leaders can be ahead of the group, but never so far ahead that they are out there on their own.

Albeit teams differ, common traits where exceptionalism helps include:

- Values
- Responsibility
- Work ethics
- Demanding more of yourself than of others
- Social skills / power awareness

⍰⍰ But never make it a competition!

Remember: you're the leader no matter what.

The competition mindset pulls you *down* to a team member.
And poorly done may even sub-communicate you're insecure about your leadership.

Instead, reward the top performers to display your self-confidence.

And own possible limitations.

For example, if you're older, don't try to be physically 'better'.

Be strategic instead.
Stay in shape, subtly highlight past high performance, and demand excellence to show you're *accustomed* to excellence.

3. Differentiate "us" from "not-us"

Make the team feel uniquely and positively distinct from others.

This reinforces the 'sense of team' and keeps people united and cohesive.

Make them feel great for belonging to such a great team, and being close to you.
As the leader, **embody that sense of being special.**
Carry yourself with confidence and pride.

And some 'positive power moves' may be allowed here with 'positive social climbs', criticizing others with the only goal of self-framing as higher value, more 'honorable', or generally superior.

This motivates people to stick with the team for the good feelings they get from 'being special'.

4. Do it "for us"

Whenever possible, frame your actions and goals as 'for the team'.

The team will appreciate you more, and you display good values of cooperation and contribution.

⍰ Example: I sought victory for the team

⍰♂Lucio's Experience

Lucio:
As a Toastmasters president, I placed 2nd in a European-level speech competition.

I shared that I sought victory for myself first, a great display of the value of honest.
And added that I also really wanted to bring a trophy back to the club -for 'us all'-.

5. Make “us” proud

Make the team matter, give it status and respect among other teams.

Part of it comes down to effectiveness and achieving goals of course.
But a good part of it is also about communication:

- Communicate progress
- Celebrate milestones
- Display optimism

⍰ Use strategic bluster

For example:

> **Value-adding Bluster**: Team, this is a memorable day.
> What we have achieved is unbelievable. What you guys did is incredible. This is the first time ever that…
> You guys are the best team I’ve ever been in.
> I’m proud to be here with you.

Build Commitment

6. Care personally

Care both for the team member as a human being, but also for what he does for the common good and common purpose.
Do 1:1s, even if just by the side of a social gathering. Check in, offer advice, encourage them to try, and celebrate their wins.

1.2. Pull people up

Speak well about people.
And speak *particularly* well about great performers and team representatives.

It’s good for leaders to be a ‘bit of a judge‘, and use your emotional rewards to motivate positive behavior.

7. Empower them to be role models

Create smaller leaders in your team.

Encourage them to be role models outside, and for the newer members. And reward them for well-representing and ‘doing the team honor’.

This approach motivates people to be better not just for them, but for others, and for the team.

Inspire

8. Minimize transaction-talk

Research suggests that focusing on transactions such as salaries and bonuses can undermine intrinsic motivation.

This seems to be especially true for creative or complex tasks, and potentially for top perfomers.

To avoid ‘crowding out’ of intrinsic motivation:

- Keep rewards and motivation separated
- Reward emotionally, which also empowers you as a leader
- Reward with growth opportunities
- Have HR negotiate salaries, while you support your team's negotiation preferences

9. Frame your goals as meaningful

Meaningful goals motivate.

And even mundane businesses can be more inspiring:

- We wash cars ➡ We make men proud of their drive
- We clean toilets ➡ We maintain public health and provide hygiene when people need them the most
- We serve drinks ➡ We foster connections and unforgettable moments among friends

Speak of '(moral) duty' instead of 'job requirements'

You're more persuasive when you assign tasks by appealing to moral duties:

- You must clean the restaurant ➡ **It's our duty to our customers** to provide an environment as clean as possible

Link tasks to meaningful causes

Frame someone's work in light of what it does for the mission, or the final user.
For example:

- Your job is to sell ➡ You help the prospect solve X problem
- Your job is to clean ➡ Your contribution is invaluable to help us please our customers

Knowing they're contributing to a larger cause inspires people to do better.

⍰⍰ Frame the goal as a challenge and 'test of value'

A possible power move, but a stretch goal may become a man's test.
And the achievement of that goal his 'badge of honor'.

This approach is extremely motivational for ambitious men who crave the feeling of conquest and victory -and fear failure-.

Sustain Performance

10. Keep "us" effective

The most underrated leader's objective is to *keep* the team effective, motivated, and cooperative.

Teams can degrade if left to themselves.

They can lose drive, top members, and a reason to be.
Worst of all, they can slowly turn uncooperative and toxic if takers and toxic people are left free to operate.

Hence, **your job is to promote and reward the best while removing bad influences**.
A leader must:

- Recognize toxic team members or employees
- Remove toxic team members before they spoil the bunch

- Recognize top performers
- Promote top performers, set them as examples to follow

To read characters and people undermining your leadership you need power-awareness.
And you must be ruthless in removing them -remember: to be good, you need to be 'bad' sometimes.

Do that, keep setting the example, and the virtuous cycle maintains the group cohesive, inspired, and effective:

Chart adapted from the group engagement model

Case Studies

Let's review two examples of leaders asking for contribution.

But one does it with transformational leadership, and one with transactional leadership.

Let's see the stark difference:

Kennedy: Transformational Request

Most examples of great leaders are transformational.

Kennedy gave the nation a dream.
The U.S. became the torchbearer for Western democracy and freedom. And moon-landing the culmination of a joint effort to bring humanity to higher heights.

That's why Kennedy's big ask worked:

> **Kennedy**: Ask *not* what your *country can do for you*—ask what you can do for your country

Kennedy asked Americans to be prestigious leaders themselves.
If he had campaigned on giving them jobs -transactional leadership-, they would reply 'To hell that, give me higher salaries'.

Andrew Bailey: Transactional Request

Bank of England governor Andrew Bailey also asked for people's contribution.

But despite carefully hedging his words, his effect was the *opposite*.
It failed because it was hypocritical and non-reciprocal (rules for thee, but not for me).

Bailey's hypocrisy was obvious because he was in the wrong exchange -the *transactional* exchange-, where people naturally focus on money and numbers.

The difference is that:

- Bailey wasn't in a position to be 'inspirational'
- His message centered on material concerns—money and inflation

A better alternative for him would have been to:

- **Shift to transformational** – higher ideals of sacrifice, togetherness, and
- **Lead from the front**, including himself in the sacrifice

For example:

Transformational Bailey: We may be in for some challenging times with inflation. <— Sets the challenge

But we can weather it. <— 'We' frame & Optimistic

Business leaders ought to give the example and freeze salaries and bonuses <— Demand first from leaders

(share or leak you froze your salary) <— ⍰⍰ Leading by example

And if everyone who can do his part <— ⍰⍰ 'Those who can' is something many want to be. Nobody wants to be 'cannot'

We can soon win inflation

Of course most bank chairmen are expected to be ‘factual’ rather than inspirational.

Alternatively, he could have asked to stall pay rises *to the industry leaders* and cascade the positive changes top-down.

If this article was any helpful, our training program Power University is designed to turn good men into influential leaders

Exec Summary

- **It's not our superior intelligence** that accounts for human success and ecological dominance
  - Biology and 'survival instincts' are insufficient to help us thrive and survive across the globe
- **Culture is the 'secret' of our success** as shaped by cultural evolution
  - Our brains are equipped for cultural learning, and the limited hard-wired instincts cannot explain our success
- **We became successful and sophisticated with cultural accumulation of knowledge** and behaviors passed down, refined, and expanded across generations, making us far more adaptable than other species
- **Natural selection ensured only the most efficient cultural norms survived and improved** over time.
  - Selection includes inter-group competition, the groups with the best culture thrived and expanded

FULL SUMMARY

About the Author:
Joseph Henrich is an American anthropologist and professor of human evolutionary biology at Harvard University. Henrich is also famous for having coined the popular acronym 'WEIRD' to highlight the bias of psychological research. He also wrote '*The WEIRDest People in the World*', which grabbed a top spot in our popular 'best psychology books' list.

Current Explanations For Our Success Are Insufficient

The common explanations for our success today relate to:

1. **Generalized intelligence** or mental processing power
2. **Specialized mental abilities** evolved for survival in the hunter-gatherer environments of our evolutionary past, and/or
3. **Cooperative instincts** or social intelligence that permit high levels of cooperation.

Failed Expeditions Provide Evidence That It's Not IQ or Cooperation

Henrich shows with captivating stories of explorers that our IQ, cooperation, or 'innate instincts' are all of little use when faced with novel environments.

Despite the explorers wanting to survive and explore, many of them died.

Instead, the explorers that fared best -and survived- survived because they encountered local populations who had the cultural know-how to survive and thrive.

Culture Explains Our Success & Continuous Progress

Our ability to learn from others is the key to human success.

While other species rely mostly on innate behaviors, we do not.

Humans are the best social and cultural learners.

We learn from our peers, collect the knowledge and progress from those who came before us, and improve it and pass it along.

Hence, as humans, **we accumulate a vast pool of knowledge and skills over time & pass it forward with our improvements**.
This leads to what Henrich calls "cumulative cultural evolution," a process that allows humanity to advance thanks to continuous progress.

Our Genetic Uniformity Explains It Wasn't Genetic Evolution

Species that have been as successful as we split into sub-species that are genetically different from each other.

Redacted for brevity:

> Other species also achieved immense ecological success; however, this success has generally occurred by speciation (…) adapted and specialized to survive in different environments.
> Ants, for example (…) split, genetically adapted, and specialized into more than 14,000 different species with vast and complicated sets of genetic adaptations

But humans remain a single species with little genetic variation -even less than chimpanzees who have 3 distinct subspecies while confined to a narrow band of tropical African forest-.

It's our *cultural* adaptations that explain our success in colonizing the globe.

Evidence to Support We're Cultural Learners

- **Success bias in learning**: We naturally learn from more successful others
- **Skill bias in learning**, preferring to pick skilled role models
- **Prestige bias in learning**
  - Infants look at more competent individuals
  - We use 'prestige cues' to decide who to copy and learn from
- **Children look at adults the most under uncertainty**, exactly what you'd expect from an evolutionary approach to cultural learning
- **Children learn norms by observation and enforce social norms without any adult supervision**
- **We automatically learn and adapt new norms as we change contexts**
  - We tend and prefer complying with social norms
  - We want and enjoy punishing norm violators
  - We are cognitively-biased to spot norm violations
- **Self-similarity cues to learn**, supposedly because those similar to us are more relevant to us
  - Copying same-sex model is neurologically more rewarding
  - Co-ethnic preferential learning
- **Copying self-harming behavior**, including suicide that would go against any genetic evolutionary logic

The above is exactly what you'd expect if cultural learning was evolutionarily selected to maximize learning.

Cultural Evolution Domesticated Us Into Prosociality

Henrich first acknowledges there is some merit in the current gene-centric and kin-centric views of cooperation popularized by the likes of Richard Dawkins and Steven Pinker.

But he then adds that that cultural evolution contributed most to cooperation:

> And to the degree that we are more cooperative than other mammalian species (and we are), it's because culturally evolved norms constructed social environments that, over eons, penalized and gradually weeded out aggressive, antisocial types (norm violators) while rewarding the more sociable and docile among us

And:

> Through social norms, culture reinforces our kin-based and pair-bonded relationships and dramatically expands our narrow circle from genetic kin to cultural kinship.

The domestication of humans

Says the author:

> Repeated norm violations sometimes provoked ostracism or even execution at the hands of one's community. Thus, cultural evolution initiated a process of *self-domestication*, driving genetic evolution to make us prosocial, docile, rule followers who expect a world governed by social norms monitored and enforced by communities.

The domestication of men into dads

In the last more speculative paragraph, the author says that it was pair-bonding, men recognizing their children, and kin-bonds that helped domesticate men, and develop a larger prosociality.

On this website, we also argued in a popular article that women also drove male domestication.
See here:

- How women 'domesticated' men to control them

> How Women Control Men: The Secret Psychology of Relationship Power

Prosocial norms spread with inter-group competition

Don't equate 'domestication' with 'weakness' though.

'Domesticated' means less internal fighting and more cooperation.
However, that intra-group cooperation will then more effectively expand the group, and potentially beat or assimilate groups of poorer cooperators:

> Having norms that increase cooperation can favor success in competition with other groups that lack these norms.
> Over time, intergroup competition can aggregate (…) social norms related to cooperation, helping, sharing, and maintaining internal harmony

Intergroup competition may also put pressure on larger groups to form because cultural advancement benefit from larger and more interconnected groups -'collective brain'-.

Cooperation trumps deception

> In the increasingly cooperative worlds constructed by social norms and reputations, it became relatively more important to communicate and teach others rather than deceive or exploit them.

Cooperation Among Large Societies Underpin Our Success

A major -and persuasive- theme in Henrich's argument is the role of cooperation in human success.

He explains that human societies are built upon complex webs of exchanges, trust, and cooperation.
Unlike other apes, humans can collaborate with individuals they've never met before and share resources and knowledge across large, diverse groups.

This cooperation is facilitated by cultural norms, which encourage behaviors like reciprocity and trust.

Henrich argues that it is these social structures—not just raw intelligence—that enabled humans to build complex societies, create advanced technologies, and thrive across the globe.

Progress & Cultural Evolution Require Prosociality & Cooperation

Cultural evolution needs a web of interconnected individuals to learn from each other and pass that learning to future generations.

And the growth of cultural know-how, what Heirich refers to as the 'collective brain', depends on community size and interconnectedness.

This, suggests the author, also explains why only we humans 'crossed the rubicons' of 'autocatalytic' or self-reinforcing and growing cultural learning.

Chimpanzees for example are hostile to their neighbors, do not pair bond, and do not develop kin relationships. Such persistent hostile relations inhibit adaptive cultural evolution by constraining the flow of cultural know-how.

Social Learning VS Cultural Learning

While many animals engage in social learning, only humans developed the cultural learning systems for the *cumulative* evolution of sophisticated technologies, complex societies, and institutions.

This ability, the author explains, is central to humanity's success as a species.

Social Learning

The process of observing and imitating others' behaviors, decisions, or actions.

- **Focus**: Individual-to-individual transmission.
- **Mechanism**:
  - As a by-product of being around others
  - Observational learning
  - Imitative learning (copying without necessarily understanding the underlying principles)
- **Limitations**:
  - Can lead to naive copying
  - Does not necessarily involve improvement, or shared meaning.
- **Example**: A child observing an adult using a tool and imitating their movements to achieve a similar outcome.

Cultural Learning

Understanding and internalizing shared norms, beliefs, values, and practices within a group.

- **Focus**: Group-level transmission and the preservation of shared culture over time.
- **Mechanism**:
  - Active information seeking from others

  - Includes mental models, making inferences about other people's goals or strategies
  - Involves teaching, norm enforcement, and language-based explanations.
  - Relies on symbolic communication, storytelling, and shared intentionality.
- **Advantages**:
  - Allows for cumulative evolution, where ideas are refined and improved over generations.
  - Allows humans to adapt to diverse environments
  - Facilitates the development of complex technologies and social structures.
- **Example**: A tribe passing down specific hunting techniques, embedded in their rituals and stories, ensuring that future generations learn the mechanics, together with the broader context and purpose.

Cultural Evolution vs. Genetic Evolution

Of course, it's not one opposing the other, since they co-exist:

> natural selection, acting on genes, has shaped our psychology in a manner that generates nongenetic evolutionary processes capable of producing complex cultural adaptations.
> Culture, and cultural evolution, are then a consequence of genetically evolved psychological adaptations for learning from other people.

While genetic evolution occurs over long timescales, cultural evolution happens rapidly.

This allows humans to adapt to new challenges much faster than genetic evolution could ever allow.

Cultural Evolution Drives Genetic Evolution

Being faster and 'better' at making humans thrive and reproduce, it's genetic evolution that recently adapts to cultural evolution.

The author says that early in our species evolution we 'crossed the Rubicon' of cultural learning to turn it into the primary driver of our development and evolution.
It's an 'autocatalytic' process, meaning that it propels and reinforces itself:

> Once cultural information began to accumulate (…) the main selection pressure on genes revolved around improving our psychological abilities to acquire, store, process, and organize the array of fitness-enhancing skills and practices (…).
> As genetic evolution improved our brains and abilities for learning from others, cultural evolution spontaneously generated more and better cultural adaptations, which kept the pressure on for brains (…).

Evidence for culture driving genetic evolution

Henrich outlines several examples of culture-driven genetic evolution, including:

- Cooking ➡ Weaker jaws, smaller intestines
- Learning to learn ➡ Larger brains, long childhoods, post-birth growth spurt, myelination for brain plasticity
  - Information resources ➡ Prestige-based leadership
- Collect and transport water ➡ Persistence hunting ➡ Sweat glands to make sweat more and run longer
- Artifacts ➡ Opposable thumb, greater hands dexterity
- Wisdom of age ➡ Longer lives, menopause
- Cooperation ➡ Norms psychology, shame & anger for norm violation

- Language ➡ Throat anatomy changes
- …

Culture Changes Us... Psychologically & Biologically

Says the author:

> Even without influencing genes, cultural evolution creates both psychological and biological differences between populations. You, for example, have been altered biologically by the aforementioned cultural download of skills and heuristics.

Biological VS Genetic Evolution

After explaining how psychology changes biology, for example our brain changing with learning to read, or the 'placebo effect', the author explains:

> These are *biological* modifications to our brain, but **not** *genetic* modifications. They are the end result of thousands of years of cultural evolution, which figured out how to effectively modify our brains without messing with our genetics.

Our biology changes much more easily and faster than our genes.
And cultural differences that impact our physiology and psychology are biological, but not genetic.

I'm grateful to Henrich for this important distinction.

Prestige & Dominance

Humans have two quite distinct forms of leaders: prestige, and dominance.

Prestige

Prestige forms the foundation of leadership even in egalitarian societies, pushing certain people 'up the social status ladder'.

The author explains that prestige evolved with cultural learning and with the advantage that learning from the best provides to groups and individuals.

However, as social exchange dictates, skilled and successful individuals don't gain anything by sharing with those who give nothing back.
So people defer to skilled and successful individuals to entice them to teach -or at least to spend more time in their presence-.

Prestigious Men Confer Benefits

I feel the current definition of prestige may be be refined to include any benefit.
A prestigious man may simply be rich, or famous, or the son of a president.

Indeed, says the author in a note:

> Besides valuable cultural information (…) high-status individuals might possess "goods" that might be traded for deference benefits.
> For example, a beautiful woman (…) less-attractive, women might want to be around her to hang out where the men are (Pinker 1997).
> Or the son of a former president might receive deference (…) because of their valuable (inherited) social

> connections.
> From this perspective, the informational goods we discuss above might be merely one type of "good" that can be acquired by paying deference and no different from accessing mates, allies, or social contacts.

I fully agree with the author's note here.
The informational goods are only one type of value being offered.

We Copy Prestigious Men Based On Who Others Copy

Since we can't always know who's best to learn from, people tend do:

- **Take cues from others for who is best to listen to**, leading to the 'famous for being famous' modern phenomenon
- **Copy across a range of unconnected domains**, leading to the popularity of modern 'celebrity endorsements' that have nothing to do with their expertise

Dominance

Dominance is older, inherited from our primate ancestors.

While prestige is based on the ability to confer benefits, dominance is based on the ability to inflict costs.

> individuals attain dominance status when others fear them and believe they will use physical violence or other means of coercion if they do not receive deference in the form of appeasement displays and preferred access to mates and resources (e.g., foods).

Prestige VS Dominance

Dominance hierarchies display stronger physical and body language cues with dominant individuals using expansive body language, and subordinate matching with diminutive body language.

Status Features	Dominance	Prestige
Influence	Based on coercion and threat	True persuasion and deferential agreement
Imitation by lower-status	No imitative bias except to satisfy dominant	Preferential, automatic, and unconscious imitation. May include affiliative imitation
Attention by lower-status	Tracking of higher-ups, avoidance of eye contact, and no staring	Directing of attention to and gazing at higher-ups, watching and listening
Sociolinguistic behavior by higher-ups	Seizure of the floor and use of aggressive verbal intimidation (e.g., disparaging humor and criticism)	Given the "floor" and permitted long pauses. Uses self-deprecating humor
Mimicry by lower-status	No preferential mimicry	Preferential mimicry of higher-ups
Proximity management by lower-status	Avoidance of higher-ups; keeping distance to avoid random aggression	Approach to higher-ups; maintenance of proximity to higher-ups
Displays		
Lower-status	Diminutive body position, shoulder slump, crouching and gaze aversion	Attention to prestigious, open-body position
Higher-ups	Expansive body position, expanded chest, wide stance, arms wide	Similar to dominance display except muted. Less expansive use of space

Status Features	Dominance	Prestige
Higher-ups	Lower their vocal pitch in the course of the interaction	Do not lower their vocal pitch
Emotions		
Lower-status	Fear, shame, fear-based respect	Admiration, awe, admiring-respect
Higher-ups	Hubristic pride, arrogance	Authentic pride, tempered arrogance
Social behavior by higher-ups	Aggression, self-aggrandizement, egocentric	Prosocial, generous, and cooperative
Reproductive fitness	Higher-ups have greater fitness in small-scale societies	Higher-ups have greater fitness in small-scale societies

Table 8.1., adapted. All credit to Joseph Henrich

Both Prestige & Dominance 'Work', Prestige May 'Work Better'

First off, the available evidence is limited.

But reporting on what's available (Ruden 2008 and Ruden 2011), paraphrasing Henrich:

> both are associated with having more babies with one's wife, more extramarital affairs, and more likely to remarry after a divorce, even after statistically removing several factors. Beyond this, the children of prestigious men die less frequently, and prestigious men are more likely to marry at younger ages (neither of these effects held for dominant men).

And:

> Not surprisingly, both dominant and prestigious men tended to get their way at group meetings, but only prestigious men were respected and generous.

'Generous' is not a benefit of course but a cost.
But 'respected' most certainly is an advantage.

Being 'liked' is also a small advantage, and another study suggests that prestigious men are liked, but dominant ones are not.

Deeper influence is a major advantage though, also going to prestigious men (redacted for brevity):

> in dominance relationships, subordinates are influenced by the dominant out of fear.
> By contrast, (…) (prestigious men) become truly persuasive such that learners often shift their underlying opinions, beliefs, and practices to be more similar to the prestigious individual.
> (…)
> In addition (…) prestigious individuals are influential both because people shift their opinions and practices to match the prestigious, and because people to go along with prestigious individuals as a form of deference, even if they don't agree.

Frankly, I wasn't sure the second reason added any benefit for the prestigious individuals since people 'are inclined to go along' with dominant individuals as well.
But the 'deeper influence' is most certainly a plus.

Finally, the author did his own research with Cheng and Tracey, who later wrote a fantastic book on the psychology of social status.
And concluded:

> Being either more prestigious or more dominant led to greater influence on their group's task outcome.

And about the differences:

> Dominant individuals tended to (1) act overbearing, (2) credit themselves, (3) use teasing to humiliate others, and (4) be manipulative. Meanwhile, prestigious individuals (1) were self-deprecating, (2) attributed success to the team, and (3) told jokes.

Social Status & Reputation Are Shields

Others may want to attack you or take from you, but a strong social status protects you because their attack would lower their social status.

However, if your social status is low, others can attack and take from you at will.
You surely can defend yourself, but attacks and taking can be covert or hidden. Hidden attacks may even be *encouraged* against people with a bad reputation.

The author also claims that we're wired to monitor our reputation and spot people with low reputation because it means we can exploit them.

Careful: nations & religions manipulate your mind

Something we often warned about here at TPM:

> intergroup competition will tend to favor the spread of any tricks for expanding what members of a group perceive as their tribe.
> Both religions and nations have culturally evolved to increasingly harness and exploit this piece of our psychology, as they create quasi-tribes.

I couldn't agree more.

Look at the jihadists fighting to expand their 'culture'.
Or populist politicians, using tools of political manipulation such as nationalism and ingroup/outgroup dynamics.

This feature of our social psychology holds the key to humanity's future.

Also read:

- **Individual-first self-development**
- Red pill group dynamics

MORE WISDOM

Cultural learning in gender-identity matters

> In fact, children learn their sex roles because they copy same-sex models, not vice versa.

Traditional rational categories are useless

> the processes I've described above actually make classical racial categories even less informative, since they operate in diverse and nonconcordant ways *within* races to make local groups less similar (e.g., lactase persistent and nonpersistent Africans) while at the same time making different continental races more similar

> (e.g., amylase genes in Japanese and Americans). The current evidence indicates that natural selection operates in diverse ways on scales much smaller than races and simultaneously on different continents.

Plus, the author adds, categories are problematic since many variations vary continuously, rather than in discrete boundaries.

However, I wasn't too convinced about this.
The author himself later shows that traditional racial categories *do* say *something*:

> Overall, traditional racial categories capture only about 7% of the total genetic variation in our species, which reveals that races are nothing like the subspecies found in chimpanzees. Given our global distribution and range of environments, our species genetic variation is actually rather limited.

Of course as they stand they may be 'nothing like chimpanzees subspecies'.
But one may categorize people differently than 'traditional racial categories' and capture a higher genetic variation.

Placebos work based on culture

Redacted for brevity:

> placebo treatments for ulcers in Germany are twice as effective (…) Meanwhile, lower blood pressure placebo does not work in Germany.
> Germans worry a lot about low blood pressure (…) so the placebo effect may be inhibited by this culturally transmitted concern.

Intergroup competition maximizes internal cooperation and norms

> Under threat, increased sanctions (…) may have favored an unconscious innate response to cling more tightly to our social norms and groups (…)
> This means that cues of intergroup competition should promote greater solidarity and identification with one's group, as well as stronger norm adherence.

Shame displays keep us within the group

After breaking a norm or offending the wrong person, shame displays and submissiveness sub-communicate that we do accept the social norm, and that we're sorry for breaking it.

Plus, it indirectly requests to 'be lenient' on the rule breaker.

Start deliberations with the lowest-ranking members first

Or you'll never hear their voice and ideas, as they either don't speak up, or conform with the higher-ranking speakers.

Prestige -and society's success- depends on what's a 'valued domain'

> prestige derives from success, skill, or knowledge in locally valued domains.
> While not infinitely malleable, what constitutes a valued domain is amazingly flexible. The differential success of societies and institutions will hinge, in part, on what domains are valued.

Norm-followers are more selfless if the social norms support pro-sociality

A study showed that norm-followers gave more Dictator Games, contributed more in the Public Goods Game, and punished low offers more frequently in the Ultimatum Game -pro-social dominance- (redacted for brevity):

> Observance of a costly nonsocial rule, like waiting at traffic lights, is linked to complying with, and punishing, social norms in behavioral games.
> (…)
> It's our automatic norm following—not our self-interest or our rational calculation—that often makes us do the "right thing" and allows society to work.

First learn the rules, THEN you can strategize around them

> in humans you first need to acquire the social norms and rules governing the world you are operating in, and only then is strategic thinking useful.

We have several resources here to learn the game and then strategize accordingly, including:

- Social exchange
- Social Exchange Practical Takeaways
- Sexual marketplace
- …

QUOTES

On human dominance demanding an explanation:

> we are the ecologically dominant species on the planet. Yet, they open the question of why us? What explains our species' ecological dominance? What is the secret of our success?

We were too powerful for the animals who didn't evolve to cope with us:

> African and Eurasian megafauna evolved to recognize that while we appear rather unintimidating, and perhaps easy prey given our lack of claws, canines, venom, and speed, we come with a dangerous bag of tricks, including projectiles, spears, poisons, snares, fire, and cooperative social norms that make us a top predator.

On the 'unfair exchange' between explorers and Intuits:

> Ross (…) enthusiastically learned about Inuit hunting, sealing, dogs, and traveling by dog sledge. In return, the Inuit learned from Ross's crew the proper use of a knife and fork while formally dining.

Poking some fun at economists and their sometimes non-psychologically-informed models:

> The difference in the results from each version surprised the economists who designed the experiment (though, admittedly, many economists are pretty easily surprised by human behavior)

On academia power hierarchies (you can't say the author hasn't a knack for a good joke):

> Maciej Chudek, Sue Birch, and I tested this prestige idea more directly. Sue is a developmental psychologist and Maciej was my graduate student (he did all the real work)

And:

> I teamed up with my colleague Jess Tracy, an emotion and social psychologist, and our then junior colleague Joey Cheng (who did all the hard work).

The best antidote for pseudo-science:

> The best antidote for pseudoscience is real science
> (…)
> What we need is more evolution-grounded science on genes, culture, ethnicity, and race, not less.

On what fuels the power of the collective brain:

> If you want to have cool technology, it's better to be social, than smart

On the power of the collective brain:

> We are smart, but not because we stand on the shoulders of giants or are giants ourselves. We stand on the shoulders of a very large pyramid of hobbits.

CRITICISM

As always, this section is in the spirit of providing some possible pushback to hopefully further advance my/our understanding:

Toddlers VS Apes: Does It Prove We're Not Smarter?

The author convinced me that our intelligence alone can't explain our success.

However, I was *not* convinced by human toddlers 'losing' to apes.

I listened to these comparisons and struggled to give it a fair chance to persuade me.
I was only impressed by how some thought toddlers fairly represented human intelligence.

The test to assess 'Machiavellianism' was unconvincing -no construct validity-

After humans lost an experiment against apes, the author suggests that apes are more Machiavellian than humans.

The test was a 'Matcher and Mismatcher in an Asymmetric Matching Pennies Game'.

Again, I'm prone to agree with the author that the 'Machiavellian intelligence hypothesis' is severely weakened in light of his evidence and logic.

But NOT because of the humans VS apes experiment.
Humans failed because they look for patterns, which is a feature extremely helpful in many other cases.
I didn't find the experiment to be a valid test for Machiavellianism -or manipulation-.

High-Status Men's Charity Explanation Unconvincing

The author claims that high-status men -think Warren Buffett or Bill Gates- do charity to encourage others to do the same, and gain by living in more charitable societies.

It's an interesting take and it's probably part of the motivation.

However, I don't believe it's the *main* factor.

The main factors, I believe, are virtue and value-signaling for:

- Status and mating
- Legacy and power-projection after death for enduring influence
- Influence by picking the 'right' causes
- Simple good feelings that come with giving

Does Roger's Paradox Undermine Cultural Learning?

From the *Cambridge Handbook on Evolutionary Perspectives*:

> This phenomenon became known as Rogers' paradox" (…).
>
> The fact that social learning does not enhance average population fitness is not inherently paradoxical, but does contradict the common claim that humans are so ecologically and demographically successful because of transmitted culture.
>
> Rogers' paradox occurs because the success of social learning is frequency dependent.
> When rare, social learners do well because they forego the costs borne by individual learners. But when common, and environments change, social learners will be copying other social learners' outdated information.
>
> At equilibrium, social and individual learners have equal fitness, which will be equal to the fitness of a population entirely composed of individual learners (which is fixed, because their learning is not dependent on others). Thus, social learning evolves, but does not enhance fitness in a way that could be described as the "secret to our success."

But Mesoudi himself later explains why this is not a real paradox:

> However, transmitted culture can enhance the average fitness of a population when:
>
> (1) individuals learn selectively, only copying others when individual learning is inaccurate or selectively copying successful individuals; and/or
>
> (2) socially learned traits can be accumulated over successive generations such that individuals can learn socially what they could never invent alone: this is the cumulative culture noted above (Boyd & Richerson, 1995; Enquist et al., 2007; Kendal et al., 2009).

Furthermore, I'd add: who says that social learners will always copy *everything*, including the outdated and ineffective parts?

Rogers' model assumes a basic form of social learning — simple copying — but human social learning is often strategic, evaluative, and flexible.

That is where human intelligence may kick in, and smart learners may be able to reverse engineer *why* what they do works, retaining what works and discarding what doesn't (and potentially improving along the way).

CONS

- **Clarification on ingroup-outgroup may be confusing**

Says the author:

> this approach means that the in-group versus out-group view taken by psychologists misses a key point: not all groups are equally salient or thought about in the same way

I don't think anyone ever said that all groups are the same.
The ingroup/outgroup concept instead come out *reinforced* with the author's contributions.

- **It may indirectly over-promote 'folk wisdom' against science**

The author lists impressive rituals to show that cultural evolution leads to effective solutions.

I bet that is the case, but I wouldn't want people to over-trust the 'wisdom of the crowds' or 'wisdom of the ancients'.

The author knows this: one may as well list elaborated rituals that are not effective, or even harmful.

One quick note on this may have prevented confusion.

REVIEW

The Secret of Our Success is a paradigm-shifting book on human nature and evolution.

For decades, Darwin's genetic evolution was seen as the sole driving force behind evolutionary processes and shaped much of evolutionary psychology thinking.
As decades of further research and refinements deepened our understanding of gene-centric evolution, it also *entrenched* the gene-centric narrow focus.

But we may now be at a turning point.

The groundbreaking work of bright thinkers like Joseph Henrich and Robert Boyd presents a compelling case for a broader perspective—one that includes **cultural** evolution as a critical driver of human development.

Henrich's insights on cultural evolution don't just reshape how we think about evolution and psychology; they have even deeper implications for the *future* of civilization and human progress.

While there wasn't much we could do about genes in the short term, there is much we can do to maximize our culturally-driven process.

Let's Keep Fueling the Secret of Our Success

Human success thrives on global cooperation, shared knowledge, and the collective progress that comes from building on each other's contributions.

At TPM, we believe it's our responsibility to uphold and advance this path—standing firm against the forces of populism, tribalism, and destructive, short-sighted, lose-lose selfishness.

APA Handbook of Nonverbal Communication: Summary & Review

Lucio Buffalmano · 11 February 2025 · Archived copy · Original

The *APA Handbook of Nonverbal Communication* (2015) is a comprehensive, research-backed guide exploring the empirical findings, research methods, and applications of nonverbal behavior.

Contents

- SUMMARY
  - What's nonverbal communication
  - Signs she likes you
  - Status and dominance cues
  - Cultural VS universal nonverbal behavior
  - The 7 basic facial expressions
  - People differ in nonverbal sensitivity & skills
  - Environmental effects on socialization
  - Gender and nonverbal behavior
  - Appearance and Physiognomy
  - Touch (haptics)
  - Posture
  - Gait
- MORE WISDOM
- Practical Takeaways
  - Signal power
  - Quit carnivore, eat vegetables & Fruits
  - Use gestures & aim for moderate level of expressiveness

- ⍰⍰♂ Lucio's Analysis
- PROS
- REVIEW

SUMMARY

About the Author:
Various authors with different experts curated different chapters. The editors-in-chief are:
David Matsumoto, PhD specializes in culture, emotion, and nonverbal behavior. He is a professor at San Francisco State University and director of the Culture and Emotion Research Laboratory
Hyisung C. Hwang, PhD with research interests in emotion, nonverbal behaviors, and facial expressions. She is an adjunct professor at San Francisco State University
Mark G. Frank, PhD, focusing on facial expressions, emotion, and deception. He is a professor at the University at Buffalo, SUNY

What's nonverbal communication

The definition for the APA Handbook is:

> Nonverbal Communication (NVC) is the transfer and exchange of messages in any and all modalities that do not involve words.

As such, NVC encompasses almost all of human communication except the spoken or written word.

Channels of nonverbal communication

1. **Physical Environment**: How surroundings influence nonverbal interactions.
2. **Appearance and Physiognomy**: The impact of physical appearance on communication.
3. **Facial Expressions**: Insights into how facial cues convey emotions and intentions.
4. **Olfactics and Odor**: The role of scent in conveying messages.
5. **Voice (Paralanguage)**: The significance of tone, pitch, and other vocal elements.
6. **Gesture**: The meanings and functions of hand and body movements.
7. **Eye Behavior and Gaze**: The communicative value of eye contact and movement.
8. **Posture, Gait, Proxemics, and Haptics**: How body orientation, movement, personal space, and touch influence interactions.

Signs she likes you

Women's romantic interest signals can be gauged with nonverbal cues, including:

- **Early nonverbal signaling** to invite an approach (Grammer, Kruck, Juette, & Fink, 2000) attracting attention by displaying openness to interaction via:
  - laughing
  - head tossing
  - grooming behaviors
  - self-touching or caressing objects
  - keeping time to music (Guéguen, 2008; Scheflen, 1965)

- **Leaning toward**

- **Self-touch** during the initial stages of flirting, and before contact is initiated (Moore, 1995; Scheflen, 1965)
- **Shoulders parallel to him**
- **Facial redness**: a woman signals interest in a romantic partner with her face through increased blood flow to the face resulting in cheeks blushing
- **Being closer**
- **Swelling of the lips** which makeup mimics, (McKinney & Sprecher, 1991), and
- **Brief touch**, particularly on the knee
- **Pupil dilation—**which studies show makes a woman look more attractive (Hess, 1965)

Status and dominance cues

Gaze, eye contact & visual dominance

Visual dominance is defined as the ratio of looking while speaking to looking while listening (Exline, Ellyson, & Long, 1975).

- **High-status subjects spend equal time looking while speaking and listening**: they had ratios close to 1 (equal time spent looking while speaking and while listening)
- **Low-status subjects looked more while listening** and less while speaking (Ellyson, Dovidio, Corson, and Vinicur, 1980)
- **Dominant men behaved similarly to high-status men**: subjects who scored high on a trait measure of dominance gazed similarly to high-status subjects. This suggests that stable trait dominance and more fluid role-based dominance both influence eye gaze behaviors.
- **High expertise and high reward power had the same effects**, including for women: Both men and women in lower status conditions looked more while listening than while speaking, producing a relatively low visual dominance ratio (Dovidio, Ellyson, Keating, Heltman, Brown, 1988)
- **Dominant individuals look less at subordinates** while listening to them speak (Exline, Ellyson, & Long, 1975)
- **Dominant men can use intense eye contact as a tool for compliance**: dominant group members can use eye contact as a tool to encourage subordinates to behave appropriately
  - **Students in a classroom behave more when reprimanded with direct gaze** (Van Houten, Nau, MacKenzie-Keating, Sameoto, & Colavecchia, 1982)
  - **Direct gaze more directly sub-communicates power**: individuals (particularly men) who engage in more direct gaze are rated as more dominant (Hillabrant, 1974; Thayer, 1969) or powerful (Dovidio & Ellyson, 1982).

- **People look more at high-status men**: participants look toward high-status males more than low-status males or females (Maner, DeWall, & Gailliot, 2008)
- **Subordinates avert eye contact when looked at by dominant members** (Ellsworth, Carlsmith, & Henson, 1972).
- **Dominant individuals judge others as less dominant**: men who score higher on the Dominance subscale of the International Personality Item Pool (Goldberg, 1999) are less likely to perceive masculinized men's faces as more dominant (Watkins et al., 2010). Similar results have been shown for women with high dominance scores viewing masculinized women's faces (Watkins et al., 2012).
- **Men and especially high power men look at their interaction partner more while talking than listening** compared to most other people (Dovidio et al., 1988).
  Women tend to do the opposite

High-power men talk more

- **High power men are more talkative**. Research initially showed that men tend to be more talkative than women (Leaper & Ayres, 2007), but recent findings suggest tendency is moderated by men's situational sense of power (Brescoll, 2011). In other words, high power men are more talkative, but:
  - Low-power men talk less: men's tendency to surpass women in talking time (i.e., volubility) tends to disappear when men are experimentally induced into a low-power mindset.

See later for 'intrusive interruptions' ⍰

Dominant Men Touch Others More

> More dominant men will touch others more, and will invade personal space more, than less dominant men (Knapp & Hall, 2010).

Dominant posture is expansive

Posture is often described along these dimensions:

- Compact VS expansive
- Relaxed VS fidgety/anxious
- Positive VS negative

Compact/expansive and relaxed/anxious have generally been associated with social confidence and social power.

The authors say:

> Body openness in adults is positively related to dominance (J. A. Hall, Coats, & LeBeau, 2005), and research on children reveals that one of the key differences between dominant and submissive individuals is body expansiveness (Weisfeld & Beresford, 1982)

People have a personal space they 'protect'

Violations of culturally appropriate social boundaries make others uncomfortable (Sussman & Rosenfeld, 1978), including feelings of loss of personal control, and privacy (Greenberg, Strube, & Myers, 1980).

People will also change their body orientation away from you, or even deploy buffers (such as books or briefcases) to demarcate territory (Hayduk, 1983).

Cultural VS universal nonverbal behavior

The authors claim that cultures create overall and context-specific norms to facilitate social coordination and avoid social chaos in socially complex environments.

All cultures suppress or play up some expressions in some contexts:

> all cultures reported that they suppress their expressions in some contexts, exaggerate their expressions in others, and express their feelings as is in others. Individuals of all cultures had a display rule norm for greater expressivity toward ingroups than toward outgroups.

But when and how to suppress or exaggerate expressions changes.
And we can find some broader demarcation lines with collectivistic VS individualistic cultures:

> Collectivistic cultures were associated with less expressivity overall than individualistic cultures, suggesting that overall expression management for all emotions is central to the preservation of social order in these cultures

Individualists express emotions to their ingroup members while collectivist ones suppress them even with ingroup members.
With the outgroup, individualists show less negative and more positive emotions, while collectivists do the opposite.

A Typology of Broad Cultural Differences in Nonverbal Behaviors

Channel	Type of cultural norms	
	Expressive	Reserved
Face	Animated facial expressions, frequent displays of emotions, use of face to amplify and illustrate speech	Fewer facial expressions, less emotions, more controlled expressions, less animated expressions
Gesture	More speech illustrating gestures, larger motions, higher frequency of emblem usage	Fewer speech illustrating gestures, smaller motions, lower frequency of emblem usage
Voice	Louder voices, larger range, higher speech rates	Softer voices, diminished range, lower speech rates
Gaze	More direct gaze during interactions	Less direct gaze during interactions
Interpersonal space and touch	Closer distances in interaction, more frequent touching	Farther distances in interaction, less frequent touching
Posture	More relaxed, open postures	More rigid, closed postures

There are also some differences in the use of context VS body language when the messages were discordant:

> American judgments were more influenced by faces, whereas Japanese and South Korean judgments were more influenced by context.

However, when facial expressions and context were congruent, everyone agreed.

Women's pitch change with changing culture

Cultural and social factors influence voices, and women in the West lowered their pitches in the last decades:

> Women in the West (e.g., Europe, United States) started to speak with lower pitches over the last 40 years or so: This has been suggested to follow the increased profile of women in the workplace, often in shared environments with men (Karpf, 2007).

But elsewhere, like women in Japan, didn't lower their pitch (Loveday, 1981; van Bezooijen, 1995).

Power and status displays vary by culture

> Cultures differ according to whether they encourage or discourage power and status differences in a hierarchy, with hierarchical cultures affording power to status, but egalitarian cultures not (Hofstede, 2001; Schwartz & Bardi, 2001).

But I'd bet that higher-status and higher-power individuals still fare much better than lower ones.

And we may be 'universalizing' body language

And, the authors suggest, we may see a growing convergence of nonverbal communication signaling and reading:

> These results are likely being driven by the strong influence of mass media around the world (…) where people can view the behaviors of others of different cultures and learn how to decode behaviors. These technologies may be helping to homogenize gestures into a worldwide emblem dictionary, and if so, it may be only a matter of time that a homogenized, universal set of emblematic gestures replaces culture-specific ones.

Also read:

- Is intercultural communication a waste of time?

Spacial proxemics: same 'categories', but different cultural 'sizes'

Hall's (1966, 1973) classic work specified four levels of interpersonal space use depending on social relationship type:

1. Intimate
2. Personal
3. Social
4. Public

The size of each differs among cultures, but people of *all* cultures appear to use space according to these four distinctions.

Equally interesting, non-native English speakers spoke in English, they adopted the American conversational distance compared.
Thus, it seems that people 'naturally adapt'.

The 7 basic facial expressions

Strong evidence supports the universal recognition of seven facial expressions of emotion:

1. anger
2. disgust
3. fear
4. happiness
5. sadness
6. surprise
7. contempt

All rights to David Matsumoto

And the interpretation of intensity is also universal:

> Not only are the seven universal facial expressions panculturally recognized (Elfenbein & Ambady, 2002; Matsumoto, 2001) but there is pancultural similarity in judgments of relative intensity among faces; that is, when comparing expressions, people of different countries agree on which is more strongly expressed (Ekman et al., 1987; Matsumoto & Ekman, 1989).

Subsequent studies also add potential new expressions, like pain (LeResche, 1982; Prkachin & Craig, 1995), anxiety (Perkins, Inchley-Mort, Pickering, Corr, & Burgess, 2012), and sexual excitement (FernandezDols, Carrera, & Crivelli, 2011).

And recent studies provided evidence the similar body movement can signal different emotions.
For example, smiling can signal embarrassment, amusement, shyness, sensory pleasure, elation, contentment, and relief (Ambadar et al., 2009; Campos, Shiota, Keltner, Gonzaga, & Goetz, 2013; Keltner, 1995: Keltner & Buswell, 1997; Krumhuber & Scherer, 2011; Ricci-Bitti, Caterina, & Garotti, 1996).
But also pride (Tracy & Robins, 2004) and triumph (Hwang & Matsumoto, 2014a, 2014b; Matsumoto & Hwang, 2012).

How people interpret facial expressions

Facial expression program (facial expressions of emotion)	Behavioral ecology view (signification of intent and verbal equivalent)
"Felt" (Duchenne) smile (readout of happiness)	Readiness to affiliate or play ("Good to see you," "Let's play [keep playing]," or "Let's be friends")
"False" smile (feigned happiness)	Readiness to appease ("Whatever you say," or "I give in")
"Sad" face (readout of sadness)	Recruitment of succor ("Take care of me," "Hold me," or "Look at what you [he/she] did to me")
"Anger" face (readout of anger)	Readiness to attack ("Back off or I'll attack")
"Leaked" anger (inhibited anger)	Conflict about attacking ("I want to attack and I don't want to attack" or "I'm close to attacking you")
"Fear" face (readout of fear)	Readiness to submit or escape ("Don't hurt me!" or "I see what you want!")
"Contentment" face (readout of contentment)	Readiness to continue current interaction ("Everything [you're doing] is just fine")
"Contempt" face (readout of contempt)	Declaration of superiority ("I can't even bother with you," or "You're not worth the trouble")
"Poker" face (suppressed emotion)	Declaration of neutrality ("I'm taking no position [on what you're doing/saying]")

People differ in nonverbal sensitivity & skills

> Nonverbal sensitivity is conceptualized as an individual difference variable (Rosenthal, 1979).

The most important interpersonal cues include:

- cues of **emotion**;
- cues of **dominance** or **status**
- cues about **attitudes**, intentions, and interpersonal orientation (likes and dislikes, desire to terminate an interaction, etc.)

And reading these cues is important for social skills, including empathy and emotional intelligence:

> It is assumed that nonverbal sensitivity is an important contributor to the concept of empathy, with ability to read others' emotions critical for empathic understanding (Riggio, Tucker, & Coffaro, 1989), and nonverbal sensitivity is seen as one of the building blocks of good interpersonal relationships.

For example, doctors scoring higher on the Profile of Nonverbal Sensitivity (PONS) had more satisfied patients (DiMatteo, Friedman, & Taranta, 1979).

Women in general tend to score higher on measures of nonverbal sensitivity.

Environmental effects on socialization

- **Good smell makes people more sociable** favorable environmental smells enhance sociability in nonverbal exchanges, negative smells frequently interfere with prosocial intentions (but see Bonini et al., 2011)
  - Pleasant ambient odors also encouraged spontaneous helping behaviors (Guéguen, 2012b) as well as social approach behaviors defined as providing a phone number to a potential suitor (Guéguen, 2012a).

- **Noise enhances aggression**, especially in angered individuals (e.g., Donnerstein & Wilson, 1976; Konecni, 1975)
  - Introverted individuals seem more easily affected by environmental noise than extroverts (Davies & Hockey, 1966; Elliott, 1971).

Dim your lights for dating – *at the right time*

But only do it if there is already a good vibe!

While dimmer lighting can foster an atmosphere of intimacy (Carr & Dabbs, 1974; Lecomte, Bernstein, & Dumont, 1981), and loosen social inhibition (Hirsh, Galinsky, & Zhong, 2011; Page & Moss, 1976), the timing must be right or it backfires.

When people feel it's inappropriate they maintain a greater physical distance (L. Adams & Zuckerman, 1991) and/or reduce the amount of mutual eye gaze (Carr & Dabbs, 1974).

Also see:

- **How to create a seductive environment**

Gender and nonverbal behavior

Gender is an important line of demarcation when it comes to nonverbal behavior, but it's only one in many variables to consider:

- **Both men and women strive to "do gender" well** so as to avoid being perceived as gender deviant (e.g., West & Zimmerman, 1987)
- **Gender-normative behavior is situational**, increasing with:
  - Number of people present
  - Sex composition, increasing with more opposite-sex individuals
- **Women smile more** BUT,
  - Larger difference with observers present (M. LaFrance, Hecht, & Paluck, 2003)
  - Older women smile as much as men gender differences are absent among young children, largest among adolescents, smaller in adults, and all but disappearing after late middle
  - Larger difference with social tension: when observed by others, when instructed to get acquainted, when self-disclosing, and when experiencing embarrassment (M. LaFrance et al., 2003).
  - Larger differences with Caucasians compared to black: Ethnicity also plays a role in U.S. samples, with Caucasians exhibiting larger differences (r = .22) than African Americans (r = .13; M. LaFrance et al., 2003)
  - Testosterone mediates smiling and men with high testosterone smile less than those with low testosterone (Dabbs, 1997).
- **Men interrupt more**, but less so in two-person encounters (Anderson & Leaper, 1998) and with larger differences in
  - Mixed groups- rather than same-gender groups or dyads.
- **Women are more accurate in producing and conveying nonverbal cues**, potentially because women are more expressive in general while men suppress overt displays of emotion
- **Self-identification may matter more than gender** ie.: the degree to which a person self-identifies as feminine, appears predict decoding accuracy more than biological sex—but little research has seriously tested this idea
  - **Self-identification predicts encoding accuracy** ie.: the degree to which a person identifies as feminine appears to predict encoding accuracy in both men and women
- **Androgynous males are more emotionally expressive** than "masculine" men (Narus and Fischer, 1982)
- **High-power men engage in more 'high-visual dominance'**: men gaze more at their interaction partners while

speaking than while listening and especially when in high-power positions. Women do the opposite, gazing at their partners more when listening than when speaking (Dovidio et all., 1988)
  - Power mediates the difference: both sexes sometimes show visual dominance when they are in high-power roles (Ellyson, Dovidio, & Brown, 1992)

- **Pride expression includes an expanded posture** with head tilted back, arms akimbo, and a low intensity smile on the face. It has been reliably recognized in adults across cultures and in children as young as 4 (Tracy & Robins, 2008; Tracy, Robins, & Lagattuta, 2005).

- **There is no clear evidence that women are more emotional**: women are more *expressive* of their emotions, but both genders feel the same.
  Men report experiencing the same emotions to the same extent (Barrett, Robin, Pietromonaco, & Eyssell, 1998; Kring & Gordon, 1998; Robinson, Johnson, & Shields, 1998), and studies comparing the physiological reactions of men and women have found that, if anything, men's physiological responses to emotion-inducing events tend to be stronger than women's (Kring & Gordon, 1998)

- **Touching behavior is highly contextual**
  - Younger men and older women touch more: For dyads younger than 30 years of age, male-initiated touch dominates, but the opposite (more female-initiated touch) is observed for dyads older than 30 years of age J. A. Hall & Veccia, 1990; Willis & Briggs, 1992; Willis & Dodds, 1998)
  - Men in non-intimate and women in intimate relationships touch more: Males initiate touch more than females when the relationship is nonintimate and in public. Among married couples, wives touch husbands more (Smith, Vogel, Madon, & Edwards, 2011)
  - Man:man touch the least, woman:woman touches the most: female-female dyads exhibit the highest levels of interpersonal touch and male—male dyads the lowest
  - Men are less comfortable with same-sex touch, especially men who self-reported homophobia, and homophobic attitudes are higher in men than in women, thus initiating less touching (Roese et al., 1992)
  - Women self-touch more (r = .22; J. A. Hall, 1984; McCormick & Jones, 1989) but *particularly in the context of cross-sex flirting interactions* (Moore, 1995; Scheflen, 1965)

- **Women face the speaker more** although this effect is smaller than other gender differences
  - Flirting men and women face each other: the difference disappears in courtship and flirtation, where men and women both face each other (Fichten et al., 1992)

- **Women head-nod more**

- **Men are more fidgety**, But:
- **Women self-touch more** (r = .22; J. A. Hall, 1984; McCormick & Jones, 1989) particularly in the context of cross-sex flirting interactions, where women self-touch during the initial stages of flirting, and before contact is initiated (Moore, 1995; Scheflen, 1965)

- **Women lean in more** towards their interaction partner (r = .16; J. A. Hall, 1984; HelwegLarsen, Cunningham, Carrico, & Pergram, 2004)

- **Men adopt larger interpersonal distances** with interaction partners (r = .27; 17 studies in J. A. Hall's, 1984, meta-analysis) and it's at maximum in male—male dyads. This has been shown cross-culturally

- **Women mirror more than men**: in same-sex dyads, feminine (i.e., sex-typed) women body mirrored significantly more than same-sex dyads of masculine males (M. LaFrance and Ickes, 1981)
  - Androgynous men mirror the most

- **Men adopt more expansive and 'high-comfort' poses**, with relaxed postures (i.e., asymmetrically arranged arms and legs; r = .33) and expansive body postures (i.e., limbs reaching farther away from the body; r = .46; J. A. Hall, 1984).
  Women take more restricted postures with legs close together and arms close to the torso

- **Women notice adjacent intrusions, men frontal ones**: women were more affected by an immediately adjacent intruder, men by an intruder directly opposite them (Fisher & Byrne, 1975).
  Women were more likely to put their books and personal items adjacent to them, whereas men put their books and materials directly opposite them

- **Men speak louder than women** (J. A. Hall, 1984; Schmid Mast & Sczesny, 2010)

- **Men have more 'speech disturbances'** such as filled pauses—"ah," "um," or incomplete sentences

- **Women use more 'back channeling'** while listening to others (J. A. Hall, 1984; Leaper & Robnett, 2011).

- **Men interrupt more**, but the difference is larger (r = .08 vs r = .16) when considering:
  - **Men use more 'intrusive interruptions'** to interrupt others' speech to take over the conversation, sometimes referred to as intrusive interruptions, rather than merely speaking at the same time as another person (Anderson & Leaper, 1998)
  - Men use more interrupting *statements* (assertive) (M. LaFrance and Carmen, 1980)
  - Women use more interrupting *questions* (responsive) (M. LaFrance and Carmen, 1980)
  - Men interrupt more in groups, men make more intrusive interruptions especially in mixes group settings (i.e., more than two interacting partners; r = .30; Anderson & Leaper, 1998) with a negligible difference for dyads (r = .06).
    (r = .30 in same-sex and r = .06 in mixed-sex groups for intrusive interruptions, and r = .01 in same-sex and r = .08 in mixed-sex groups or dyads for overall interruptions; Anderson & Leaper, 1998)

- **Women sway hips, men swagger shoulders**, and it is these perceptions that aid in the inference of the gender of a walking target (Johnson & Tassinary, 2005)

- **Women cry more** (Bekker & Vingerhoets, 1999, 2001; Vingerhoets & Scheirs, 2000), consistent across several cultures, even though the magnitude of the difference differs (Becht, Poortinga, & Vingerhoets, 2001).

In children younger than 8 there is no difference, or even boys crying slightly more. Why this divergence happens has been the subject of considerable debate

- **Women are more subtle flirting** to potentially deny having sent any indicator of interest.
  That's why both males and females are more accurate at deciphering when a man is being flirtatious than when a woman is (Grammer et al., 2000; Place et al., 2009).

Nonverbal behavior/domain	Gender difference	Moderator(s)
Encoding accuracy	W > M	Age; channel (face vs. voice)
Encoding accuracy	W > M	Gender; filtering context; target gender; specific emotion expressed
Smiling	W > M	Age; context (instructed vs. expressive task, social vs. only psychological gender, country, race
Gaze (general)	W > M	Gender composition of dyad; psychological gender
Visual dominance	W > M	Power mindset/status
Touch	W > M	Age; relationship type; gender composition of dyad; type of touch (e.g., hand vs. nonhand)
Self-touch	W > M	
Interpersonal distance	W > M	Target gender
Overall relational warmth	W > M	Target gender
Facial expressiveness	W > M	Psychological gender; gender consistent with dyad
Relational closeness (liking)	W > M	
Relational responsiveness	W > M	
Hand gesturing	W > M	
Forward leaning	W > M	
Expansive body posturing	W > M	
Receptive body posturing	W > M	
Smooth rhythm	W > M	
Smooth interactions	W > M	
Visibility	W > M	Power mindset/status
Intrusive interruptions	W > M	Group versus dyadic setting; gender composition of group or dyad; relative status of participants (instrumental vs. expressive tasks); psychological gender
Filler pauses	W > M	Gender of interlocutor (vs. expressive tasks); psychological gender
Fluency	W > M	
Sociable behaviors	W > M	Sexual orientation
Blushing (general)	W = M	
"Correct" blushing	W > M	
Crying frequency	W > M	Age

Psychological gender may matter more than biological gender

Most casual readers and commentators may take the above differences as evidence for biological differences.

Instead, suggest the authors, they may as well be the evidence for psychological self-identification:

> psychological gender may be more critical than biological gender.
> In other words, nonverbal behaviors may often be telltale indicators of femininity and masculinity rather than manifestations of biological femaleness and maleness.
> The critical issue may thus be the degree to which any male or female personally subscribes to societal definitions of masculinity and femininity. In some cases, psychological gender dovetails with biological gender

Albeit this obviously doesn't deny the important role of biology, I think it's a great point and several pieces of evidence indeed support this view.

Attractiveness Is Gender-Linked: Fertility & Dominance

> Fertility seems to apply exclusively to females, and dominance exclusively to males.

Some other traits apply to either both genders or lean more towards one gender:

> Health applies equally to both genders, but signals of availability also seem to favor females over males, as females are the limiting sex

Also see:

- **The traits of attraction and mate value**

Appearance and Physiognomy

- **Attractive people are viewed more positively** in general, a phenomenon known as the attractiveness halo effect (Dion, Berscheid, & Walster, 1972).
- **Greater homogeneity in skin texture is attractive** (Fink, Grammer, & Thornhill, 2001)
- **Light-skinned women are more attractive**: Preferences for light skin in women have been found across cultures (Coetzee et al., 2012; van den Berghe & Frost, 1986) and may reflect the need for increased Vitamin D synthesis Jablonski & Chaplin, 2000)
- **Average-weight faces are more attractive**: Faces rated as average weight were perceived as healthier and more attractive than those rated as underweight or overweight (Coetzee et al., 2009). Adiposity mediates the relationship between attractiveness and immunocompetent. Adiposity serves as a cue to attractiveness via its strong relationship with health and immunocompetence—a heritable genetic trait that can be passed to offspring

Physiognomy: appearances can tell you something

First off: the correlation between appearance and personality is small, so don't jump to conclusions:

> Reported correlations between personality judgments are usually minor to moderate (with the most striking correlation coefficients reaching 0.2-0.4, and most falling below this range; Zebrowitz & Collins, 1997).

But they exist nonetheless, especially in some traits.
There are four possible mechanisms through which facial appearance and personality converge:

1. **Biological causes for both appearance and personality**: Genetics or hormones influence both facial appearance and personality traits.
2. **Environmental cause for both appearance and personality**: Life experiences and surroundings shape both personality and facial features over time.
3. **Facial appearance shapes personality**: People may develop traits based on how others react to their looks.
4. **Personality shapes facial appearance:** Expressions and habitual behaviors gradually influence facial features.

Among the findings shared in the book:

- **People consistently judge characters from faces** there is consistency in judgments of personality from faces
- **People's judgments of personality from faces may be accurate** Many studies have now shown that perceptions of personality drawn from single face images, short videotapes, or very brief personal encounters align with the target's self-reported personality (Ambady, Hallahan, & Rosenthal, 1995; Berry, 1990; Bond, Berry, & Omar, 1994; Borkenau & Liebler, 1992a, 1992b, 1993a, 1993b)
- **Faces hold cue of future (workplace) success**: Several studies, focusing largely on leaders' faces, examined correlations between attributions of faces and objective measures of workplace success. Business leaders' success is correlated with perceptions of dominance and power drawn from images of their faces (Rule & Ambady, 2008b, 2009).
  Other studies found relationships between perceived power and success among managing partners of law firms (Rule & Ambady, 2011)
  And judgments of dominance and competence from political candidates' faces correlate with electoral success (see Olivola & Todorov, 2010, for review).
- **Judgments of power and babyfacedness predict success in terms of business and political leadership**. Youthful and friendly (AKA babyfacedness) make one appear weak and incompetent (ZebrowitzMcArthur &

Apatow, 1984) AND reduces the likelihood of attaining leadership positions in politics (Zebrowitz & Montepare, 2005), and are detrimental to business leaders (Rule @ Ambady, 2008b)

- **Republican faces are viewed as more powerful**: Using facial stimuli of American politicians (cropped tightly around the outer edge of the hair), Rule and Ambady (2010) found that faces of Republicans were viewed as more powerful

- **Political attitudes and affiliations can be guessed by appearances**: German and Swiss perceivers correctly judged left- or right-wing affiliation from the faces of Swiss and German participants, respectively (Samochowiec, Wanke, & Fiedler, 2010).
  Ratings of dominance predicted both perceptual and actual political affiliation, with more dominant looking people tending to have right-wing affiliations (Samochowiec et al., 2010)

- **People could recognize ethnicity**: empirical studies investigated whether Jews could be distinguished by appearance (Allport & Kramer, 1946; Elliott & Wittenberg, 1955; Lindzey & Rogolsky, 1950; Pulos & Spilka, 1961).
  Two recent meta-analytic reviews of this research found that people were able to accurately categorize Jews and non-Jews from still facial photographs alone (Andrzejewski, Hall, & Salib, 2009; Rice & Mullen, 2003), and one study found that similar effects still apply in modern times (Andrzejewski et al., 2009).

Nonverbal behavior & personality

	Nonverbal behavior			
Personality trait	Face	Voice	Body	Overall
Extraversion				
	More smile	More loud/high	More dominant	Attractive
	Friendly expression	Fast rate	Less posture	Believed to be likeable (good-natured)
	Less neutral expression	Powerful voice	More hand/leg movement	Perceived positively
	Smiling	Powerful voice	Less posture	
	More "social" face	Quiet voice	Fast/Energetic walking	
	Generally dominant	Fast speech	More smiling	
	More open mouth	Rhythmic voice	Upright posture	
Neuroticism				
	Less friendly expression	More sonorous/rich/pleasant	Weak handshake	Unattractive
	Round face	Soft voice	Fewer expressive gestures	Poorly proportioned body
		Less nasal voice		More negative personality
Agreeableness				
	More smile	More pitch	More head movement	Attractive
	Baby-faced	Fewer conversational interruptions	Less gesturing	More warmth
	Friendly face			Higher overall level
	Less social dominance			More cheerful
	More social attention			More equipotential interaction
	Fewer negative body expressions			More positive expressivity
Conscientiousness				
	More distinctive gaze	Powerful voice	More self-confidence/vigor	Attractive
		More loud speech	Fast/Energetic	Believed to be likeable (good-natured)
			Less hand movement	Less hostility
				Less hostility
				More equipotential interaction
Dominance/Extraversion				
	More social attention	Dominant	More dominant	Bad personality
		Gay speech		Younger age
		Less nasal voice		

Facial expressions signal character traits

> Facial expressions signal individual differences, which by their very nature reflect broad tendencies to think and act in a specific fashion.

- **Natural smiles & expressivity signal trust and cooperation**: spontaneously occurring smiles have also been linked to trust, cooperation, and prosocial behavior, and recent research suggests that overall expressivity, not

limited to smiles, may be such a marker (Boone & Buck, 2003; Schug, Matsumoto, Horita, Yamagishi, & Bonnet, 2010).

- **Duchenne smiling predicted relationship satisfaction and multiple measures of personality** (i.e., affiliation, warmth, competence), plus personal well-being, and marital satisfaction at various times over the next 30 years
- **Facial expressions of disgust (and glaring) differentiate Type A or B personalities**,
  - Contempt, anger, and disgust all correlated with various speech indices of hostility, anger, competitiveness, and despondency (Chesney, Ekman, Friesen, Black, & Hecker, 1990)
- **Dominance can be perceived from human faces**, both in terms of physical strength, and dominant behavior

Say the authors (redacted for brevity):

> Masculinizing human faces increases perceived dominance, whereas 'feminizing' them decreases perceived dominance (Boothroyd et al., 2007; DeBruine et al., 2006; Jones et al., 2010; Main, Jones, DeBruine, & Little, 2009; Perrett et al., 1998).
> Masculine and dominant looking faces are perceived as more aggressive and threatening (Oosterhof & Todorov, 2008), and untrustworthy (Stirrat & Perrett, 2010).
> Men with dominant-looking faces have higher social status (Mueller & Mazur, 1996), and people are more likely to follow their gaze (Jones et al., 2010; Ohlsen, van Zoest, & van Vugt, 2013).
> Perceptions of dominance also drive the expectation of anger and contempt (Hess, Adams, & Kleck, 2005), and men with dominant-looking faces act less cooperatively and less trustworthy in real life (Stirrat & Perrett, 2010).

Voice can also signal character traits

Listeners can predict with some accuracy personal characteristics and traits from vocal stimuli, such as:

- Dominance, associated with certain vocal characteristics such as lower pitch (Anderson & Klofstad, 2012).
- Neuroticism (Hu, Wang, Short, & Fu, 2012)
- Extraversion (Scherer, 1978)

Attractiveness & facial masculinity are complex

Male facial attractiveness is less straightforward than women's facial attractiveness:

> The high amount of variation in women's preferences for men's facial masculinity may arise from the differential benefits attributed to masculine and feminine faces.
> A masculine face structure cue genetic benefits, but masculinity is also linked to undesirable traits and aggressive behavior, both perceptually and in real life

Culture and environment may also affect male facial attractiveness, and facial masculinity is favored in cultures where paternal investment is traditionally low, such as rural Jamaica (Penton-Voak, Jacobson, & Trivers, 2004), suggesting that women select mates for genetic benefits when male commitment is unlikely.

That being said, attractive women seem to prefer masculine faces:

> This replicates results from static stimuli demonstrating that attractive women prefer more masculine men (Penton-Voak et al., 2003) and may partly explain the lack of masculinity preferences found in previous studies where observers' attractiveness was not rated. (Morrison et al., 2010).

Finally, adiposity may be a better marker for male facial attractiveness than testosterone:

> Moreover, another recent study found that facial adiposity, not masculinity, mediated the relationship between facial attractiveness and immunocompetence (Rantala et al., 2013). These findings suggest that plastic, flexible cues such as adiposity may be better indicators of immunocompetence than masculinity, a static cue that is invariable after puberty.

Touch (haptics)

- **Touch conveys positive emotion**, closeness, comfort, compassion, intimacy, immediacy, interpersonal closeness, liking, acceptance, warmth, and love (Richmond, McCroskey, & Payne, 1991; Thayer, 1986).
  - Withholding touch can signal an assortment of negative feelings, such as resentment, hostility, anger, or mistrust (Richmond et al., 1991).

- **Men are more likely to interpret touch as communicating affection and sexual attraction**, whereas women are more likely to separate those meanings (Hollender, Luborsky, & Scaramella, 1969; Nguyen, Heslin, @ Nguyen, 1976).

- **More touch = more cooperation in NBA players** and improved performance (Kraus, Huang, & Keltner, 2010).

- **Touch by female wait staff increased tips** offered at restaurants (Ebesu Hubbard, Tsuji, Williams, & Seatriz, 2003).

- **Touch may increase compliance *in some settings***. In one of the first studies (Kleinke, 1977) An experimenter approached the person who next used the phone, asking if he found the money. 96% of the people who were touched returned the money, whereas only 63% of the people who were not touched did.
  Touch also increased compliance to signing petitions and completing research surveys (Patterson, Powell, & Lenihan, 1986; Willis @ Hamm, 1980) as well as complying with a physician's request to take antibiotics (Guéguen et al., 2011).
  - There are likely cultural differences. One study in Poland found that touching by a man of another man when making a request negatively affected the chances for compliance (Dolinski, 2010); the noncompliance was related to homophobic attitudes among the participants.
  - If the costs to the request are high touch doesn't work—for example, donating blood—(Guéguen & Vion, 2009).

- **Self-touching may be indicative of negative affect**, anxiety, withdrawal, hostility, or depression (Mahl, 1968; Mehrabian, 1972).
  - Self-touching behavior is also related to information processing (Barroso, Freedman, Grand, & Van Meel, 1978); language construction (Freedman & Bucci, 1981); Type A behaviors such ambition, rigid organization, status consciousness, impatience (Friedman, Hall, & Harris, 1985), distractability (Barroso & Feld, 1986, Barroso et al., 1978).
    In general, self-touching also signals psychological functioning.

Posture

- **Open body postures communicate more power** (Cashdan, 1998; J. A. Hall, Coats, & LeBeau, 2005).

- **Open arms and legs in a seated position communicate a more positive attitude and openness**
  - arms akimbo (arms on hips) or arms crossed in front of one's body generally are associated with more negative attitudes.

- **Posture can also signal anger, sadness, and happiness**, with some obtaining greater than 90% agreement rates (Coulson, 2004)
  - Anger was conveyed by a backward head tilt, absence of a backward chest bend, no abdominal twist, arm raised forward and upward, and weight transfers either forward or backward
  - Happiness was conveyed by backward head tilt, no forward movement of the chest, and arms raised above shoulder level and straight at the elbow.
  - Sadness was conveyed by a forward head tilt, forward chest bend, no twisting, and arms at the sides.
  - Disgust, fear, and surprise could not be detected beyond chance levels

- **Nonverbal cues reliably signal rapport** across cultures (Bernieri & Gillis, 1995).
  It includes:
  - smiling (Rotenberg et al., 2003)
  - direct body orientation
  - uncrossed legs
  - symmetrical arms
  - moderate eye contact (Harrigan, Oxman, & Rosenthal, 1985)
  - congruent limbs
  - forward-leaning postures (Trout & Rosenfeld, 1980)
  - Voice change (Garrod & Pickering, 2004), breathing together, speaking at the same rate in conversational speech (McFarland, 2001; Pardo, 2006), and converging on similar pitches.
    With greater rapport, also similar words, syntactic structures, and pronunciations of certain words (Chartrand & Bargh, 1999).

- **The triumph expression is 'over the top',** includes an expanded posture with chest out and head back, arms away from the body and raised above the shoulders, and torso pushed out. With an aggressive component, facial grimaces or aggression, fists, punching motions, and shouts or utterances.
  It's been documented around the world, even in congenitally blind individuals, immediately after a victory in an agonistic context (Hwang & Matsumoto, 2014b). But status-oriented cultures have more of these whole body expressions than more egalitarian cultures

- de**Shame overlaps with submission** opposite to triumph (e.g., head tilted forward or down, tongue out, eyes closed, and one or both arms pulled in toward body) has been referred to as "shame", also associated with submission (see also Andrews, Brewin, Rose, & Kirk, 2000; Dickerson, Gruenewald, & Kemeny, 2004; J. A. Hall et al., 2005; Keltner & Harker, 1998). If there is a difference between the two, it must still be found

Gait

- **Pepole can read from gait angry, happy, sad, or neutral emotions** situations from 3 seconds videoclips beyond chance levels (Montepare, Koff, Zaitchik, & Albert, 1999),

- **Angry movements were jerkier, stiffer, faster, more expanded, and harder**

- **Depressed patients walk slower, with shorter strides,** decreased coordination of arms in movement (Lemke, Wendorff, Mieth, Buhl, @ Linnemann, 2000)

- **Victim-looking strides are 'constricted'**, with too long or too short strides, not swinging their feet, and moving in only two dimensions compared to three (Grayson & Stein, 1981).

Nonverbal Behavior Like Gait Signals Power – Or Exploitability

> gait signal non-formidability and a potential target of aggression.
> Individuals imprisoned for mugging others agreed on which individuals (…) they would choose to victimize (Grayson & Stein, 1981).
> Individuals high in psychopathy could recognize, from gait alone, which individuals had been previously assaulted (Book, Costello, and Camilleri, 2013)
> Thus, one's body actions seem to draw the attention of the more violent predator-like individuals in society

The psychopaths mentioned the would-be victims showed 'low confidence' in their gait.

MORE WISDOM

Hold off your judgment across cultures for expressiveness and reservation

> It is easier for people from expressive cultures to judge those from reserved cultures as being untrustworthy, inscrutable, sly, deceptive, or shifty. At the same time, it is easier for people from reserved cultures to judge those from expressive cultures as arrogant, loud, rude, immature, or vulgar.

Men may over-estimate women's sexual interest because of poor reading -'error management theory'-

The common evolutionary explanation suggests that it's advantageous for men to overestimate women's sexual interest because a false-negative (i.e., missing cues of sexual interest) would lead to a missed mating opportunity (B. H. La France et al., 2009).

This means that men have a lower decisional threshold than women for labeling ambiguous behaviors as sexual (Haselton & Nettle, 2006).

BUT:

> The problem with this explanation, however, is that men "see" more sexual interest in both males and females (Shotland & Craig, 1988).
> Additionally, Farris et al. (2008) found that male participants mistook friendliness for flirtatiousness just as often as they misread flirtatiousness as friendliness, providing evidence for men's lower ability to accurately read the nonverbal cues of others.

Personally, I'd be surprised though if the evolutionary explanation doesn't provide any explanatory power on this phenomenon.

Ignoring others' gaze is a power move that makes others feel excluded

> the violation of mutual looking and acknowledgment norms can induce feelings of social exclusion (Wesselmann et al., 2012; K. D. Williams, Shore, & Grahe, 1998; Wirth, Sacco, Hugenberg, & Williams, 2010). For instance, when confederates were instructed to look at passing pedestrians without making eye contact, that is, "as though looking through air," the affected individuals subsequently reported stronger feelings of disconnection from others than individuals who received either a gaze or a gaze and smile from the confederate (Wesselmann et al., 2012).

Autism can be seen as ‘extreme male brain’

The authors note it may be telling that men show similar patterns of facial scanning as autistic individuals, given the conceptualization of autism as an “extreme male-brain” disorder (Baron-Cohen, 2002).

We’re Biologically Wired To Recognize Facial Similarity

> This ability to recognize faces is surprisingly robust;
> participants (…) are more likely to choose the cooperative move when they see a photo (…) that has been morphed with a photo of the participant himself (DeBruine, 2002).
> (…)
> Taken together, we can argue that we seem biologically wired to recognize individuals, to recognize when they are kin, and to band together with them to defeat nonkin competitors

Don’t force ‘mirroring’

Albeit it’s popular advice, forcing mirroring likely backfires:

> Mirroring (…) in general has been supported by the available evidence as producing positive regard for the other.
> However, some studies also show null or even negative effects on rapport as a function of mirroring (La France & Ickes, 1981).
> These data suggest that mirroring may positively influence rapport if it is done naturally and subconsciously (or at least appears to be so); if an interactant partner feels that one is deliberately trying to mirror behaviors, the partners are likely to feel manipulated, diminishing the chances for rapport building.

Practical Takeaways

Signal power

The authors show that how you move and behave can help you signal status, confidence, and power.

We have many articles here, including:

- **High power social behavior**
- Dominant body language
- High power communication

Quit carnivore, eat vegetables & Fruits

It also makes you more attractive:

> One recent study examined how real facial skin coloration is altered with changes in carotenoid consumption over a Appearance and Physiognomy 6-week period, revealing that an increase in carotenoids equivalent to an extra 3.3 portions of fruits and vegetables per day was enough to make participants reliably more attractive (Whitehead, Re, Xiao, Ozakinci, & Perrett, 2012).

Use gestures & aim for moderate level of expressiveness

People remember things more when you accompany your words with gestures.

And you’ll be clearer with some facial expressiveness, but keep it balanced:

> Sending accuracy will tend to be greatest (all else equal) at moderate levels of expressiveness, and it will be low at the extremes of low or high expressiveness

Also see:

- Law of optimum balance

⍰⍰♂ Lucio's Analysis

As for almost all handbooks reviewed here, I'd wished for book-level editing that consolidated all repeated information, and more information-sharing about studies sample size and quality.

- **Few studies were cited multiple times**

Which made me question whether the empirical evidence supporting certain claims was as diverse as it could have been.

- **Sometimes you'd benefit with a 'TPM supplementation'**

The authors say they 'understand the function of communication to facilitate the sharing of social intentions'.

And that's certainly true.
However, a broader look at communication would also include deceit and manipulation.

- **Rarely I felt it was culturally deterministic**

For example:

> Walking on dark streets late at night will evoke fear in some cultures but not in others, and these different emotional reactions occur because of culturally learned differences about the meaning of that specific context.

At my current level of psychological understanding, I feel pretty strongly that the cultural impact is limited. Anyone -especially a woman- in a dangerous environment will be apprehensive to walk alone at night, independent of culture.

- **Some findings may have benefited with some more caution**

For example, women's increased attraction to stronger and 'formidable' males in dangerous area or the hands—digit ratio.

PROS

- **Tells it as it is**: this book does not hide or sugarcoat things, including sensitive topics
- **Learned a ton**
- **Really good gender analysis**: the section on differences between men and women was really good
- **Deep insights into social status**
  - Empirical insights into dominance VS submissiveness nonverbal behavior

REVIEW

The *APA Handbook of Nonverbal Communication* is an authoritative resource for nonverbal behavior studies.

I learned a lot for it and I'm grateful to the editors' and authors' work.

And the biggest compliment I can pay to any resource, it allowed me to improve several articles and even our flagship product Power Univeristy.

Check the **best body language books** or **get this book on Amazon**.

The Presentation of Self in Everyday Life: Impression Management (Book Review)

Lucio Buffalmano · 17 February 2025 · Archived copy · Original

The Presentation of Self in Everyday Life (1959) draws parallels between theater and human interactions, exploring how individuals and teams perform roles to manage impressions, signal competence, and create desired perceptions.

Exec Summary

- **We're all performers** managing impressions just like actors
- **We all have a stage (public persona) and backstage (private self)**, the former for the performance we must keep up, and the backstage to relax by ourselves or with the members of our performing team
- **Good performance rests on good manipulation** of the audience, but that manipulation is not always bad for the audience

FULL SUMMARY

About the Author:
Erving Goffman (1922–1982) was a pioneering Canadian-American sociologist known for his innovative studies on face-to-face interaction and social order.
His work laid the foundation for microsociology and frame-level analyses.

We're all actors managing impressions

> (…) the individual will act in a thoroughly calculating manner, expressing himself in a given way solely in order to give the kind of impression to others that is likely to evoke from them a specific impression he is concerned to obtain

At the core of Goffman's thesis is the concept of impression management.

Individuals control and adjust their behavior to project their preferred narrative of the self, and the reality - 'definition of the situation', as Goffman calls it-.

This process is not accidental but a deliberate performance to achieve specific social goals.

Some actors believe in their own act

And we'd call them 'sincere'.

Others know it's an act, and Goffman refers to them as 'cynical'.

However, sometimes it's the audience that demands to be deluded and played.
A doctor for example may present a placebo while playing the doctor part.

Also see:

- Don't be naive
- Machiavellians are better player

Front stage and back stage

In front stage settings—public spaces, formal interactions, or any scenario where an audience is present—people present a curated version of themselves to achieve self-presentation and team goals, or align with societal expectations.

Conversely, in back stage settings, such as private homes or informal gatherings, individuals 'let their guard down'

and reveal aspects of their 'true selves' that are hidden in public.

Playing a role is how we become socially effective

> our role becomes second nature and an integral part of our personality. come into the world as individuals, achieve character, and become persons

In a way, suggests Goffman, education is about learning our roles and **growing into effective humans means learning our roles**.

People prioritize 'visible traits' for better performances

> if a service is judged on the basis of speed and quality, quality i s likely to fall before speed because poor quality can be concealed but not slow service

Virtue signaling and DEI are predicted by impression management

Funny how Goffman predicted much of the 2020s political climate:

> when the significance of unofficial qualifications becomes a scandal or political issue, then **a few individuals who are obtrusively lacking in the informal qualifications may be admitted with fanfare and given a highly visible role** as evidence of fair play. An impression of legitimacy is thus created.

Our nonverbals signal in advance the roles we'll play

> Thus a haughty aggressive manner may give the impression that the performer expects to be the one who will initiate the verbal interaction and direct its course. A meek, apologetic manner may give the impression that the performer expects to follow the lead of others

Effective actors control the interaction: waitress example

There are many passages in the book relevant to social power dynamics, strategies, or frame control.

Here's a good one of them:

> The skilled waitress tackles the customer with confidence
> (…)
> she may find that a new customer has seated himself before she could change the cloth.
> She greets him, says , " May I change the cover, please and, without waiting for an answer, takes his menu away from him so that he moves back from the table.
> The relationship is handled politely but firmly, and there is never any question as to who is in charge

Good wives help him assume a dominant role (in public)

> When husband and wife appear before new friends for an evening of sociability, the wife may demonstrate more respectful subordination to the will and opinion of her husband than she may bother to show when alone with him or when with old friends.
> When she assumes a respectful role, he can assume a dominant one

For men who don't want their wives to act but be naturally devoted, see:

- **How to maintain respect and attraction in relationships**

> 6 Proven Techniques to Keep Her Attracted & Committed

Team performances

In some social situations, interactions are a collaborative performance.

Individuals work together to create a unified impression.
Each member's behavior contributes to the overall image, reinforcing shared identities and collective norms.

The group becomes closer and sometimes forms an ingroup/outgroup dynamic where they may ridicule the audience.

Team members who 'misbehave' threaten the team

Any member of a team who acts against the team's best 'definition of the situation' ruins it for everyone.

For example:

> a girl at a party who is flagrantly accessible may be shunned by the other girls who are present, but in certain matters she is part of their team and cannot fail to threaten the definition they are collectively maintaining that girls are difficult sexual prizes.

Incidentally, this is one of the reasons why here at TPM aren't too fond of 'tribes': they enforce rules on the individuals that limit the individual's freedom.

Group therapy seeks to create back-stage feelings

For example:

> A sinner, sometimes admittedly not of very high status, stands up and tells to those who are present things he would ordinarily attempt to conceal or rationalize away; he sacrifices his secrets and his self-protective distance from others, and this sacrifice tends to induce a backstage solidarity among all present

From a strategic and power dynamics perspective, I couldn't help but notice Goffman's reference to the sinner low status.
Indeed, **it's never the high status men who open up and show vulnerability.**

Also see:

- How to do vulnerability without looking weak

> How to Be Vulnerable Without Looking Weak (The Right Way)

Machiavellian subordinates forge closeness with the leaders

As an example from doctor/patient dynamics:

> Attempts are made to establish a special relationship with the doctor. Patients often attempt to cultivate the

> illusion of a secret understanding with the doctor by, for example, trying to catch his eye if one patient brings up something that sounds 'crazy.'

This is titillating for the doctor's ego -and his natural craving of connection-, but it's disruptive for his work and the team:

> If they succeed in getting a response from the doctor which they can interpret as indicating a special bond, it can be very disrupting to the group.

Social rituals and norms also dictate our performances

Social rituals and norms dictate appropriate behavior.
These rituals serve as scripts for our performances, guiding how we act in various situations.

People who can't follow the scripts are seen as awkward, and often marginalized.
Also see:

- **How to calibrate to the situation**

> The Science of Social Calibration: 7 Steps to Social Effectiveness

Practical Takeaways

Learn to play, but allow others to drop their mask

Says a woman about having to dumber and more feminine to appeal to her dates:

> Toward the date, I feel some contempt because he's taken in by my technique.
> If I like him, I feel maternal condescension.
> At times, I resent him. Why isn't he superior in all ways in which a man should excel so that I can be my natural self

Yep, why not.
Become that guy, call her games, and you'll conquer dating like nobody's business.

MORE WISDOM

Courtship requires male leadership

> courting practices involve a concerted aggression against the alignment between the sexes on the part of the male, as he attempts to manoeuvre someone for whom he must at first show respect into a position of subordinate intimacy.

Goffman also says that when the man is of lower status, he will play up physicality to redefine the situation.

Also see:

- How to lead in dating
- The role of dominance for dating success

Leaders: let the troops closer to improve morale

Goffman also had the foresight to see leadership in terms of social exchanges:

> By sacrificing the exclusiveness of those at the top, it is felt that the morale of those at the bottom can be increased (…) such relaxation of front provides a basis for barter; the superordinate receives a service or good of some kind, while the subordinate receives an indulgent grant of intimacy

Drug usage shows the theatrical nature of life

> Becker reports that the irregular user has a great fear of finding himself with parents or work associates who will expect an intimate undrugged performance from him.
> The irregular user does not become a confirmed regular user until he learns he can be ‘ high ’ and yet carry off a performance betraying himself

It’s similar for young children, says the author.
Only when children can be relied upon to keep up an act they can be allowed to listen to the family’s full backstage.

We are moral, but often our moral allegiance is to the performance

> performers dwell more than we might think in a moral world. But, qua performers, individuals are concerned noc with the moral issue of realizing these standards, but with the amoral issue of engineering a convincing impression that these standards are being realized.
> Our activity, then, is largely concerned with moral matters, but as performers we do not have a moral concern in these moral matters. As performers we are merchants of morality.

Past audiences make us uncomfortable: the ‘teacher effect’

This is why for many it can be emotional or strange to meet former teachers or mentors.

They saw and met us when we were learning, naive, and lower power.
And now they may expect us to be the same.

> useful for the performer to exclude from the audience those before whom he performed in the past a show’ inconsistent with the current one. Persons who are strongly upward or downward mobile accomplish this in a grand manner by making sure to leave rhe place of their origins.

First-time interactions cautiously drop the guard

> When individuals are unfamiliar with each other’s opinions and statuses, a feeling-out process occurs whereby one individual admits his views or statuses to another a little at a time.
> (…) By phrasing each step in the admission in an ambiguous way, the individual is in a position to halt the procedure of dropping his front at the point (…) and at this point he can act as if his last disclosure were not an overture at all.

PROS

- **Great analysis**
- **Smart author**

With great power awareness, and several of his findings have later been confirmed by research.
Says the *APA Handbook of Nonverbal Communication*:

> Goffman (1963) used the term civil inattention (…) when strangers approach one another. For example, as pedestrians approach one another on the sidewalk, they might initiate a brief glance outside a distance of 2.5-3 m. This glance simply serves to recognize the presence of the other person. However, as they approach more closely, they look away to respect the other person' s privacy. Goffman offered the analogy of driving at night and dimming one's bright lights as an approaching car gets close. The results of three studies on gazing behavior among elevator riders supported Goffman's (1963) prediction of civil inattention in unfocused interactions (Zuckerman, Miserandino, & Bernieri, 1983).

QUOTES

> All the world is not a stage, but the crucial ways in which it isn't aren't easy to specify

On the double face nature of humankind:

> Individuals are treated relatively well to their faces and relatively badly behind their backs. This seems to be one of the basic generalizations that can be made about interaction

On drama, and the older profession in the world:

> The performer who is to be dramaturgically prudent will have to adapt his performance to the information conditions under which it must be staged.
> Aging prostitutes who restricted their place of work to dark parks were practicing a strategy that was even older than their profession

On the endless nature of role-playing:

> everyone is always and everywhere, more or less consciously, playing a role. It is in these roles that we know each other; it is in these roles that we know ourselves

REVIEW

The Presentation of Self in Everyday Life is a brilliant analysis of social dynamics and remains the most captivating book from my university curriculum.

I have a personal connection to it, still recalling the evening I first opened the big binder of photocopied pages. To me, it was the first book that accurately portrayed the reality of social interactions -a powerful mix of dispassionate Machiavellian analysis, social skills, and sociology-.

It captivated me like no other university book, and in retrospect, this book signaled that I was meant to pursue similar work.

Goffman's work is in many respects similar to our work at TPM.
The key difference is that we also transform social and power dynamics insights into actionable strategies, techniques, and mindsets to empower good men to succeed.

On the downside, it stops at surface-level sociology without connecting to the deeper evolutionary drivers that shape human behavior.

And practically, it never translates its analyses into actionable strategies for achieving real-world goals like status, respect, or attraction.
To bridge insights into results, I developed Power University.

Get this book on Amazon or check the **best books** for men's empowerment.

The Presentation of Self in Everyday Life: Summary & Review

The Presentation of Self in Everyday Life (1959) draws parallels between theater and human interactions, exploring how individuals and teams perform roles to manage impressions, signal competence, and create desired perceptions.

Cues: Are Vanessa Van Edwards Cues Valid for High-Value Men? (Book Review)

Lucio Buffalmano · 3 March 2025 · Archived copy · Original

Vanessa Van Edwards' *Cues* lists and explains the nonverbal and verbal signals that influence how people perceive us by dividing them into two main dimensions: **warmth**, affecting trust and likability, and **competence**, affecting power and authority.

Contents

Exec Summary

- **Be both high warmth and high competence**
- **Calibrate competence and warmth to situation and people**, depending on whether you need more competence or warmth/connection
- **Avoid the extremes** of no warmth/no competence

FULL SUMMARY

About the Author:
Vanessa van Edwards holds a Bachelor of Arts (B.A.) degree from Emory University and started her entrepreneurial journey with children and writing children's books under the pseudonym 'Vanessa van Patten'. She later moved to teach social skills from her point of view 'recovering awkward person', authoring several books and courses on social skills, including *Captivate*, *Body Language of Love*, and her main course *People School*.

Intro

The book categorizes warmth and competence cues into different aspects of communication: body language, vocal tone, verbal cues, and facial expressions.

Below is a breakdown of each type of cue according to warmth and power.

Body Language Cues

❤ Warmth Cues (Trust and Connection)

- **Leaning In –** Shows engagement and interest.
  - Don't lean when disagreeing, with toxic people
- **Open Body Language –** Uncrossed arms and a relaxed posture signal approachability.
- **Head Tilt –** Slightly tilting the head makes you appear more empathetic. Especially good when listening
- **Authentic Smiling –** A genuine smile, especially one that reaches the eyes, fosters connection.
  - Savor smiles take longer to spread across someone's face. Researchers found that they are seen as more attractive.
- **Mirroring –** Subtly copying someone's gestures creates rapport.
- **Palms Up Gestures –** Signifies openness and honesty.
  Common palm-flashing gestures include:
  - Pre-Handshake: Hold your hand out with a palm up in a greeting and you're asking for a handshake.
  - Pre-Hug: Hold both hands out with palms facing toward the other person and you're asking for a hug.
  - Get Excited: Hold your hands up with palms facing up and move your hands up and down toward the sky (Think about "raise the roof" gesture.)
  - Calm Down or sit: Hold your hands out with palms facing down and move your hands up and down toward the ground
  - Stop: Hold your hand up and show someone your palm
  - Tell Me More: Hold your hands out with palms up and gesture toward someone
  - Let Me Explain This: Hold out one hand with a palm up and gesture while speaking to punctuate you're

explaining something

⍰⍰ Competence Cues (Confidence and Authority)

- **Expansive Posture –** Taking up more space conveys confidence.
  - Shoulders relaxed and pulled down. Anxiety causes us to tense our shoulders to protect our neck and “turtle” our head down. Pull your head up, shoulders down
  - Feet spaced apart**.** Place your feet 10cm wider than you normally would to feel more grounded. If you’re a leg crosser, that’s fine. Just take a note from Kennedy and keep one foot firmly planted and the other relaxed. And if you can, angle them toward the person you’re with
  - Hands relaxed and away from your torso. Create some space between your arms and torso
- **Stillness –** Moving with purpose rather than fidgeting signals control.
- **Strong Eye Contact –** Direct but non-intimidating eye contact asserts dominance.
  - Magnetic eye contact: tense your eyelids for intensity, signal attention, and attractiveness
- **Hand Steepling –** Pressing fingertips together conveys authority.
- **Purposeful Gestures –** Controlled hand movements reinforce your message.
- **Standing Tall –** Good posture with shoulders back enhances presence.

Hardening our lower lid, called “flinty eyes,” “steely eyes,” or “narrowed eyes. is a signal of intensity, judgment, and scrutiny -Vanessa says it signals interest and it’s what attractive men do–

⍰⍰⍰ Explanatory Gestures

- **Numbers**: emphasize your numbers by showing it on your hand.
- **Big or Small**: small or no big deal, hold your fingers an inch apart. Big or important, hold your hands as if holding a beach ball.
- **Me vs. You gesture**: your opinion or something personal, gesture toward yourself, sometimes even touching your heart. When encouraging the audience or speaking about a call to action, gesture toward the audience.

- **Link body parts with meaning:** Highly competent speakers show two different opinions or two different groups with their hands. For example, left hand talking about liberals; right hand when talking about conservatives.
  The audience knows who the speaker is referring to with body language alone

Vocal Cues

❤ Warmth Cues

- **Varied Vocal Tone –** A dynamic voice makes conversations more engaging.
- **Warm, Relaxed Pitch –** A slightly lower but soft tone conveys warmth.
- **Encouraging Sounds ("Mm-hmm," "Ah") –** Shows active listening.
- **Pauses –** Allowing others to respond makes interactions feel balanced.

And I add:

- **Address the desire to bond**
  Ie.: 'Sorry I can't shake your hand' or 'Sending you a hug from here'

⍰⍰ Power Cues

- **Lower Voice Tone –** Deeper voices are perceived as more authoritative.
- **Steady, Controlled Speech –** Avoiding filler words ("um," "uh") shows confidence.
- **Well-Placed Pauses –** Strategic pauses add weight to your words.
  - Pause after a power move, to highlight it and pressure the attacker
- **Speaking in Statements, Not Questions –** Avoiding rising intonation when making statements prevents sounding unsure.

Verbal Cues

❤ Warmth Cues

- **Personalized Greetings –** Using someone's name increases connection.
- **Inclusive Language –** Words like "we" and "together" foster warmth.
- **Compliments and Acknowledgments –** Sincere appreciation strengthens bonds.
- **Warm Greetings & Goodbyes –** "*Sending a hug", "Fist-bumping my camera"*

⍰⍰ Power Cues

- **Concise Language –** Being direct and clear avoids diminishing authority.
- **Definitive Statements –** Avoiding hedging phrases like "I think" or "maybe."
- **Command Phrasing –** "Let's do this" instead of "Should we try this?"
- **Competence Words** such as *brainstorm*, *effective*, *productive*, and *science.*

Facial Expression Cues

❤ Warmth Cues

- **Eyebrow Raise –** A slight lift shows interest and engagement.
- **Soft Eye Contact –** Gentle rather than piercing gaze increases trust.

- **Nodding –** Encourages others to continue speaking.

⍰⍰ Power Cues

- **Neutral, Composed Expression –** Avoiding excessive smiling in serious moments maintains authority.
- **Slow Blinking –** Signals control and patience.
- **Head Held High –** Avoiding excessive tilting downward keeps a strong presence.

CRITICISM

We sometimes analyze nonverbals differently, see an example here:

> **Vanessa**: She should show more signs
> **Lucio**: Her signs were obvious, he had to lead more

And specifically about the book:

Men beware: power matters more

I agree with Vanessa: *both* warmth and competence matter.

Vanessa van Edwards leans more towards warmth, making her an excellent role model for women—especially those who prioritize connection in their interactions.

Vanessa's nonverbals skew more towards warmth. Men who need to gain more power need to keep that in mind

However, for men who want to maximize influence, emphasizing competence and power may be even more crucial. And that's even more true for 'too good men' who naturally come across as agreeable.

So, in general **men ought to prioritize competence and power** -and *especially* nicer men.

Dominant men win elections

Quoting from the *Cues* itself:

> Want to know who will win an election before it happens? Researchers found that voters decide who is more dominant in just one minute of political exchange, and that predicts their vote.

There you have it.
Voters don't decide who is warmer -or nicer-.
They decided based on dominance.

Some strategies needed more power/dominance

For example, Vanessa advises a manager seeking attention and respect to:

- Start with quick updates so 'latecomers won't miss anything crucial'
- Surprise slide with a funny meme

That's not a high power approach.

A stronger alternative: start with the most important updates—those who arrive late will miss them and will learn next time to be on time.

Avoid over-chit-chatting if work is the priority

Little later in the book, she advises that the 'high competence' question while waiting for latecomers is 'anyone listened to any good podcast recently' or 'anyone reading good books'?

This is fair for relaxed workplaces.
But it's a no-no for high-power executives or highly effective workplaces.

Accepting lateness disempowers you and random chit-chats while the boss waits for latecomers is *too* warm -including books and podcasts that Vanessa marks as high competence topics-.

TPM's take: power better represents 'competence'

Since we first implemented Fiske's original research on warmth and competence to social skills, we made a decision.

And we decided to replace 'competence' with 'power'.

The name 'competence' has a positive frame that makes it naive.
Power is more neutral, encompassing both value-giving and value-taking approaches.

Competence, with its positive frame, runs into some issues.
For example, asked whether Trump's yank and pull handshakes was high competence or warmth, Vanessa replied 'neither'.

What she didn't say, but she probably thought, is that Trump's handshake was domineering -and bullying-.

However, we don't run into that issue with the 'power' angle.
We easily fit Trump -and any other domineering and bullying approach- into the extreme version of power.
Extreme power without warmth = *over*-dominance = bullying.

Focus on detecting dark triad traits rather than 'lying cues'

Spotting lies is notoriously unreliable.

It's as likely to help you as it is to sidetrack you.

That's why I prefer this approach:

- **Focus on character**
- **Focus on diverging interest**. Don't worry when interests overlap, careful when they diverge

Vanessa mentions some famous examples of public lies.
All of them are interesting, but Armstrong's example stuck out with me the most.

She says that 'her gut feeling told her something was wrong' and lists a couple of cues.

My thoughts were 'No wonder, the guy is a psychopath'.
It was easier for me since I had the vantage point of knowing Armstrong's history better than most -including what I deemed as shameful behavior, even as a teenager-.

Still, the general concept stands.
And I advise to **focus on reading characters, rather than single and potentially misleading gestures.**
Character is your forest.
Once you see a rotten forest, you know the tree can't be good.

Some examples left me wondering

The examples make the book engaging and accessible to a wide audience.

Vanessa has mentioned her appreciation for Malcolm Gladwell's writing, and her storytelling approach reflects a similar effort to make complex concepts digestible.

But it's difficult to find good and applicable examples, and some of them felt forced.

One above all, NBA player Stockton.
Vanessa says that Stockton's success is because he used nonverbal cues such as gaze and torso direction to show where he was going to pass the ball.

It didn't make much sense to me.

The cues seemed basic -what I'd expect any amateur to do, let alone professionals-.
And I'd expect cues to go both ways: as much as your teammates see them, so do the opponents.

Finally, a good player will also fake often.

Just as I expected, artificial intelligence confirmed my doubts:

Yeah, that claim sounds exaggerated or oversimplified. If she's talking about John Stockton, the NBA all-time leader in assists, his success wasn't just about turning his body toward his target—it was a mix of court vision, decision-making, passing accuracy, and understanding defensive movement.

Why Her Claim Seems Weak:

1. **Basic Body Mechanics:** Turning your toes, torso, and head toward your passing target is just fundamental basketball technique. Nearly every competent player does it at some point, especially on basic passes.
2. **Elite Passers Use Deception:** The best passers (including Stockton) don't always turn fully toward their target. Look-away passes, misdirection, and subtle body movements to manipulate defenders are key parts of high-level play.
3. **Stockton's Real Strengths:** His greatness came from reading defenses, executing quick decision-making, and making pinpoint passes under pressure—not from simply aligning his body.

It's possible she's highlighting a small detail that helps with passing fundamentals, but it's misleading to frame it as the reason for Stockton's success. Sounds more like

Message ChatGPT

> **AI**: Yeah, that claim sounds exaggerated or oversimplified
> (…) turning your toes, torso, and head toward your passing target is just fundamental basketball technique. Nearly every competent player does it (…) The best passers (including Stockton) don't always turn fully toward their target. Look-away passes, misdirection, and subtle body movements to manipulate defenders are key parts of high-level play.

I agree that Vanessa may have been highlight *one* (tiny) element of Stockton's passing success, but it's unlikely to be the only -or even main- reason.

Some quoted research left me wondering

For example, discussing Brian's conversion, she says:

> the open posture won by A LOT. Simply switching to the open posture increased Brian's website conversions by 5.4 percent! That might not sound like much, but in terms of web traffic conversions, it's phenomenal.

An *increase* of 5.4% seems misleading to me.
It probably didn't go from, say, 2% to 7.4%.

It means it went from 2% to 2.1%.
That's something, but it's *not* 'by A LOT' -and not 'phenomenal'-.

Also, looking at the pictures, the open posture of Brian seemed off:

The left side Brian increases conversion by 5.4%. A modest increase, in my opinion, and not too surprising given that Brian, albeit in closed posture, is higher power on the right side.

There was no source to check this.

The popularization of science may come at a scientific cost

I purposefully avoid 'pop-psychology' here because it's often used pejoratively and Vanessa does a great job.

Sometimes though, the popularizing of science can estrange more rigorous learners.

For example, going after 'top line' quantitative numbers impresses readers, but I'm doubtful about how much value they truly add:

> Researchers find that nonverbal signals account for 65 to 90 percent of our total communication
> (…)
> Researchers found that (…) some gestures are so powerful that they carry 400 percent more information!

It's not so much that *researchers* find, but most likely a single *research* found.

Similar to the famous Mehrabian study, I find that top-line quantification add limited value -and may confuse more than enlighten-.

Finally, some sources, including some for 'studies', were from newspapers.

Contextualization would add refinement

Vanessa is well aware that power/warmth cues also depend on context, people, and culture.

And she shares several examples and notes on how to adapt the cues.
This is a strength of *Cues*, and something that I very much appreciated.

In just some cases I'd have added some extra notes as well.
For example, Vanessa says that 'glasses are an instant symbol of competence' -based on her internal study-.

|I bet it depends on the glasses type and age bracket.

I guarantee you that thick glasses for a primary school kid aren't 'competent'.
They're dorky.

Same goes for some general advice like 'be more expressive'.
While that may be valid for most, the *APA Handbook of Nonverbal Communication* says that *moderate* levels of expressiveness best convey your message -ie.: abide the law of optimum balance-.

CONS

- **References to bonuses on her website, for which you must provide your email**

And a few of those quizzes ask your email once again, sometimes then promoting *Cues* which is the reason why you're there in the first place.

- **The video bonuses could have been time-stamped**

To the relevant parts.

PROS

- **Highly Practical:** Van Edwards provides actionable techniques with real-world applications.
- **Well-Structured:** I'm not sure if I'd have followed the same categories, but Vanessa's approach is valid.
- **Engaging Writing Style:** The examples and anecdotes keep the content lively and relatable.
- **Great narrating voice**: Vanessa must have been an actress in a previous life -or will be one in her next one-. She's that good at narrating and mimicking voices -and, in videos, in mimicking various cues-
- **Vanessa embodies her own teachings**: She's warm, engaging, contagiously happy, and a pleasure to listen to -and, probably, also just a great person to be close to-

REVIEW

Cues is an excellent resource for assessing and improving one's presence and nonverbal communication and is backed by the power/warmth framework we also first championed here at TPM.

We use a different system in PU.
We prioritize warmth with character and prosocial cues to provide all the benefits of warmth, without the downsides—warmth and submissiveness can dangerously overlap.

But Vanessa allowed me to extend PU's nonverbal cues.
And given how demanding I am for Power University, that's the best compliment I can pay to anyone.

Why You Can’t Trust AI With Advanced Social Skills

Lucio Buffalmano · 13 March 2025 · Archived copy · Original

Artificial intelligence tools are transforming the world.

These tools can serve as valuable allies in enhancing your social skills, advancing your personal growth, and achieving your ambitions—provided you understand their limitations.

So, when does AI excel, and when does it falter?

Let’s find out:

Can artificial intelligence help you win ‘the game of life’?

Contents

- AI Results: Overview
- Examples
  - ⍰ 1. Business Negotiation Response: OK
  - ⍰ 2. Humorous responses for dating: great
  - ⍰ 3. Relationship advice: average
- Why AI Falls Short
  - When AI Trips The Most
  - ⍰ Example: How to Read People
- Where AI Nails It
- SUMMARY

AI Results: Overview

I've been experimenting with AI tools to improve our offerings.

So far, I've used and evaluated it for:

TASK	RESULT
Editing: Improve flow, grammar, and clarity for our posts and Power University lessons	**9/10**, this is its bread and butter. One point shy of 10 for over-correcting TPM's nomenclature, and minor slippages
Editing 2: Tighten sentences for brevity and readability, while preserving meaning	**8/10**, needed careful supervision, including editing or ignoring some advice, but overall great work
Contempt improvements: Ask what we may add or remove for added value for students, 'uniqueness', and thoroughness	**7/10**, some great ideas amidst largely generic advice. Think of it as 'finding diamonds in the rough'. And better for cutting, than adding.
Comparison: Added value of TPM material compared to available sources	**6/10**, valid analyses, but it's either we *always* came out on top, or it was too complimentary :)
Coaching: Unique real-life situations that required advanced approaches, strategies, and techniques	**5/10**, good for general guidance, lacking in specific, advanced, and nuanced responses ("PC," "nice guys responses", lower-power, sometimes naive)

Examples

Let's review some real-life examples of AI's capabilities:

1. Business Negotiation Response: OK

Hi guys, great to be a part of this group!
I run an [redacted] business and generally have no issues with quoting fees for new clients. I tell them the price and if they think I am too expensive, they go elsewhere, which I am fine with.
The issue is talking too clients who I have had for a number of years, who I would like to charge more. These are people who I feel are underpaying for the service I provide. The fee increase is, in some cases, as much as double the existing fee!
Any suggestions for how to approach this?

Raising prices for long-term clients—especially by a significant amount—requires a careful approach to minimize resistance, maintain goodwill, and ideally, retain as many clients as possible. Here's how to do it effectively:

1. Frame It as a Business Necessity, Not Just a Price Hike

People accept price increases more easily when they understand the reason. Instead of simply announcing a higher fee, position it as an adjustment due to:

- Increased costs (e.g., inflation, software, compliance, staff)
- Enhanced service quality (more expertise, faster response, better tools)
- Market alignment (your prices now reflect industry standards)

> **Question**: How can I raise prices for old customers?
> **AI Response**: Frame it as a business necessity

Some good general principles.
But it **misses the opportunity to showcase value.**

Instead, it showcases averageness:

- Blaming the increases on your costs ⍰ Justifying.
- Aligning prices with industry standards ⍰⍰ You aren't any better than everyone else

My answer provided a higher level of sophistication, showcasing honorable character, and value:

> **Lucio**: Say that you withheld an increase for as long as possible <— Frames you as a giver
> Frame the increase as driven by demand <— Uses the scarcity principle at its most powerful
> Say most customers are already paying the new prices <— The 'principle of fairness', that most people (righteously) accept

And more techniques below that.
Just a different level, increasing conversion, appreciation, and value all at the same time.

⍰ 2. Humorous responses for dating: great

On the positive, AI was fantastic in suggesting 'humorous' replies

> **Her**: I'm with my girls right now <— I saw the opportunity for teasing
> **Me**: LOL I like how call them 'my girls' :) <— Good one, highlighting her 'boss power move'
> **Her**: hahaa why <— Likes it. But at this point

After that though I couldn't think on the fly on how to add to the tease with humor.
And AI suggested the perfect responses.

Beware, however—this doesn't imply AI excels at dating.
It doesn't equip you with high-power approaches that make women swoon and fall in love.

Even in this example, ChatGTP wouldn't have advised to quit texting and invite her out.
But I knew that, and how to take it from there :).

But still, for this specific use case on humorous responses, it was fantastic.

And helpful for me, as I've never excelled at humor.

⍰ 3. Relationship advice: average

It did slightly worse for dating and relationships:

My ex has asked me to stay at her house with our kid unt[illegible]. I live [illegible] hours away and means I'll be home late. Do I have the right to ask her what she's doing until then? Or how do I approach this without her getting shitty with me?

A good response balances asserting your needs while avoiding unnecessary conflict. Here are a few strategic approaches:

1. Frame It as a Logistics Question

Instead of making it about her plans, focus on how the timing affects you:

- *"Hey, I saw you asked me to stay until [illegible]. That means I'll be getting home quite late. Is there any flexibility on the time?"*

This keeps it neutral and practical. If she gives a reason, you'll get insight into her plans without directly asking.

2. Offer an Alternative

If [illegible] inconvenient, suggest an earlier handover:

- *"Would it work to switch the handover to earlier [illegible] the day? That way, I can get home at a reasonable time."*

> **Question**: My ex asked me to babysit for longer, do I have the right to ask her what she's to?
> **AI Response**: Ask if there is flexibility, and offer alternatives (and a few more standard ideas)

In this case, it defaulted to the general principles of:

- **Give her privacy and freedom**, valid for avoiding social faux pas and preventing controlling behavior
- **Find a middle ground**, valid negotiation principles for resolving issues without antagonism

Valid principles… But somewhat more obvious.

Our asker *knew* already that a controlling approach wasn't cool, and that he could ask for a middle ground.

AI's advice is helpful lower EQ men and abusive types who over-seek control -but these wouldn't ask or take advice anyway-.

But it fails at these levels:

- **Average nice guy approaches**, Advice for 'good men' who struggle to gain women's devotion and maintain attraction over the long-term.
- **Misses possible deeper issues** such as jealousy from emotional attachment, and her levels of respect.
- **Misses how to gather intel strategically, yet high-power**. Without sub-communicating 'nosiness', fear, or a too strong desire for control that would (rightfully) raise her guard up.
- **Misses frame control strategies** in case she pushed back. That's crucial to (re)gain respect

Why AI Falls Short

AI is great whenever:

- **High-quality information is abundant**

- **Expertise is easily recognizable**
- **Consensus emerges**
- **General principles apply to most or all cases**

While quantitative disciplines and codified data suit AI perfectly, social skills are less mechanistic.

In most social situations, nuance is key.
And specific situations call for general principles to be calibrated, or sometimes even overturned.

That's where AI may struggle:

When AI Trips The Most

The majority floods data sets with average responses. If the top 1% doesn't speak, AI provides average solutions. It's the 'garbage in, garbage out' principle.

The characteristics of some disciplines and human endeavors intrinsically send down AI the wrong path.
They are:

- **High discernment is required**, like effective social strategies
- **Many (averagely skilled) people create content**, as it's the case for dating and relationships
- **Expertise is hard to assess**. Without personal experience, AI relies on logic and 'citations'. But one externally wrong argument can be perfectly internally logical. And as '*Lying With Statistics*' shows, sometimes the most deceitful source brings the most citations
- **Experts may never share (or even purposefully confuse)**. As it's the case for some Machiavellian approaches, where experts either *use* the wisdom themselves and keep quiet, or actively sidetrack others
- **Scientific guidance struggles at the individual level**. Despite many enlightening frameworks, social science studies can only cover a tiny portion of limitless real-life situations one can encounter
  - Exceptions abound
- **Ethical considerations & 'political correctness' safeguards**, some of which may even be fair, may obfuscate

or hide the most effective responses

In these cases, AI can't easily sidestep quantity and go for proven quality.

And when AI must fall back on quantity, **the 'wisdom of the crowds' fails when the crowd has limited wisdom**. Or, to be more precise, the wisdom of the crowd is the wisdom of the average man.

I've noticed AI often reverts to bland, average advice like 'share your concerns with him openly and assertively'. This is great when you're dealing with quality people in cooperative relationships.
But it's *terrible* strategy when competing at work or when dealing with manipulators

⍰ Example: How to Read People

I wrote this post on the 'spur of the moment' as an off-shoot from another article.

In a yet-to-be-plubished list of 'best books on how to read people' I was cautioning against AI recommendations. After researching the "best books on reading people," here's what I found:

The AI results for 'best books to read people' provided ZERO books on reading personalities. Likely because it prioritized popularity, picking from unqualified sources

There wasn't a SINGLE book I'd consider great for reading people.

Some of them weren't even about reading people at all.
There is *nothing* in '*Thinking Fast and Slow*' about reading people.

It seems like AI picked from the list of *popular* psychology books, rather than *great* book on how to read people.

The proposed list in general is heavy on body language books.
That's at least closer to the topic.

But body language reads people *in the moment*, mostly in *transitory states*. Instead, it's far more useful to read people in their *stable*, long-term traits and dispositions.

For example, if you want to avoid toxic people as friends or wives, you don't care whether they're sitting confident. Instead, you want to read the red flags of a taker personality.

Where AI Nails It

AI probably works well for beginner-level guidance on high-level issues.

I haven't tested it as extensively because it's not part of our core teachings here.
But from what I've seen it works for questions such as:

- **How to overcome social anxiety**, since studies and proven approaches abound
- **Conversation openers**, since it's hard to go wrong *as long you deliver it well*
- **How to keep a conversation going when you run out of things to say**, since countless guides online provide good enough advice on these topics

My issue with these is that the answer will *stop* at the basics.

And those basics aren't very helpful to achieve life-relevant goals.

For example, your goal is not to 'keep conversations alive', but to make great friends, high-value connections, or get girlfriends.

'Running out of things to say' doesn't even feature as a possible issue for me because 'conversing' is not a goal.
If I 'run out of things to say' it means I'm not interested enough.
The *last* thing I want is to keep conversing.

The question itself on 'not running out of things to say' comes from the wrong frame of mind.
Remember: high-value men don't waste time with random chit-chat.
Read more here:

- **Should beginners start with more advanced material?**

> Should Beginners Start With Power University?

But for a beginner, maybe, it can be a fair start.

SUMMARY

Human ingenuity is stunning.

The world hadn't yet finished exploring and implementing all the breakthroughs of the Internet revolution, and we're now already facing a new seismic change.

AI changed and will change the world in ways we can't yet predict.
And it will only improve.

Yet, when it comes to human behavior and strategies, AI faces structural and substantial limitations that are challenging to overcome.

Up until now, that means that AI is delivering average advice and coaching.

For those aiming to surpass mediocrity and achieve top-10% status, respect, and attraction, the solution is **Power University**.

Self-Protection in Love and Business, Without Losing Trust

Lucio Buffalmano · 21 March 2025 · Archived copy · Original

Betrayal can strike anywhere—a partner's infidelity or a business deal gone wrong can leave you reeling.

At The Power Moves, we've mastered power dynamics and smart social strategies for enjoying relationships and cooperation while staying secure and without losing trust.

This guide shows you **how to protect yourself** in relationships and business, weaving **win-win strategies** with emotional resilience and smart planning.

Let's dive in:

Contents

- Two Pillars of Self-Protection
- 1. Mental Self-Protection
  - ♂ She May Cheat… Her Loss
- 2. Practical Self-Protection
  - 1. Prevention
  - 2. Tools & Techniques
  - 3. Smart Vigilance
  - 4. Covert Control
  - 5. Contingency Planning
- It's Not Cynicism, It's Peace of Mind
  - Business: self-protection is a duty
  - Relationships: self-protection strengthens relationships
- Key Takeaways
  - Learn More

Two Pillars of Self-Protection

The two main pillars are mental and practical:

- **Mental Strength**
  - Awareness of betrayal risks
  - Comfort with possible cheating (emotional resilience)
    “Hopefully, it’ll go well—if not, I’ll manage.”
  - Optimism, self-esteem, self-confidence
    “One door shuts, another swings open.”

- **Practical Prep**
  - Lower betrayal odds
  - Trust but verify
  - Plan contingencies

1. Mental Self-Protection

Balance these mindsets for **relationship trust** and beyond:

1. **Trust enough to collaborate** or get emotionally close
2. **Never trust blindly**, discounting the possibility of cheating or hurt

Emotional resilience is your inner shield, often reducing the need for external defenses.

Research from the Journal of Personality and Social Psychology shows proactive coping cuts emotional distress by preparing you for setbacks, while the American Psychological Association links this mindset to better mental health outcomes.

It’s about staying antifragile—stronger through adversity.

Two examples:

♂ She May Cheat… Her Loss

Lucio:
I once moved in with an ex to her new place.

Not wanting to assemble furniture (provider's job), her ex helped. (Quite humiliating for him, BTW).

Knowing what I knew, I considered their hookup odds low-ish.
But not *extremely* low, and certainly not zero. <— Realistic approach

Knowing they hooked up would have hurt me.
But not to the point of anguish.
And with antifragile self-esteem, even if she cheated, I'd still think of myself as a top guy and option.

I could live with that possibility and still like her and the relationship. <— Still maintaining the win-win

I thought about options to confirm, but never felt the need to. <— Mental empowerment saved time and effort

What can happen, after all? <— Worst-case preparation
It'd hurt, I'd have to end it… But I'll be fine. (And it will be cool to be back in the game).

Empowered quote:

> **Trust is not about trusting her, it's about trusting yourself to handle the pain**
>
> *Lucio Buffalmano*

Business Risk Management: When a Handshake Works—a deal I sealed with a trusted partner, no contract needed, thanks to mental prep.

2. Practical Self-Protection

Here's are self-protection strategies to win, no matter what:

1. Prevention

Among the foundational and proven prevention strategies:

- **Pick trustworthy people**, as research shows that people differ
  See 'how to recognize a taker' and 'how to pick loyal woman'
  - Test loyalty: Ask for a small favor—do they follow through with effort or flake?
    For dating see 'shit tests'

- **Evaluate situations** for (changing) incentives
  ⍰ Find out when cheating is most likely

- **Design smart systems**
  - Cut weak links: Tighten your circle—fewer players, less risk
  - Distributary systems of key information: Multiple contacts mean no single failure point—avoid bottlenecks where a single bad manager can screw your business
  - Attract the best: In dating, skip flashy cash that lures gold diggers. In business, lead with a strong mission that attracts missionaries.

- **Diversify risks**:
  Ie.: One frenemy won't sting if you've got solid friends.
  Also see 'how to spot a frenemy'

P.S.:
Never forget, **the biggest self-protection is becoming a higher quality man**.
Especially for relationships: women don't leave men they love.

2. Tools & Techniques

Some staples of self-protection include:

- **Asset diversification**
- **Asset shielding**
- **Prenups**
- **Pay yourself first**
- **Detectives** and background checks

But remember, tools are only as useful as the mind who wields them.
Strategic foresight beats quick fixes.
Become a strategic thinker, not a 'pay for security and forget' type of guy.

Also see:

- How to be a good Machiavellian

3. Smart Vigilance

Paranoia boosts safety but has big downsides.

It lowers life quality, worsens relationships, demotivates teams, and **heavy control signals fear and lower value**.
Paranoia is even bad for health.

Here's the smarter approach:

1. **Strike the optimum balance**—use fear as a siganl, don't let fear rule
2. **Prioritize key risks**, relax on the small stuff—like checking a contract but not every email
3. **Control discreetly**—keep morale high while in your teams and sub-communicate you're a high-value man

3.1. Healthy Caution

A good balance of caution, without becoming paranoid:

Balance your vigilance

3.2. Focus Where It Counts

High-stakes areas demand extra vigilance—here's where to double down:

- **Marriage** (divorce risk)
  - Vet her thoroughly—values, not just vibes
  - Live-in—do you really need to make this step?
  - Secure a prenup—protection, not distrust
- **Intimate relationships** (paternity doubts)
  - Kids before vows—delay legal ties
  - Check loyalty—watch actions, not words
  - DNA test discreetly—peace of mind without drama
- **Work**
  - Stay legally clean—paper trails save you
  - Collect proof quietly—emails, receipts, proof of work
    See 'how to dispatch a bad boss'

4. Covert Control

Machiavellian-style control—subtle, effective, and well-framed:

4.1. Smart Framing

Compare:

✖ *"We have cameras so people cannot steal"* ⁉ We don't trust you ➡ Morale drops

VS:

✅ *"Cameras are needed for insurance, unfortunately"* ⁉ We trust our people ➡ Team thrives

4.2. Strategically Hidden Verification

Take paternity testing for peace of mind as an example.

Most likely, it's your child.

But if you tell her you want to take a patersnity test, you show mistrust that will harm the relationshp.
This approach lacks power protection, and offends her.
And frames your relationship as a relationship lacking trust.

Worst yet, you sub-communicate fear and low confidence, which harms your leadership—and the relationship as well.

So… Do it quietly.

5. Contingency Planning

Contingency planning helps you land on your feet, no matter what.

- **Safety cushion**: Stash cash for emergencies—6 months' worth is a solid start
- **Network backup**: Line up job contacts—think LinkedIn connections ready to vouch and refer
- **Solid friends**: Loyal and empathic friends are your safety net for rough patches—you'll be grateful when you need someone to listen.
  See 'How to make quality friends'
- **Big commitment Plan B**: Don't enter any big commitment without knowing what you'll do in case it doesn't work.
  Ie.: Map your exit if marriage flops—know your next address
- **Keep an eye open for backup options.** Don't cheat or be ready to abandon existing commitments ⁉. But be aware of 'market conditions' and stay on top of your market value.
- **Know your next move**, right after a fallout
  Ie.: know where and how you'll meet women if you breakup. Know who you'll contact first if laid off.

Bonus: Build self-reliance—thrive solo, and you won't even need any contingecy.

Shield up… And eyes on the field

It's Not Cynicism, It's Peace of Mind

It's not cynicism.

It's **an essential approach for any honorable man who wants to win**, without being a cheat himself.

Business: self-protection is a duty

Trust but verify, a phrase coined by Ronald Reagan, is a cornerstone of risk management.

Doing anything else is business malpractice. A dereliction of duty towards shareholders, employees, and even the world at large.

Cheating cuts deep into businesses' bottom line.
Statistics reveal that businesses lose 5% of revenue to fraud annually. And that doesn't even account for the countless, founders, abd employees screwed over by co-founders, investors, or bosses.

So be smart, and secure your work.

Relationships: self-protection *strengthens* relationships

Intimate relationships may be even riskier.

About 20% of married men and 13% of women admit to infidelity. And that's probably an underestimation based on *admission*.

Our take is not about complaining or getting paranoid though.
Paranoia is weak. It turns toxic and controlling, not the type of eagles we develop here.

Our take is about empowerment, giving you control in an unpredictable world.

Mental empowerment and smart self-protection strengthen relationships because they make you a better

leader.
Smart self protection wins you peace of mind. And **instead of worrying about risks you can focus on making that relationship stronger**. And you can display relationship-positive confidence.

And remember: the best self-protection is a devoted woman.

Of course, not every relationship demands a backup plan; many thrive on mutual goodwill.
But making sure is better than hoping for the best.

When stakes rise—think marriage, partnerships, or big investments—these tactics ensure you're never caught off guard.

Key Takeaways

1. **Know betrayal's possible**
2. **Stay cool with it**
3. **Pursue win-win** anyway
4. **Trust but verify**
5. **Plan backups**—you'll be fine

Master First Impressions: Handshakes, Intros, & Social Confidence

Lucio Buffalmano · 2 April 2025 · Archived copy · Original

Whether you're meeting someone new or navigating a group setting knowing how to make a good first impression is a fundamental life skill.

At The Power Moves, we taught thousands of men to decode power dynamics for social confidence and life success.

In this article, you'll discover practical handshake tips, body language first impression strategies, and social confidence tips to master introductions like a pro.

Let's dive in.

Contents

- Let Them See You Cool
- 2. Approach Others High-Power & High-Warm
- 3. Extend Your Arm After Eye Contact, Within 2 Meters
- 4. Firm Handshake, 2 Pumps, Eye Contact, & Smile
- 5. Lead & Control The Conversation (If Appropriate)
- 6. Grab The Spotlight If It's A Group Interaction

- Self-defense
  - 1. Prevent it
  - 2. Prepare: See It Coming
  - 3. Defend Against Power Moves
  - 5. Fix Wrong Names
  - 6. Defuse The "Giver/Taker" Frame

- 7. Disempowering Openers
- Learn More: Master Social Success

Let Them See You Cool

Research shows that first impressions matter, and last.

And a good first impression begins when they first see you, *before* you even say hi.

So:

- Dress well
- Adopt cool body language poses
- Look busy or chill, never bored

⁉ **Tip**: Avoid burying your nose on the phone while waiting.

See:

- High-power body language
- Re-empower yourself if they make you wait

> Alpha Male Body Language: 7 Poses to Gain Status

2. Approach Others High-Power & High-Warm

High power gives you respect, while high warmth gives you friends and allies.

We explain the tactics in other articles, but knowing how to make a good first impression starts with the right mindset:

- I'm a great guy
- I expect good interactions
- I start with the best foot forward
- … But it's on them to show me they deserve more

That last one prevents you fall prey of takers and toxic people.

⁉ Example:

> **Brad Pitt**: (slight tight-lipped smile, deep and neutral voice, nodding up) Thanks Charlie

⬆ You can be friendlier than Pitt
Pitt prioritizes power over friendliness. As long as you're a respect-worthy man, you can be warmer, talk more, and also nod down—without overdoing it.
⍰⍰ Nod slowly for extra power in your body language first impression.

Also read:

- Mastering power and warmth for maximizing status and relationships

3. Extend Your Arm After Eye Contact, Within 2 Meters

One of our top handshake tips:

Make eye contact before introducing yourself and extending your arm.

If you don't, the frame is that you're looking for them, while they ignore you. You want them and chase them, and they don't care.
That frames you as lower status, and you don't want that.

If he hasn't noticed you and you want to approach, raise your hand and shake once he acknowledges you.

⍰ Example:

> **Lower status**: (Approaches unacknowledged, leans in, palms up, bowing, nods, exits) <— Extending too far in advance is too warm, over-extending signals over-deference, and approaching unacknowledged suggests chasing.

4. Firm Handshake, 2 Pumps, Eye Contact, & Smile

The handshake per se is simple.

For a strong body language first impression you only need:

- **Firm handshake**, two pumps in the West
- **Eye contact**—while avoiding looking down
- **Smile** to add warmth

Some people look down to locate their hands.
But if you overdo it, can still look submissive, even if you don't intend it to.

 Example:

⬆ **Low power handshake**
Looks down too much, too long sits un-masculine, clasps Trump's hand too weakly

Compare now:

⬆ **Much better, but you can loosen the arm grip**
Too strong clasp on the arm, but it's only because he came prepared this time. Overall, still much better

⁉ **Tip**: Use peripheral vision or a quick glance to spot his hand and avoid staring down—one of our favorite handshake tips.

More?
⁉ **Two examples** of back-to-back introductions: one low-confidence looking down, and one eye-confidence making eye contact with a taller man.

5. Lead & Control The Conversation (If Appropriate)

Signaling value early on is crucial, and the best way of doing it is with sub-communication and behavior.

Here are good ways to lead and signal social confidence:

- **Initiate** the introduction
  - Add one power move if they initiate, like placing your other hand on the arm or wrist
- **Ask the first question**
- **Control topic transitions**
- **Control the ending move**, end it yourself, or add someone else to your group

⚠ **Calibrate: let them lead if they're legitimate leaders**
Don't try to over-power legitimate leaders or higher-ranking people like bosses, mentors, event hosts, etc. Display power and gain their respect, but respect them too by not threatening their legitimate leadership.

Learn more about calibration:

- **How to learn social calibration**

⍰ Example

I was recording approaches for Seduction University when someone greeted me as if we were friends.

I wanted to gain more control without being cold, a key skill in how to make a good first impression:

Taking The Lead: High-Power, High-Warmth

⍰ (Exclusive real-life example from Power University)⍰

Him: Lucio?
Me: (warm tone and expression) Hey, hi man! Who are you <— Straight talk
Him: Joe <— Gained the intel I wanted
Me: Oh Joe, nice meeting you man <— Leading the intro
(…)
Me: How are you doing man <— Keeps leading

Also read:

- Frame control introduction
- Frame control techniques

6. Grab The Spotlight If It's A Group Interaction

Some social confidence tips to stand out in a group:

- **Walk to the front**

To avoid over-powering the hosts, say: "*I move here so we can better see each other*".
⍰⍰♂ My experience: hosts treated me as an equal and several people came to me after that, including women.

- **Speak louder than most**

No need to yell, but most people speak too quietly to be well-heard by all.

- **Crack a joke if possible**

No need to over-sweat it, but if something witty comes up, it sub-communicates social confidence with high power and warmth.

- **Present yourself interestingly**

For example, share an interesting tidbit of information:

⍰♂Lucio's Take: **Grab attention and display confidence**

(audio file in our program)

> **Me**:
> Name is Lucio <— Instead of ‘my name is… ‘: grabs attention by breaking expectations
>
> I help good men become life winners <— Intriguing
>
> And I achieved my goal of… <— Everyone’s interested in goal achievements
>
> 10k in under 1h <— Shares information relevant to a group of runners

Result:
Several people approached me later about both my job and timed runs. More than one said I sounded ‘confident’—probably volume and body language since tonality can further improve.

Self-defense

Domineering men often start with a power move, but you can counter it.

To defend:

1. Prevent it

Use high-power body language and social status strategies to set the tone *before* you even introduce yourself.

2. Prepare: See It Coming

The odds of handshake power moves rise with:

1. Scowls

2. Puffed out chests
3. Loudness
4. Attention craving

⍰ Example

Trump's pose right after he shoved a prime minister:

Sub-communication All eyes on me, I'll out-dominate people standing in the way

Solutions:

1. Don't go to them first <— Expect to be semi-ignored and used as a 'social peg' if you do!
2. Lower warmth, increase power
3. Get ready for power moves

3. Defend Against Power Moves

Including these handshake tips to stay in control:

- **Palm down upper hand**
  Solutions:
  - Offer a different handshake like fistbump or high-five
  - Offer a vertical hand instead of taking a palm down
  - Rotate his hand vertical, adding 'Let's keep the handshake neutral'

- **Patting your hand**
  Solution:
  - Pat him back on the arm or shoulder

- **Yank and pull**, a Trump's staple

Solutions:
- Get physically closer
- Plant your feet or put one in front of you
- Place a controlling hand on their arm (see Trudeau above)

These always work too:

- **Display disapproval**
  ▯ Abe with Trump

- **Surface the power move** with a comment or joke Ie.:
  - *"Bro, easy with the squeeze"*
  - After a yank: "*Dude, are you trying to take me home or something*" <— ▯▯♂ This was my winning move in a real-life scenario. The whole group laughed, and the jerk turned submissive

- **Touch him**
  - Cup his hand
    ▯ Video + analysis
  - Touch his elbow
  - Place a hand on his forearm

- **Intense stare** like Macron did <— Balance! Macron was confrontational and pushed Trump into revenge mode, here

Offer a fistbump

Touch elbow

Cup the hand

5. Fix Wrong Names

Deliberate mispronunciation and demanding perfect pronunciation are power moves that can lower your status.

Handle it like this:

- **Correct wrong pronunciation a couple of times**, then move on.

⍰⍰♂I sometimes move on with a smile and say ‘Close enough’

- **Try to get their name right once or twice**. Then move on. Say ‘We’ll get it with time’

Don’t over-try: it’s high effort and expands your failures

⍰ Example

A dominant response for people who over-insist:

> **Her**: (teaches pronunciation with teacher frame)
> **Him**: (doesn’t try and calls the toast) <— If he kept trying he’d follow her lead and over-invest, losing power and status. Instead, he leads

Learn more:

- When people pretend to forget you
- When people mispronounce your name

5.2. Reject Their Nickname of Choice

Most nicknames are dismissive.

Assertiveness works well by simply telling people you prefer your real name.
An option I like is to display more power and self-respect with something like “*Why would I want a name that’s not mine*“.

If it’s your boss, you can power-protect saying that ‘it would diminish you with your colleagues and make it harder for you to do your job’.

6. Defuse The “Giver/Taker” Frame

Example in business networking:

> **Him**: How can I help you? <— ⍰⍰ I’m the value giver, you need me
> **You**: Thank you for saying that, maybe we can both help each other, let’s see

Learn more about these foundational dynamics in:

- **Social exchange dynamics**

7. Disempowering Openers

Principles to maintain control:

- **Guard personal information early on**, unless *you* decide to share
- **Make it an exchange**, never let others grill you
- **Reject power moves** including tasks, challenges, or

⍰ Examples:

- **Personal questions**
  - “*How much you make*” ➡ *“Too early to ask that”*
  - “*What’s your job*” ➡ *“Why are you asking”*

- **Overly direct**
  - "*Who are you*" ➡ *"A guy"*
  - "*What are you selling*" ➡ *"What makes you think I'm selling anything"*

⁉ **Calibrate the dominance**: deflect to maintain rapport, but feel free to be blunter if you can (ie.: 'none of your business')

Learn more:

⁉ **How to handle direct questions** while keeping rapport: examples
⁉ **Strategy over dominance** to enforce boundaries with high-value men, while still preserving rapport

⁉ Example: The Tasking Colleague

John shares this example in a hospital setting:

1. **Colleague had to report** about a patient <— You're "power up"
2. **He tasked me** to call on his available time <— *He* must deliver the info, not task you to chase at his convenience
3. **I tasked him** back to report 'at his convenience' <— Resets the correct dynamics
4. **He called, and he's much nicer** -even submissive <— As it should be

John adds that if he complied, the relationship would be set as convenient *to him*. And he's right.
Early power dynamics 'cement' fast and set the frame for future exchanges—and for the relationship.

Learn more in:

- How to handle tasking

⁉ **Power Move: Look Away To Display Disapproval**

Eye contact sub-communicates base-level confidence, but also consideration.

Deliberate looking away displays disapproval and superiority.

⁉ Example:

♟ **Calibrate it!**
Zero eye contact = *high* disrespect. A good balance is a tight lip smile, *little* eye contact, without angling your face away.

Learn More: Master Social Success

That's the blueprint for owning your introductions and beyond—small moves that add up to big wins in status and respect.

If you're ready to take it further, Power University is where it all comes together.

It's our flagship program designed to transform good guys into high-quality men—equipping you with the tools to project unshakable confidence, earn respect effortlessly, and spark attraction without even trying.

The journey from first impressions to lasting impact starts with **Power University**.

Persuasion: Social Influence and Compliance Gaining – Summary & Review

Lucio Buffalmano · 20 April 2025 · Archived copy · Original

Persuasion: Social Influence and Compliance Gaining (2022) by Robert H. Gass and John S. Seiter provides a deep dive into the mechanics of influence, blending theory with real-world applications. This article distills the book's core insights, focusing on practical takeaways.

FULL SUMMARY

About the Author:
Robert H. Gass is a professor of Communication Studies with a focus on persuasion, social influence, and political rhetoric.
John S. Seiter is a professor of Communication who specializes in influence, deception, and intercultural communication.

1. What's Persuasion?

Persuasion is still as much an art as it is a science.

Human nature is complex and our understanding of persuasion is still too limited.

However, the inverse is also true.
Persuasion is not just an art; it's also a science.

And we can better persuade if we understand the science.

Definition of persuasion:

> Persuasion involves one or more persons who are engaged in the activity of creating, reinforcing, modifying, or extinguishing beliefs, attitudes, intentions, motivations, and/or behaviors within the constraints of a given communication context.

Persuasion is about long-term influence, while compliance gaining is about immediate agreement.

- **Persuasion** involves changing someone's attitudes, beliefs, or behaviors over time.
- **Compliance Gaining** is more immediate and focuses on getting a person to say *yes* to a specific request.

Types of Influence

- **Persuasion –** A voluntary process where people change attitudes or behavior due to logical, emotional, or ethical appeals.
- **Coercion –** Uses force or threats to change behavior.
- **Manipulation –** Uses deception or psychological tricks to influence others.
- **Propaganda –** Often one-sided messaging designed to shape opinions in a biased way.

⍰ Practical Application:

- **Use "Nudges"**: Subtle cues can influence behavior (e.g., placing fruit at eye level to increase fruit consumption)
- **Use Opinion Leaders For Persuasion**: People underestimate the power of in-person influence compared to other communication contexts

2. The Two Prevailing Models of Persuasion

Researchers have identified two major persuasion models, both largely based on how much people reflect and process the information.

While there is criticism against the 'dual model' (see 'unimodel of persuasion'), many studies upheld both models' utility, and both enjoy broad acceptance.
They are:

Elaboration Likelihood Model (ELM)

Suggests there are two routes to persuasion:

- **Central Route**: Involves deeper thinking. Logical arguments and evidence appeal to critical thinking.
- **Peripheral Route**: Uses cues like attractiveness, authority, quantity of arguments and emotions that are less related to the substance of the message

Example: A car buyer researching safety features (central route) vs. choosing based on a celebrity endorsement (peripheral route).

People use one or the other depending on:

- **Motivation** to engage in central processing, for example if you're highly involved with the topic or issue. Conversely, low involvement, or not caring, means more likely to resort to peripheral cues
- **Ability**, which refers to mental faculties and knowledge of the topic (ie.: IQ and expertise)

More factors that influence central or peripheral include:

- Background noise
- Time constraints
- Mood
- Need for cognition, a personality trait related to 'enjoying thinking about things'

Some researchers suggest there can be *parallel processing*—that is, using both routes at once (Petty, Kasmer, Haugtvedt, & Cacioppo, 2004).
However, they also suggest there is usually a tradeoff between the two and one tends to prefer one or the other.

Central Route	Peripheral Route

Central Route	Peripheral Route
Long lasting (Carpenter, 2015 ; Petty, Haugtvedt, & Smith, 1995)	**Short-lived**
Resistant to counter-influence	**Fickle**
Effective disagreement, generating more counter-arguments	**Intellectual pushover**, more likely to 'go along with the flow'

Heuristic-Systematic Model

Similar to ELM, emphasizing systematic (deep) vs. heuristic (shallow) processing:

- **Systematic Processing**: Careful evaluation of arguments
- **Heuristic Processing**: Relying on mental shortcuts like "experts know best."

Example: Trusting a doctor's advice because of their white coat, rather than evaluating the evidence yourself.

Shelley Chaiken and Alice Eagly, the original researchers behind the model, maintain that simultaneous processing of messages by both system is common, but there is little empirical evidence for simultaneous processing.

'Sufficiency principle': states that people use the systematic processing as little as possible to conserve mental energy. Such as, we strive for the perfect tradeoff where we know and process as much needed, but no more than needed.

Applications

- **Make people think for lasting persuasion**
- **Tailor your approach to their cognitive engagement**

Social Judgment Theory: Why Ideologues Are Tough to Persuade

Social judgment theory explains how people accept or reject certain messages.

On a given topic there are a range of possible opinions that one can hold.
For example, on the murder's punishment one's position can range according to this chart:

Seiter, J. S. , & Gass, R. H. (2022). Persuasion, Social Influence, and Compliance Gaining (7th Edition). The 'X' marks the 'anchor position', the most preferred option

Note that Muffy and Mort's positions are close.

But Muffy is an ego-involved person because this has personal significance to them and their sense of self. They are strongly committed to their stand and are more likely to reject other positions.

It's difficult to persuade someone who is ego involved because their latitude of rejection is large while their latitude of acceptance is narrow (e.g., Sherif, Kelly, Rodgers, Sarup, & Tittler, 1973).

Exceptions apply if the intervention is related to *goals/needs* rather than values, in which case strong arguments facilitate persuasion.

Trump's success is dexplained by large latitudes of rejection

The authors observe that while Trump has low approval ratings, he was an effective politician and persuader, and is revered by his fanbase.

Even in the face of compelling evidence, some people do not change their minds.
And they explain why with social judgment theory:

> Political polarization highlights the role of resistance to persuasion.
> Social judgment theory, goes a long way in explaining this divide. When people have small latitudes of acceptance and large latitudes of rejection, opposing messages are discounted.

3. Attitudes and Consistency

'Attitude' is:

> "A psychological tendency that is expressed by evaluating a particular entity with some degree of favor or disfavor"

You can think of it as part of character and linked to behavior.
In general, stronger attitudes are better predictors of behavior. When attitudes are weaker, people may use the reverse approach, inferring their attitudes from their behavior (Holland et al., 2002).

Why is this relevant?
Because attitudes help predict, explain, and modify behavior.

Besides attitude, people's intentions also matter, shaped by attitudes towards behaviors, normative beliefs (what we believe people generally do), and perceived behavior control, related to whether we believe we can do it or not.

Key Takeaways:

- People strive for **consistency** in beliefs and actions.
- **Cognitive dissonance** occurs when behavior contradicts beliefs, often leading to attitude change.

⍰ Practical Application for Marketing

- **Sell both indulgence and virtue at once**: Marketing products as "light," "fat-free," or "organic" allows consumers to indulge while staying consistent with their health goals or values.
- **Brand Loyalty with consistency**: Foster strong associations with your brand to make consumers feel inconsistent or uneasy to switch

And its opposite:

- **Marketing Inconsistency – Encourage brand switching**: Ads like "Think different" (Macintosh) or "I could have had a V8!" create psychological imbalance, urging consumers to question habits and try new products.
- **Encourage active participation to deepen commitment**: Asking consumers to vote, customize, or share experiences with a product increases their psychological investment and brand attachment.
- **Merchandising – Secure loyalty with branded rewards**: Offers like logo mugs drive consumers to buy more of a product to earn rewards, locking in loyalty and boosting consumption over time.
- **Adapt your message to their values**: Persuasion works best when you align your appeal with the audience's beliefs and values, rather than trying to shift their entire worldview.

⍰ Practical Applications for Interpersonal Persuasion

- **Expose contradictions to motivate change**: Pointing out inconsistencies in someone's attitudes can move them toward your position—but push too hard, and you risk backlash or rejection.
- **Secure public commitments**: When people state their choices or beliefs publicly (e.g., resolutions, political support), they're more likely to follow through due to the pressure to stay consistent.
- **Use effortful or ritualized entry**: The more effort or symbolic meaning involved in joining (e.g., initiations, training, pledges), the stronger the psychological commitment.
- **Let people make small initial commitments**: Once someone says yes or invests a little, they're more likely to escalate and stay the course (the *foot-in-the-door* technique).
- **Leverage sunk-cost bias**: People often stick to a decision because they've already invested time, energy, or money—even when it's irrational. Persuaders can use this tendency to keep people engaged.
- **Ask, don't order**: people naturally push back against threats to their freedom. For example, littering behavior increases with negative or punitive messages compared to polite ones (Horsley, 1988 ; Huffman, Grossnickle,

Cope, & Huffman, 1995).
So acknowledge listeners' personal autonomy

- ⍰ **Avoid commitment traps yourself** *(defensive strategy)*: Don't be rushed into commitments, and be willing to back out if a decision turns out poorly. This isn't a persuasion tactic, but it's useful resistance advice.

Cognitive Dissonance, Consumption, & Persuasion

- **CDT explains rationalizing contradictions**: People experience discomfort (dissonance) when their beliefs clash with actions, like enjoying Apple products despite poor worker conditions, and seek to reduce it by justifying their choices.
- **Post-decision discomfort drives justification**: After tough choices, people worry if they were right, using strategies like "sour grapes" (e.g., "the grapes were sour anyway") to ease the tension.
- **Buyer's remorse ties to selective exposure**: After purchases (e.g., an expensive TV), people seek confirming info (ads for their brand) and avoid conflicting info to lessen regret and dissonance.
- **Polarization simplifies decisions**: Post-choice, people exaggerate the chosen option's value (e.g., iPhone over Android) and downplay the rejected one, turning gray areas into black-and-white for self-justification.
- **Dissonance varies by self-image and culture**: Internal conflict (e.g., laughing at offensive jokes despite values) or cultural lens (individualistic vs. collectivistic) shapes dissonance, though it's universal to some degree.
- **Magnitude depends on choice and effort**: More choice, foreseeable bad outcomes, belief contradictions, or effort (e.g., big sacrifices) increase dissonance; forced actions reduce it ("I had no choice").

⍰ How to use cognitive dissonance to persuade

- **Increase dissonance** to make someone question their current beliefs or behavior—prompting change.
- **Decrease dissonance** to reassure someone that a past choice or action was correct—reinforcing commitment.
- **Use selective exposure**: Encourage people to focus on information that supports their decisions while avoiding contradictory evidence.
- **Get people to persuade themselves (CAA)**: Have individuals voluntarily advocate for a position they initially disagree with. The dissonance between their spoken message and private beliefs leads them to shift their attitudes to align with what they publicly expressed. This works best when the behavior is **voluntary**.

4. Credibility

Credibility may be defined as:

> "Judgments made by a perceiver (e.g., a message recipient) concerning the believability of the source"

To increase your credibility, focus on the primary dimensions because the secondary ones may or may not matter:

Primary dimensions

- **Expertise** (AKA competence or qualification). There is a 'halo effect' of expertise, so famous people successful in one area 'carry over' their expertise in another -that's why brand endorsers may know nothing of what they endorse.
  - experienced/inexperienced

  - informed/uninformed
  - trained/untrained
  - qualified/unqualified
  - skilled/unskilled
  - competent/incompetent

Credibility can be thought of as a ‘peripheral cue’, and works even more with ‘cognitively lazy’ people.

⁉ **TIP**: Be more confident if you have low credibility, but share possible doubts or limitations of your analyses if you have high credibility (Karmarkar & Tormala, 2010)

- **Trustworthiness** (AKA also called character, safety, or personal integrity), akin to ‘warmth’ in the competence and warmth model
  - honest/dishonest
  - open-minded/close-minded
  - fair/unfair
  - unselfish/selfish
  - moral/immoral
  - ethical/unethical
  - genuine/phony

Wearing religious symbols such as crosses increases trustworthiness. And companies engage in corporate social responsibility to bolster their trustworthiness.

⁉ **TIP**: If you’re unbiased, objective, and non-partisan, explain why. If you’re biased, admit it upfront and then display you weigh all sides and are fair-minded in your evaluation.

- **Goodwill**, is synonymous with ‘perceived caring’ and can be demonstrated with empathy, understanding for others’ needs and ideas, responsiveness, and receptive
  - cares about me/doesn’t care about me
  - not self-centered/self-centered
  - sensitive/insensitive
  - understanding/not understanding

Expertise seems to have the greatest effect on persuasion.

Secondary Dimensions

Extroversion
– timid/bold
– verbal/quiet
– meek/aggressive
– talkative/silent

Composure
– poised/nervous
– relaxed/tense
– calm/anxious
– excitable/composed

Composure

– poised/nervous
– relaxed/tense
– calm/anxious
– excitable/composed

⍰ Strategies for Enhancing Credibility

- **Be well-prepared and organized.**
  Know your material, plan your argument, and anticipate objections to appear competent and credible.
- **Cite evidence and credible sources.**
  Back your claims with facts and trustworthy references—especially important if you lack personal credibility.
- **Mention your (or your sources') expertise early.**
  Establish qualifications before presenting your argument to maximize perceived authority.
- **Demonstrate honesty and sincerity.**
  Show moral character and mutual benefit to build trust with your audience.
- **Show goodwill and empathy.**
  Be caring, responsive, and attentive to your listeners' needs and emotions.
- **Highlight your objectivity.**
  If you have no personal stake, say so. If you do, acknowledge it and give solid reasons for your stance.
- **Be likable.**
  Use warmth, smile, remember names, and act genuinely to boost emotional connection and receptivity.
- **Match your speech style to the audience and context.**
  Avoid disfluencies and inappropriate slang to maintain a smooth and credible delivery.
- **Emphasize relevant similarities.**
  Show shared positive traits or experiences that connect you meaningfully to your audience.
- **If low in credibility, focus on substance and relevance.**
  Raise involvement and emphasize the message content to engage the central route of persuasion.
- **Use endorsements or introductions from credible others.**
  Leverage someone else's reputation to enhance your own credibility via association.

5. Communicator Characteristics and Persuasion

Some brief takeaways:

- **Middle-aged people are less persuadable**, while younger and older people are more persuadable (curvilinear relationship between age and persuadability
- **Lower IQ people are more persuadable**, but the author suggest that a truthful persuasive message based on solid logic may work better on intelligent people
- **Men are more persuasive**, due to a double standard in audience perception that judges assertive women more harshly (Matthews, 2016; Smith et al., 2013)
- **Authoritarians obey authorities** (Adorno, Frenkel-Brunswik, Levenson, & Sanford, 1950 ; Allport, 1954)
  - Dogmatic also obey authorities, are closed-minded, have difficulty being objective, and tend to believe there is only one right way to do things (i.e., their way)

  - Social vigilantes are similar to dogmatics but seek to persuade others, counterargue more, seek to dominate the conversation and resort to manipulative tactics (also see **gaslighting** and gaslighting signs)
- **Narcissists are persuaded by messages that enhance their conceit**

The Role of Personality in Persuasion

Different personality traits affect how individuals persuade and are persuaded:

- **High self-monitors** adapt their persuasion style to fit the audience.
- **Low self-monitors** remain consistent regardless of context.
- **People with a high need for cognition** prefer logical arguments, while those with a low need for cognition respond better to emotional appeals.

⍰ Practical Application:

- **Adapt persuasion tactics**: Use logical arguments for analytical individuals and emotional appeals for intuitive thinkers.
- **Mirror and match communication styles**: Adjust language and tone to align with the audience.

6. Conformity and Group Influence

Researchers have long debated how group size influences conformity.
Two key theories offer differing predictions:

- **Social Impact Theory (SIT)** posits that the first person added to a group has the greatest persuasive impact, with each additional member having progressively less influence
- **Social Influence Model (SIM)** argues that conformity increases up to about three or four group members, after which additional members have little added effect

Empirical research has shown mixed support for both theories. A major reason might be that people conform for two distinct reasons:

- **Informational Influence**: wanting to be right.
- **Normative Influence**: wanting to be liked.

Campbell and Fairey (1989) proposed that group size affects these motivations differently:

- When accuracy matters (e.g., quiz shows), informational influence dominates, and early group additions have the most impact.
- When social approval matters (e.g., fitting in with neighbors), normative influence peaks with groups of two or three.

Further findings:

- **People follow the majority**: **use social proof**. Works particularly well in collectivist cultures and when people purchase gifts or products for others)
- **Deindividuation**: Individuals in groups act differently than alone.
- **Public responses** trigger more normative influence; **private responses** allow more informational influence.
- **Allies reduce conformity**: even when they're 'dubious' partners, a dissenting partner (ie.: visually impaired) can prevent someone from yielding to majority pressure.

- **Anger from the majority backfires**: rather than encouraging conformity, it often leads to *anti-conformity*, as dissenters resist perceived coercion.
- **Conformity increases quickly with small groups** but levels off after 3–4 members.
- **People conform either to be right or to be liked**, and group size affects these motives differently.
- **Women are more likely to conform**
- **Groups polarize decisions**, a phenomenon initially wrongly understood as 'risky shift', people instead tend to become more extreme in their decisions when in groups (and become less accurate)
  - ⍰ Solution: make important decisions in isolation, or be aware of the group's tendency to go for extremes
- **Collectivist cultures conform more**: A meta-analysis by Bond and Smith (1996) finds much higher conformity higher among collectivists than individualists. Even when they are encouraged to dissent, collectivists resist doing so more than individualists do (Curseu & ten Brink, 2016).
  But the difference disappeared in one study examining informational influence.
- **An audience improves outcomes for simple and rehearsed tasks** and impairs performance on complex and novel tasks
- **People contribute less in bigger groups** (social loafing)
  ⍰ Solutions:
  - Provide individual feedback about their own performance or their group's performance
  - Monitor individual performance or make individual efforts identifiable
  - Assign meaningful tasks
  - Make tasks unique so individuals feel more responsibility
  - Enhance cohesiveness of work groups
  - Make them feel their contributions matters

⍰ Persuading Groups: Practical Tips

If you're alone in a group and want to influence others:

- **Establish credibility** if you have expertise.
- Use one of two proven minority influence strategies:
  - **Conform first, then deviate** (build goodwill before challenging the group).
  - **Disagree consistently and confidently** (signal conviction and attract attention).
- **Win over just one person**—it can trigger a shift in the majority.
- **Mention future interactions**—people are more open to minority opinions if they expect to engage again.

Fitting in is good, but too much of a good thing is bad

While identification helps with unity and communication, too much of it can backfire.

Seiter (1998) warns that over-identification can lead to *ethnocentrism* (Gudykunst & Kim, 1997), *groupthink* (Janis, 1972), and *strong organizational culture* (Tompkins & Cheney, 1985), which happens when employees over-conform to the organization's values and actions.

All of these can harm decision-making and increase bias.

To quote the authors:

> identification, by enabling us to communicate, organize, and decrease division, can be a worthwhile goal. However, we must be moderate in promoting it, because too much identification can be "too much of a good thing" (Seiter, 1998).

To fix these issues, dissenters who challenge group norms play a key role in promoting better outcomes (Jetten & Hornsey, 2014).

Also see our seminal article on this issue:

- **Enlightened individualism**

> Winner's Mindsets: 10 Commandments of Enlightened "Me First"

7. Language and Persuasion

Positive words frame your message positively and improve persuasion.

Some takeaways:

- **Aphorisms work**
- **Metaphors are persuasive**
- **Names influence judgments**, popular get better grades and can be sources of stereotypes and discrimination (Elon Musk ought to take note)
- **Using people's names increases tips**
  - Younger men prefer first names, older men prefer titles + surnames
- **Language influences thoughts**
  - The labels we assign others affect the recipient, but also tell about our own attitudes
- **Tell people 'Please don't be a cheater'** instead of 'Please don't cheat'. Personalization increases compliance with 'personal identities'
- **Cussing is a double-edged sword**. Avoid it in formal settings: it makes significantly less competent compared to less formal settings. But when cussing violated audience expectations in a positive way (e.g., people rated themselves as positively surprised by the cussing), ratings of the speaker's competence increased.
- **Vivid language is more persuasive**: Ie.: it's more vivid to say "the glass crashed and shattered into pieces" than it is to say "the glass broke." A meta-analysis of over 40 studies found that vivid messages tend to be more persuasive than pallid ones (Blonde & Girandola, 2016)
- **Intense language is a double-edge sword** (read below), and intensity can be thought of as 'deviating from normality'.
  Eg.: "*You are shockingly stupid*" versus "*You are not real smart*." "*The lumber industry is raping our forests*" versus "*The lumber industry is cutting down a lot of trees*."
  It works better when:
  - The audience already agrees with you. If they disagree, the exaggeration will turn them off
  - The speaker is credible as credible people are afforded more latitude
  - The intensity grabs attention *without exaggerating it*. The extra attention may increase processing and reach, but too much intensity is perceived as extreme and will be rejected
  - The speaker matches the audience's language style. Intense speaker persuade intense speakers, but turn off non-intense speakers

Power & Ultimate Terms

Richard Weaver (1953) labeled ultimate terms the highly revered words that carry special power in a culture. According to Weaver, there are three types of ultimate terms:

Good Terms (God Terms)	Bad Terms (Devil Terms)	Charismatic Terms
Fact	Communist	Freedom
Progress	Nazi	Democracy
Family values	Fascist	
Critical thinking	Dead-beat dad	
Teachable moment	Racist	
Prosperity	Terrorist	
Empowerment	Hate crime	
	Sweat shop	

However, ultimate terms change with time and culture.
These days, 'empowerment' is a power word, and also popular are *superfoods, future-proof, moonshot*, and, perhaps especially, *monster, ultra, energy, and performance*.

Framing

For more modern political framing, for example, Luntz, a political consultant advises:

- Tax cut ➡ tax relief
- Global warming ➡ climate change
- Voucher ➡ opportunity scholarship

"Washington" and "I.R.S.," are negative and should be attached to a policy you want to turn people against.

For more see:

- Framing 101
- Political framing with George Lakoff's book '*Don't Think of An Elephant*'
- Framing techniques
- Political manipulation

Name manipulation

Read these organizations' names:

- "Citizens for the Environment"
- "National Wetlands Coalition"
- "Greening Earth Society"

Sound environment friendly enough?
Well, they're all ANTI-environment think tanks, chosen on purpose to manipulate public opinion (Bricker, 2014).

⍰ Powerless Language

In general, it's best to avoid these low-power expressions:

> a considerable amount of research indicates that using these powerless forms of speech can prevent you from

> being persuasive (Erickson et al., 1978 ; Newcombe & Arnkoff, 1979), even when you are using strong arguments (Hosman & Siltanen, 2011).

- **Hesitations** (signal uncertainty or anxiety): "*Well, I, uh, you know, um, would like to borrow a dollar.*"
- **Hedges** (qualify the utterance in which they occur): "*I guess I sort of like you and kind of want to know you.*"
- **Intensifiers** (fortify the utterance): "*I really believe that and agree with you very much.*"
- **Polite forms** (indicate deference and subordination): "*Excuse me, if you wouldn't mind too much, I'd appreciate it if you'd please shut the door. Thank you.*"
- **Tag questions** (lessens the force of a declarative sentence): "*This is fun, don't you think? Much more fun than yesterday, isn't it?*"
- **Disclaimers** (utterances offered before a statement that anticipate doubts, signal a problem, or ask for understanding): *"I know this is a really dumb question, but . . .?*"
- **Deictic phrases** (phrases indicating something outside the speaker's vicinity): "*That man over there is the one who stole my wallet.*"

But there are important caveats, including:

- **Type of powerless language**: Not all powerless forms are equally damaging.
  → *Politeness* can **enhance credibility** (Bradac & Mulac, 1984)
  → *Hedges* may hurt, but can **sometimes help** depending on context (Durik et al., 2008; Jensen, 2008)
- **Speaker credibility**:
  → *Tag questions* **hurt low-credibility speakers**, but **can help high-credibility ones**—especially when paired with strong arguments (Blankenship & Craig, 2007). Presumably because it makes people think harder
- **Gender**, and women must navigate speech expectations more carefully (Carli, 1990)
  → *Women* were more persuasive using **powerless speech with men** and **powerful speech with women**
  → *Men's persuasiveness* was **unaffected by speech style**

Learn more:

- **Powerless language to avoid**
- **Empowered language to adopt**

8. Nonverbal Influence

- **Warm behavior is persuasive** (AKA: 'immediacy') warmth, closeness, friendliness, and involvement with others increase persuasion (*direct effects model of immediacy*, see Andersen, 2004 ; Segrin, 1993)

But calibrate to the context:

- **Sometimes anger and dominance are more persuasive**, and likable facial expressions could be counterproductive.
  One study found warm behavior is effective among equal status, but dominant behaviors are more effective in established hierarchies (Mehrabian & Williams, 1969)
- **Conservatives prefer leaders with dominant faces**, liberals prefer leaders with non-dominant ones (Laustsen & Petersen, 2016)

- **Mirror your speaking partner**: in one study (Guéguen, 2009), 66 males found the women who mirrored their behavior more sexually attractive. Another study found that mirroring negotiators were more likely to reach a deal (Maddux, Mullen, & Galinsky, 2008)

Read more on:

- The science of social calibration
- Dominant body language
- Warmth and competence and how to perfectly combine the two

⍰ Further findings and practical takeaways:

- **Emblems** (nonverbal behaviors with a precise meaning, often hand gestures) **and illustrators increase persuasion**. Meaning: gesticulate
- **Self-touching (adaptors) signals anxiety**, albeit it's not sure it lowers persuasion: while some research suggests that the use of adaptors was associated with less persuasion (Maslow et al., 1971 ; Mehrabian & Williams, 1969), other research shows the opposite (Maricchiolo et al., 2009). But most research agrees that self-touching behaviors signals anxiety and lack of composure
- **Gazing at listeners produces more compliance** than averting gaze if it's a legitimate request, but within limits
  - Long fixed gazes are perceived as challenges, so don't overdo it
- Look away with illegitimate requests to increase compliance, it makes you look more humble and wins sympathy
- **Smile broadly for warmth, slightly for power**: One study, for example, found that broad smiles foster perceptions of warmth, while slight smiles promote perceptions of competence (Wang, Mao, Li, & Liu, 2017)
- **Maintain open body language**: Avoid crossed arms and maintain eye contact.
- **Smile slowly and maintain it for some seconds**: when smiles appear quickly, the smiling person is perceived as less trustworthy and attractive than when smiles have a slower onset (Krumhuber, Manstead, & Kappas, 2007)
- **Avoid smileys**: unlike actual smiles, "smiley" (⍰)emoticons did not increase perceptions of warmth and actually decreased perceptions of competence (Glikson, Cheshin, & van Kleef, 2018)
- **Scarcity is persuasive** because it limits the freedom of buying at any time. How well it works depends on people's time orientation, but a future-oriented focus can be temporarily activated by making people focus on how the future will be like
- **Attractiveness is persuasive**
  - Attractive *friends and partners* make average people more attractive (assimilation), but attractive random people make average people less attractive (contrast) (Melamed & Moss, 1975)
  - Endomorphs body shapes may be discriminated against
  - Baby-faced women are perceived as more attractive but less mature, but it may still benefit them politically, while baby faces cost male politicians
  - The most persuasive faces are similar to ours
  - Clean-shaven men better sell beauty products, bearded men better sell when expertise and trustworthiness matter (De Souza, Baião, & Otta, 2003)
- **High-status clothing is persuasive**, but it also depends on context. Meta-analyses indicate that fancy suits,

uniforms, and high-status increase compliance (Segrin, 1993), but clothing that makes people identify with a persuader work better. Hensley (1981), for instance, found that well-dressed people were more persuasive in airports, but casually dressed people were more persuasive at bus stops

- **Optimal speed of voice depends on the receiver's ability to understand.** Fast speech can boost credibility and persuasion (Simonds et al., 2006; Miller et al., 1976), but its effectiveness depends on the listener's ability to process it (Buller & Aune, 1988). It may also reduce message scrutiny (Smith & Shaffer, 1995), but fast disclaimers are less persuasive than when delivered at normal speed (Herbst et al., 2012).
  - Synthetic voices can be as persuasive as human ones (Stern et al., 1999).

- ***Appropriate* touching is persuasive** and to do it well, again, you must be a well-calibrated person

Say the authors:

> The use of touch for persuasive purposes is tricky because touch is so ambiguous.
> What one person may see as "warm," for example, another may view as a "power play." (…) What one person might interpret as "friendly," another may see as "flirtatious."

In one study in competitive contexts touching decreased cooperation, probably because it seemed a power move (Camps, Tuteleers, Stouten, & Nelissen, 2013).

The studies that found touching increased persuasion was done on the hand or arm.

- **Stand closer if you're cool or powerful** but maintain appropriate distance if you aren't or it backfires

Research on personal space and persuasion shows conflicting results.

While some studies, like Baron and Bell (1976), found that standing closer increased compliance—possibly because closeness signals liking or urgency—others found the opposite (ie.: Smith and Knowles (1979) and Albert and Dabbs (1970) reported that space invasions decreased helpfulness and persuasiveness).

Judee Burgoon's expectancy violations theory may explain why (and, I add, standard power dynamics and social exchange theory also explain why).
When our expectations for distance are violated, we feel aroused or distracted. Whether that helps or hurts persuasion depends on how rewarding we find the person. If the violator is likable or powerful, the violation can boost persuasion. If not, it backfires.

Practically, if you're perceived as attractive or credible, a slight space violation may help. If not, it's safer to respect expected distances.

⍰ How to Undermine Your Opponent In Debates

Does shaking your head in debats work to undermine your opponents?

This is when it works:

Background disbelief makes the speaker appear more deceptive IF the audience was suspicious of the debater (Seiter, 2001), but it improves the speaker's credibility if people trust him (Seiter et al., 1998)

Derogatory and undermining nonverbal background behavior can also make you seem more deceptive, less credible, less likable, and inappropriate (see Seiter & Weger, 2020)

And if an opponent confronts you with such nonverbal behaviors, you'll be perceived as most effective if you politely and directly ask him or her to stop (Weger, Seiter, Jacobs, & Akbulut, 2010, 2013)

9. Structuring and Ordering Persuasive Messages

Research shows that message structure and timing significantly affect persuasion.

Strong arguments are most persuasive when placed at the beginning (anticlimax) or end (climax) of a message—not in the middle (pyramidal) (Sikkink, 1956).

Whether you speak first or last in a sequence also influences outcomes.

⍰ Best Ordering to Increase Compliance:

- **Start or end with your strongest points**, not the middle—lead or finish strong.
- **For spoken messages (like speeches or videos):** put strong arguments **first** for more impact.
- **If the audience will decide immediately after hearing your message:** go **last** (recency advantage).
- **If there's a long delay before decision-making:** go **first** (primacy advantage) (Miller & Campbell, 1959)
- **If your message is interesting, controversial, or familiar to the audience:** go **first** (Furnham, 1986)
- **If your message is dull, neutral, or unfamiliar:** go **last**.
- **For sensory, experiential products (e.g., food, music):** aim to be **sampled last**.
- **For functional, information-heavy products (e.g., tools, appliances):** aim to be **sampled first** (Biswas et al., 2010)

How to Inoculate Against Persuasion

Inoculation theory (1964) uses a biological metaphor where exposure to a weakened virus builds immunity.

In persuasion, it involves presenting a threat (warning of counterarguments) and refutational preemption (weakened counterarguments with refutations) to strengthen resistance to persuasive attacks, especially for unchallenged beliefs like cultural truisms (McGuire & Papageorgis, 1961).

It outperforms supportive strategies by preparing individuals for future arguments, offering broad protection (Banas & Rains, 2010; Pfau, 1997).

⍰ Practical Takeaways: Quick Tips for Persuasion Resistance

- **Warn your audience of opposing arguments:** Alert people to upcoming challenges to their beliefs to prepare them mentally (McGuire & Papageorgis, 1961; Banas & Rains, 2010).
- **Present and refute weak counterarguments**: Expose people to diluted versions of opposing views and show why they're flawed to build stronger resistance (McGuire & Papageorgis, 1961).
- **Use two-sided refutational messages that include your POW, and the opposing side that you refute**: Present your argument alongside opposing views, then debunk them.
  Two-sided messages are more persuasive than onesided messages, as long as the two-sided messages refute opposing arguments. When two-sided arguments were not refutational, they were less persuasive than one-sided messages (Daniel O'Keefe,1999; Mike Allen; Allen et al., 1990)
  - Two-sided messages also make you more credibile (O'Keefe, 1999), and make people more open minded towards opposing message when dealing with deeply entrenched moral attitudes, especially if you do it respectfully (Xu & Petty, 2021)
- **Focus on unquestioned beliefs**: Protect widely accepted ideas (e.g., "brush your teeth daily") by preemptively defending them against attacks (McGuire & Papageorgis, 1961).
- **Encourage generating supporting arguments**: Prompt people to think of reasons supporting their beliefs to shield against diverse attacks (Papageorgis & McGuire, 1961; Parker, Rains, & Ivanov, 2016).
- **Give time after warnings**: Allow a short delay (e.g., 10 minutes) after warning about a persuasive message to let people prepare counterarguments (Freedman & Sears, 1965; Romero et al., 1996).
- **Make the issue personally relevant**: Connect the topic to your audience's lives to motivate them to resist persuasion (Romero et al., 1996).
- **Minimize distractions during preparation**: Ensure people can focus after a warning to develop strong counterarguments (Romero et al., 1996).
- **Forewarn about persuasive intent**: Alert people that a message is designed to persuade them to spark psychological reactance and increase resistance (Fukada, 1986; Benoit, 1998). It's related to inoculation, but a different tactic. Research shows both tactics are moderately affects, and forewarning works best with people who have the motivation and ability to counter-argue
  - Mental depletion increases persuasion attempts, but forewarning combats it
- **Reinforce resistance periodically**: Refresh warnings or inoculation every few weeks to maintain effectiveness (Scheibe et al., 2014).
- **Emphasize fairness to reduce reactance**: When persuading a warned audience, stress impartiality or their interests to lower resistance (Fukada, 1986; Benoit, 1998).

Loss Frame VS Gain Frame: The Myth of The 'Loss Frame'

Tversky & Kahneman set off a pop psychology myth with their early findings that 'people react more to losses than to gains'.

Instead more recent studies show no clear winner, and what works best depends on a variety of factors, including:

- **Present-minded people** → respond better to **loss-framed** messages.
- **Future-minded people** → equally influenced by **both**.

- **High sensation seekers** → prefer **loss-framed**.
- **Low sensation seekers** → prefer **gain-framed**.
- **Good mood** → makes people more open to **loss-framed** info.

Health context matters:

- **Detection behaviors** (e.g., cancer screening) → **loss-framed** is better.
- **Prevention behaviors** (e.g., sunscreen, exercise) → **gain-framed** is better.

Explicit VS Implicit: Explicit Generally Better... But It Depends

Implicit conclusion ads lead audiences to infer the message themselves (e.g., Burger King example), while explicit conclusion ads state the message directly.

Advantages of implicit conclusions:

- People who reach their own conclusions persuade themselves, often more effectively (Kardes et al., 1994).
- More effective when the message is personally relevant (Sawyer & Howard, 1991).
- Preferred by individuals high in need for cognition (Martin et al., 2003/2004).
- Viewed as less pushy when audiences are suspicious of persuasion (Martin & Strong, 2016).

Advantages of explicit conclusions:

- More persuasive overall, especially in narratives and media (Moyer-Guse et al., 2012).
- Provide clearer guidance, leading to better outcomes (Dillard, 2014).

⍰ Further Findings and Takeaways

- **Choose quality for attentive audience, quantity for inattentive people**: If your audience scrutinize your message, use strong arguments, but if your audience is not involved, quantity of arguments may be quite effective
- **Evidence works for lower-credibility speakers**, but not much for high-credibility speaker. But most speakers gain with evidence, so use lots of high quality evidence
- **Statistical evidence is generally more persuasive** than anecdotal/narrative evidence—especially when making generalizations or when audience involvement is high.
- **Vivid narrative** (stories or personal examples) **evidence works better when audience involvement is low**
- **Use both statical and narrative evidence** since they're additive. E.g.: start with a story, follow up with data to show it's not a fluke
- **Repetition is persuasive up to a point**, then it becomes less persuasive. A study pointed at 3 repetitions

10. Compliance Gaining

Persuasion is an umbrella term for changing beliefs, attitudes, and behaviors. Compliance is a subset of persuasion, typically referring to changing a person's overt behavior—think of tasking and executing, for example.

Compliance-Gaining Tactics

With examples of how you could get your son to clean his room, based upon Marwell & Schmitt (1967)

- **Promising a reward**: Offer a reward for compliance.
  E.g., promise him ice cream if he cleans his room.
- **Threatening a punishment**: Threaten a consequence for non-compliance.
  E.g., say you'll give away his Wii if he doesn't tidy up.
- **Using positive expertise**: Assert that compliance benefits him based on your knowledge.
  E.g., say successful people keep things clean.
- **Using negative expertise**: Warn of harm from non-compliance based on your knowledge.
  E.g., say messy people fail in life.
- **Promoting liking**: Build rapport before making the request.
  E.g., act cheerful and give attention, then ask him to clean his room.
- **Using reciprocity**: Give something he wants before asking for compliance.
  E.g., buy him a game, then ask him to clean his room.
- **Administering punishment**: Apply punishment until compliance.
  E.g., ban Wii use until his room stays clean for a month.
- **Creating indebtedness**: Remind him he owes you for past help.
  E.g., say you go out of your way for him, so he should keep his room clean.
- **Generating moral obligation**: Frame non-compliance as morally wrong.
  E.g., say disorganized people are morally bad.
- **Promoting positive esteem**: Suggest compliance will boost his self-esteem.
  E.g., say a clean room will make him feel proud.
- **Promoting negative esteem**: Suggest non-compliance will lower his self-esteem.
  E.g., say a filthy room will make him feel bad about himself.
- **Using positive altercasting**: Say admirable people would comply.
  E.g., say good boys like him naturally want clean rooms.
- **Using negative altercasting**: Say only bad people would not comply. This can be more manipulative and several experiments showed it worked less well than more prosocial approaches
  E.g., say only bratty kids have dirty rooms.
- **Being altruistic**: Highlight how much his help would mean to you.
  E.g., say you're overwhelmed and he'd help a lot by cleaning.
- **Using positive admiration**: Say admired people will respect him more if he complies.
  E.g., say his brother Timmy will be proud if he keeps his room clean.
- **Using negative admiration**: Say admired people will lose respect if he doesn't comply.
  E.g., say Timmy will be ashamed if he keeps his room messy.

Power Dynamics & Persuasion: Persuading With Power In Mind

Power influences how people use and respond to persuasive messages.

When one party holds more power, persuasion tends to be more polite and indirect to avoid threatening the other person's "face" (Brown & Levinson, 1987).

Those with less power use more positive, polite strategies because their requests may not be seen as legitimate or appropriate.
Conversely, more powerful individuals tend to be less polite in their requests (Baxter, 1984).

⍰ Practical Takeaways:

- **Save face**: Avoid threatening the other person's self-image to increase compliance (Brown & Levinson, 1987; Jenkins & Dragojevic, 2013).

- **Use politeness when lacking power**: Less powerful people succeed more with positive, respectful strategies (Golish, 1999; Golish & Olson, 2000).
- **Frame requests positively when lower power**: Positive framing works best for persuaders with little power (Levine & Boster, 2001).
- **Ask directly and respectfully**: Direct requests are both effective and not seen as impolite (Kellermann & Shea, 1996).
- **Respond to disrespect calmly**: In conflict, polite and direct responses are most effective and appropriate (Weger et al., 2010).
- **Refuse without offense**: How you say "no" affects both your and the requester's face and determines whether the refusal is seen as fair or rude (Johnson, 2007).
- **Adapt to context and relationships**: Power, situation, and social ties all influence which compliance strategies work best.

Cialdini's 7 Principles of Social Influence

The author's dedicate a paragraph to Cialdini's work on Influence.

1. **Reciprocity** – We feel obligated to return favors, gifts, or kindness, making us more likely to comply with requests.
2. **Scarcity** – We value things more when they are limited or rare, increasing their persuasive power.
3. **Consistency/Commitment** – Once we commit to something, we feel pressure to act in ways that align with that commitment.
4. **Authority** – We are more likely to follow or believe people we see as credible or in positions of power.
5. **Liking** – We are more easily persuaded by people we like or find attractive and friendly.
6. **Social proof** – We tend to follow the actions and choices of others, especially in uncertain situations.
7. **Unity** – We're more influenced by people with whom we share a group identity or strong sense of connection.

11. Sequential Persuasion

1. **Foot-in-the-Door (FITD)** – Works because people want to stay consistent with previous actions.
   Example: Getting someone to sign a small petition before asking for a donation. To make it work:
   - Start with the largest possible request that will be accepted – Make the first request big enough to matter, but not so big it gets rejected.
   - Tap into prosocial motives – Use the technique for altruistic or socially beneficial causes, not self-serving ones. So this technique is more useful in demanding donations than for on-commission salespeople
   - Avoid material rewards – Don't offer incentives for the first request, or it weakens internal motivation to comply again.
   - Switch requesters – Use a different person for the second ask to increase compliance.
   - Label the person positively – Reinforce the first behavior by labeling the person (e.g., "You're generous"), which boosts follow-up compliance.
   - Appeal to consistency – Make the second request align with the first, especially for people who value being consistent.
     People differ with 'need for consistency' though, and some, like Machiavellians, need it less
   - Target clear self-concepts – The tactic works best on people who have a strong, stable sense of self

2. **Door-in-the-Face (DITF) –** Start with a large request, then scale down to a more reasonable one. Works due to reciprocal concessions (people feel obligated to compromise).
   Example: Asking for a $500 donation first, then lowering it to $50.
   Here's how to make it work:
   - Start big—but not absurd: Make your first request large enough to be rejected, but not so extreme that it triggers anger or disbelief. (Cialdini et al., 1975; Even-Chen et al., 1978)
   - Use DITF for altruistic goals: The tactic works best for prosocial requests (e.g., volunteering) and when seeking verbal compliance, not personal gain or money. (Feeley et al., 2012)
   - Follow up fast: Make the second, smaller request immediately after the first is refused to maximize compliance. (Dillard et al., 1984; Feeley et al., 2012; Fern et al., 1986; Guéguen et al., 2011)
   - Stick with the same requester: For DITF to feel like a concession, both requests must come from the same individual. (Cialdini et al., 1975)
3. **Low-Balling –** Get commitment first, then change the deal later. Works because people dislike backing out of commitments.
   Example: A car salesperson quotes a price, then adds extra fees once the buyer is invested.
   - Bait-and-switch: advertises an attractive product or deal to hook you in, but once you're committed, the product is "unavailable" and you're steered toward a more expensive or inferior alternative.
     It's deceptive but effective.
4. **That's-Not-All –** Add bonuses or discounts before the person decides. People see the new offer as better by comparison, and enjoy receiving small "wins" even when spending money. Of these, the *silver lining effect*, or framing the added gift as '*yes, it costs, BUT you also get…* ' has the strongest support. (Burger, 1986; Thaler, 1985; Lee et al., 2019)
   Example: Infomercials offering *"But wait, there's more!"*
   - Sweeten the deal before they say no: Add free extras *before* the person can reject your offer—this boosts sales and compliance. (Burger, 1986)
   - Price drops count too: Lowering a price after stating a higher one also increases compliance—more than just stating the lower price directly. (Burger, 1986)
   - Be careful with altruism or high initial asks: The tactic works best in sales, not in charitable or altruistic contexts, and may backfire if the initial price is too high. (Burger et al., 1999; Lee et al., 2019)
   - ⍰⍰ If you're adding a valuable product mention the value or you risk cheapening as a lower-value add-on
5. **Even a Penny Will Help –** Minimizes resistance by making the ask seem trivial.
   Example: Charity campaigns saying *"Even $1 makes a difference."*
   - '*But it's up to you*' technique: Adding a phrase like "but you are free to refuse" significantly boosts the chance they'll say yes. In one study, this simple line increased donations from 10% to 47.5%, and doubled the average amount. (Guéguen & Pascual, 2000)
6. **Pique Technique –** Make an unusual request to grab attention.
   Example: Asking for 37 cents instead of spare change.

That's not all with its bonuses is more persuasive than DITF because it doesn't require rejection first. (Burger, 1986)

⍰⍰ **Use a combination whenever possible**: research has found that combinations of sequential tactics can be effective (Goldman & Creason, 1981; Goldman, Creason, & McCall, 1981; Goldman, Gier, & Smith, 1981; Souchet & Girandola, 2013)

More compliance technqiues

Besides the 'mainstays':

1. **Foot-in-the-Mouth**: Ask how someone is doing, acknowledge their reply, then make your request. It builds

rapport and increases compliance (Howard, 1990; Meineri & Guéguen, 2011).

2. **Dump-and-Chase**: Don't take no for an answer—counter objections with solutions. Works as well or better than foot-in-the-door or door-in-the-face (Boster et al., 2009).
3. **Four Walls**: Ask easy yes-questions to get agreement, then deliver the real ask (e.g., donations). It primes people to say yes (Cialdini & Sagarin, 2005; Guéguen et al., 2013).
4. **Just One More**: Saying someone is the *last one needed* increases compliance with requests (Carpenter, 2014).
5. **You'll Probably Refuse, But…**: Prefacing a request this way increases donations—likely due to reactance (Guéguen, 2016).
6. **Only Request**: Saying "This is my only request" makes people more likely to comply, especially with donations (Grzyb & Dolinski, 2017).

12. Deception

Deception is a form of persuasion. Even from the standpoint of pure cases of persuasion, deception involves an intentional attempt to get someone to believe what the liar knows to be false.

Also read:

- **Persuasion VS manipulation**

> Persuasion vs. Manipulation: Understanding the Fine Line

Signs of Deception

People are bad at detecting lies and deception, and there are no foolproof or reliable cues for deception.

There are though some cues that are more likely to be present with deception.

DePaulo and her colleagues (DePaulo et al., 2003) combined the results of 1,338 estimates of 158 deception cues. They are:

- **Talking time**: Liars' responses are shorter than truth tellers' responses.
- **Details**: Liars provide fewer details than do truth-tellers.
- **Pressing lips**: Liars press their lips (as if holding back) more than truth tellers.
- **Making sense**: Liars' stories are more discrepant, ambivalent, and have less plausibility and logical structure.
- **Lack of immediacy**: Liars seem more evasive and impersonal, distancing themselves from listeners (e.g., passive voice).
- **Uncertainty**: Liars sound more uncertain than truth-tellers.
- **Raising chin**: Liars raise their chins more, possibly to appear more certain.
- **Repetition**: Liars repeat themselves more than truth tellers.
- **Cooperation**: Liars are rated as less cooperative in conversation.
- **Negative statements**: Liars use more negative expressions and complaints.
- **Pleasantness**: Liars' facial expressions are less pleasant.
- **Nervousness**: Liars appear more nervous overall.
- **Vocal tension and pitch**: Liars' voices are more tense and higher-pitched.
- **Pupil dilation**: Liars have more dilated pupils.
- **Fidgeting**: Liars fidget more than truth tellers.
- **Spontaneous corrections**: Truth tellers correct themselves more often.

- **Admitted lack of memory**: Truth tellers more often admit forgetting something.
- **Related external associations**: Liars mention more peripheral or unrelated events.

Who Tells Better Lies

- **Machiavellian lie better** (and probably more)

> The Machiavellian personality is not interested in interpersonal relationships, manipulates others for selfish purposes, and has little sense of social morality (Christie & Geis, 1970; Geis & Moon, 1981). Machiavellian personalities are truly "wolves in sheep's clothing." Not only do they lie and intend to cheat more often than their counterparts (i.e., low Machiavellians) (Brewer, & Abell, 2015; Jonason, Lyons, Baughman, & Vernon, 2014), they appear more innocent while doing so.

The authors share a study showing that even as children Machiavellians were better liars, both more persuasive, and seen as more innocent.

- **High self-monitors lie better**

High self-monitors, who use situational information to behave more appropriately, are better deceivers than low self-monitors (Elliot, 1979; Miller, deTurck, & Kalbfleisch, 1983).

- **Socially skilled and emotionally aware people are better deceivers**

Emotional awareness (Wielgopolan & Imbir, 2020) and skills at expressing basic emotions improve deception (Riggio & Friedman, 1983).

Expressive, socially skilled, and tactful individuals (Riggio, Tucker, & Throckmorton, 1987; Riggio, Tucker, & Widaman, 1987), as well as competent (Feeley, 1996) and precise, friendly communicators (O'Hair et al., 1988), are more successful at deceiving others.

Apprehensive communicators instead leak more cues (O'Hair, Cody, & Behnke, 1985).

- **Men are better liars than women**

> The results of two meta-analyses found that males tend to be more successful at lying than females (Kalbfleisch, cited in Burgoon, Buller, Grandpre, & Kalbfleisch, 1998 ; Zuckerman, DePaulo, & Rosenthal, 1981). Likewise, a study by Lloyd, Summers, Hugenberg, and McConnell (2018) found that female deceivers were easier to "read" than male deceivers

Can you train people to be effective lie detectors?

Training people to detect lies has shown only minor improvements in accuracy, with some studies even reporting negative effects from such training (Hauch et al., 2016; Akehurst et al., 2004; Kassin & Fong, 1999).

However, when experts can actively question suspects, their accuracy improves significantly, suggesting that enhancing interrogation techniques may be a more effective focus (Levine et al., 2014; Luke et al., 2016).

As for whether some people are naturally better lie detectors, research has not found strong evidence for consistent individual differences (Roulin & Ternes, 2019; Bond & DePaulo, 2008).
While traits like emotional intelligence, involvement, or self-monitoring have been explored (Forrest & Feldman, 2000; Brandt et al., 1980b; Geizer et al., 1977; DePaulo et al., 1980; Rosenthal & DePaulo, 1979), their impact on detection accuracy appears limited.

However, some individual differences may still play a role in real-world settings, especially if lie and truth detection

are treated as separate abilities, with distinct skills supporting each (Stewart, Wright, & Atherton, 2019).
Initiating and maintaining attention increased truth detection, while understanding people's mental states improved deception detection (Stewart et al., 2019).

However, rather than just observing, a more proactive approach may help.
Hartwig and Bond (2011) argue that actively *eliciting* cues to deception—rather than just observing—can make liars easier to detect. Here are three key strategies:

- **Increase cognitive load** to strain liars' mental resources:
  Asking suspects to recount events in reverse order or through multiple formats makes lying more difficult and less consistent (Vrij, 2018; Vrij et al., 2008; Leins, Fisher, & Vrij, 2012).
- **Request verifiable details** to test claims:
  Liars tend to avoid details that can be fact-checked. Asking for verifiable information helps distinguish them from truth tellers (Vrij, Leal, & Fisher, 2018; Nahari, Vrij, & Fisher, 2014; Harvey et al., 2016).
- **Use strategic questioning and expose contradictions at once**, later in the questioning works best (early on can make innocent people look guilty):
  Techniques like Strategic Use of Evidence (SUE) withhold known evidence until after suspects commit to statements, making contradictions clearer (Granhag & Hartwig, 2008; Hartwig et al., 2005; Vrij, 2018; Sorochinski et al., 2014).
- **Leverage context-sensitive information** to assess plausibility:
  Providing interrogators with relevant background info (e.g., demographics of NFL players) greatly improves detection accuracy (Blair, Levine, & Shaw, 2010; Levine, 2020).
- **Ask diagnostic questions** that reveal underlying motives:
  Questions targeting confidence in co-conspirators, justification of actions, and suggested punishments can differentiate liars from truth tellers (Levine et al., 2014).

Other findings

- **It's harder to lie well on important matter**: a phenomenon called 'motivational impairment effect' (DePaulo & Kirkendol, 1989)
- **Peple tend to assume honesty**, 'truth default theory'
- **Stereotypes on lie detection are untrue**
  - Shifty eye contact: liars don't avoid eye contact, and sometimes engage in even more eye contact
  - Direction of gaze has no evidence to support it
- **People say they look for certain cues, but rely on others** like signs of ambivalence, uncertainty, and indifference, all more reliable
- **Truth detection and deception detection are two different skills**
- **Collaborative deception detection may be more effective** than relying on individuals. One study found that groups were significantly more accurate than individuals when the group consisted of established teams—not strangers (McHaney, George, & Gupta, 2018).
- **Familiarity is a double-edged sword**: some biases like expecting honesty or dishonesty decrease accuracy but knowledge increases accuracy.
- **Suspicion increases accuracy of judging lies**, but decreases accuracy of judging truth. Overall, the effect cancels each other out
- **Anxious behavior looks like deception** (Cruz, and Morr, 2000)

13. Motivational Appeals

Definition of motivational appeals:

> external inducement (AKA incentives), often of an emotional nature, that are designed to increase an individual's drive to undertake some course of action.

Emotions work better when people rely on peripheral processing

Use strong arguments with anger

- Use **message-relevant anger** with strong arguments for persuasion;
- **Avoid unrelated anger** (Walter et al., 2019)
- **Channel anger constructively** to avoid destructive outcomes (Skurka, 2019), and include clear actionable speps

Fear Appeals Can Be Effective

Fear appeals are common and can be persuasive in parenting, advertising, and public discourse (Altheide, 2002; Furedi, 2018; Gardner, 2009; Glassner, 1999).

Well-designed fear appeals can change attitudes, intentions, and behaviors (Boster & Mongeau, 1984; Cho & Witte, 2004; Mongeau, 1998; Ruiter et al., 2001; Tannenbaum et al., 2015; Witte & Allen, 2000)

The Stage Model explains that **fear is most persuasive when it's relevant to us, and the risks are high**, leading to central processing and looking and ready for solutions ('coping appraisal').

Stage Model of Fear Arousal		
	High severity (serious consequences)	**Low severity (serious consequences)**
High susceptibility (personal risk)	most effective; likely to change attitudes, intentions, and behaviors	likely to change intentions and behaviors
Low susceptibility (personal risk)	likely to change attitudes	least effective; unlikely to change attitudes, intentions, or behaviors

Stage model of fear arousing communication

However, **people only take action if they believe they can do something about the risks.**

Extended Parallel Process Model (EPPM) explains that people either ignore, fear, or take action based on perceived threat and efficacy (Witte, 1992, 1994; Maloney, Lapinski, & Witte, 2011):

- **Response efficacy**: "Will the suggested action work?"
- **Self-efficacy**: "Can *I* do it?"

If both types of efficacy are also high, people take steps to address the threat rationally and proactively ('danger control').

If efficacy is low (even with high threat), people often engage in *fear* control—they panic, deny, or suppress the fear instead of addressing the danger.

So, to summarize:

- **Low threat** → Message ignored
- **High threat** → People listen
- **High threat + high efficacy** → **Danger control** (desired outcome)
- **High threat + low efficacy** → **Fear control** (undesired outcome)

⍰ To make your fear appeal work:

1. **Emphasize severity and susceptibility** (high threat),
2. **Clearly outline effective solutions** (response efficacy),
3. **Instill confidence in the audience's ability to act** (self-efficacy).

Otherwise, the message may backfire, increasing anxiety without action.

Pity, Guilt, & Shame

- **Pity works in eliciting donations**, with with negative portrayals more persuasive than positive ones (ie.: starving children)
- **Moderate guilt can work**, but it's easier to overdo it and it backfires (Bessarabova, Turner, Fink, & Blustein, 2015), with a feeling of being manipulated (Singh, Crisafulli, & Quamina, 2020)
  - Emphasize the positive feelings of doing the right thing, rather than the guilt trip of inaction

Humor

- Humor seems more effective at increasing knowledge than changing attitudes or behavior
- Avoid self-disparaging humor when you must project competence
- Use moderate humor, don't overdo it

Pride & patriotism work

- Patriotic ploys are effective when used appropriately, and they work better on nationalistic receivers
  - Food servers earned significantly more tips with a patriotic message ("United We Stand") on patrons' checks than a traditional message ("Have a Nice Day").
  - Patriotism increased consumers' intentions to purchase domestic brands without altering perceptions of quality or reliability

The authors note that 'flag waving effects' may be waing though, although I'm not convinced of that as more

liberalism is often contrasted with even stronger nationalism from the conservatives.

Ingratiation & flattery work

Overall, research suggests that ingratiation works—and works well (Gordon, 1996).
It can backfire when it's too obvious, albeit some studies find that even shameless ingration works (e.g., Chan & Sengupta, 2010).

However, to make it work best **perceived sincerity is the key**.

There are four types of ingratiation:

- **Other Enhancement**, giving compliments or flattery.
  - Indirectly through a third party to appear more genuine.

- **Opinion Conformity**, agreeing with the target's views or preferences.
  - Technique: initial disagreement followed by agreement to show persuasion.

- **Self-Presentation**
  - Bragging or showcasing admirable traits to boost one's image.
    Example: mentioning volunteer work to appear virtuous.

- **Doing Favors** *(added by later scholars)*
  Example: Providing help or assistance to win favor.

 Tips to make ingration work:

- **Focus on positives** effective ingratiators mentally focus on the target's strengths, which helps make praise sound authentic rather than calculated (Westphal & Shani, 2016).

- **Make it sincere** Ingratiation is more effective when perceived as genuine. If the flattery appears manipulative or self-serving, it can lead to the "slime effect," where the ingratiator is disliked and distrusted (Vonk, 1998; Yan et al., 2020).

- **Tailor the delivery** with personalized and targeted compliments (e.g., directed at individuals in small groups) are more persuasive than broad or generic ones, which can seem insincere (Seiter & Weger, 2010).

- **Use subtlety and questions**
  Reframing a compliment as a question (e.g., asking for style advice while embedding flattery) makes it feel less obvious and more authentic (Westphal & Shani, 2016).

14. Visual Persuasion

- **Pictures beat words**, at least when it comes to being more easily recognized and recalled (Hockley, 2008 ; Pelli, Farell, & Moore, 2013; Stenberg, 2006)
- **Movies export Western values**, and movie characters' action may be seen as placing a stamp of approval on those behaviors.
  - Adolescents who see a lot of smoking on the big screen are more likely to light up (Leonardi-Bee, Nderi, & Britton, 2016 ; Wellman et al., 2016)
  - Exposure to sexual content increases the likelihood of unprotected sex (O'Hara, Gibbons, Gerrard, Li, & Sargent, 2012)
  - Viewing more violence = more aggression and antisocial behavior in people. "Fifty years of research on the effects of TV violence, notes John Murray (2008), "leads to the inescapable conclusion that viewing media

violence is related to increases in aggressive attitudes, values, and behaviors" (p. 1212).
Plus, people tend to view the world as scarier and more dangerous

- **Shocking ads work if they work a fine line**. It significantly increases attention, benefits memory, and positively influences behavior" (Dahl, Frankenberger, and Manchanda, 2003). Other studies also support the effectiveness of shock ads (Scudder & Mill, 2009).
  However, they must not be so shocking to incite rebellion, and people may get used to shock if there is an oversupply

15. Esoteric Forms of Persuasion

- **Subliminal advertising doesn't work**

> "the results show no significant positive or negative effect . . . subliminal advertising does little to influence consumer behavior" (p. 527). After reviewing 50 years' worth of research on subliminal advertising, Broyles (2006) similarly announced that "subliminal advertising just is not effective"

- **Priming is too weak to make an impact in the real world**

First off, people must *already* have a need or drive for subliminals to have any effect.

Priming's effects also rely on controlled laboratory settings without distractions and with the test immediately following the priming.
The real world is inherently more chaotic.

Finally, the effects are minor and transitory.

- **Neurolingist programminc is hogwash**

> The original theory, developed by Richard Bandler and John Grinder (1975 , 1979), lies somewhere between pop psychology and junk science (…) Despite the extravagant claims, there is scant evidence that NLP works.

One study compared an indirect message using NLP with a direct message without NLP (Dixon, Parr, Yarbrough, & Rathael,1986), and the one without NLP was significantly more effective.

- **Background music works** to affect mood or emotions without the person realizing it
- **Scents work**, but purchasing decisions are too complex to be influenced by scent alone, and there is too much varciance among people
- **Different colors have different effects**

The Cultural Element: How to Persuade Interculturally

Individualist VS Collectivist

1. **Collectivist cultures** (e.g., China, Korea) value harmony, group goals, and social obligations.
2. **Individualistic cultures** (e.g., U.S.) value independence, personal achievement, and self-expression.

Power Distance

1. **High Power Distance Cultures** (e.g., China, Russia):
   - Accept hierarchy and inequality.
   - Less likely to donate to charity (feel less personal responsibility).

- Judge product quality by price.
- Less prone to impulsive “vice” purchases.

2. **Low Power Distance Cultures** (e.g., U.S., Germany):
   - Value equality and challenge authority.
   - More egalitarian in persuasive approaches.

⍰ How to frame your message

- **Individualistic messages for the West** (e.g., “The art of being unique”) work better in individualistic societies.
- **Collectivist messages for the East** (e.g., “We bring people closer together”) are more effective in collectivist societies.
- **Indirect tactics for East**, Chinese managers favor indirect, relationship-based tactics like coalition-building, gift-giving, hints, and group-based appeals
- **Direct & rational for the West**, U.S. managers prefer rational and direct persuasion and requests
- **Self-persuasion for the West**, e.g., “Why would you choose healthier foods?”).

MORE WISDOM

Naive heroes enable takers: working bees & social loafers

I found this part enlightening, and once again confirmed why the world can benefit from our mission:

> diligent isolates, unlike social loafers, are people who increase their efforts and willingly work alone in an effort to rescue group projects.
> However, because they do not know how to delegate or have the social skills required for group projects, diligent isolates can be just as bad for group projects as social loafers. (…) the presence of diligent isolates promoted social loafing in other group members

And I’ve also personally experience this dynamic in real life multiple times (I was the loafer).

Persuasion and coercion are close relatives

While many draw a net distinction, the authors seem them as ‘close relatives’ and often overlapping:

> In fact, we would suggest that most influence attempts we encounter in daily life include both persuasive and coercive elements. Rarely in life is one free to make a completely unfettered choice. There are almost always strings attached. This is particularly true of face-to-face encounters. If a friend asks to borrow 20 bucks, we can say “no,” but there may be relational consequences for declining.

True.
That’s why on this website we espouse more strategic approach to saying no.

Also see:

- How to say no
- How to reject a date invite
- How to turn down sex (for women)

Everyone runs ‘mental calculations’ in relationships

> Research by Cai and Wilson (2000) suggests that different types of requests, such as these, present similar concerns for persuaders in all cultures, though cultural differences may occur when making such requests. For instance, on one hand, asking a favor may lead you to feel indebted, regardless of your cultural background

But culture may change how the same feelings and calculations translate into behavior:

> because they are more concerned with saving face, people from Japan, compared to those from the United States, may worry more about imposing on others. As a result, the Japanese may be less direct and especially polite when seeking favors (Cai & Wilson, 2000). Moreover, although the rebuff phenomenon (see previously) occurs in both U.S. and South Korean cultures, it is less pronounced in the latter culture (Kim et al., 2019)

Collectivist cultures are feminine?

Hofstede (1984) identified four different dimensions of values along which any culture can be placed.

One of them was masculinity/femininity:

> Third, some cultures can be characterized as “masculine” because people in them value competition, strength, assertiveness, and achievement, whereas others can be characterized as “feminine” because people in them value cooperation, affection, intuition, and nurturance.
> As such, members from masculine cultures (e.g., Japan, Italy, Austria, Mexico, England, Venezuela) should conform less than members from feminine cultures (e.g., Scandinavian countries, Portugal, the Netherlands).

Beware of Debates To Distort Public Opinions

> more than 97% of climate scientists believe humans are causing global warming? Despite that, the media frequently features one mainstream scientist debating one dissenting scientist. As a result, viewers often develop the mistaken impression that there is a 50:50 debate on the issue, rather than nearly overwhelming scientific consensus—unless, that is, they’ve been taught ahead of time (i.e., inoculated) about the ways in which people are typically bamboozled by such false impressions of equivalence

Beware of Manipulative Labeling

This can be a technique of dark psychology, making people feel guilty until they comply with your request:

Label someone’s behaiovr negatively to make them feel guilty, and they will be then be ‘nicer’ to regain prosocial points.
And they’re more likely to agree to related, prosocial requests—especially those that let them reject the negative label.

Also read:

- Dark psychology
- Manipulation tactics
- Manipulation: an overview
- Emotional manipulation

QUOTES

It's often a matter of where you stand:

> propaganda and indoctrination are largely pejorative terms used to describe persuasive messages or positions with which people disagree.

On repetition losing persuasiveness over time (though I had to wonder whether the authors weren't conflating tiredness with unpersuasiveness):

> The authors, for example, have become so tired of that tedious Energizer bunny, they wish it would "keep going and going" and never come back!

CONS

On rare occasions, the text leaned slightly toward a discursive style

For instance, in the discussion of Hollywood films, the authors note that Hollywood exports Western values, while some foreign audiences push back against this perceived 'cultural imperialism.'

I would have appreciated more evidence-based insights into whether such resistance is effective, or whether Hollywood—and Western cultural exports more broadly, the 'soft power'—tend to prevail in spreading Western values.

That said, these moments are exceptions in what is otherwise an excellent and well-researched work.

PROS

Highly practical

The 7th Edition of *Persuasion* offers a wealth of actionable guidance and takeaways for becoming a more effective persuader, making it especially valuable for practitioners and students of influence alike.

Well-researched and put together

The authors draw on a wide range of literature—including meta-analyses—without over-relying on isolated studies, which lends the work both depth and credibility.

Sound judgment where evidence is limited

In areas where the research is inconclusive or does not support firm conclusions, the authors offer their own interpretations.
These contributions come across as thoughtful, logical, and intellectually honest.

Engaging (unlike most handbooks)

As sleuths of persuasion, the authors wrote the book to be a captivating read.

I found it easy to read, engaging… And even entertaining.
The authors share many personal anecdotes, and don't shy away from humor.

Just some examples of:

- ***If you don't stop doing that you'll go blind'*** <— The title for the persuasiveness of fear :D
- ***We suspect that the male shoppers avoided the frozen food aisle.*** <– Referring to 200 naked shoppers who

responded to the ‘free groceries for naked shoppers’ campaign in Germany

While some may find this tone too informal, I appreciate it.
As empowered readers, we shouldn’t confuse humor with (lack of) authoritativeness.

A coherent narrative helps you grasp persuasion in all its facets

The authors excel at stepping back from the individual “trees” of specific studies to present a cohesive, big-picture view of persuasion.

This clarity of structure allows for a big-picture understanding of persuasion and its core principles.

REVIEW

Persuasion: Social Influence and Compliance Gaining is a deeply insightful, engagingly written book that combines academic rigor with practical strategies to help readers master the art and science of influence.

It allowed me to improve several articles on this website.
And if we decide to make a lesson on persuasion strategies and techniques for Power University, this book will serve as a core resources. And given our high bar for Power University, that’s always the biggest compliment I can pay to any book.

Many thanks to Robert H. Gass and John S. Seiter, I’ll be sure to also get the 8th edition.

Check the **best books** on persuasion or **get this book on Amazon**.

Is Vanessa Van Edwards' Legit? Not For Men, Says Lucio

Lucio Buffalmano · 28 April 2025 · Archived copy · Original

Vanessa Van Edwards, bestselling author of *Cues* and founder of Science of People, is a teacher of body language and social skills.

Starting online as 'Vanessa van Patten', she's today known for her TED talk, books, and podcast appearances. She helps "recovering awkward" individuals thrive socially.

But is her warm, accessible style the best fit for everyone?

As social dynamics experts, we explore her strengths, limitations, and how our power-focused strategies compare.

Contents

- Vanessa Is Perfect For…
  - 1. Women
  - 2. Socialites & Party Hosts

Vanessa Is Perfect For...

Vanessa's brand of social skills is perfectly suited for:

1. Women

Vanessa's feminine energy, emotional transparency, and collaborative tone resonate well with women—especially those who don't want to "become more like men" to get ahead socially or professionally.

She offers a softer yet effective approach to connection-building and influence.

2. Socialites & Party Hosts

Vanessa shines in explaining the nuances of small talk, group dynamics, and making others feel comfortable.

If you host events, go to networking functions, or enjoy cultivating connections, you'll find her advice very actionable.

3. Female Leaders Who Embrace High Femininity

A social charmer with a flying career and great family life, Vanessa is a perfect role model for women who want the best of both worlds.

Although higher in warmth and friendliness, Vanessa doesn't shy away from leading when needed.

Verbal command, reinforcing hand movement, and second hand to display trust. Perfect mix of power and warmth

Also read our guide:

- **How to combine power and femininity**

4. Women Recovering from Social Awkwardness

Vanessa self-identifies as "recovering awkward."

And judging by how confidently and smoothly she now operates in front of large audiences and high-status hosts, she's made huge progress.

She teaches by example—her ability to replicate both poor and great social behavior makes her lessons feel hands-on and digestible. Her personal transformation also gives hope and motivation to others on the same path.

In that sense, she's a near-perfect guide for women who want to go from socially anxious to socially skilled.

5. High Neurotic Women

Vanessa openly shares that she's high in neuroticism.

That's a rare—and commendable—level of self-awareness from a public figure in the self-help space.

Neuroticism, in psychological terms, often correlates with emotional sensitivity and mood swings, anxiety, and social worry.
And yet, Vanessa has developed a public persona that's confident, cheerful, and warm.

That gives credibility to her advice: if she can do it, others high in neuroticism can learn too. Her personal example is both relatable and aspirational for women in the same emotional category.

Perfect synchrony of nonverbal leadership supporting the verbal request, enhancing compliance

6. Women Looking to Date

Vanessa is in a happy, long-term relationship, and speaks from real-world dating experience.

Her advice for women aligns closely with what we've historically taught at TPM: **make it easy for men.**

She encourages:

- Going out more
- Sending clear attraction signals
- Helping carry conversations
- Saying "yes" when invited
- Finding time to meet the guy

That's how you get a boyfriend, fast.

She also digs into personality traits to help women find a long-term compatible match, which adds a more refined, advanced, and yet foundational layer to the usual dating advice.

Look for dark triad traits as well
We'd strongly recommend women to also look into dark triad traits, controlling tendencies, and abusive personalities.
OCEAN is helpful, but not enough. You can live with a guy who's introverted if you're ambivert. But you set yourself up for an ocean of trouble with an abuser.

Vanessa Is Less Ideal For...

It's TPM's target audience that needs this section, including:

1. Men

Especially men looking to project, develop, or maintain a strong masculine presence.

Vanessa's style leans warm, expressive, and emotionally open—traits that don't always resonate with men who want to cultivate stoicism, groundedness, or gravitas.

⍰ Example: don't laugh if it's not funny

In one interview, the host of *Diary of a CEO* asked her: "Why are you smiling?"
That brief moment captures how some men may perceive a too-warm communication style as "weak" or "non-serious."

Vanessa's big smiles and face covering were high in femininity, warmth, and vulnerability.
They're great for women—even endearing. But may not work equally well for men.

Covering your face and laugh is endearing, but not something we'd recommend to our readers

2. Ambitious Men Who Want To WIN

Vanessa herself says she has to be 'PG'.

And her 'PG approach' eschews dark psychology, manipulation tactics, negotiation power moves, etc.

But executives, entrepreneurs, or any man interested in an extraordinary life needs more than 'PG'.
We make the case on this website that awareness and skills in manipulation dynamics, social power dynamics, Machiavellianism, etc. are *necessary* for all.

And especially for ambitious men.

3. Men Looking For High-Status Networking

Vanessa's advice is perfect for making friends.

What some must first understand though is that **socialization with high achievers is inherently different** than

random socialization.

Management professor and Ph.D Kelly Reardon refers to ‘Secret Handshake‘ for the sub-communication that high-status people use to weigh each other.
High achievers look at your words and behavior as signals of your mindsets.

And some of Vanessa’s approaches may fit better general socialization than top-10% achievers.

Take some recommended questions for socialization:

Recommended questions	High power man’s reaction
Who is your celebrity crush?	Winners seek attractive woman in real life, ‘celebrity crushes’ are for…
What do you want more of in your life?	If winners want more of anything, they’ll get it
What do you daydream about?	Winners don’t day dream, they make stuff happen

These work well for random socialization and getting to know people better.

But these questions also sub-communicate a very different mindset than a go-getter ‘alpha type’.
These men they’ll think you’re different—potentially not at their level.

Furthermore, any question that prioritizes ‘sparking’ is at high risk of making you come across as a try-hard.
Like… Why are you trying so hard to be interesting or different?

Vanessa righteously suggests avoiding probing questions like ‘What do you do’.
But go-getters aren’t shy about direct questions. Direct questions cut to the chase, save time, and quickly tell you whether you should be even talking to the person you have in front.

⍰ Yes to Empathy, But You Must Retain Power

Vanessa emphasizes empathy and relationships, and that’s great.

But as for everything, balance and calibration.

This moment in the interview was telling:

> **Vanessa**: (explaining forehead lines that Steve also had) I’m so sorry, I’m so sorry, I’m so sorry <— Ruinous empathy. Disempowers Steve and gets sidetracked
> **Steve**: (ignores the ‘sorry’) <— Rejects the ‘poor you frame’ and sticks to the interview

'Sorrys' are empathic but disempowering for their 'poor you' frame. Winners reject it because they're favorite frame is 'f*ck that, I'm a winner and I'll win anyway'

4. Busy Men, Looking For ROI Socializing

In the *Diary of a CEO* interview, Vanessa recommends sending texts when someone crosses your mind.

That's sweet and thoughtful—but not efficient.

Says Vanessa:

> **Vanessa**: Text them I was just thinking of you
> (…)
> or and better you see a movie, a documentary, a Macha latte (…) and you're like 'oh this made me think of you'.
> My text messages are full of moments where I was triggered to think of that person

But this is not the ambitious man's modus operandi.
Vanessa's texting advice takes time that ambitious men would rather put to productive use.

Indeed, here's Steve's reply to that:

> **Steve**: My surface level reaction to that was <— Nice move to save face and 'power protect'. But it's probably what he means deep down
>
> God another job
> (…)
> if I've got to set aside an hour to text everyone I know and <— Busy ambitious men don't wanna spend too much time texting friends

Vanessa's incredulous and emphatic reaction is telling of the two different approaches. There is a major disconnect between men who prioritize goals, and women who prioritize relationships.

This approach may also harm your relationship with more masculine and ambitious men.

Ambitious men will avoid you if you text too often.
I guarantee you that, because I do that even with great people I love and respect.

Busy men often prefer a minimal-investment approach to networking: maintaining key relationships, with the *least* possible energy.
The non-written agreement is this: I love you and I'll love to meet you but we don't text to make the most of our time.

That's also why we recommend a more strategic, ROI-focused method of connection-building and friends-making.

5. Men Who Need To Master A Powerful Presence

Vanessa is a bubbly personality who would liven up any party.

She's high energy, and high energy is great in the right contexts.

However, for men, it's critical to master a higher power more grounded presence.
This is our 'social ROI matrix' based on the Social Investment Model:

High energy risks of making you look flunky-powerless

You see these two different modes clashing *hard* in this segment:

> **Vanessa**: (louder, high energy) Oh yeaaah join the cluuub (reaches out for a high five) <— Unmasculine high energy
> **Steve**: (neutral) I wouldn't say it like that <— Masculine approach

Steve then says it's because he's British.
That may contribute. But it's also because he's a man and… Most high-status men don't act like that.
Especially not powerful men who gain respect, status, and attraction.

You can also see the more masculine's host distancing himself from that attitude.

6. Kind, Unassertive Men (Prioritize Respect)

These men are typically lower in power and need clear, no-fluff, power-building advice.

That's the only way for them to gain some respect, status, and attraction.
And to go places in life.

Vanessa understands power dynamics and even teaches about power cues—but her delivery may be too feminine for men who need to learn to be more assertive and positively dominant.

For example, when talking about dating with the host, Vanessa says that *"leaning in"* as a form of 'highlight' is 'powerful'.
That's valid in the right contexts, but her execution is already too warm for a man -even if only as a highlight-:

Smiling right after finishing a sentence, as she does here, might come across as overly accommodating.

That's not the best modeling for men trying to build assertiveness, presence, and lead socially and in life.

7. Men Looking To Date

Vanessa herself says she has to be 'PG'.

And that may be an issue because effective dating skills for men require a *non*-PG approach.

That's already obvious in dating *theory*.
For example, Vanessa suggests that women don't approach because of culture.
While culture certainly plays a role, it's also about genetics, mate value, and market-like dynamics.

The PG framework is an even bigger handicap in real-world dating.
It glosses over key dynamics like male leadership, high-value (sub)communication, and positive dominance—skills we believe are fundamental for effective dating.

Take, for example, the line from Vanessa's book *Captivate*.
Asking her *"if she can give you her number"* subcommunicates lower status.
It's not something a top catch—or a skilled dater—would say. And it probably makes you *less* attractive.

This different lens became obvious in this date breakdown Vanessa did on Steve's podcast—especially compared to our own analysis of the body language dynamics:

https://youtu.be/dcJZxXJOtvs

> **Vanessa**: (says there are no signs of attraction)
> **Lucio**: (sees plenty of signs of attraction)

Me-too destroys attraction

Vanessa encourages looking for 'me too' moments to foster a deeper connection.

However, it's all about the delivery, and being too fast on 'me-tooing' frames you as *chasing* and destroys attraction. It's also emotionally needy.

So instead of saying 'me too', *imply* similarity.
Bonus points if you also display higher value while displaying similarity:

Low Power	High Power
Me too I go to the gym	Time is never enough when you run a business, but I always find time for the gym
I also like reading	Rock on, I like people smart people, what do you read
Oh you like TV shows? High five, I love binge-watching Netflix!	Netflix is addictive. I'd watch some if I had the time, but work, sports and friends take all my time

The left column CHASES connection.
The right column sub-communicates similarity without chasing, and while dispalying higher vlaue.

8. Good Men Who Must Learn to Spot Toxic People

Unfortunately the 'PG approach' without manipulation dynamics is most harmful to *good* men.

After all, toxic people and 'takers' aren't going to stop just because you prefer a simple happy life.
If anything, naivete makes you a *bigger* target.

As we say here:

> Lambs hoping there are no wolves play against the odds.
> Wolves *search* for lambs
>
> *TPM quote*

Also read:

- Naive self-help that sets you up for failure
- Dating red flags of women you must avoid
- Spotting the takers that make you worse off
- Self-defense strategies and techniques

Vanessa & Lucio: Comparison

If you're still wondering whether Vanessa's social skills angle is good for you, this table helps you decide:

Goal / Trait	Best Pick	Why
Be **liked**	Vanessa ⍰⍰	She leans on warmth, likability, emotional expressiveness
Be **respected**	Lucio ⍰	Teaches frame control, dominance, and how to avoid getting disrespected or used.
Women	Vanessa ⍰⍰	Friendly tone, speaks to female professionals
Men	Lucio ⍰	Focused on male-relevant challenges for status, respect, and attraction
Beginners in social skills	Vanessa ⍰⍰	Accessible, supportive, and gentle introduction to soft skills and body language.
Intermediate or **Advanced** in social skills	Lucio ⍰	Goes farther into advanced dynamics of manipulation, Machiavellianism, etc.

Goal / Trait	Best Pick	Why
Good relationships	Vanessa ⍰⍰	Focus on empathy and good conversations.
Influence up / reach **executive** level	Lucio ⍰	Includes power dynamics, high-level leadership, and elite-status navigation.
Safe, inclusive, 'PG-14'	Vanessa ⍰⍰	Polished, inclusive, and psychologically safe
Hard truths, power-based psychology	Lucio ⍰	No-fluff, straight talk on dominance, manipulation, and social realities.
Corporate **employees** / Public speaking	Vanessa⍰⍰	Caters to professionals and presenters.
Entrepreneurs, **lone wolves**, strategists	Lucio ⍰	Men forging their path, those who want edge + strategy.

Or see picture here.

FAQ

Does Vanessa van Edwards have a degree?

Vanessa holds a Bachelor of Arts (B.A.) degree from Emory University

How much does Vanessa Van Edwards charge for speaking?

Vanessa Van Edwards's speaking fee is said to be around $20,000–$63,000, on the lower end for remote speaking and higher for in-person speaking. The changes may be increasing as podcasts like Diary of a CEO gave her broader recognition

Is Vanessa Van Edwards the founder of Science Of People?

Yes, Vanessa Van Edwards is the founder of ScienceOfPeople and the CEO

Does Vanessa Van Edwards have children?

Yes, Vanessa Van Edwards has two wonderful daughters with her husband. They met at university and have been together ever since

Vanessa Review

Vanessa Van Edwards is a masterful teacher of social skills and body language, inspiring women and socially anxious individuals to shine.

While her approach excels for many, ambitious men seeking dominance in high-stakes environments need more assertive, power-driven strategies.

That's where Power University comes in—a comprehensive course designed to equip you with the tools to navigate complex social dynamics, outmaneuver manipulators, and command respect.

Discover how to elevate your influence and achieve your goals with Power University's proven framework.

Is Science of People Legit? Men Need More, Says Lucio

Lucio Buffalmano · 5 May 2025 · Archived copy · Original

Science of People, founded by Vanessa Van Edwards, is a popular platform for improving social skills and understanding human behavior.

With over 1,000 articles, hundreds of videos, and courses like *People School*, it targets professionals, daters, and 'socially awkward' individuals.

But is its warm, accessible style the best fit for everyone?

As social dynamics experts, we explore her strengths, limitations, and how our power-focused approach compares.

Science of People Is Perfect For... ⍰⍰

1. Women

Science of People’s writing team is more than 80% women, and their course’s accountability coach is also a woman.

Add to that Vanessa’s own feminine energy, and the website leans more towards women’s point of view.

That’s a plus though as we believe it’s better to niche down and deliver value to a core audience, than trying to appeal to everyone.

Science of People’s advice on connection-building and influence offers a softer yet effective approach ideal for female audiences seeking to enhance interpersonal skills.

Also read:

- **How to be feminine**

> How to Be Feminine: 12-Steps Guide (With Examples)

2. Socialites & Party Hosts

The platform excels in explaining small talk, group dynamics, and making others feel comfortable.

It offers actionable advice for networking events or social gatherings, which makes it great for socialites and hostesses.

3. Female Leaders Who Embrace High Femininity

As a role model balancing warmth and leadership, Vanessa demonstrates how to lead with both power and femininity, inspiring women in leadership roles to leverage emotional intelligence for success.

Also read the guide:

- **How to combine power and femininity**

> Feminine AND Powerful: 9 Tips For Women Bosses

4. Recovering Awkward Women

Vanessa, identifying as “recovering awkward,” offers hope and practical guidance through her personal transformation.

Men recovering from social awkwardness can also learn a great deal from Science of People, of course.

And that will prepare them to eventually tackle more male-relevant challenges like status, respect, and attraction.

5. High Neurotic Women

Vanessa is open about her neuroticism.

Neuroticism correlates with emotional sensitivity and anxiety, making social skills harder for highly neurotic people.
Vanessa's successful handling of this trait makes her advice credible and aspirational, showing confidence is achievable for anyone with similar traits.

6. Women Looking to Date

Science of People provides insights into attraction and compatibility, encouraging women to make it easy for men to approach.

This also aligns with our dating advice for women.
See for example:

- Common mistakes women make in dating
- How to get a boyfriend… Fast
- How to slow down sex… And get a relationship

Science of People Is Less Ideal For... ⍰⍰

1. Men

Especially those seeking a strong masculine presence.

Science of People's warm, expressive style and more approachable content may not fully equip men with the edge they need to succeed.

2. Ambitious Men

The platform's approachable style focuses less on complex social dynamics like manipulation or power plays.

Ambitious men might find these skills necessary in business and high-stakes environments where other competitive men are ready to do whatever it takes to win.

3. Men Looking For High-Status Networking

Some of Science of People's most popular articles, such as those on 'conversation starters,' are engaging and fun.

However, they may not cover the needs of people seeking high-power networking.

Recommended questions, like "Who is your celebrity crush?" suit casual interactions but may subcommunicate lower ambition and poise.
And that kills your chances of networking with high-achievers.

For a power-aware approach to introductions and first impressions, see:

- How to make great first impressions

4. Busy Men, Needing High ROI Learning & Socializing

Science of People publishes numerous articles each month, likely to enhance visibility and SEO (an understandable

strategy we have nothing against).

That can make it hard to tell apart foundational content with foundational skills, from more surface-level or entertaining articles.

The advice also leans more for highly engaged relationships with frequent texting and in-person meetings.

This approach is thoughtful, but may not be efficient for men who prioritize goals.
These men benefit most from an approach that allows them to maintain relationships and friends, without constant meetings and texts.

5. Men Who Need To Master A Powerful Presence

Science of People tends to espouse:

- Approach-first attitude to socializing
- Strong signals of interest in dating
- High-energy socializing, including high expressiveness

While all of these have a place, men often benefit from a grounded, powerful presence.
Also, men who reach the top aren't meant to approach first or send obvious signals of interest since *others* are going to do that for them.

6. Kind, Unassertive Men

These men might need clearer, more direct advice on assertiveness and how to gain respect.

While Science of People deals with power as well, we find that sometimes it leans towards more warmth.
Or not tailored to what men need not just to be likable, but to gain status and respect.

Also read:

- **How to be assertive**
- Learn assertiveness with a brief 'good jerk phase'

> How to Be Assertive In 7 Simple Steps

7. Men Looking To Date

Science of People's "PG" approach might overlook key dating dynamics for men, including leadership, positive dominance, and high-value communication.

These are crucial skills since women are most attracted to men they feel are 'above them'.
Also see more about hypergamy, and mate value.

Take Vanessa's take in her book *Captivate*.
Asking her *"if she can give you her number"* subcommunicates lower status.
It's not something a top catch—or a skilled dater—would say. And it would make men *less* attractive.

You can get a taste of our different takes in this video review:

> **Vanessa**: She should show more signs
> **Lucio**: Her signs were obvious, he had to lead more

Is Science of People ‘Science Backed’?

Science of People quotes many studies in its articles and videos.

We like that, and we’d suggest looking less at individual studies, and more at the full literature.

Lets dig deeper:

Science is one of three TPM pillars that support solid strategies and techniques, flanked by experience, and critical thinking skills.

The pillars work in synchrony, including by addressing each other’s limitations.

Science alone is not enough.
It takes experience and critical thinking skills to make sense of studies and translate them into effective strategies.

Common issues of ‘science-backed’ approaches include:

- **Over-Reliance on Individual Studies**

Single studies, especially with low statistical power, are less reliable and often fail to detect true effects.
When measuring small effect sizes, low-powered studies are more likely to produce unreliable or inconsistent results due to statistical noise.

This applies to many studies conducted before the replication crisis and those not pre-registered.

And with bad data in, poorer strategies come out.

This is why at TPM we go for literature overviews, preferring handbooks by accredited researchers who also understand how to interpret studies.

- **Hyped Studies That Don’t Always Hold Up**

The catchier a study is, the more likely it is to grab attention (and end up in an article).

However, as Steven Pinker explains in *Rationality*, the more surprising a study is, the more likely it is to be wrong.

This comes down to psychology and statistics.
While surprising equals attention-grabbing, surprising is also, by definition, exceptional.
And exceptions are more likely to be flukes.

Consider, for example, the past craze surrounding power poses, which claimed that certain postures boost confidence.
Science popularizers embraced it, and may not have been as quick to move to more effective strategies.

Power posing in a lab coat

- **Effect Sizes and External Validity Aren't Fully Appreciated**

Many studies show small effect sizes that may not translate well to real-world applications.

Good examples are smiling to be happier—if there is any effect, it's tiny, and priming.

Priming effects have been observed in controlled laboratory settings designed to detect subtle behavioral changes under isolated conditions.

But they may not make a difference for real-world influence—so skip that warm cup to bond with others, and learn how to actually bond with others.

Say the *Routledge Persuasion Handbook*:

> Although priming has been demonstrated in controlled laboratory settings, we wish to emphasize the practical limitations of this technique (…) "the short-lived nature of the influence of subliminal information casts serious doubt on its effectiveness in everyday life (…) We are aware of no studies demonstrating any commercial success at using subliminal priming.

And, we can probably add 'no studies demonstrating a major effect in real-life encounters'.

Science of People VS The Power Moves

What if you've read this Science of People review and are not yet sure if it helps you with your social skills?

Here's a quick table to help you decide which platform better suits your needs:

Goal / Trait	Best Pick	Why
Be **respected**	TPM	Teaches positive dominance, frame control, and how to avoid getting disrespected or used.

Goal / Trait	Best Pick	Why
Be **liked**	SoP	Leans heavier on warmth, likability, emotional expressiveness
Women	SoP	Vanessa's approach is perfect for female professionals
Men	TPM	Focused on male-relevant challenges for status, respect, and attraction
Beginners in social skills	SoP	Accessible, supportive, and gentle introduction to soft skills and body language.
Intermediate or **Advanced** in social skills	TPM	Goes further into advanced dynamics of manipulation, Machiavellianism, etc.
Good relationships	SoP	Focus on empathy, matching personalities for relationships, and good conversations.
Influence up / reach **executive** level	TPM	More power strategic with office politics, career strategies, boss ingratiation and high-power behavior for executives
Safe, inclusive, 'PG-14'	SoP	Polished, inclusive, and psychologically safe
Hard truths, power-based psychology	TPM	No sugar coating, straight talk on dominance, manipulation, and social realities.
Socialites, employees, & Public speaking	SoP	Caters to professionals and presenters.
Entrepreneurs, **lone wolves**, strategists	TPM	Men forging their own path, entering or creating new social circles, and men who want an edge

Or see picture here.
If Science of People is better for you, you're in good and capable hands with them.

FAQ

Is Vanessa Van Edwards the founder of Science Of People?

Yes, Vanessa Van Edwards is the founder of ScienceOfPeople and the CEO

Yes, Science of People is a credible resource for improving social skills, conversations, and being more likable

Science of People Review

Science of People is a top-notch resource for improving social skills, particularly for women and recovering awkward individuals.

Its accessible, engaging content empowers users in business, life, and love.

If you appreciate Vanessa's accessible style, you'll enjoy Science of People articles and courses.

However, ambitious men or those in high-stakes environments may need more assertive, power-driven strategies, as the platform's approach may not fully address their needs.

To navigate complex social dynamics, outmaneuver manipulators, and command respect with proven frameworks,

check out **Power University**.

Social Status: What It Is, Why It Matters, How to Master It

Lucio Buffalmano · 12 May 2025 · Archived copy · Original

Social status shapes how others treat you, how much power you have, and even how attractive you appear.

In this guide, we break down what social status really is, why it matters more than most people realize, and how you can actively gain status.

Social status is a key pillar of our expertise at The Power Moves. Continuously updated with the latest empirical findings, this article synthesizes the research literature and our real-world insights to serve as your definitive reference on social status.

Let's dive in:

What Is Social Status?

Social status is your standing or rank in a social hierarchy.
It reflects how much respect, influence, and value others assign to you.

Status hierarchies are:

- **Competitive** for classic supply-and-demand imbalance: few top spots, many contenders.
- **Inescapable**: people naturally sort themselves into hierarchies in any group, especially for top spots—whether it's your workplace or your friend circle.
- **Fast**: the initial stages of group formation sort leadership within minutes

That 'sorting' is based on a combination of value and power signals like early leadership, body language, dominance, and 'power moves'—and how you respond to them.

I differentiate between two types of status:

- **Society-level status**, based on profession, income, or class (SES)
- **Group-level status**, based on:
    - Group-specific values, the more relative and contextual form of status
    - Personality traits related to interpersonal dynamics (eg.: social dominance, charisma, leadership, etc). Related to 'individual value'

They overlap, but are different domains, calling for different traits, approaches, and strategies.

Why Social Status Matters

You can't afford to ignore status.

Whether you like it or not, **status shapes your life in ways you might not even realize**.

Higher-status individuals get more attention and deference.
They're more persuasive, more trusted, and more listened to—even when they say the same things as lower-status men.
And of course, they get more social and mating opportunities.

In other words, status is power. Social power.

Outcome	Low Status	High Status
Dating	Less attractive, fewer options	More attractive, more options
Longevity	5-10 years shorter life expectancy	5-10 years longer life expectancy
Physical Health	Higher risk of chronic diseases (e.g., heart disease, diabetes)	Lower risk of chronic diseases
Psych. Health	Higher rates of anxiety, depression, and stress	Better mental health, lower stress
Self-Esteem	Lower self-esteem and feelings of inferiority	Higher self-esteem and confidence
Social Influence	Lower persuasive power; limited ability to effect change	More persuasive; greater ability to influence attitudes and behaviors
Social Networks	Smaller, less diverse; limited access to influential connections	Larger, with access to influential and supportive connections
Reproductive Success	Lower reproductive success	Higher reproductive success
Social Power	Low; target for exploitation	High, respected, power to exploit

Low Status vs. High-Status Comparison Table™, Lucio Buffalmano, 2025

Benefits of Social Status

1. Better Health

People with higher social status tend to be mentally and physically healthier across cultures and populations. This effect is consistent even with subjective perceptions of status, suggesting strong psychological and biological underpinnings.

- **Lower stress**: reduced cortisol and better cardiovascular function
- **Better mood** and fewer depressive symptoms: status buffers against anxiety and mood disorders
- **Stronger immune function**: higher status is linked to lower inflammation and faster recovery (source)
- **Healthier behaviors**: status is associated with better sleep, diet, and activity levels

2. Higher Self-Esteem

Self-esteem is intrinsically linked to status because self-esteem acts as a “sociometer,” gauging how much others value us (Leary & Downs, 1995).

Status may also boost confidence, and interpersonal status (respect, admiration, importance) matters more than class-level socioeconomic status (SES: education, income, occupation).

3. Social & Romantic Success

Status is closely related to romantic success.

Across cultures, status boosts perceived mate value, and women especially prefer high-status men for long-term relationships (Buss, 2016).

High-status individuals also attract more friends, allies, and better support networks, enhancing life satisfaction.

- **Increased attractiveness**, especially for men
- **Better friendships** with larger, more supportive social networks

Higher-status men enjoy more attraction and dating options

4. Influence & Persuasion

Social status dramatically boosts interpersonal influence across all socialization:

- **Better negotiations**: Being perceived as high-status improves bargaining power and leads to better outcomes
- **Interpersonal relationships**, gaining more attention, compliance, and faster adoption of ideas
- **Leadership**: High-status individuals gain more followers and trust

4. Greater Reproductive Payoffs

High-status men have more children.
Though the link is strongest in nonindustrial societies, it's also true for modern industrial societies of 'soft polygamy'.

5. Social Shields Against Attacks

Harvard professor Henrich states that we evolved to track status for exploitation and self-defense.

Your status and reputation shield you because attackers would *lose* their status.

And although we may need more evidence on this, Henrich's observation squares well with power dynamics logic and our analyses of social climbers targeting weaker 'social pegs'.

Downsides of Low Status

Contrary to high status:

- **Poorer health and longevity**: The Whitehall studies showed that lower-ranking British civil servants had significantly higher mortality than higher-ranking peers.
  - Lower mood and depression: Peterson claimed that 'there is little difference between being depressed and being at the bottom of the hierarchy'

- **Fewer social and mating opportunities**: Status often works as a filter in the mating market, and women

eliminate potential mates based on perceived low status *before* other traits are even considered.

- **Reduced influence**: less heard, more interrupted and dismissed, and more likely to be blamed and scapegoated
- **Socio-systemic discrimination**: individual and institutional discrimination combine to systemic discrimination in many facets of life
  - Group-level discrimination: Individuals inherit the costs of lower-status classes. Compelling evidence from social dominance theory shows persistent systemic discrimination in all studied societies
- **Vulnerable to exploitation**: no status equals 'no social shield'. Attacks may even be encouraged when low status is coupled with low reputation. It's no coincidence the poorer and lower classes are also the most victimized

Limitations of High-Status Seeking

Status is great to have, but there are important downsides we want to emphasize:

- **Group-dependent**: status is contextual to the group it's based on and it resets to zero the moment you change group
- **Other-dependent**: status depends entirely on others' recognition, so you depend on others for status
- **Fear and neediness**: The more status you gain, the more you worry losing it.
  - Neediness: group dependence can lead to over-investment, both emotional and practical to keep the group alive
- **Excessive status-seeking turns maladaptive** since you lose potentially higher ROI pursuits ('opportunity costs').
  Researchers link it to poor mating strategies, delayed families, and fewer offspring.
- **Status doesn't guarantee respect** when it's not 'earned'. This can lead to a disconnect between rank or title, and little respect among subordinates

The best leaders have *both* status from their rank, and respect from their personality

Traits That Impact Status

What increases or decreases status is partly relative to group, culture, and context.

But studies find these traits consistently drive higher social status:

Traits That Increase Status

- **Competence**, especially in fields related to the group's activities and goals
- **Social skills**: High-status duties are often social. Eg.: inspire, maintain peace among members, facilitate inter-member communication (Van Vugt et al. 2008). Different subsets include charisma, charm, etc.
- **Confidence** is a proxy for competence (Areni and Sparks 2005; Price and Stone 2004). Observers infer higher status from overconfidence (Anderson et al. 2012)
- **Size**, with a bidirectional relationship, and high-status men perceived as taller/more muscular
- **High value**: as per social exchange model, value-giving potential makes you socially valuable
  - Resources
  - Displaying value and status, including expensive cars or watches
  - Attractiveness makes people 'start' with higher status
- **Competitiveness** and strategic predisposition, since status is inherently scarce, and a central domain of male competition and intrasexual competition for mating opportunities (Massar, 2022)
- **Benefiting others** as part of 'giving value' (Blass and Ferris 2007).
  - Effort, sacrifice, and loyalty to the group or cause. For example, employees who put extra effort into their jobs are often accorded higher status (Allen and Rush 1998; Podsakoff and MacKenzie 1997).

Also helps:

- **Intelligence** (Buss et al., 2020)
- **Bravery and courage**, including daredevil acts among adolescent groups
- **High extraversion**. Especially during group formation extroverts emerge as leaders more than introverts (Bass 2008; Judge et al. 2002)
- **Social strategy**: "political skill" like social astuteness, behavioral flexibility, and adaptability (Cheng and Tracy, 2014).
  - Smart self-promotion, including displaying skills and successes and hiding shortcomings (Jones and Pittman, 1982)
  - Self-monitors desire status and are more likely to emerge as leaders in task groups

Prestigious and dominant traits

Traits related to the two proven approaches to gaining status are:

- **Dominance**
  - Selfishness and disregard for others
  - Arrogance
  - Hubristic pride (Beall and Tracy, 2020)

Possible example of hubristic pride

- **Prestigious traits** – Valued knowledge and teaching ability (Henrich, Gil-White, 2001)
  - Generosity and prosociality, but must be public (Bereczkei et al., 2007)
  - Number of allies
  - Cooperativeness
  - Ethics and concern for public good

- Authentic pride (Cheng et al. 2010)

Traits That Decrease Status

In general, **being low value or taking value from others decreases status**, and various studies found:

- **Antisociality**, including nastiness, meanness, and being known as a thief.
  Note: caveats apply for the domineering approach to status
- **Poor hygiene**, including dirty, unclean, or acquiring sexually transmitted disease
- **Neuroticism**, and especially so for men
- **Shaming one's family**

Prestige vs Dominance, based on Joseph Henrich, revisited by Lucio Buffalmano, 2025

According to the Dual Strategies Theory, people climb social hierarchies through prestige and dominance.

They're two very different approaches as **dominance inflicts costs, while prestige confers benefits** and look very different in socialization:
As Henrich reports, they act and look very differently in socialization:

> Dominant individuals tended to (1) act overbearing, (2) credit themselves, (3) tease to humiliate others, and (4) be manipulative.
>
> Meanwhile, prestigious individuals (1) were self-deprecating, (2) credited the team, and (3) told jokes.
>
> *Henrich, 2015*

A new theory claims competence is the basis of both prestige and dominance.

And although we tend to agree with that, the dominance/prestige dichotomy still provides a useful model.

So let's dive in:

1. Dominance

Dominance is older, inherited from our primate ancestors, and it's usually described as 'the path of force and fear'.

In some contexts, it may include more forceful means.
For example, we agree with several researchers who consider bullying a tool for social power and status (Olweus, 1993; Vaillancourt et al.; 2007). And it's unfortunately toxic but potentially effective.

However, contrary to more simplistic definitions, dominance goes beyond overt aggression and bullying.
The most extreme forms of dominance are rarer in most contexts of modern society.
Dominance can come from simple rank, or be more covert. Even threats—as Cheng and Tracy (2014) note—can be more psychological.

Dominant dyads also include everyday examples such as:

- Boss over employee
- Police over citizen

Also see:

- **Dominant men archetypes**

Advantages

- **Works** for individuals, despite the costs on others.
  - Value-taking approach can also work: bullying, rude, demeaning, and anti-social individuals tend to be higher rank and more influential in both experimental contexts (e.g., Van Kleef et al. 2011) and real-world relationships (e.g., romantic couples, fraternity members) (Keltner et al. 1998 on value-taking teasing).

- **Works fast**

- **Bottom line power**: control over resources and violence are bottom line of human social hierarchy. When societies disintegrate they represent the 'hardest currency'

Disadvantages

- **Resistance and pushback** *(e.g., Falbe and Yukl 1992; Kipnis and Schmidt 1988)* and I expect stronger resistance from higher-value and empowered individuals

- **Lower performance at work** (*e.g., Falbe and Yukl 1992; Higgins et al. 2003; Yukl et al. 1996)*

- **Sub-communicates incompetence**: studies found that leaders who felt incompetent were most abusive (i.e., who lack Prestige), suggesting that aggression replaces a lack of Prestige

- **Shallower influence**: complying out of fear doesn't shift opinions

And potentially:

- **lower health outcomes** than prestige as observed in small-scale societies, but I feel more studies are needed
- **Less attractive to women** who generally indicate a preference for prestigious men. But dominants still beat submissives, and may be preferred in competitive contexts, or for short-term mating. But it's more true for dominance, rather than *aggression* (Snyder et al. 2008).

 See: dominance and dating success

2. Prestige

The prestige route earns respect through competence, wisdom, and the ability to give value.

Henrich claims that prestige evolved later as part of homo sapiens' cultural learning.
People defer to prestigious men in exchange for learning, a logic that aligns with social exchange theory, and social power dynamics.

Prestige is more stable, longer-lasting, and admiration-based since people defer voluntarily.

Advantages

- **Deeper influence**: because people shift their underlying opinions, beliefs, and practices to be more similar to the prestigious individual (Henrich, 2015). Even 'agreement as deference' is deeper than coercion
- **Well-liked**
- **Better relationships**
- **More loyal followers**
- **Largest genetic payoffs**: the evidence is still limited, but Henrich reports that prestigious men's children die less frequently, and prestigious men marry younger (neither of which held for dominant men) (Ruden 2008 and Ruden 2011)

3. Joining The Upper Class

Social status can be *achieved*, or it can be *ascribed*—for example, being born into a wealthy upper-class family.

However, one can also *enter* upper classes, for example:

- **Marrying** into upper class

- **Moving** and matching the elites
- **Joining the ruling class** as a top politician
- Etc., etc.

4. Influencer Approach & Digital Popularity

Attention has always been a currency of status, and the digital age changed the game.

Digital popularity breaks the traditional barriers of status to achieve *global* status.

Written language first endowed writers to transcend interpersonal interactions, and it accelerated with Internet and social media.

Influencers can also lean more toward prestige or dominance, but prestige works better for influencers.

5. Status Signaling

In *The Cambridge Handbook on Evolutionary Perspectives*, Chapais claims that, together with seeking and defending status, **signaling status is a universal human adaptation**.

Many verbal and nonverbal behaviors help signal and attain status.
Some of them include:

- **Visual dominance**, defined as the ratio of looking while speaking to looking while listening (Exline, Ellyson, & Long, 1975)
  - **High-status subjects look in equal measure speaking and listening**, looking more than most others (Dovidio et al., 1988)
  - **Low-status subjects looked more while listening** and less while speaking (Ellyson et al., 1980)
- **Dominant men look less at subordinates** while listening (Exline, Ellyson, & Long, 1975)
- **People look more at high-status men** than low-status males or females (Maner, DeWall, & Gailliot, 2008)

Carmey looked at Trump more than Trump looked at him, while rotating toward him more than Trump did. Trump was dismissive, but signaled higher power

Of course, as for most human adaptations and behaviors, men likely differ in their ability to signal status.
And **the most skilled signalers reap the largest rewards.**

Learn more about status signaling:

- High-status behavior
- Low-status behavior

Status VS Liking

Status and acceptance are different, and sometimes opposite.

For example, Cheng and Tracy state that touting status-related traits conveys superiority. That may afford status, but the competitiveness or envy it generates may decrease liking.

The status/acceptance tradeoff is likely related to the 'pratfall effect', or being more liked after a blunder.

People seem subconsciously aware of this tradeoff, and acceptance-craving individuals underestimate their status (Anderson et al. 2006).
This may be linked to people pleasers' tendency to *over*-self-deprecate.

Status for the ambitious, acceptance for nice-guys...

Hierometer theory suggests that some men, including grandiose narcissists, focus on *status*, rather than inclusion.

In general, a stronger drive for status and power over inclusion is associated with masculinity, over femininity (Hays, 2013; Yang & Girgus, 2019).

This isn't to say that plenty of men don't prioritize inclusion, of course. However, as Storr suggests, **connection without status is hollow.**
As a man, you're neither successful nor happy being 'accepted' as the lowest rung.

Storr calls that "connected but low status" state "likable but useless".
Instead, successful men are driven *both* to "get along and get ahead".

We agree with Storr's analysis, but you can combine status and liking:

... And both for life winners

Status and liking Matrix, Lucio Buffalmano, 2025

Prestige allows for both liking and status.
And our power/warmth approach strengthens it with the best of both worlds:

- **Combining liking and status with power and warmth**

> Competence and Warmth: The Science of Winning People Over

Why Status Even Exist?

Status is a constant of all social animals.

But one may wonder: why lower-status individuals accept it?

Evolution, game theory, and power dynamics explain why.

Most **lower-status individuals accept hierarchies because little is better than nothing**, and subversion would incur bigger losses.

Species with near-zero resources for low-status individuals see more rebellion and conflict because 'with nothing to lose, you can risk everything'.

But most commonly, low-status men retain some of the following benefits:

- **Better health and survival**
  - Stay in the group
  - Partake in shared resources
  - Avoid harm
- **Better mating odds**
  - Kin reproduction

  - Lower-status women mating
  - Sneaky mating
- **Future status re-negotiations** (biding time strategy)

In short, hierarchies are an 'evolutionarily stable strategy (ESS)' because there is something in it for everyone, and it beats any alternative strategy.

Over time, evolution also shaped behaviors and physiologies that reinforce hierarchy formation and acceptance (eg.: high status feels good, submission to high-status individuals decreases stress, and self-regard tracks social power to act accordingly).
As mentioned already, evolutionary theories suggest depression may be linked to social status, helping low-status men avoid the costs of challenging higher-status individuals (Price et al., 1994).

Superior Group Performance

Hierarchies' fewer fights also translate into saved energy and increased cooperation (Berger et al. 1980).

Evolutionary theories of cooperation and morality suggest that human status is deeply tied to the evolution of moral systems and collaborative behavior—key factors behind our success as a species.

In competition within our species, hierarchical groups tend to outperform and displace non-hierarchical ones thanks greater coordination and efficiency (see Henrich, 2020 for cultural expansion).

Hardwired, but also learned

Sapolsky argues that submission and aggression are hardwired, but we learn the *calibration* -when and how to use them-.

While we can't easily test in humans, a monkey raised in isolation displayed all the "correct" aggressive and submissive behavior, but at the wrong times and with the wrong people.
For example, challenging the alpha without strength and allies, and losing.

Learn more:

- **Social calibration**

Who Seeks Status

Status-seeking is a human universal drive (Anderson et al., 2015).
Meaning that **everyone prefers more status**.

But *some* want it more than others, including:

- **Men**, more than women because of their reproductive differential
- **High testosterone** individuals (Sapolsky, 2017)
- **High social-dominance orientation men**, a scale measuring the preference for social hierarchies and group-based inequality
- **Narcissists**

Let's dig deeper:

Dark Triad Traits & Status

Dark triad men pursue status and power more than the average (Lyons, 2019).

- **Narcissists pursue status**: although vulnerable narcissists may not be as effective, grandiose ones are

- Grandiose narcissists gain status (Grapsas et al., 2019), but lose reputation with growing intimacy (probably as the 'real' them is revealed).
  One study found that the 'dark' aspects of narcissism (ie.: manipulativeness) lowered leadership ratings but 'bright' expressions like self-confidence helped (note: lower *ratings* doesn't mean one can't become the leader)

- **Machiavellians gain status**. I find 'socially strategic' to overlap with Machiavellianism, which has been shown to facilitate influence and leadership (Christie and Geis, 1970)

- **Psychochpathy is a double-edged sword**: psychopathy is probably related to the dominant approach, which can be effective. But higher psychopathy is maladaptive for long term and society-wide socio-economic status

Why Power Beats Status

Status binds you to other people's acceptance. Power frees you

Status is important, and it's one of Power University's key outcome.

However, we approach status-building at the group level as a stage toward empowerment.
The original dominance and prestige researchers explain why:

> since **status relies on others**, (…) **high-status parties** (…) **strive to fulfill others' expectations** (…)
> This description of the effects of status stands in stark contrast to the effects of **power, which liberates people from social and normative pressures**

Meaning: power is superior for self-empowerment.
Especially if we include the time and energy cost of the games people play in groups.

Status is also a double-edged sword for our 'win-win' preference.
Status games that reward contribution build empires and propel civilization forward.

But antisocial status games and status-awarding inter-group competition can turn toxic.

Fortunately, modernity frees you from status dependence because you can achieve your goals alone, or enter and exit countless groups.

So we advise you to **learn the *skills* to acquire status in any group, while being *independent* of any *specific* group**.
Think of 'abundance mindset', but applied to socialization.

In the vernacular of male self-development status-seeking relates to 'alpha males', while our approach relates to 'sigma males'.

We help men master to game, so they can transcend it .

SUMMARY

About The Author:
David Buss is an evolutionary psychologist and researcher, currently teaching at the University of Texas. He is a widely recognized name in the field of evolutionary psychology and has authored several books, including '*The Evolution of Desire*', and '*When Men Behave Badly*'.

Men's Mating Strategies

Buss discusses how **high baseline testosterone is associated with a greater interest in short-term mating strategies**, especially among men.

Testosterone also moderates traits linked with short-term mating—like risk-taking, status seeking, and sexual assertiveness.

Conversely, entering committed relationships or fatherhood tends to lower testosterone, supporting long-term bonding and caregiving behaviors.

Mate Switching vs. Dual Mating Strategy

These two hypotheses attempt to explain why some women engage in short-term mating—despite the higher potential risks compared to men (e.g., pregnancy, reputation, safety).

Mate switching hypothesis suggests women may pursue short-term mates as a way to:

- Replace a current mate
- Test alternative partners
- Secure a "backup" in case the current partner fails to provide resources or protection

In this 7th edition Buss states:

- **Stronger empirical support**s **the Mate Switching Hypothesis**. It's framed as a more functionally robust and flexible strategy, particularly:
  - In **contexts of relationship dissatisfaction**, abuse, or neglect
  - Where a woman's **current mate shows low mate value or investment**

Studies show that:

- Women's **short-term affairs often occur during troubled long-term relationships**
- These affairs **precede breakups** in many cases
- Women sometimes "trade up" in mate value after switching

Buss emphasizes this strategy as more adaptive and behaviorally grounded, especially when parental investment theory is taken into account.

Why Dual Mating Strategy Hypothesis Is Weakened

The dual mating strategy suggests that women seek genetic benefits from high-quality men during peak fertility, while maintaining pair bonds with reliable but lower-quality partners.

This theory originally drew on:

- **Ovulatory shift research**: Women's preferences change near ovulation (e.g., more attracted to masculine, symmetrical men)
- **Infidelity during fertile windows** as a covert strategy to secure "good genes"

Buss presents **DMSH with caution** in the 7th edition.
Despite the initial appeal and seeming logic of this theory, Buss:

- Acknowledges the **replication crisis in ovulatory shift research**.
- Notes **mixed and weak support** for key assumptions (e.g., that women reliably shift preferences or behavior during ovulation).
- The empirical foundation for DMSH has **eroded**, especially as meta-analyses show weak effects and newer studies have failed to consistently replicate earlier findings.

Conclusion:

The **Mate Switching Hypothesis is Buss' favored explanation** for women's short-term mating, while the Dual Mating Strategy is treated as more speculative and less empirically solid.
And the argument and evidence presented back Buss' take.

Sperm Competition May Be Real

We strongly criticized *Sperm Warms* on this website, and still believe the criticism is valid for the less-than-scientific approach.

However, Buss lends some support to sperm competition, discussing:

- **Physiological adaptations**: e.g., volume of ejaculate based on time apart from partner
- **Men's sperm delivery strategies** (e.g., deeper thrusting, quicker ejaculation) vary in response to cues of female infidelity or absence (new evidence in the 7th edition)

Sperm competition is a component of short-term mating theory, especially from the male adaptation side.

⍰♂Lucio's Take: **why I have doubts regarding sperm competition**

Lucio:
Sperm competition is a fascinating topic.
Buss and newer studies convinced me to assign it more weight to its potential impact in humans than I had previously thought.

Still, several important questions remain—questions that, for now, limit how much I believe sperm competition truly shaped human evolution:

- **Pair bonding is a powerful evolutionary tool** that reduces the need for sperm competition in the first place.
- **Universal expectations for loyalty** add emotional and social controls that restrict women's freedom to "sperm shop"—especially in our evolutionary past. A woman would have to hide not just from her partner, but also from his kin, allies, and possibly the tribe as a whole.
- **Female mate choice sidesteps sperm competition altogether.** While some women pursue sex for its own sake, more restrained and conscious female choosers who pick and stick with a partner still limit the scope for post-mating competition.
- **Biology 1 – Timing:** It can take less than an hour for sperm to reach the egg. Even if we allow for a few hours or a day, that short window places a major constraint on the opportunity for sperm to compete.
- **Biology 2 – Egg bottlenecks:** The egg is a bigger bottleneck than sperm. Most healthy men have enough viable sperm to fertilize an egg. If the egg is the bottleneck, the human system simply doesn't lend itself to discriminating against sperm

Unless these points are more fully addressed, I remain cautious about assigning sperm competition a major role in human evolution. And in modernity, it may happen less 'in nature' and more in sperm bank labs.

Mating Budgets

Mating budgets are part of the exchange model of dating.
The mating budget framework applies economic principles to mate selection.

It asks:

> *If you had a limited budget to "spend" on a mate, how would you allocate your priorities?*

Buss uses this framework to distinguish between:

- **Women** typically list **resource acquisition ability, emotional stability, and kindness** as *necessities*. Traits like muscularity, height, or humor tend to fall into the *luxury* category.
- **Men** typically rate **physical attractiveness and youth** as *necessities*, while status, education, and shared interests are often considered *luxuries*.

This model helps explain:

- **Why mate preferences are not absolute** (they adjust based on constraints)
- **Why high-status individuals can afford to be choosier** (they have more mating "budget")
- **Why lower-status individuals may feel frustrated** if they prioritize luxuries without securing necessities

Also see:

- Sexual marketplace
- Mate value

Attachment Styles Make Evolutionary Sense

Similar to what we first learned in the *Oxford Handbook of Evolutionary Psychology and Romantic Relationships* in which Buss also penned a chapter:

1. Secure Attachment

- Evolutionary advantage: Promotes **exploration + safety**
- Typically results from **responsive, consistent caregiving**
- Associated with:
  - Greater trust
  - Effective long-term bonding
  - Higher likelihood of pursuing **long-term mating strategies** as adults

2. Anxious Attachment

- May evolve in **environments with inconsistent caregiving**
- Strategy: Stay close to caregivers (clingy, hyper-vigilant)
- In adulthood:
  - More jealousy
  - Mate guarding
  - Strong emotional needs
  - **Risk of short-term mating when seeking validation or fear of abandonment**

3. Avoidant Attachment

- Adaptive in contexts where **caregivers are neglectful or unresponsive**
- Strategy: Self-reliance, emotional detachment
- In adulthood:
  - Reluctance to commit

- More open to **short-term, low-investment mating**
- Less parental investment

Buss doesn't treat these as disorders, but as **conditional strategies** calibrated to the environment—a classic evolutionary-developmental approach.

Read more:

- Attachment styles
- Avoidant attachment
- Anxious attachment
- Secure attachment

Suicide Is Rrelated to Lower Reproductive Odds

Suicide, together with homosexuality, has often been listed as an evolutionary conundrum.

Buss proposes an explanation linked to reproductive odds, and whether one can add value, or take value from kins:

> Individuals with low reproductive potential (e.g., who perceive that they are not attractive to members of the opposite sex) and high burdensomeness-to-kin reported more suicidal ideation, as well as more depression and hopelessness.

It's important to note though that the impact of reproductive optential and burdensomeness seemed evident, but not a *complete* explanation.

Cooperative Alliances

The foundational concept is that helping others can be adaptive, as long as there's a return.
In other words:

> If I help you today, you'll help me tomorrow, and we're both better off.

For this to work, three conditions need to be in place:

1. **Frequent interaction** between individuals
2. **Memory** of past behavior (so you can tell who's a good partner)
3. **Ability to withhold help from cheaters**

Buss describes this as the evolutionary logic behind friendship, especially in ancestral environments where interdependence often meant the difference between survival and death.

Trust, Cheating, and Game Theory

The chapter uses game theory to explain how cooperation evolves and breaks down.

Buss says:

- **Tit-for-tat is an evolutionarily stable strategy**—cooperate first, then mirror your partner's behavior. This allows cooperation while punishing cheaters.
- **Long-term relationships and repeated interactions** increase the success of cooperation. That's why real friendships require time and trust to develop.

Prestige and Reputation

Reputation matters.
People are more likely to cooperate with individuals who are:

- Seen as generous
- Known for fairness
- Associated with high social status or *prestige*

Prestige isn't just about dominance—it's about being respected and chosen as a role model. Buss ties this into how people:

- Promote their good deeds (even subtly)
- Avoid behaviors that would brand them as exploitative or selfish

In short, your **reputation is your social capital**, and it can attract allies, mates, and protection.

Friendship as Strategy

Friendship, then, is more than just emotional—it's strategic.
The book explains that:

- **Individuals choose friends with valuable traits** (e.g., skills, loyalty, generosity)
- **Alliances shift** when resources or status change
- **People often dissolve friendships after betrayal or freeloading**

Also read:

- **How to make quality friends** for both benefits and pleasure

> How to Make Quality Friends as an Adult: 10 Simple Steps

Status, Prestige, and Social Dominance

Humans go to extraordinary lengths to protect their status and avoid shame.

Whether it's falsifying credentials or striving for respect, **status is a universal motive in every known society** (Anderson, Hildreth, & Howland, 2015).
People even choose death over a ruined reputation, highlighting status's primal importance (Vonasch et al., 2017).

Studies show hierarchies form fast—within minutes in small groups—and people can predict their place in a new group just by sizing up others (Fisek & Ofshe, 1970; Kalma, 1991).

How Dominance Hierarchies Emerge

Dominance hierarchies are emergent outcomes of individual interactions.

And they apply across species because of their evolutionary logic:

hierarchies save individuals' energy and minimize harm by letting animals assess their strength and act accordingly—dominant ones secure most resources and mates, while subordinates avoid costly battles (Pinker, 1997).

Evolutionary Theories of Status

The chapter explores two paths:

- Dominance (force or threat)
- Prestige (freely given respect for skills or generosity) (Henrich & Gil-White, 2001)

A bully might dominate through fear, while a skilled hunter earns prestige through admiration.

A newer theory argues **competence—whether in fighting, leadership, or knowledge—is the root of both (**Chapais, 2015).

Prestige often comes from costly signaling, like sharing food or donating publicly, which boosts reputation only when others notice (Bereczkei, Birkas, & Kerekes, 2007).

Leadership and the Service-for-Prestige Theory

Leadership evolves from reciprocal exchange: leaders provide skills like organization or wisdom, and followers grant prestige in return (Price & van Vugt, 2014).

Preferred leaders are competent, generous, and fair—though "fairness" varies.
This dynamic explains why groups rally behind leaders who solve problems, from hunting to conflict resolution (van Vugt, 2006).

Also interesting is the difference between contributors and 'lower contributors':

High contributors want equity (rewards based on effort), while low contributors prefer equality (equal shares regardless of effort).
You can always count on a scrounger to be a socialist :)

Sex Differences in Status-Striving

Men evolved stronger status-seeking motives due to reproductive stakes.

Such as, higher status men gain more mates and leave more offspring. Modern data confirms high-status men have more sexual partners and children, even in monogamous societies (Perusse, 1993).

Women also seek status, but often through subtler, prestige-based tactics, like nurturing or community roles, and their status often ties to physical attractiveness (Buss et al., 2020; Blake, 2022b).

Dominance Theory and Cognitive Strategies

Denise Cummins's dominance theory argues humans evolved cognitive tools to navigate hierarchies (Cummins, 1998).

Kids as young as 3 show deontic reasoning—understanding rules about permissions and obligations—and check for rule-breakers, especially among lower-status peers. We also remember low-status cheaters better, suggesting our brains are wired to monitor hierarchy dynamics (Mealey, Daood, & Krage, 1996).

Social Attention-Holding Theory

Paul Gilbert's theory focuses on emotions in hierarchies (Gilbert, 1990). Winning boosts elation and helping behavior, while losing triggers anxiety, shame, rage, envy, or depression.

These emotions motivate action: shame pushes us to avoid scorn, envy drives imitation or derogation, and pride fuels status-seeking (Sznycer et al., 2017).
Even nonverbal cues, like a victor's raised arms, signal triumph across cultures (Matsumoto & Hwang, 2012).

Indicators of Dominance

Buss highlights that we're lacking a comprehensive theory of indicators of dominance and how we appraise it.

But almost common knowledge signals likely include:

- **Confident posture**: cominant people stand tall, speak loudly, gaze directly, and gesture confidently (Argyle, 1994)
- **Low-pitched voices**, seen as dominant, and CEOs often have deeper voices (Puts, Gaulin, & Verdolini, 2006; Mayew, Parsons, & Venkatachalam, 2013)
- **Testosterone (T) and serotonin** correlate with dominance in men, rising after wins and falling after losses, though causality is unclear (Mazur, 2005; McGuire & Troisi, 1998).
- **Physical size still matters**—tall men are hired, promoted, and elected more often (Gillis, 1982).

Other correlates of dominance across cultures include:

- **Athleticism**
- **Intelligence**
- **Physical attractiveness**
- **Humorousness**
- Good grooming

Self-Esteem as a Status Tracker

Self-esteem acts as a "sociometer," gauging how much others value us (Leary & Downs, 1995).

High status boosts self-esteem, while rejection lowers it, motivating us to repair relationships or seek new ones (Barkow, 1989).
It also guides decisions about who to challenge or submit to, preventing costly missteps in the hierarchy (Mahadevan et al., 2023).

Submissive Strategies

Yes, as we claimed on this website, submissiveness and passive communication style can be strategies.

- **Appeasing negotiation**: Women use appeasement gestures (e.g., smiling) more than men when negotiating with gatekeepers like nightclub doormen (Salter, Grammer, & Rikowski, 2005).

- **"Deceiving down"**—lowering self-confidence to seem nonthreatening—may help subordinates avoid dominant wrath (Hartung, 1987)

Subordinates also derogate "tall poppies" (successful peers), taking pleasure in their downfall, especially if their success seems undeserved (Feather, 1994).

Practical Takeaways for Navigating Status in Everyday Life

- **Leverage Competence for Prestige**: Build and showcase skills that others value—whether public speaking, problem-solving, or generosity—to earn respect without resorting to force (Henrich & Gil-White, 2001).
- **Mind Your Signals**: Stand tall, speak confidently, and maintain eye contact to project dominance, but balance it with prosocial acts to avoid seeming selfish (Argyle, 1994; Buss et al., 2020).
- **Protect Your Reputation**: Public acts of altruism boost your status, but only if others see it (Bereczkei, Birkas, & Kerekes, 2007).
- **Know When to Submit**: Submissive strategies, like smiling or deferring, can help you navigate powerful gatekeepers or bide time for better opportunities (Salter, Grammer, & Rikowski, 2005).
- **Monitor Your Sociometer**: Pay attention to your self-esteem—it's a clue to how others perceive you. If it dips, strengthen social bonds or seek new groups (Leary & Downs, 1995).

Updates of 7th Edition

Dark Triad and Short-Term Mating

The 7th edition doubles down on newer personality research, particularly:

- Dark Triad traits linked to exploitative short-term mating strategies

The empirical foundation is clearer now: individuals high in Dark Triad traits are more likely to engage in sexual coercion, infidelity, and deceptive mating strategies. This area has exploded in research since the last edition.

Correction of the Kin Altruism Hypothesis for Homosexuality

- The **6th edition** presented the *Kin Selection Theory* as a leading contender for explaining male homosexuality (i.e., gay men increase their inclusive fitness by investing in kin).
- The **7th edition challenges this view**, citing weak support and preferring the **Female Fertility Hypothesis** (homosexuality persists because it's linked to higher reproductive success in female relatives).

My Mote: Neither of these two hypotheses is very convincing to me.
Evolutionary psychology sometimes looks for neat explanations for evertyhing, even 'evolutionary noise' and random fluctuations that maybe just that: random.

Stronger Emphasis on Domain-General Mechanisms

Traditionally, evolutionary psychology has emphasized domain-specific modules (e.g., jealousy module, cheater-detection module).

But the 7th edition introduces greater appreciation for flexible, domain-general tools, such as:

- **General intelligence as an adaptive problem-solver**
- **Learning and imitation in unstable environments**
- **Cognitive flexibility in dealing with novel, modern mismatches**

This addition feels like an intellectual maturing of the author and field.
Not abandoning modularity, but embracing a more *integrative model*.

Extra Case Studies, Data, and Real-World Applications

- **Coverage of "evolutionary mismatches,"** discrepancies between modern environments and the ancestral environments in which humans evolved, is expanded.
- **Modern environment of internet dating**, people search on computer or smartphone screens through hundreds or thousands of potential mates who could live anywhere—one example from a list of eight evolutionary mismatches in the domain of mating.
- **Female hunters** challenging the narrative of large-game hunting as primarily a male activity. Recent evidence suggests that women may have played a far more active role in hunting than previously believed, a topic actively debated in the scientifi c community.

- **High scores on disgust may protect against different pathogens** from the outgroup, potentially explaining why more easily disgusted people are more prejudiced toward outgroups
- **Men eat more meat**. A study of 23 cultures found that men consumed more meat than did women in all of them, and women are more likely to adopt a vegetarian or vegan diet.
- **Fear is an evolutionarily ancient emotion**. Sea slugs, moths, mammals, and primates all experience fear, suggesting that it dates back to at least 700 million years ago in the evolution of life on earth.
- **Physical attractiveness is linked with good immune functioning.**
- **Higher-income and education are attractive**: A study of 1.8 million online daters from 24 diferent countries found that men high in resource acquisition ability, as measured by stated income and level of education, received dramatically more positive responses from women.
- **Bisexuality is increasing in women**. Recent studies point to a larger percentage of women who identify as bisexual
- **Incels always existed, but there may be more because of 'evolutionary mismatches'** with dating apps rewarding top men the most. However, Buss points out that incels may also be overstating their comparative lack of options by comparing themselves to famous social media personalities
- **Children run away to get more investment**: Offspring use a strategy of withholding cooperation from parents, such as socially withdrawing or running away from home, as a means to elicit greater investment from parents My note: it may also help dissuade parents from having more children, thus monopolizing their investment. However, a lot of times, it may just be a troubled personality more than a 'strategy'
- **Everyone prioritizes honesty in friends**; displays of dishonesty are friendship deal-breakers.
- **Peer aggression increases status** and popularity as young as the elementary school years.
- **Self-esteem tracks status**: Lab experiments that increased a person's status caused an increase in self-esteem, suggesting that self-esteem does indeed track social status.
- **Dark Triad men** are more prone to sexual infidelity (narcissism, Machiavellianism, psychopathy)
- **We lost some odor sensitivity**: because agriculture made odor detection less important, leading to a lower genetic sensitivity
- **Female hunters**: Archaeological findings challenge the notion that hunting was exclusively male—now presented as a topic of *ongoing debate*.
- **Social media lowers female self-esteem**

⍰⍰♂ Lucio's Analysis

The book is great and Buss is a top scientist, so consider these as personal and smaller notes that take little away from *Evolutionary Psychology*:

Effect sizes & sample sizes should be disclosed more often

This isn't just Buss, but a criticism I have for many handbooks and textbooks, including in evolutionary psychology.

There is a tendency to share the outcome of a study and generalize with sentences like 'men are more', without disclosing the effect sizes.

However, if you checked the specific study, sometimes the sample was small.

And if you check the effect sizes of gender differences, they're also sometimes very small and **the overlap between gender may as telling as the difference**.

I wished for more disclosure of effect sizes.

Possible overemphasis on income and education on men's attractiveness

Says Buss:

> In online dating, for example, a small percentage of men, typically those with higher incomes and more education, attract hundreds of women; many men receive few responses or none at all (Jonason & Thomas, 2022).

I took a cursory look at the study, and it seems to focus on resource-acquisition ability only.

However, online dating is heavily appearance-driven, especially in the early stages of matching. Based on both personal experience and years of coaching, I'd be surprised if education plays a larger role than physical attractiveness when it comes to initial interest.

This is worth noting because much of the research in this area relies on questionnaires and self-reports, which in my view tend to downplay the role of looks, social dominance, and social/dating skills, while overemphasizing prosocial traits like kindness.

Could the 7th edition have waited?

You know how it is, Buss writes a new book, I must read it (or listen to it).

But after only 5 years after the 6th edition, it's a fair question.

Several new updates are interesting, and especially the expanded coverage of status made it worth it for me.
But a few years more wouldn't hurt.

The incel phenomena has more explanations

I applaud Buss for engaging with more recent trend and phenomena and using their vernacular name.

And his analysis, as it's often the case, is on point.
However, I believe there are even more, and potentially deeper explanations for the possible increase of 'involuntary celibates', including:

- **Women's empowerment**, making lower-status men less appealing to them
- **Libertine dating** increase, reducing the number of monogamous pair bonding marriages

These are larger trends that have been ongoing for decades and accelerated recently.
Online dating gave a new outlet and a possible boost to these underlying trends.

Mate switching '*VS*' dual mating strategy?

There seems to be a tendency to view these two models as opposing and mutually exclusive.

I understand that there is 'much at stake' and that many men are keenly interested in women's infidelity—evolutionary psychology itself explains why.

But while I agree with Buss that 'mate switching' seems a better explanation in most cases, it seems to me this issue has overly divided researchers into one camp or the other.
I see them as *both* valid.
Whichever best explains infidelity depends on the context.

Furthermore, a recent podcast by Macken Murphy strengthened the case for the dual mating strategy with what seemed like credible and recent evidence.

I'd advise sticking to evidence-based sources (less Pinker)

The author referenced and quoted Steven Pinker several times, including Pinker's book *How the Mind Works*.

And while Pinker certainly doesn't lack clout and popularity, I found his otherwise excellent books to be less evidence-based compared to some other researchers, and more opinion-based.

For example, Buss explains why status hierarchies evolved quoting Pinker.
However, I didn't think Pinker offered a comprehensive explanation and I had many unanswered questions (eg.: what's in it for the low-status individuals to accept the hierarchy? How do hierarchies become 'evolutionary stable'?).
I had to look elsewhere to better understand how social hierarchies can become evolutionarily stable.

Caution against overextending evolutionary explanations

You know the saying: when you have a hammer, everything starts to look like a nail.

Evolution is a powerful explanatory tool—but precisely because of that, there's a risk of using it to explain *everything*, even when chance and randomness may be the 'answer'.

Take this passage, for example:

> Sensitivity to the odors produced by plants and animals was essential for our hunter-gatherer ancestors. With the advent of agriculture, odor detection became less important, leading to a lower genetic sensitivity to the odors of plants and animals.

To me, this feels overly mechanistic.

Yes, odor sensitivity may have become less crucial. But the fact that we lost some of it may just be a random walk down the evolutionary path. Reduced importance doesn't necessarily lead to trait loss. It just reduces the selective pressure to maintain it.

Run the evolutionary dice another million times, and I'm sure that in some variations, we don't lose much olfactory sensitivity. If it's not vital to keep, it doesn't necessarily follow that we were bound to lose it.

PROS

- **Epistemic caution**

And more clarity.
The 7th edition seemed more careful to distinguish between what's well-supported and what's speculative, and I liked that.

- **Greater interdisciplinary openness, including cultural evolution**

Borrowing more from anthropology, behavioral genetics, and cultural evolution, quoting both Doyle and Henrich.
I loved that and was curious to see if Buss had taken note of Henrich's recent work.

Review

Evolutionary Psychology by David Buss stands as a rigorous, current, and expansive overview of human nature through the lens of evolution and remains the best overview of evolutionary psychology I've studied.

It comes just 5 years after the previous 6th edition, so while the changes are not massive, it still provides the most updated overview of the discipline.

I particularly loved the chapter on status—it's a rich, well-researched section that will serve as a valuable resource for future status-related articles on this site.

Overall, I am grateful to Buss and his work. He made our articles and products more grounded, more rigorous, and ultimately more effective.

Social Dominance: Summary, Review, & Criticism

Lucio Buffalmano · 26 May 2025 · Archived copy · Original

Social Dominance (1999) introduces Social Dominance Theory (SDT), explaining why and how group-based hierarchies persist across societies. Authors Sidanius and Pratto unveil Social Dominance Orientation (SDO), a key trait predicting support for inequality, making this a foundational work on power dynamics, status, and systemic oppression.

Contents

- Exec Summary
- FULL SUMMARY

- MORE WISDOM
  - Marx Was Smart, & Marxism Is An Insightful Theory
  - Group-Based Versus Individual-Based Social Hierarchies
  - Why Pre-Industrial Hunter-Gatherers Are More Socially Egalitarian

  - Nationalists from lower status give up ethnic identification
  - Conservative Pushback Follow Liberal Policies
  - Force Alone Isn't Enough: Framing & Manipulation
- QUOTES
- CRITICISM
  - Focus on win-lose, rather than win-win (socialist undertones?)
  - Doesn't take into account small sample size (law of disproportion)
  - Potentially overstates the impact of 'terror' / oppression
  - Never considers there may be some truths to the stereotypes
  - Doesn't account for rational red-lining or profiling
  - Overlap with conservatism is modest?
  - Patriarchy dynamics miss the cooperation of all men, not just the higher classes
- REVIEW

Exec Summary

- **Higher status individuals cooperate to maintain the social hierarchy** with over or covert discrimination, manipulation, and force
- **Status hierarchies are ubiquitous in all societies** for gender and age. Post-agricultural socies also add arbitrary classes (ethnic, racial, etc.)
- **Hierarchies are a consequence of male reproductive strategies**, with men cooperating to keep women below them, and high-status men allying themselves to keep other classes of men marginalized

FULL SUMMARY

About the Author:
Jim Sidanius was a professor of psychology and African American studies at Harvard University. He was internationally known for his work on prejudice, ideology, and intergroup conflict.
Felicia Pratto is a professor of psychology at the University of Connecticut. Her research focuses on power dynamics, social inequality, and intergroup relations.

Together, Sidanius and Pratto developed Social Dominance Theory (SDT), integrating psychological and sociological insights into a unified theory of hierarchy and oppression.

Chapter 1: From Viciousness to Viciousness: Theories of Intergroup Relations

This chapter surveys four major families of theories—psychological, social-psychological, structural-sociological, and evolutionary—that seek to explain why intergroup hatred and oppression recur across time and culture.

Psychological models like the frustration-aggression hypothesis (Dollard et al., 1939) suggest displaced anger fuels prejudice, while authoritarian personality theory (Adorno et al., 1950) links it to personality traits. Social-psychological approaches, such as realistic group conflict theory (Campbell, 1965), tie discrimination to resource competition, and social identity theory (Tajfel, 1978) reveals bias even in minimal groups.

Here are the main pre-existing theories, and what SDO takes from them:

- **Psychological models** examine intrapsychic drives (e.g. the frustration-aggression hypothesis), personality syndromes (authoritarianism; RWA), and values conflicts (equality vs. individualism) to account for prejudice and displaced hostility (Turner, 1994).

  - ➡ From authoritarian personality theory and Rokeach's two-value theory of political ideology comes the notion that the importance that people place on the values of equality, dominance, and submission are of fundamental importance to our understanding of a whole range of sociopolitical beliefs and behaviors

- **Social-psychological approaches** emphasize how social learning and symbolic racism sustain covert biases in post–civil-rights societies, and how minimal-group settings reveal a basic drive for ingroup favoritism (even at self-cost) as part of positive social identity strategies (Tajfel & Turner, 1986).
  However, favoritism isn't enough to explain more active oppression.
  - ➡ From realistic group conflict grou group position theories comes the notion that the political choices and attitudes of individuals must often be seen within the context of group conflict over both real and symbolic resource allocation
  - ➡ From SIT come the important notions that conflict between groups is not necessarily or even primarily designed to maximize the absolute material return to the ingroup, but rather to maximize the relative return to the ingroup, sometimes even at the cost of substantial material loss to both the self and the ingroup

- **Structural-sociological theories** (group-position, Marxism, neoclassical elitism) show how dominant groups institutionalize inequality and legitimize their power through ideology (e.g. divine right, free-market doctrines), breeding false consciousness among subordinates (Blumer, 1958).
  - ➡ From classical and neoclassical elitism theories comes the notion of the functional value of ideology in the dynamics of hierarchical social control

- **Evolutionary perspectives** argue that ethnocentrism and male dominance coalitions are by-products of inclusive-fitness and sexual-selection dynamics; hierarchical social structures thus amplify adaptive tendencies for ingroup cooperation and outgroup hostility (van den Berghe, 1981).
  - ➡ The ubiquitousness of social hierarchy and ethnocentrism seen in terms of survival strategies adopted by hominoids, including Homo sapiens

Insights From All:

Despite their flaws, these approaches offer valuable insights into how stereotypes, individual differences, culture, institutions, and possibly evolution contribute to social oppression, including:

- **Stereotyping is Common**: Due to limits in human information processing, people often rely on social stereotypes.
- **Individual Differences Matter**: People vary in their tendency to adopt negative stereotypes and discriminate.
- **Cultural Transmission is Key**: Socialization spreads ideologies and practices that shape attitudes and behaviors.
- **Institutions Play a Role**: Lasting oppression can't be explained without considering systemic and institutional actions.
- **Shared Ideologies**: Both dominant and subordinate groups internalize social ideologies, which help sustain inequality.
- **Possible Evolutionary Basis**: Traits like patriarchy and ethnocentrism may stem from evolved predispositions—but caution is urged to avoid simplistic biological explanations or justifications for oppression.

Some theories I particularly enjoyed here were:

Authoritarian Personality

While some early claims have been criticized, modern research using improved methods supports several key points. Notably, there is evidence for a generalized ethnocentrism tied to political conservatism and themes of dominance and submission.
However, foundational claims about child-rearing origins and the psychological pathology of authoritarianism

remain unsupported or untested.

Pros – Supported Claims:

- ✅ **Generalized Ethnocentrism Exists**: Research confirms a broad tendency to stigmatize various outgroups (ethnic, political, sexual, religious).
- ✅ **Dominance & Submission Themes**: These are central to authoritarian attitudes, consistent with original theory.
- ✅ **Link to Conservatism**: Generalized ethnocentrism correlates strongly and consistently with political conservatism across cultures.

Cons – Weaknesses & Unsupported Claims:

- ❌ **Child-Rearing Origins Lack Evidence**: No strong empirical support for the theory's foundational claim about upbringing.
- ❌ **Psychoanalytic Foundation Unnecessary**: The complex Freudian basis may not be required to explain findings (and, we add, feels like psychobabble)
- ❌ **No Evidence of Psychological Pathology**: Authoritarianism is not proven to be a psychological disorder or condition needing treatment.
- ❌ **No Societal-Level Explanation**: The theory doesn't bridge individual psychology with broader institutional or ideological dynamics.

Pareto Knew Better Than Marx: Elites Make Their Interest First

> Pareto disagrees with Marx and Engels that the modern class struggle differs in any essential degree from group struggles of the past.
> Pareto argues that, rather than bringing about the "victory of the Proletariat," the end of the class struggle will instead merely bring about the victory of new elites speaking in the name of the proletariat. In essence, the Paretian model is the ultimate statement of "Plus ca change, plus c'est la meme chose."

And turns out, every single communist revolution proved Pareto right.
Unsurprisingly, since it aligns with human nature and foundational power dynamics.

Building on the insights of Chapter 1, Sidanius and Pratto introduce Social Dominance Theory (SDT) as an integrative framework connecting individual attitudes, legitimizing ideologies, and institutional discrimination into one dynamic system.

Chapter 2: Social Dominance Theory: A New Synthesis

Social Dominance Theory (SDT) starts with the observation that all human societies are organized into group-based hierarchies. These hierarchies typically include dominant groups at the top and subordinate groups at the bottom. The dominant group possesses a disproportionate share of positive social value like power, status, higher income, better homes , etc. And the subordinate groups possess a disproportionate share of negative social value like low power and social status, high-risk and low-status occupations, poorer health care and food,
modest homes, and severe negative sanctions (e.g., prison and death sentences).

Goal of SDT: To identify and explain the mechanisms that create and sustain these group-based hierarchies.

Key Points:

- **Group-Based Hierarchies Are Universal** for at least age and gender: All societies tend to be structured with dominant and subordinate groups.

- **All surplus-producing societies generate arbitrary hierarchies**, some of which are 'arbitrary' that go alongside 'common ones' such as:
  - Age
  - Gender
  - Arbitrary
- **Dominant Groups Gain On Subordinate Groups**, hold a disproportionate share of *positive social value*—such as power, wealth, status, quality food, housing, and healthcare.
  - Subordinate Groups: Bear a disproportionate share of *negative social value*—like poverty, low status, poor healthcare, risky jobs, and harsh punishments.
- **Oppression expressions (racism, ethnocentrism, sexism, nationalism) are manifestations of a universal predisposition** to maintain group-based hierarchies (Sidanius et al., 1994).
  Social Dominance Orientation measures this predisposition at individual level
- **Oppression is directed towards male of subordinate groups**, probably because of evolutionary psychology reasons. Men are competitors, while women are potential mates

Key mechanisms that maintain social hierarchies

- **Social Dominance Orientation (SDO)** at an individual level. Simple definition: an individual's general preference for group-based inequality.
  The 4 drivers of SDO are:
  - **Group Membership & Identification**: SDO is higher among those who belong to or identify with dominant, hierarchical groups.
  - **Socialization & Background**: Factors like education, religion, and major life events (e.g., war or disasters) influence SDO levels.
  - **Personality & Temperament (empathy)**: Traits such as empathy play a role—higher empathy generally leads to lower SDO.
  - **Gender**: Men consistently show higher SDO than women, even beyond differences in social roles (invariance hypothesis).
- **Aggregated individual discrimination** as an emergent social-level component of a multitude of personal attitudes and behavior. They can be small and seemingly insignificant in daily life, but add up
- **Institutional discrimination** includes the rules, procedures, and actions of social institutions, both private and public, including courts, lending institutions, hospitals, retail outlets, and schools. Institutional discrimination may be conscious, deliberate, and overt, or unconscious, unintended, and covert
- **Behavioral asymmetry,** ways in which behavior and attitudes differ between dominant and subordinate groups. These asymmetries help explain how social hierarchies are maintained and internalized.
  - **Asymmetrical Ingroup Bias**: All groups show some ingroup favoritism, but dominant groups tend to exhibit stronger bias in favor of their own group compared to subordinate groups.
  - **Outgroup Favoritism (Deference)**: In extreme cases, subordinate groups may favor the dominant group over their own—e.g., "Uncle Tom" behavior among some African-Americans.
  - **Self-Debilitation**: Subordinates may engage more frequently in self-destructive behaviors, often aligning with negative stereotypes. These stereotypes are internalized by both dominants and subordinates and can become self-fulfilling.
  - **Ideological Asymmetry** refers to how dominants and subordinates differ in their beliefs around group-based hierarchy. Dominant classes are more likely to support hierarchy-enhancing ideologies, and their social attitudes and policy preferences are more strongly driven by social dominance <— I found this sub-component less clear and less value-adding

- **Legitimizing myths**: cultural ideologies (e.g. meritocracy, universal rights, divine sanction) that justify or challenge hierarchy.
- **Proximal processes**: aggregated individual discrimination, institutional discrimination, and behavioral asymmetries that sustain the power differential.
- **Hierarchy-enhancing** (HE) and **hierarchy-attenuating** (HA) **forces shape group inequality**, and HE forces typically predominate (Pratto et al., 1994).
  Hierarchy-enhancing tend to be conservative, and hierarchy-attenuating tend to be liberal
- **Group oppression is a cooperative game**. While sometimes subordinates rebel or sabotage the system, most often they go along with it and cooperate. Sometimes, they wholeheartedly buy into the ideologies and legitimizing myths.

TPM Note: Hierarchy Maintenance Is Manipulation

Quoting but rephrasing for brevity some key passages:

> (…) the greater the degree to which dominants can induce subordinates to endorse self-demeaning ideologies (…) the less physical force or threat of force will be necessary to keep the hierarchical group relationships in place.
> (…) one of the reasons that the Protestant work ethic is such a potent HE-LM is because it is widely embraced across broad swaths of the social power continuum, by rich and poor (…)

It can go even deeper, to associations you never questioned:

> While the color black is most often associated with implications of evil, filth, depravity, and fear, the color white is most often associated with notions of purity, truth, innocence, goodness, and righteousness. These two contrasting color symbols permeate a great deal of Western culture and can be discerned in everything from classical fairy tales to popular film and literature.

- Manipulation 101: the basics
- Political manipulation

Black skin seems to be a target for discrimination in many countries:

> There is also relatively consistent evidence from Australia, Canada, Ghana, Jamaica, the United States, and Western Europe that those with darker skin complexions are evaluated as being less valuable, experience higher levels of discrimination, and have lower socioeconomic status than those with lighter skin complexions.

Chapter 3: The Psychology of Group Dominance: Social Dominance Orientation

Definition:

> SDO is defined as the degree to which individuals desire and support group-based hierarchy and the domination of "inferior" groups by "superior" groups.

- **Development and validation**: Factor analyses demonstrate that SDO loads uniquely on dominance attitudes, distinct from authoritarianism or ideological conservatism.
- **Correlates**: High-SDO individuals consistently favor punitive criminal justice policies, oppose welfare and affirmative action, and endorse free-market capitalism over redistributive programs.
- **Cross-cultural stability**: SDO predicts prejudice and policy attitudes in multiple societies, underscoring its universal utility.

How SDO Correlates to Attitudes

- **Racism & ethnic prejudice:** SDO is positively correlated with racism across cultures, including anti-Black, anti-Arab, anti-Asian, and anti-Palestinian attitudes.
- **Cross-cultural bias:** SDO predicts prejudice in many countries, not just the U.S., but is muted in politically repressive contexts like China.
- **Internal attributions for low-status (it's their fault):** High SDO correlates with blaming low-status groups' misfortunes on internal traits like laziness or low ability.
- **Denial of external attribution for low status (it's not about context):** High SDO correlates negatively with blaming inequality on external factors like discrimination or poor schooling (except in Taiwan, where fatalistic external beliefs correlate positively with SDO).
- **Rationalization for inequality (expedience over analysis)**: Across the cultures studied, SDO is not a particular habit of making internal or external attributions. Rather, SDO orients people to find the most socially acceptable way of rationalizing inequality.
- **Protest is criminality:** High SDO individuals view social unrest (e.g., LA riots) as criminality, not protest against injustice.
- **Policy support for hierarchy-*enhancing* measures:** e.g., law-and-order, punitive policies
- **Opposition to hierarchy-attenuating (HA) policies:** e.g., diversity, LGBTQ+ rights
- **Policy justification for hierarchy defense:** People high in SDO prefer HE rationales (e.g., "affirmative action causes conflict") and reject HA rationales (e.g., "promotes equality"), even when discussing the same policy.

- **War support:** High SDO predicts support for military action (e.g., Gulf War), particularly when framed as reasserting dominance.
- **Conservative leaders support:** SDO aligns with support for conservative, anti-affirmative action figures, especially during polarizing political moments.

Roots of SDO

Gender and **group status** are the strongest and most consistent predictors of SDO.

The authors believe that SDO is shaped by three main influences: socialization, situational context, and possibly temperament (though the latter is less studied).

People from dominant social groups (e.g., men, Whites, heterosexuals) tend to have higher SDO than those from subordinate groups.
This is likely because hierarchical beliefs align with their self-esteem and societal treatment and society defines norms that reinforce dominant group superiority.

Empirical and experimental evidence confirm it.
Across multiple samples and countries, higher SDO levels are consistently found in higher-status groups:

- In the U.S.: Men > Women, Whites > Blacks/Hispanics, Heterosexuals > Gays/Lesbians/Bisexuals.
- Among police officers in L.A. and New Zealand: White officers had higher SDO than minority officers.
- In Israel: Ashkenazi Jews (highest status) had the highest SDO, followed by Sephardic Jews, mixed Jews, Israeli Arabs, and finally Palestinian Arabs (lowest status).

SDO vs. Political Conservatism

The authors state that SDO (Social Dominance Orientation) is often mistaken for political conservatism, but they are conceptually and empirically distinct.

While conservatism has many definitions—ranging from resistance to change to support for traditional values and capitalism—only opposition to social equality overlaps with SDO.

Empirically, the correlation between SDO and conservatism is modest, and statistical analyses show that SDO predicts social and political attitudes even when conservatism is controlled for. This means SDO offers unique explanatory power beyond political conservatism.

SDO vs. Authoritarianism

While SDO and authoritarianism share similarities—both predict prejudice, low empathy, and conservative attitudes—they are conceptually distinct.

Authoritarianism centers on submission to ingroup authority, while SDO reflects a preference for hierarchical relationships *between* groups.

Authoritarianism is also is seen as a pathological personality style, while SDO is considered part of normal personality variation.

Empirical research shows only weak correlations between the two, and SDO continues to predict prejudice and ideological attitudes even when authoritarianism is controlled for.
Studies consistently find that both SDO and authoritarianism uniquely and independently contribute to explaining group-based prejudice.

Chapter 4, 5, 6, 7, 8: Proving Psychological & Systemic Discrimination

The central chapters lay out the evidence for social, psychological, and systemic discrimination against lower-status groups to perpetrate and maintain the higher class privileges.

I find the evidence convincing and it changed my mind on several issues.

However, we provide a briefer summary because while the book focuses on a few countries, the level and targets of systemic discrimination is contextual and changes:

Chapter 4: “Let’s Both Agree That You’re Really Stupid”: The Power of Consensual Ideology

Sidanius and Pratto examine how dominant groups shape and maintain shared belief systems, or consensual ideologies, that legitimize hierarchy.

- **Mechanisms of ideological negative stereotyping**: educational curricula, media framing, religious doctrines, and cultural ritual reinforce stereotypes of subordinate groups as lazy, unfit, or dangerous.
- **False consciousness**: subordinates may internalize HE myths—e.g., “hard work alone determines success”—which obscure structural barriers and dampen collective resistance.
- **Ideology as social glue**: consensual myths bind diverse dominant-group factions and diffuse intra-elite conflicts

by focusing hostility outward.

Chapter 5: “You Stay in Your Part of Town, and I’ll Stay in Mine”: Discrimination in the Housing and Retail Markets

An empirical investigation of how SDT processes shape residential segregation and consumer discrimination.

- **Housing market bias**: Real-estate agents and landlords use coded language and institutional “redlining” to steer minorities away from affluent neighborhoods
- **Retail discrimination**: High-SDO business owners and managers more frequently refuse service, enforce longer waits, or “profile” minority customers as shoplifters.
- **Consequences**: Segregation entrenches resource gaps in schools, policing, and access to healthy food, reinforcing broader hierarchies.

Chapter 6: “They’re Just Too Lazy to Work”: Discrimination in the Labor Market

This chapter documents employment disparities driven by group dominance dynamics.

- **Hiring and promotion**: Employers with high-SDO profiles rely on subjective “fit” criteria, disproportionately excluding minority and female applicants.
- **Wage gaps**: Legitimate-looking justifications (e.g. performance “metrics”) mask systematic under-rewarding of subordinate groups.
- **Glass ceiling**: Even high-achieving women and racial minorities face institutional barriers shaped by HE ideologies that valorize traditional male breadwinner norms.
- **Low*est*-status men pay the bigger price** because the level of employment discrimination is greater for lower qualifications and highest during recessions

Chapter 7: “They’re Just Mentally and Physically Unfit”: Discrimination in Education and Health Care

Sidanius and Pratto explore how HE ideologies permeate schools and clinical settings, resulting in unequal outcomes.

- **Educational tracking**: Schools track minority and low-SES students into lower-quality programs based on deficit-oriented stereotypes, limiting academic mobility.
- **Medical bias**: High-SDO practitioners are more likely to under-diagnose pain or deny treatment to subordinate-group patients, rationalized by notions of “lower compliance” or “risk.”

Chapter 8: “The More of Them in Prison, the Better”: Institutional Terror, Social Control, and the Dynamics of the Criminal Justice System

This chapter examines how official and semiofficial terror sustain group hierarchy through mass incarceration and targeted policing.

- **Disproportionate sentencing**: Racial minorities receive harsher penalties for identical offenses (Tonry, 1995).
- **Policing “stop-and-frisk”**: High-SDO precincts deploy aggressive street tactics in minority neighborhoods, producing a self-reinforcing cycle of surveillance, arrest, and conviction.
- **Collateral consequences**: Legal disenfranchisement, employment bans, and social stigma post-release perpetuate subordinate-group marginalization.

Light bar unadjusted, dark bar adjusted

Chapter 9: Social Dominance Theory: A Cooperative Game

A crucial tenet of SDT is that, in large part, subordinates participate in their own subordination.

Sometimes the subordination is internalized from childhood.
For example, black children preferred playing with the white dolls and thought the black dolls looked bad.

- **Behavioral asymmetries**: Dominant groups employ both carrot (cooptation, patronage) and stick (punitive sanctions) tactics, while subordinates oscillate between compliance, contestation, and exit.
- **High status groups present higher favoritism for the ingroup**, but exceptions apply when the political climate for example discourages favoritism and shames the dominant group for bias and racism
- **Outgroup favoritism helps maintain hierarchies**: Even as children, more black children preferred playing with the white dolls and thought the black dolls looked bad (Clark and Clark, 1947).
- **Feedback loops**: HA successes (e.g. civil-rights gains) spur HE counter-reactions (e.g. “color-blind” backlash), underscoring the non-linear “spiral” of equality struggles (Sidanius & Pratto, 1999).
- **Policy design**: Sustainable reductions in group inequality require simultaneous structural reforms and ideological shifts—quadruple-helix interventions spanning legal, economic, educational, and cultural domains.

Chapter 10: Sex and Power: SDO, Patriarchy & Social Classes Are Reproductive Strategies

In this chapter the authors close the circle by adopting an evolutionary framework to explain the rationale behind SDO.

Their argument was convincing and well-aligns with accepted evolutionary psychology principles.
And it also aligns with many of our social power dynamics analyses of inter-gender dynamics.

One key quote to summarize it perfectly:

> Thus, what is called intrasexual competition among males may encourage men not only to dominate women politically and economically and so control women's sexual and reproductive behavior, but also to form expropriative male coalitions against outgroup males.
> These activities will result both in the oppression of women and in class stratification among men.

Some takeaways:

- **Patriarchy and economic status hierarchies are the result of men's efforts to gain reproductive advantage** b keeping women below them, and gaining a comparative advantage reproductive advantage over outgroup men
  - Discrimination against women softer, to disempower them, without harming them
  - Discrimination against men is more aggressive to remove them as competition (subordinate male target hypothesis)
- **High status men are higher SDO because they gain with larger economic disparities**, and the less the relative political power of women, the greater the degree of overall economic inequality.
- **Higher SDO men are more likely to want to have multiple partners**, be jealous, and reject adoption, reinforcing the link between SDO as a sexual reproductive strategy
- **Women's higher SDO correlates with a higher desire for high status men**: Women prioritize securing high-status mates and favor redistributive social policies, reflecting evolutionary investments in offspring survival. However, higher SDO women sought higher status men

TPM Addition: Refining SDO

Since SDO is important to our work I will add the extra research and refinements that followed in the years to make this an even more comprehensive resource:

Revised SDO scale (SDO7) Adds Two Dimensions

The revised SDO scale (SDO7) breaks it down into two dimensions:

- **SDO-D**(dominance): Group-based dominance
- **SDO-E**(equality): Opposition to equality

Some studies find that gender differences are larger in SDO-D but smaller or inconsistent in SDO-E.

Women may reject dominance but still vary in equality preferences based on ideology, religion, or context.

Dual-Process Motivational (DPM): Threat VS Competition

John Duckitt (2001) offers one of the most influential refinements and extensions of SDO, connecting it with Right-Wing Authoritarianism (RWA).

The Problem Duckitt Solved

Before Duckitt, SDO and RWA were known to correlate with prejudice — but their interrelation was unclear, and their causes poorly understood.
Why do some people score high on SDO, others on RWA? Why are their prejudices different?

Duckitt's Dual-Process Model (DPM) explains that they stem from different personality traits and worldviews and lead to different types of prejudice.

The Dual Motivational Pathways

1. RWA Pathway: Threat-Driven

- **Personality trait**: Low openness to experience + high conscientiousness
- **Worldview**: The world is a **dangerous and threatening place**
- **Motivation**: Seek **social security, stability, and group conformity**
- **Ideology**: High **Right-Wing Authoritarianism**
- **Prejudice type**: Against **threatening or deviant outgroups** (e.g., immigrants, criminals, religious minorities)

2. SDO Pathway: Competition-Driven

- **Personality trait**: Low agreeableness + low empathy
- **Worldview**: The world is a **competitive jungle**
- **Motivation**: Seek **power, dominance, and group-based hierarchy**
- **Ideology**: High **Social Dominance Orientation**
- **Prejudice type**: Against **low-status or subordinate groups** (e.g., the poor, ethnic minorities)

Key Implications of the Model

Different roots = different interventions:

- RWA prejudice is **fear-based** → reduced by **security, education, and diversity exposure**
- SDO prejudice is **dominance-based** → reduced by **empathy training**, **equality norms**, or disrupting **hierarchical framing**

Explains distinct ideologies:

- RWA → supports law & order, religious conservatism, moral traditionalism
- SDO → supports capitalism, nationalism, militarism, and elite privilege

Predicts different policy support:

- RWA: Opposes abortion, supports surveillance, wants law enforcement crackdowns
- SDO: Opposes welfare, supports harsh immigration laws, favors hierarchy-maintaining systems

MORE WISDOM

Marx Was Smart, & Marxism Is An Insightful Theory

> Though Marxism has been criticized from a number of perspectives, this model also contains several very insightful ideas of enduring value.
> Among the most important are that ideology functions to justify and support hierarchical group relations and that ruling elites largely control the contents and framing of social discourse

This is manipulation at its finest:

> Because of this control of social ideology, ruling elites are able to convince not only themselves but, more importantly, their subordinates of the legitimacy of their rule.
> (…) can exercise near hegemonic control over the social system without serious resistance from, and often with the cooperation of, the working class.

Group-Based Versus Individual-Based Social Hierarchies

The two overlap but are distinct:

> In an individual-based social hierarchy, individuals might enjoy great power, prestige, or wealth by virtue of their own highly-valued individual characteristics, such as great athletic or leadership ability, high intelligence, or artistic, political, or scientific talent or achievement.
> Group-based social hierarchy, on the other hand, refers to that social power, prestige, and privilege that an individual possesses by virtue of his or her ascribed membership in a particular socially constructed group such as a race, religion, clan, tribe, lineage, linguistic/ethnic group, or social class.

Why Pre-Industrial Hunter-Gatherers Are More Socially Egalitarian

First off, it's not that the hunther-gatherer societies have no status hierarchies, but it's more they have an *individual*-based hierarchy.

It's not class-based, and it's not transgenerational or hereditary in nature, but it exists.

In hunter-gatherer societies, the absence of arbitrary-set, group-based social hierarchies stems primarily from the lack of economic surplus, driven by limited food production and storage technologies.

As nomadic groups, they cannot amass nonedible resources like animal skins or weapons, which restricts the development of specialized roles such as professional armies or bureaucracies that enable coercive political authority. Without military or coercive specialists, all adult males are essentially equal in military capacity, fostering political authority based on mutual agreement, persuasion, and consultation rather than domination.

Nationalists from lower status give up ethnic identification

The more that dominants embrace group dominance, the more strongly they should with their ingroups.

However, it's the opposite for subordinate groups.

> These findings then show that while patriotism implies the endorsement of the ethnic self among dominants and only mild rejection of the ethnic self among people with intermediate ethnic status (i.e., Asian-Americans), patriotism implies relatively strong rejection of the ethnic self among those at the bottom of the ethnic status continuum (i.e., Blacks in particular).

Conservative Pushback Follow Liberal Policies

While we may think the world smoothly advance(d) towards more agalitarianism, that advance is never linear (and, I'd add, never granted).

Historical advances in equality are always met with HE counter-currents.
We're seeing one at the time of writing (2025) with the rise of populist leaders.

Force Alone Isn't Enough: Framing & Manipulation

There are two primary means to maintain a hegemonic position over subordinate groups

- **Naked force**, threatened or actualized
- **Ideology**, controlling the contents of "legitimate" social discourse

Say the authors:

> Of these two mechanisms, control over discourse and ideology are much to be preferred. Maintaining hegemonic control by the use of violence alone carries at least two critical dangers.
> First, use of naked force can further stiffen resistance and resentment within subordinate groups. If deemed "excessive," the use of force will only delegitimize the dominant group's right to rule in the eyes of subordinates and dominants alike. The more illegitimate the dominants' power is seen to be, the more violence dominants will be required to use, leading to even greater delegitimation and thus into an ever spiraling downward cycle

Of course, I'd add, the two aren't mutually exclusive.
But for a functioning society that progresses and moves forward, ideology is foundational.

Also see:

- **How to build an empire**

QUOTES

Power dynamics set the foundation for social dynamics:

> In essence, social dominance theory presumes that, beneath major and sometimes profound differences between different human societies, there is also a grammar of social power shared by all societies.

That's the grammar we focus on TPM.

CRITICISM

Focus on win-lose, rather than win-win (socialist undertones?)

The authors' frames and choice of words, including for 'hierarchy enhancing idelogies' hint at manipulation to keep lower classes at the bottom.

While I don't fully disagree, I also don't fully *agree*.
The line between manipulation and persuasion can be blurred sometimes, but 'hierarchies enhancing idelogies' also maintain a wealth-producing system that make everyone's life better.

Less social tension, more cooperation, and more hard workers make a bigger pie for all, not just the upper classes.
And hard-working men also advance for themselves.

In bullets, the authors never stop to wonder if:

- **Accepting the class systems may be better for all** because insurrection is costly, often goes nowhere, only replaces the upper class if successful, and shrinks the pie for all.
  This why social hierarchies are an evolutionary stable strategy (ESS)
- **Working within the class system is better for industrious lower-class individuals**, because rebellion is costly for the individual, while hard working subordinates fare far better than lazy ones
- **Accepting protestant work ethic may be better for all** because hard work and commerge makes the pie bigger for all, and a smaller slice of a bigger pie is also better for subordinates

Such as, hierarchy-enhancing ideologies may ultimately be win-win, rather than win-lose.
Sure, upper classes win 'more', but with a larger pie everyone can get a bigger slice.

Overall, I felt the authors may hold a left-leaning bias that may influence their work.

Doesn't take into account small sample size (law of disproportion)

I'm nitpicking: the text seems well-referenced and logical

One survey had 26 respondents, and I'd have liked a note on the small sample size.

And the law of increasing disproportion, such as that the higher the political authority, the more likely it is that a member of the elite will hold the post, is inherently biased by small sample sizes.

Take most countries' history, and the history of top prime ministers or presidents is naturally too small to draw big conclusions.
And it would take one single outlier to skew the number.

For example, the US with Obama, or Italy now with the first female prime minister, would completely skew the numbers' calculation.

That being said, I still agree with the authors.
But a note on the numbers would have increased its persuasiveness.

Potentially overstates the impact of 'terror' / oppression

For example, write the authors on minority killings:

> This type of terror can be quite widespread in scope and comprehensive in its effects. For example, unofficial terror resulted in the deaths of at least 3,400 African-Americans in the United States between 1882 and 1927.24

I don't doubt that some of those were motivated by hatred, racism, or social dominance motives.

But I couldn't help to think that the numbers pale in comparison to how many African Americans were killed by other African Americans, by accidents, by diseases, etc. etc.

It doesn't take anything away from the horrible brutality of any single murder.
But if we're talking about systemic-level murder, then it didn't struck me as 'comprehensive in its effects', and one should note that the numbers are puny compared to most other causes of death.

Never considers there may be some truths to the stereotypes

Including the potential factors of genetic and/or cultural differences, leading to different attitudes and behaviors.

I know, tough nuts to crack, but not mentioning it won't make the elephant in the room disappear.

For example, if a certain lower class commits more crimes and the reason is that they're marginalized, why don't we see Asians committing more crimes than whites despite the book itself claims Asians are below whites?

That's a damning question.

That being said, SDO as a psychological construct still holds.

Doesn't account for rational red-lining or profiling

The authors never stop considering that:

- **Profiling can make statistical sense**. That may be unfortunate, but it's no less true
- **Preventing lower classes from joining affluent neighborhoods may be rational** or driven by pragmatic and economical reasons as well, since lower classes may lower properties values

Overlap with conservatism is modest?

The authors say that the correlation between SDO and conservatism is modest and that only one element, opposition to social equality, overlaps with SDO.

However, even if it's one element, it's such a meaningful element that it weakens the point of general non-correlation.
Indeed, say the authors a bit later:

> Another robust relationship was that between SDO and political conservatism, measured in standard ways, using some combination of respondents' political party preferences and their self-classifications along a liberal-conservative continuum on several issue domains, such as foreign policy, economic policy, and social policy. This relationship was robust within the United States, Canada, New Zealand, and Israel. Though conservatism was not correlated with SDO in Taiwan (r = .04), support for the existing ethnic/political hegemony was correlated with SDO

Same goes for authoritarianism, which is even more closely related to SDO.

To me, the denial of the significance of overlap is akin to saying 'the overlap between a tree and a trunk is low because a tree is so much more'.
Sure a tree is much more, but don't tell me the overlap is modest because if we focus on the trunk, a highly relevant part of a tree, the overlap is 1:1.

Patriarchy dynamics miss the cooperation of *all* men, not just the higher classes

I think the authors may underestimate the level of shared interest among all men, beyond class-level, to keep women politically and economically disempowered.

Even lower-status men gain when women are lower power because, at least, they can date and find a woman among the lower-status ones.

REVIEW

Social Dominance was at the time of publication a groundbreaking book and it remains a *foundational* theory in the study of power, prejudice, and social hierarchy.

Its introduction of Social Dominance Orientation (SDO) marked a turning point in how researchers and practitioners understand social dynamics and inter-group competition.

Furthermore, the reader may wish to know that SDT/SDO have been supported by subsequent research and across cultures, and it enjoys wide acceptance.

For anyone studying power dynamics, status dynamics, or institutional power *Social Dominance* is essential reading.

SUMMARY

About the Author:
Various authors for different chapters, each focusing on their area of expertise.
The main editor is Owen Hargie, Emeritus Professor of Communication at Ulster University and a leading expert in interpersonal and organizational communication. He has published extensively on communication theory and practice.

What Are Social Skills and Why Do They Matter?

Social skills involve a process in which the individual implements a set of goal-directed, inter-related, situationally appropriate social behaviours, which are learned and controlled (Hargie, 2019, p. 15). They're the foundation of effective communication, enabling you to navigate relationships, workplaces, and social settings with competence.

Practical Takeaways:

- Set Clear Goals: Before engaging in a conversation, know your purpose (e.g., building rapport, solving a problem).
- Adapt to Context: Behave in ways that suit the situation—formal in a job interview, casual with friends.
- Practice Control: Stay calm and intentional, even in heated moments, to maintain effective communication.

Qualities of Communication Competence

A comprehensive review by Wilson and Sabee (2003) concluded that communication competence hinges on three qualities: knowledge, motivation, and skill (Hargie, 2019, p. 16). These work together to ensure your interactions are perceived as effective and appropriate.

Practical Takeaways:

- Build Knowledge: Understand the context, audience, and possible responses before speaking (e.g., know cultural norms in diverse settings).
- Stay Motivated: Cultivate a genuine desire to connect and communicate well—it drives better outcomes.
- Hone Skills: Practice specific behaviors like active listening or clear articulation to boost your competence.

Stages of Learning New Communication Skills

Learning communication skills follows four sequential stages (Hargie, 2019, p. 19):

1. unconscious incompetence
2. conscious incompetence
3. conscious competence
4. unconscious competence

This progression helps you move from unaware mistakes to effortless mastery.

Practical Takeaways:

- Embrace Awareness: Recognize when you're not communicating well (e.g., interrupting others) to start improving.
- Be Patient: Early skill practice feels awkward—keep at it until it becomes second nature.
- Seek Feedback: Ask trusted peers to point out areas for growth and track your progress.

Context Is King: Situationally Appropriate Behavior

For behaviour to be socially skilled, it must be contextually appropriate, since behaviours that are apposite when displayed in one situation may be unacceptable if applied in another (Hargie, 2019, p. 22). What works in one setting (e.g., joking with friendsegn) may flop in another (e.g., a boardroom).

Practical Takeaways:

- Read the Room: Observe the setting and adjust your tone, body language, and words accordingly.
- Test and Learn: If unsure, start neutral and adapt based on others' reactions.
- Avoid One-Size-Fits-All: Tailor your approach to each unique interaction for maximum impact.
- Learn social calibration

Understanding Cultural Influences

Feature	Collectivist Cultures (e.g., Japan, China)	Individualist Cultures (e.g., EU, USA)
Communication Context	Indirect, subtle, meaning is implicit (High context)	Direct, explicit (Low context)
Style	Indirect, relationship-focused, self-concealing	Direct, clarity-focus
Self-Concept	Interdependent ("We")	Independent ("I")
Request Example	"It's cold" (implied request)	"Close the window"
Response Preference	Relationship-first. Preserve harmony, avoid offense, save face	Clear and direct
View of Time	Subordinate to relationships and duties	Time is a commodity ("spent", "saved")
Typical Goals	Fitting in, maintaining harmony	Personal achievement, autonomy

Lucio Buffalmano, 2025

A widely researched distinction is that between collectivist and individualistic cultures (Hagger, Rentzelas, & Koch, 2014). Eastern cultures (e.g., Japan, China) tend to be collectivist and high-context, favoring indirect, relationship-focused communication, while Western cultures (e.g., USA, UK) are low-context, prioritizing open, direct communication with explicit meaning (Hargie, 2019, p. 67). However, individual differences matter just as much (Pfundmair, Graupmann, Frey, et al., 2015; Ivey, Ivey, & Zalaquett, 2014) (Hargie, 2019, p. 68).

Individuals matter more than cultures

That being said, always look at the individual first:

> However, it has also been found that there are individual as well as cultural differences in individualism and collectivism (Pfundmair, Graupmann, Frey, et al. , 2015). Individuals differ as much as or more than cultures, and so it is the nature of the interlocutor that is important rather than the cultural background from which he or she comes (Ivey, Ivey, & Zalaquett, 2014).Furthermore, at different times, in varying situations, and with different people, we may adopt either a more individualistic or a more collectivist style

Learn more in:

- Why intercultural communication is NOT your top priority

> Why Intercultural Communication Is a Waste of Time

Practical Takeaways:

- Respect Cultural Norms: Use indirect requests ("Could we close the window?") in high-context cultures to avoid offense (Kim & Wilson, 1994) (Hargie, 2019, p. 68).
- Focus on the Individual: Don't assume cultural stereotypes—pay attention to the person's unique style.
- Be Flexible: Shift between direct and indirect styles depending on the situation and person.

Feature	Collectivist Cultures (e.g., Japan, Korea)	Individualist Cultures (e.g., USA, UK)
Communication Context	High-context (indirect, subtle, meaning is implicit)	Low-context (direct, explicit)
Style	Indirect, relationship-focused, self-concealing	Direct, clarity-focus
Self-Concept	Interdependent ("We")	Independent ("I")
Request Example	"*It's cold*" (implied request)	"*Close the window*"
Response Preference	Relationship-first. Preserve harmony, avoid offense	Time as commodity: clear and and direct
View of Time	Subordinate to relationships and duties	Time is a commodity ("spent", "saved")
Typical Goal	Fitting in, maintaining harmony	Personal achievement, autonomy

Mastering Nonverbal Communication

Nonverbal behavior—kinesics (body language), paralanguage (vocal patterns), touch, proxemics (spacing), and more—carries significant weight in communication (Knapp, 1972) (Hargie, 2019, p. 88). It conveys emotions, status, and intent, often more powerfully than words. Mehrabian (1972) organizes nonverbal cues into three dimensions: positiveness (liking), potency (status), and responsiveness (activity) (Hargie, 2019, p. 95).

Practical Takeaways:

- Use Immediacy Cues: Lean forward, maintain eye contact, and smile to show engagement and likability (Mehrabian, 1972) (Hargie, 2019, p. 95).
- Signal Status Thoughtfully: Relaxed posture (e.g., open arms) can convey confidence without arrogance (Mehrabian, 1972) (Hargie, 2019, p. 95).

- Watch for Health Indicators: Notice signs like furrowed brows (pain) or forced smiles (irritability) to gauge others' emotions (Ekman & Friesen, 1975; McClintock & Hunt, 1975) (Hargie, 2019, p. 111).

Detecting Deception (and Its Limits)

Nonverbal cues like fidgeting, speech errors, or less eye contact are often linked to deception (Mehrabian, 1971; DePaulo, Zuckerman, & Rosenthal, 1980) (Hargie, 2019, p. 112).

However, a meta-analysis by DePaulo et al. (2003) found most deception cues are weakly related to deceit, and many people misinterpret them (Hargie, 2019, p. 112). Skilled deceivers can even appear less anxious (Schneider et al., 2015) (Hargie, 2019, p. 489).

Direct Deception Indicators

- Speech errors deviating from a person's normal baseline (Mehrabian, 1971)
- Changes in tone of voice (DePaulo, Zuckerman, & Rosenthal, 1980)
- Fidgeting with objects
- Reduced eye contact compared to baseline behavior
- Coordinated body movements: patterns of rocking, head-shaking, and nodding together (Druckman et al., 1982)
- Reduction in hand movements among skilled deceivers and those high in public self-consciousness (Vrij, Akehurst, & Morris, 1997)
- Increased pauses during speech (Anolli & Ciceri, 1997)

Indirect Deception (Evasion) Indicators

- Increased leg movements during silent moments, often linked to low assertiveness
- Frequent gaze aversion, especially during stress
- Frequent head-shaking in early parts of the interaction
- Progressive increase in self-fidgeting as the interaction continues (Druckman et al., 1982; McClintock & Hunt, 1975)

Practical Takeaways:

- Focus on Content: Pay more attention to what someone says than their body language when assessing truthfulness (Vrij, 2008) (Hargie, 2019, p. 102).
- Look for Inconsistencies: Repetitious answers or vague details may hint at deception, but don't rush to judge (DePaulo et al., 2003) (Hargie, 2019, p. 489).
- Train Your Skepticism: Avoid over-relying on stereotypes (e.g., gaze aversion = lying) and seek evidence (Bogaard et al., 2016) (Hargie, 2019, p. 102).
- Don't look for cues of deceit cause you'll likely be wrong:

> However, findings from decoding accuracy studies suggest that either such a set of reliable cues simply does not exist or, alternatively, that the majority of individuals have little knowledge on how to use such a set of cues for diagnostic purposes. A review of fndings appears in a meta-analytic assessment conducted by DePaulo et al.(2003) based on 120 independent samples. Although the review reveals consistencies with some of the indicators listed above (e.g. liars tend to talk less, provide fewer details, and tend to be perceived as more tense as a function of perceived vocal tension and fdgeting), the majority of deception cues were found to be unrelated, or only weakly related to deceit

The Power of Questioning

Question do more than gather information—they control conversations, build rapport, and assert authority.

In a sample of spontaneous conversations, Stivers (2010) found only 43% of questions had the primary purpose of seeking information; the other 57% were used for conversational management (Hargie, 2019, p. 140).
Hargie (2017) lists purposes like initiating interaction, maintaining control, or arousing curiosity (Hargie, 2019, p. 139).

Practical Takeaways:

- Use Questions Strategically: Ask specific questions to steer discussions or open-ended ones to encourage participation (Morgan & Saxton, 2006; Solem, 2016) (Hargie, 2019, p. 140).
- Balance Power: In group settings, direct questions to quieter members to ensure everyone's involved (Hargie, 2017) (Hargie, 2019, p. 140).
- Frame Carefully: Avoid face-threatening questions (e.g., aggressive challenges) to maintain positive relationships (Holmes, 1995; Steensig & Drew, 2008) (Hargie, 2019, p. 140).

Questions and Power Dynamics

Questions are tools of influence, shaping topics, participation, and authority (Bolden, 2009) (Hargie, 2019, p. 145). They can be coercive or empowering, depending on their use. Heritage (2010) notes that questions set agendas, embody presuppositions, convey authority, and prefer certain responses (Hargie, 2019, p. 146). In formal settings, higher-status individuals have greater questioning rights (Drew & Heritage, 1992; Wang, 2006; Wilson, 2015) (Hargie, 2019, p. 147).

Practical Takeaways:

- Set the Agenda: Use questions to guide conversations toward your goals without seeming domineering (Heritage, 2010) (Hargie, 2019, p. 146).
- Respect Status: In formal settings, lower-status individuals (e.g., patients) often soften questions to avoid seeming rude—mirror this tactfully (Skelton & Hobbs, 1999; Tracey, 2002) (Hargie, 2019, p. 148).
- Avoid Face Threats: Phrase questions to protect others' self-image, like asking "Could you share your thoughts?" instead of "Why didn't you do this?" (Brown & Levinson, 1987; Tracey, 2002; Wang, 2006) (Hargie, 2019, p. 147).

Also read:

> 10 Frame Control Techniques to Out-Frame Anyone

Power Protection & Respect With Questions

> Interestingly, even when Q&A turns/obligations are not formally pre-allocated, participants show an understanding that questioning rights are linked to institutional status and shape their communication accordingly. For example, Skelton and Hobbs (1999) found that patients often prefaced their questions to doctors with phrases such as 'I was wondering …', while doctors never did so. These phrases constitute politeness markers, which attend to the status differentials and potentially face-threatening act of asking a

> question of a higher status individual (Tracey, 2002)

Also read:

- **How to respect others with 'power protection'**

> How to Show Respect, Maintain Rapport, & Influence People

Reinforcement: Shaping Behavior

Reinforcement, rooted in behavioral psychology, uses rewards to encourage desired communication behaviors (Hargie, 1986, 1997, 2006, 2017; Hargie et al., 1994) (Hargie, 2019, p. 163). Social reinforcers like verbal praise, nods, or smiles are especially powerful (Hargie, 2019, p. 169). Positive reinforcements yield better results than negative ones, like threats (Irwin, Mulder, & Simpson, 2014; Mulder, VanDijk, DeCremer, & Wilke, 2006) (Hargie, 2019, p. 393).

Practical Takeaways:

- Offer Positive Feedback: Praise specific actions ("Great point!") to reinforce good communication.
- Use Nonverbal Cues: Nod or smile to show approval during conversations, encouraging others to continue.
- Avoid Over-Rewarding: Excessive praise can seem manipulative—keep it genuine and balanced (Wit & Wilke, 1990) (Hargie, 2019, p. 393).

Learn more:

- **Manipulation tactics and red flags**

> Manipulation Tactics Abusers Use: Recognizing and Protecting Yourself

Self-Disclosure: Building Intimacy

Self-disclosure—sharing personal information—drives closeness in relationships and is a defining characteristic of close bonds (Brehm et al., 2002) (Hargie, 2019, p. 218).

It's risky but essential for trust, with reciprocity being key (Derlega & Berg, 1987; Sprecher & Treger, 2015) (Hargie, 2019, p. 219).
Disclosure introduces risk, potentially leading to acceptance or rejection (Sedlovskaya et al., 2013) (Hargie, 2019, p. 220).

Practical Takeaways:

- Start Small: Share superficial details early in relationships, saving deeper disclosures for trusted bonds (Miell & Duck, 1986) (Hargie, 2019, p. 219).
- Reciprocate Thoughtfully: Match others' disclosure levels to build rapport without oversharing (Sprecher & Treger, 2015) (Hargie, 2019, p. 219).
- Disclose Emotions in Romantic Relationships: *Mutual disclosure of emotion, rather than facts and information, predicts romantic partners' reported experience of intimacy* (Beach & Tesser, 1988; Laurenceau et al. , 1998)
- Manage Risks: Be cautious with sensitive info (e.g., financial struggles) until trust is established (Lieber, 2010) (Hargie, 2019, p. 218).

And pro tip to gather intel:

> Using self-disclosure to gain information is more effective than requests for disclosures due to our tendency to reciprocate

Learn more:

> How to Build Deep Emotional Connection

Relationship Maintenance Through Disclosure

Self-disclosure sustains relationships, boosting satisfaction and shared meaning (Vangelisti & Banski, 1993) (Hargie, 2019, p. 221).

Regular "catching up" during absences keeps bonds strong (Sigman, 1991; Gilbertson et al., Dindia & Allen, 1998) (Hargie, 2019, p. 221).
Moderate disclosure levels are most conducive to satisfaction (Bochner, 1982; Gilbert, 1976; Lippert & Prager, 2001; Parks, 1995) (Hargie, 2019, p. 223).

Practical Takeaways:

- Debrief Daily: Share daily experiences with partners or friends to maintain connection (Vangelisti & Banski, 1993) (Hargie, 2019, p. 221).
- Create Shared Meaning: Discuss values and experiences to build a collective identity with loved ones (Harvey & Omarzu, 1997; Terzino & Cross, 2009; Walters & Burger, 2013) (Hargie, 2019, p. 222).
- Balance Sharing: Moderate disclosure—neither too much nor too little—keeps relationships healthy (Bochner, 1982) (Hargie, 2019, p. 223).
- Seeking Support If Needed: *'Sharing information for the purposes of seeking support or expressing emotions made friends feel 'more important and more mutually included in each other's life'* (Lee, 2006, p.13)

> 6 Proven Techniques to Keep Her Attracted & Committed

Group Dynamics: Conformity and Influence

In groups, majority opinions often pressure conformity, but minorities can spark innovation if they're consistent and persuasive (Asch, 1951; Schachter, 1951; Nemeth & Kwan, 1987) (Hargie, 2019, pp. 381-383).

Normative pressures (seeking social approval) and informational pressures (seeking accuracy) shape behavior (DeVries, DeDreu, Gordijn, & Schuurman, 1996; Gordijn, DeVries, & DeDreu, 2002) (Hargie, 2019, p. 384).

Techniques like the Nominal Group Technique (NGT) reduce dysfunctional conformity (Hargie, 2019, p. 386).

Practical Takeaways:

- Resist Blind Conformity: Stand firm on well-founded beliefs, especially in private settings, to avoid groupthink (Asch, 1951) (Hargie, 2019, p. 382).

- Leverage Minority Influence: Present consistent, persuasive arguments to sway groups toward new ideas (Nemeth & Kwan, 1987) (Hargie, 2019, p. 385).
- Encourage Openness: Use techniques like NGT or appoint a devil's advocate to ensure all voices are heard (Herbert & Estes, 1977) (Hargie, 2019, p. 387).

Group Contribution & Dealing With Free Riders

Even under normative pressure, cooperation in task groups can break down—especially if one "bad apple" triggers reciprocity-based noncooperation from others (Kerr, 1983).

Challenges worsen in larger groups, where individual contributions are harder to identify, evaluate, or link to responsibility. Group identity can promote cooperation, but subgroup boundaries (e.g., student vs. staff) may undercut it if members prioritize subgroup interests over collective goals (Kramer & Brewer, 1984; Wit & Kerr, 2002).

To counteract these challenges, persuasion should be paired with additional measures:

1. **Increase Norm Salience & Monitoring**:
   Cooperation improves when norms are salient and **contributions are identifiable**. Public accountability and visibility reduce free-riding and social loafing (Harkins & Jackson, 1985; Harkins, 2006).
2. **Use Social Reinforcements**:
   Praise, encouragement, and visible appreciation promote cooperation more effectively than threats or punishments, which may reduce internal motivation (Irwin et al., 2014; Mulder et al., 2006; Van Lange et al., 2014, 2017). But even positive rewards can backfire if seen as manipulative (Wit & Wilke, 1990).
3. **Leverage Influential Communicators or Leadership**:
   When softer strategies fail, group members may support persuasive interventions from respected communicators (Klandermans, 1992) or even **delegate authority** to a leader to ensure cooperation (DeCremer & Van Knippenberg, 2003; Van Vugt & DeCremer, 2002).
4. **Remove free riders**
   When motivation losses are more or less subconscious, the decrease of individual contributions to the group is termed 'social loafng'. When group members deliberately let others do the work, we speak of 'free riding' (Kerr, 1983). A very likely reaction in response to the (assumed) presence of free riders in the group is to reduce one's own efforts, too, rather than to take the risk of being exploited (being the 'sucker')

Persuasion

Persuades have four main avenues to convince others:

1. **Remove Barriers**: Persuaders can increase self-efficacy by eliminating obstacles to action.
   If the barrier is **informational**, they provide necessary details (e.g., how to adjust a water heater temperature: Cardenas & Simons-Morton, 1993; instructions for DIY medical tests: Feufel et al., 2010). If the barrier is **substantive**, they might offer practical help (e.g., free transport for low-income patients: Marcus et al., 1992). Immediate opportunities and convenient access also facilitate compliance (e.g., organ donor registration: Sharpe et al., 2017; eye protection provision: Dingus et al., 1991).
2. **Create Practice Opportunities**: Allowing people to rehearse or practice the target behavior can build self-efficacy (e.g., role-playing safer-sex discussions: Calsyn et al., 2010; Noar et al., 2006; Yzer et al., 1998; also Duncan et al., 2000; Latimer & Ginis, 2005; Luzzo et al., 1999).
3. **Use Modelling**: Showing others successfully performing the behavior helps observers believe they can do it too (e.g., teaching techniques for classroom management: Hagen et al., 1998; breast self-exam modeling: Anderson, 2000; also Gaston et al., 2012; Mahler et al., 1993; Ng et al., 1999).
4. **Provide Encouragement**: Verbal persuasion and expressions of confidence can boost perceived ability (e.g.,

telling someone they can stop a friend from drunk driving: Anderson, 1995, 2009).

Inducing Feelings of Hypocrisy (guilt)

This strategy works by making people aware of both their positive attitudes and their past inconsistent behaviours. When both are made salient, people often change their behaviour to align with their attitudes.

For instance, in a study on home energy conservation, participants who received both feedback on their actual energy use and a reminder of their conservation attitudes conserved more energy afterward than those who received feedback alone (Kantola et al., 1984; see also Aitken et al., 1994).

However, this approach can easily backfire, so go easy on guilt:

> For instance, persons made to feel hypocritical about apparent attitude–behavior inconsistency might resolve that inconsistency not by changing their behavior so as to align it with their attitudes, but by changing their attitudes so as to justify (be consistent with) their previous behavior (Fried, 1998).

Especially when people overdo it and annoy others:

> And several studies have found that although more explicit guilt appeals do arouse greater guilt than less explicit appeals, those more explicit appeals are signifcantly less persuasive than less explicit appeals, perhaps because the strategy generates anger or resentment (e.g. , Cotte, Coulter, & Moore, 2005; similarly, see Bessarabova, Turner, Fink, & Blustein, 2015; for reviews and discussion, see O'Keefe, 2000, 2002

Negotiation: Resolving Conflicts

Negotiation resolves conflicts of interest through communication (Greenhalgh & Lewicki, 2015) (Hargie, 2019, p. 399). Collectivism aligns with indirect communication, while individualism favors direct approaches (Ting-Toomey, 1988) (Hargie, 2019, p. 412). Individual traits matter more than cultural stereotypes (Hargie, 2019, p. 413).

Negotiation Theories

Structural Theories:
These theories focus on **power distribution** in negotiations, assuming that the party with the most power controls the outcome. While this theory is useful, it doesn't always match real-world outcomes, as power dynamics are more complex.

Strategic Theories:
Strategic theories view negotiation as a tactical process involving **moves and counter-moves**. Each party works to position themselves for cooperation rather than conflict. Walton and McKersie's (1965) Model of Social Negotiations is a key example, outlining four systems:

- **Distributive Bargaining**: Competitive, zero-sum where one party wins at the other's expense.
- **Integrative Bargaining**: Collaborative, aiming for mutual gains.
- **Attitudinal Structuring**: Focusing on relationships, like trust between parties.
- **Intra-Organisational Bargaining**: Internal agreements within groups to ensure unity during negotiations.

Critics argue that attitudinal structuring is not a separate system but a tactic used in collaboration, and intra-organisational bargaining should not be viewed as distinct (Anthony, 1977). Trust plays a critical role in shifting between distributive and integrative strategies.

Process Theories:

These theories focus on the **convergence of positions** through concessions over time. There are two main types of communication models:

- **Stage Models**: Sequence of distinct stages in negotiation, each with specific activities.
- **Episodic Models**: Divides the negotiation into episodes, each with a different type of activity.

Situational Models:
These models are tailored for specific **contexts** like hostage or intercultural negotiations. For instance, the aftermath of the **Munich Massacre** in 1972 led to the development of specialized **hostage negotiation teams**. Models like Hammer and Rogan's SAFE model and Taylor's Cylindrical Model focus on techniques for dealing with high-stakes situations, particularly in crisis contexts (Soskis & Van Zandt, 1986; Grub, 2010).

Practical Takeaways:

- Prepare Thoroughly: Know your goals and the other party's needs before negotiating.
- Adapt to Styles: Use indirect communication with collectivist individuals, direct with individualists (Ting-Toomey, 1988) (Hargie, 2019, p. 412).
- Focus on the Person: Avoid cultural stereotypes—tailor your approach to the individual's behavior (Hargie, 2019, p. 413).

Assertiveness

Assertion typically has been conceptualized as the midpoint on the continuum between non-assertion and aggression though recent data suggest it incorporates elements of aggressive and submissive behaviour as well (Dirks, Suor, Rusch, & Frazier, 2014; Dirks, Treat, & Weersing, 2011; Wilson & Gallois, 1993).

However, many fail to differentiate between socially acceptable assertive behaviour and inappropriate aggressive behaviour (Hargie, 2017).
Laypersons label conflict assertion as aggression, describe assertion as pushy, rude, and insensitive (Rakos, 1991), and see high levels of assertiveness as a weakness of leaders rather than as a strength (Ames & Flynn, 2007).

Mindsets are key

A negative internal dialogue (e.g., "I will be embarrassed if I speak up") undermines assertive social behavior, while positive self-statements (e.g., "My opinions are valuable") support it (Meichenbaum et al., 1981).

Assertive individuals tend to use twice as many positive self-statements as negative ones, unlike nonassertive individuals who use both equally (Rakos, 1991). Training people in positive self-instruction alone can significantly increase assertiveness (Craighead, 1979).

Negative self-talk often reflects fear of rejection and a relational or "feminine" focus (Wine, 1981; Wilson & Gallois, 1993). Rather than labeling such dialogue "negative," it may be more constructive to view it through the lens of autonomy vs. affiliation, where effective assertiveness draws more on autonomous self-statements.

Takeaways:

- **Assertion makes you less likable but more effective**: *A confict assertion that only expresses a right has been termed a "standard assertion" and consistently is judged to be equally potent to and somewhat more desirable than, conventional aggressive behaviour, and less likeable but more socially competent, than nonassertive behaviour*

- **Calibrate Its Use**: Even though assertion now embodies a positive social value across many different cultures around the world, the use of these skills will not be the preferred option in every situation

Cognitive Interview: Enhancing Recall

The Cognitive Interview (CI) uses memory retrieval techniques to improve eyewitness reports, increasing valid information by over 40% (Memon, Meissner, & Fraser, 2010) (Hargie, 2019, p. 511). The Enhanced CI (ECI) adds rapport-building, focused retrieval, and interviewee-compatible questioning (Geiselman & Fisher, 1997) (Hargie, 2019, p. 515).

Practical Takeaways:

- Build Rapport: Start interviews with casual chat to put others at ease and encourage openness (Geiselman & Fisher, 1997) (Hargie, 2019, p. 515).
- Reinstate Context: Ask people to mentally recreate the setting of an event to boost recall (Flexser & Tulving, 1978; Tulving & Thomson, 1973) (Hargie, 2019, p. 513).
- Follow Their Lead: Time questions based on the interviewee's recall pattern, not a rigid script (Geiselman & Fisher, 1997) (Hargie, 2019, p. 515).

Employment Interviews: Making an Impression

Structured interviews reduce bias and predict job performance better (Dipboye et al., 2012; Chapman & Zweig, 2005) (Hargie, 2019, p. 479).

First impressions matter, but most decisions happen later (Frieder et al., 2016) (Hargie, 2019, p. 482). Personality traits like conscientiousness and powerful speech styles boost success (Sackett & Walmsley, 2014; Parton et al., 2002) (Hargie, 2019, pp. 493, 495).

And speak with power:

> In terms of speech styles, powerful versus powerless speech was examined by Parton et al.(2002). Professional (and undergraduate) respondents evaluated interviewees' dynamism, social attractiveness, superiority, control over self, control over others and employability. Evidence suggested that those with a powerful speech style were rated more favourably (competent and employable), particularly by professionals

Practical Takeaways:

- Prepare for Structure: Expect consistent, job-relevant questions in modern interviews—practice clear, concise answers (Dipboye et al., 2012) (Hargie, 2019, p. 479).
- Project Confidence: Use powerful speech (avoid hesitations, be direct) to appear competent (Parton et al., 2002) (Hargie, 2019, p. 495).
- Show Personality: Highlight traits like agreeableness and drive, which employers value highly (Sackett & Walmsley, 2014) (Hargie, 2019, p. 493).

Learn how:

- **Speak with power and project confidence**

> Dominant Conversations: 10 Ways to Speak With Confidence

MORE WISDOM

Relationships evolve in phases

> Dialectical theories argue that relationships evolve through turning points, or remembered meaningful events that increase or decrease partners' intimacy and mark relationship changes (e.g. having sex for the frst time, having a serious argument; Stafford et al. , 2006)

However, it's not all about 'power', and couples can grow in inter-connectedeness:

> Partners may even adopt a relational identity, viewing 'themselves as a collective unit (rather than as individuals) as they become increasingly committed to each other' (McIntyre et al. , 2015, p.858)

Read more:

- **The phases of power in relationships, and how to navigate them**

> Relationship Power Dynamics: Strategies for All 9 Stages

Calibration is the mother of communication skills

> If there is one skill that is most fundamental to persuasive success, it is message adaptation – adapting or tailoring one's persuasive efforts to the particular situation faced, the particular audience to be influenced

Learn more here:

- **How to calibrate**

> The Science of Social Calibration: 7 Steps to Mastery

CONS

- **Less practical for people looking for a communication manual**

And it's more of a note than a con.

There are also plenty of examples and even useful mock dialogues in the cognitive behavioral therapy chapter.
It's just tha it's not meant to be a practical manual for learners.

- **I wished for more *intepersonal* communication and *effective* communication**

For example, what makes people *enjoy* talking to someone, or feel bondend to someone, or like/dislike someone, or what provides/loses status.

But this is a personal note from someone looking turn as much research as possible into practical strategies and techniques.
That said, I could still find something along those lines in chapters such as the ones on questions, self-disclosure,

interviews, and more.

REVIEW

The Handbook of Communication Skills provides an evidence-based overview of the research literature on communication.

While it's less hands-on that our typical articles, it helped us refine, source or confirm several approaches in our articles, and I'm very grateful for that.

Check the **best books** to read or get this book on Amazon:

Vanessa Van Edwards' Books: Lucio Ranks Them for Men

Lucio Buffalmano · 2 June 2025 · Archived copy · Original

Vanessa Van Edwards has earned a following for her books on social skills, particularly *Captivate* and *Cues*, which offer practical tips for navigating human interactions.

Her bubbly personality and expressive style make her work especially appealing to women and those eager to learn a high-energy, yet warm approach.

As experts in social dynamics, we critically review Vanessa Van Edwards' books, ranking them to pinpoint what's the best book for boosting your social impact.

Vanessa's best books ranked and reviewed

Contents

- Intro

  - Pros and Cons of Captivate
- #1. Cues: A Foundation of Social Skills
  - Pros and Cons of Cues
  - What's Vanessa's Best Book? Why Cues Stands Out
  - The Book For Men Who Want More…
  - Conclusion: Vanessa's Books and Your Next Read

Intro

Vanessa Van Edwards started writing children's books under the name 'Vanessa Van Patten'.

Since her switch to social skills, she wrote 3 books, including two commercial successes that she is most famous for.

She hinted at an upcoming book focusing on conversations and words—sounds like she'll go into frame control, but probably call it differently.

But for now, here are Vanessa's books ranked:

#3 Human Lie Detection

Before Vanessa became a household name in the world of social skills books, she encountered a significant challenge with her first book project.

She spent three years collaborating with a major publisher, pouring her heart into a manuscript that ultimately was a commercial failure—or so she defines it, some authors would consider it an OK result.

Pros & Cons of Lie Detection

In my opinion, this is not Vanessa's 'least good' because of the copies it sold or didn't sell.

It's because 'human lie detection' is an oxymoron.

As the *Routledge Persuasion Handbook* states, **training people in lie detection only shows *minor* improvements**, and sometimes even *regressions* in accuracy.

And if you can barely improve with training, how far can you take someone with a book?

I also have doubts regarding the *approach* to spotting detection.
And I suspect the regressions occur because people over-focus on trying to detect specific cues, and miss everything else—ie.: they lose the forest for the tree.

This is why here at TPM we still love our cues, but rely more on different strategies.
For example:

- Frame control to encourage win-win thinking and discourage cheating
- Power intelligence to increase context awareness (e.g., conflicts of interest)
- Reading general character (e.g.: honorable character VS taker)
- Self-defense strategies

There is one more reason I'm not a fan of the cue approach to detecting lies.
Trying to detect lies by looking at common signals at best catches the *bad* liars, and misses the *good* liars. And the latter are the people you want to avoid the most.

Anyway, fortunately, Vanessa didn't stop writing books after her first attempt fell below her expectations.
She shares that while she vowed never to write again, her husband supported and encouraged her to move on (sounds like a supportive husband!).

With time and great work, her website grew more popular, her YouTube channel gained subscribers… And she hit it big with her next book:

#2. Captivate: Vanessa's Guide to Socialization

Published in 2017, *Captivate: The Science of Succeeding with People* marked Vanessa's breakthrough into the literary world.

Translated into 16 languages, this book offers a comprehensive toolkit for improving social skills, mastering first impressions, and navigating interpersonal dynamics.

Vanessa draws on her experience to provide actionable strategies, such as the "highlighting" technique—celebrating others' successes to build rapport—and tailoring communication to personality types using frameworks like the Big Five traits (openness, conscientiousness, extraversion, agreeableness, and neuroticism).

While grounded on some valid research, *Captivate* extends into 'Vanessa's approach to social skills', with sparkling and starting conversations with "I want to test a new conversation starter" :).

If you like Vanessa's style, and it seems to be working great for her, that's a plus.

Pros and Cons of Captivate

PROS:

- + Practical strategies for enhancing social skills and leadership.
- + Good broad insights into personality types and how to adapt communication.
- + Effective and timeless techniques for making good first impressions, like maintaining strong eye contact.

CONS:

- – Relies on the Myers-Briggs, which lacks strong scientific backing.
- – Frequent upsells to Vanessa's website can disrupt the reading experience.
- – Some dating advice for men is less than ideal for successful dating.

For a deeper dive, check out this Captivate review.
While *Captivate* is a strong starting point for social skills books, it feels more like 'Vanessa's style' rather than a book that works for anyone.
Vanessa addresses this in her next work.

#1. Cues: A Foundation of Social Skills

Released in 2022, *Cues: Master the Secret Language of Charismatic Communication* has become Vanessa's best-selling and most successful book.

I enjoyed *Cues* the most as it draws from the same research we used for our original power and warmth approach. We're more tailored to men, status, and respect though, so her take stands strong on its own, and adds plenty of

value.

Indeed, Vanessa sparked valuable updates to our own article, and her list of Cues was even linked as an extra resource from Power University (with just minor adjustments from our end).

This book offers readers practical tools to influence how they're perceived through gestures, facial expressions, and tone.
Vanessa's engaging writing style and exceptional narration (she narrates the audiobook ⍰⍰) brings the content to life, making it both educational and enjoyable.

One standout example is her advice on using "open palms" early on to signal trustworthiness and approachability. She also explores how to read others' cues, like a furrowed brow indicating confusion, to adjust your communication in real-time.

Finally, what makes *Cues* such an engaging read is that Vanessa ties her principles to real-life examples, an approach we love and always embraced since our early beginnings.
That makes *Cues* a top contender among the best social skills books available today.

Pros and Cons of Cues

PROS

- + Highly practical with immediately actionable nonverbal techniques.
- + Engaging writing paired with Vanessa's warm, charismatic narration.
- + Vanessa embodies her teachings, making the book authentic and relatable.

CONS

- – Vanessa's leaning stronger towards warmth may not align with men seeking to project power or dominance.
- – Some examples, such as analyzing NBA player John Stockton's cues, felt a bit forced and oversimplifying more complex dynamics.
- – Emphasis on 'catching lies' through cues, albeit you're better off reading *characters*, rather than 'cues of lying'.

Explore this Cues review for more details.

What's Vanessa's Best Book? Why Cues Stands Out

When it comes to determining Vanessa Van Edwards' best book, the choice is clear: *Cues* takes the crown.

While *Captivate* is an excellent introduction to social skills, ***Cues* dives deeper into a more foundational aspect of social skills**: power and warmth.
It's not by accident that power and warmth was one of the very first articles on this website, and still remains one of our foundational approaches to successful socialization.

Compared to *Captivate*, *Cues* is more practical and effective.

For instance, where *Captivate* spends time on personality frameworks like Myers-Briggs, *Cues* shifts the focus from debated theories to *practical* behaviors.

Vanessa's engaging style also shines brighter in *Cues*, with vivid examples—like decoding a politician's hand gestures—that make the content stick.
While *Captivate* is a good read for beginners, *Cues* is a more effective book that can elevate most readers interested in perfecting their social skills, charisma, and charm.

The Book For Men Who Want More...

The Social Stragist provides a quick overview of our groundbreaking approach to men's self-development based on the science of power dynamics

For ambitious men looking for social skills books to gain an edge for respect, status, attraction, and advanced strategies in general, *The Social Strategist* is the perfect next step.

While *Captivate* and *Cues* provide a strong foundation in social skills, they may not fully address the specific challenges men face in competitive professional and social environments.

The Social Strategist fills this gap introducing sophisticated techniques for networking, influence, and leadership.

The Social Strategist also touches on foundational mindsets that help you build a high-quality man character that effortlessly attracts other, without having to force any 'cool line' on them.

It complements Vanessa's work by taking her foundational lessons and adding some more advanced material to keep you going along the way of social mastery.

And if you want to learn more about what approach is best for you, check out the best feature of Vanessa's approach, compared to Lucio's The Power Moves:

Goal / Trait	Best Pick	Why
Be respected	TPH	[illegible]
Be liked	[illegible]	[illegible]
Women	[illegible]	[illegible]
Men	TPH	[illegible]
Beginners in social skills	[illegible]	[illegible]
Intermediate or Advanced in social skills	TPH	[illegible]
Good multiculturalism	[illegible]	[illegible]
Influence up / reach executive level	TPH	[illegible]
Kids, Inclusion, 'Pro-Id'	[illegible]	[illegible]
Hard-hitting, power-based psychology	TPH	[illegible]
Realtors, employees, & Public speaking	[illegible]	[illegible]
Entrepreneurs, homewives, virologists	TPH	[illegible]

Conclusion: Vanessa's Books and Your Next Read

Vanessa Van Edwards' books are well-written, well-researched, and instructive, mixing accessibility with depth.

They're not the most rigorous deep-dives because achieving mass-market success requires a tradeoff between realistic complexity and mass-appeal simplicity (the 'Best-Seller Quality Tradeoff™' phenomenon).

But Vanessa does a good job at striking a rare balance of being both simple and instructive, making them good companions for those who want to combine self-development with the pleasure of reading.

Captivate lays a solid groundwork for socializing more like Vanessa, while *Cues* tackles the foundations of both power, and likability.
For being more foundational and broadly applicable, *Cues* earns the title of Vanessa's best book.

For those ready to go beyond, especially ambitious men, *The Social Strategist* offers a natural progression.
It builds on some of the basic skills from Vanessa's books, bridging into more advanced social skills for men who want to win in their personal and professional lives.

Whether you're new to Vanessa Van Edwards' books or a longtime fan, these reads—paired with *The Social Strategist*—will equip you with the tools to thrive in any social setting.

And if you're ready for the full immersion, you may even consider our full course to go from good guy, to confident life winner:

Power University: Men's #1 Self-Development Course

Rationality: Summary & Review

Lucio Buffalmano · 6 June 2025 · Archived copy · Original

Rationality: What It Is, Why It Seems Scarce, Why It Matters (2021) by Steven Pinker explores human reasoning, its strengths, its limitations, how to increase it, and its critical importance to both individual well-being, and humanity as a whole.

TPM Note: Rationality is foundational to effect change in the real world
This book is not included because of its cultural criticism. It is included because it is influential in modern rationality thinking (though more from a theoretical point of view, and now an how-to guide).

Contents

- Key Takeaways
- Notes
  - Intro: what's rationality and why it matters
  - We're more rational than Kahnmann suggests
  - The replication crisis was a failure of rationality
  - The forbidden truths people deny
  - Self and Others (Game Theory)
  - What's Wrong with People? Clannisshness VS truth
  - Why rationality matters
- MORE WISDOM
- QUOTES
- CRITICISM
  - Less a book on rationality, more Pinker's take on rationality
  - Not a guide for learning rationality

  - Overstates rationality and IQ, ignores cultural learning
  - Too much space wasted on ‘common knowledge’
  - Over-emphasis on present events make Rationality already dated
  - Strawmen arguments
  - Some irrational conclusions
- PROS
  - We need more rationality, and all the help we can get to promote it
  - Respect for Pinker’s stand against both left & right irrationality
- REVIEW

Key Takeaways

- **Rationality is a public good** that we must defend from a tragedy of the commons. *Each of us has a motive to prefer our truth, but together we’re better off with the truth*.
- **Humans are more logical than cognitive biases would suggest**, and we’re more accurate when it’s framed as human-relevant
- **We adapted to be lawyers more than scientists**, to win arguments. Ie.: it’s more about *power*, than truth

Notes

About the Author:
Steven Pinker is a psychology professor at Harvard and a popular author of books such as “*The Better Angels of Our Nature*“, “*How the Mind Works*”, “*The Blank Slate*“, and *Enlightenment Now*.

Intro: what’s rationality and why it matters

The author outlines the book’s purpose:

to explain the tools of rationality (logic, probability, critical thinking, etc.), explore why they are underutilized, and affirm their necessity in fostering progress.

Pinker suggests that traditional cognitive psychology fails to fully address contemporary irrationality, such as belief in conspiracy theories.
And he reminds readers that rationality is the cornerstone of human thought and action, essential for addressing pressing global challenges like health crises, democratic erosion, and climate change.

Tools of rationality:

- logic
- critical thinking
- probability
- correlation and causation
- the optimal ways to adjust our beliefs and commit to decisions with uncertain evidence
- yardsticks for making rational choices alone and with others

Be more open to evidence and reflect more for higher rationality

> Openness to Evidence correlates with cognitive reflection (the ability to think twice and not fall for trick

> questions) and with a resistance to many of the cognitive illusions, biases, and fallacies.
> This cluster of good cognitive habits, which Stanovich calls the Rationality Quotient (a play on the intelligence quotient or IQ), correlates with raw intelligence, though imperfectly: smart people can be closed-minded and impulsive, and duller ones open and reflective.
> Together with resisting weird beliefs, reflective people are better at spotting fake news and at rejecting pseudo-profound bullshit like "Hidden meaning transforms unparalleled abstract beauty."

We're more rational than Kahnmann suggests

Just like he's done in some previous books, Pinker challenges the notion that humans are inherently irrational.

He revisits a theme he already addressed in more evolutionary-leaning previous work, and says that Kahneman's work led many to believe humans are more irrational than they actually are.
Instead, Pinker points out, those tests are biased to make humans fail.

My note: His example of the San people is unconvincing.
This example doesn't isolate individual reasoning ability from accumulated cultural knowledge, which makes it weak evidence for innate rationality.

Key Takeaways:

- Humans are capable of remarkable rationality, as seen in hunter-gatherer societies.
- Modern irrationality stems from misapplications of cognitive tools in unfamiliar contexts.
- Rationality is a skill that can be honed through understanding and practice.
- Logic is a powerful but abstract tool that humans apply better in familiar contexts.

The replication crisis was a failure of rationality

On the studies that grab attention:

> The notorious replication failures come from studies that attracted attention because their findings were so counterintuitive.
> Holding a warm mug makes you friendlier. ("Warm"—get it?) Seeing fast-food logos makes you impatient. Holding a pen between your teeth makes cartoons seem funnier, because it forces your lips into a little smile. Any reader of popular science knows of other cute findings which turned out to be suitable for the satirical *Journal of Irreproducible Results.*

Pinker explains why it was obvious these much-publicized studies by pop psychologists were likely false to begin with:

> The reason these studies were sitting ducks for the replicability snipers is that they had low Bayesian priors. Not as low as ESP, to be sure, but it would be an extraordinary discovery if mood and behavior could be easily pushed around by trivial manipulations of the environment.
> It was the extraordinariness of the findings that earned them a place in the science sections of newspapers and snazzy ideas festivals, and it's why on Bayesian grounds we should demand extraordinary evidence before believing them. Indeed, a bias toward oddball findings can turn science journalism into a high-volume error dispenser.

Indeed, acutely notes Pinker, the mere fact of something being surprising makes it more likely to be wrong:

> The problem is that "surprising" is a synonym for "low prior probability," assuming that our cumulative

> scientific understanding is not worthless. This means that even if the quality of evidence is constant, we should have a lower credence in claims that are surprising.

The forbidden truths people deny

Rephrased for speed:

> The stage for forbidden base rates is set by a law of social science.
> Measure any socially significant variable: test scores, vocational interests, social trust, income, marriage rates, rates of different types of violence.
> Now break down the results by the standard demographic dividers: age, sex, race, religion, ethnicity. The average differences among groups are sometimes very large.
> Whether the differences arise from nature, culture, discrimination, history, or some combination is beside the point: the differences are there.

To use these differences to enact policy or decision-making may be rational.
But it would also be textbook profiling:

> Say you sought the most accurate possible prediction about the prospects of an individual—how successful the person would be in college or on the job, how good a credit risk, how likely to have committed a crime, or jump bail, or recidivate, or carry out a terrorist attack.
> If you were a good Bayesian, you'd start with the base rate for that person's age, sex, class, race, ethnicity, and religion, and adjust by the person's particulars. In other words, you'd engage in profiling. You would perpetrate prejudice not out of ignorance, hatred, supremacy, or any of the -isms or -phobias, but from an objective effort to make the most accurate prediction.

Self and Others (Game Theory)

The chapter on game theory was one of the most interesting for our focus on self-development and goal achievement.

It applies game theory to real-world scenarios like communal outrage, environmental policy, and international relations, highlighting the importance of aligning individual and collective rationality.

The environment is a tragedy of commons

> To get back to the example with which I opened the chapter, here is the Tragedy of the Carbon Commons. The players can be individual citizens, with the burden consisting of the inconvenience of forgoing meat, plane travel, or gas-guzzling SUVs. Or they can be entire countries, in which case the burden is the drag on the economy from forgoing the cheap and portable energy from fossil fuels.

Pinker says this realization undermines radical libertarianism, "despite the eternal appeal of unfettered freedom".
I agree.

Key Takeaways:

- Rationality is a public good with a tragedy of the commons in tow. *Each of us has a motive to prefer our truth, but together we're better off with the truth.*
- Cooperation can emerge from strategic interactions of selfish players, as seen in Tit for Tat.
- Game theory can improve social and policy outcomes.

- Social animals often play in a series of iterated prisoner dilemmas. But the iteration makes cooperation beneficial and common

What's Wrong with People? Clannisshness VS truth

Pinker dedicates a full chapter addressing the apparent irrationality crisis of conspiracy theories, fake news, and polarized politics.

Pinker argues that these phenomena often reflect rational pursuit of non-epistemic goals, like signaling group loyalty (myside bias) or seeking comfort in a mythology mindset.
He says that politics have become bigger ideology machines:

> We've long known that humans are keen to divide themselves into competitive teams, but it's not clear why it's now the left–right split that is pulling each side's rationality in different directions rather than the customary fault lines of religion, race, and class.
> The right–left axis aligns with several moral and ideological dimensions: hierarchical versus egalitarian, libertarian versus communitarian, throne-and-altar versus Enlightenment, tribal versus cosmopolitan, tragic versus utopian visions, honor versus dignity cultures, binding versus individualizing moralities.

Pinker distinguishes between the reality mindset (evidence-based reasoning) and the mythology mindset (beliefs for social or emotional purposes).
People don't really 'believe' fake news and conspiracies, they just promote them to advertise group belonging or influencing the narrative.

Key Takeaways:

- Irrational beliefs often serve social or emotional functions, not just cognitive errors.
- The mythology mindset prioritizes group identity over truth.
- Education and institutional accountability can counter the irrationality crisis.

Why rationality matters

In the final chapter Pinker seeks to leave us with a parting argument on why rationality matters.

Some points make sense, but some felt less convincing.
Overall, the last chapter felt biased to favor Pinker's favored outcome: that rationality makes a huge difference.

Key Takeaways:

- Rationality has driven significant material and moral progress.
- Strengthening rationality requires education, institutional reforms, and cultural norms.
- Rationality is a collective asset vital for a flourishing society.

MORE WISDOM

Shit tests with hypotheticals

> A person who is capable of entertaining certain hypotheticals might stab us in the back were the temptation ever to arise.
> Imagine someone were to ask you: For how much money would you sell your child? Or your friendship, or citizenship, or sexual favors?

That's a trap/shit test.
And, says Pinker:

> The correct answer is to refuse to answer—better still, to be offended by the question.
> (…) We trust those who are constitutionally incapable of betraying us or our values, not those who have merely chosen not to do so thus far.

Randomized controlled trials aren't 'golden standard for showing causation'

> Randomness is the key: if the patients who were given the drug signed up earlier, or lived closer to the hospital, or had more interesting symptoms, than the patients who were given the placebo, you'll never know whether the drug worked.

Talent matters: increasing practice increases the difference between talent and non talent

> Smarter players gain more with every additional game of practice. An equivalent way of putting it is that without practice, cognitive ability barely matters (the leftmost tips of the lines almost overlap), but with practice, smarter players show off their talent (the rightmost tips are spread apart)

QUOTES

Rationality as a public good, probably the best concept and quote in the whole book:

> Rationality is a public good, and a public good sets the stage for a tragedy of the commons. In the Tragedy of the Rationality Commons, motivated reasoning for the benefit of oneself and one's side produces an opportunity to free ride on our collective understanding.

> Each of us has a motive to prefer *our* truth, but together we're better off with *the* truth.

On the difference between claiming conspiratory beliefs, and living accordingly to them

> even relativists who deny the possibility of objective truth and insist that all claims are merely the narratives of a culture lack the courage of their convictions. The cultural anthropologists or literary scholars who avow that the truths of science are merely the narratives of one culture will still have their child's infection treated with antibiotics prescribed by a physician

On scientists' own failure of rationality and publication irrationality:

> A failure of Bayesian reasoning among scientists themselves is a contributor to the replicability crisis. (…) Daryl Bem published results (…) which claimed to show that participants successfully predicted (at a rate above chance) random events before they took place (…) Not surprisingly, the effects failed to replicate, but that was a foregone conclusion given the infinitesimal prior probability that a social psychologist had disproven the laws of physics

CRITICISM

Less a book on rationality, more *Pinker's take* on rationality

While the author does discuss principles of rationality, they're drowned out in personal takes, anecdotes, and tangents.

The book feels more like *philosophizing* over rationality than dispassionately analyzing rationality.

Not a guide for learning rationality

While the book does discuss how rationality works, it doesn't deliver the *guide* on how to be more rational that I was hoping for.

Overstates rationality and IQ, ignores cultural learning

The San people didn't feel like compelling evidence for human rationality in decision-making.

After I had the fortune of learning about cultural evolution, Pinker's example struck me more as a case of cultural learning, than unfettered rationality.

I'd recommend Pinker to sit down with his fellow Harvard professor Henrich and learn more about:

- ***The Secret Of Our Success***
- ***The Weirdest People In The World***

Too much space wasted on 'common knowledge'

Readers well-versed in foundational principles of cognitive psychology may feel like Rationality wastes valuable space to revisit known themes without bringing anything new to the table.

The same can be said for the usual obvious holes in human rationality, like overestimating the risks of terrorism, or of airplane travel risks.

Several themes also repeat from Pinker's previous books.

And as much as I agree with them, I wasn't looking for a rerun.

I think an assertive editor should have reminded Pinker on when and where to cut.

Over-emphasis on present events make *Rationality* already dated

Human biases that Pinker failed to heed are over-weighing present events, and extrapolating recent trends onto the future.

Pinker hints that the US is moving away from Trump's denials of facts and truths, and back to rationality:
He says:

> These safeguards are belatedly being deployed.
> In a single week in early 2021 (…) Trump was banned from Twitter (…) a mendacious senator who pushed the stolen-election conspiracy lost a major book contrac (…) The platforms have tuned their algorithms to stop rewarding dangerous falsehoods (…) and damped down the runaway dynamics that can viralize toxic content and send people down extremist rabbit hole

History proved this misleading.
Trump won again in 2024, making that chapter a cautionary tale of not jumping to conclusions.

Strawmen arguments

For example:

> All too often, people write as if every outcome had a single, unfailing cause (…)

He may be right that too many do it way too often.
But I believe that it's more often a case of power dynamics, and seeking to persuade, win arguments, or increase engagement, than about true irrationality.

Most people instead would agree that both nature/nurture and talent/practice matter.

Simplistic arguments

For example, pitting against the supposed hyper-rationality of the San people with modern human societies:

> The sapience of the San makes the puzzle of human rationality acute.
> Despite our ancient capacity for reason, today we are flooded with reminders of the fallacies and follies of our fellows

Does Pinker really believe that an average San is so much more rational than an average modern man?
Because I don't think so.
Not that the modern society man is more rational, but simply that there is no reason to believe a San is more rational than any other random human being.

Some irrational conclusions

Seems like Pinker may slip on rationality seeking to be an optimist:

> "If the smartest people in the world predict something, it will come true." But we know that this conditional is false.
> Einstein, for example, announced in 1952 that only the creation of a world government, P, would prevent the impending self-destruction of mankind, Q (if not P then Q), yet no world government was created (not P) and mankind did not destroy itself (not Q; at least if "impending" means "within several decades").

Pinker may want to note there is no timeline in Einstein's prediction.
A prediction without a timeline cannot be proven false because 'there is always time for the prediction to become true'.

PROS

We need more rationality, and all the help we can get to promote it

I stand beside Pinker's message on the importance of rationality for the sake of humanity as a whole.

For that, I applaud Pinker's effort on this arena and I'm glad a popular scientist is fighting this good battle.

Respect for Pinker's stand against both left & right irrationality

In the past some may have seen Pinker's criticism of academic wokism as a sign of his conservatism.

However, Pinker took an even stronger stance against Trump.

That suggests me Pinker truly puts values above politics, something I deeply respect (and a stance we also happen to agree with here at TPM):

> **Pinker**: Wokism poses some problem, but Trump's attacks on democracy are worse

Much respect to Pinker for defending academic freedom and the pursuit of truth above and beyond any politics

REVIEW

Rationality is a typical Pinker book mixing deep insights and some science with lots of Pinker's takes and opinions.

You'll love the latter if you love Pinker, and you'll love *Rationality* a bit less if you were looking for fewer tangents and more science and pragmatism.

I wished it were more of the latter.
With all his clever quips and quotes **Pinker's books make you think 'he's smart'. But I want books that make *readers* smarter.**

I could not agree more with the author for the call on more rationality, including for humanity's own sake and future.
And I also believe rationality is a meta-skill for life's success and effectiveness.

So I wished that a smart and capable thinker like Pinker could pen a stronger manifesto.
With less Pinker-ing, and more dispassionate pragmatism *Rationality* could have been a manifesto. As it stands, it's not, and it left me wishing for more.

How to Gain Social Status as a Man: A Field Guide

Lucio Buffalmano · 9 June 2025 · Archived copy · Original

Want to boost your social status and earn respect?

At The Power Moves, we specialize in helping men master power dynamics to achieve high status and influence.

Backed by social psychology and experience, this guide reveals how to blend prestige (competence and value-giving) with strategic dominance to gain status in any group.

Let's dive in:

Contents

- 1. Be More Prestigious
  - But Avoid 'Powerless Prestigious'
- 2. Be More Dominant
  - But Avoid 'Domineering Jerk'
- 3. Be Both Prestigious & High Power
- 4. Focus on The Foundations of Status
  - Foundations of Personal Value
  - Foundations of Society-Wide Status
- 5. Grow Socially Skilled
- 6. Socialize Strategically For Status
  - How to Climb To The Top
  - Greet Prestigious Men, Avoid Dominants
  - Approach The Leaders After You Displayed Value
- 7. Pick The Right Groups, And Gain Group-Value

- ⍰⍰ Pick Based On Skills, Interests, and Similarities
- 8. Be Ready to Compete & Defend Yourself
  - Be Smart With Physical Treaths
- 9. Be ‘Positively Machiavellian’
  - ⍰ Example: Leveraging Your Connections

1. Be More Prestigious

Social psychology research highlights two approaches to status:

- **Prestige** ➡ Competence and value-giving power
- **Dominance** ➡ Coercion and value-taking power

Features	Dominance	Prestige
Influence	Based on coercion and threat	True persuasion; deferential agreement
Imitation	No imitative bias except to satisfy dominant	Preferential, automatic, and unconscious imitation
Attention	Tracking of higher-ups, eye contact avoidance, no staring	Attention and gazing at higher-ups, watching and listening
Mimicry	No preferential mimicry	Preferential mimicry of higher-ups
Proximity	Avoidance; keeping distance to avoid random aggression	Approach and proximity to higher-ups
Higher-ups language	Seize the floor, aggression (ie.: power moves, criticism)	Given the floor, permitted long pauses. Self-deprecating humor
Higher-ups behavior	Aggression, self-aggrandizement, egocentric	Prosocial, generous, and cooperative
Displays	ThePowerMoves.com	
-Lower-status	Diminutive, shoulder slump, crouching, gaze aversion	Attention to prestigious, open-body position
-Higher-ups	Expansive, expanded chest, wide stance, arms wide	Similar to dominance but ‘muted’. Less expansive use of space
-Higher-ups	Lower pitch during interaction	Do not lower vocal pitch
Emotions	ThePowerMoves.com	
-Lower-status	Fear, shame, fear-based respect	Admiration, awe, admiring-respect
-Higher-ups	Hubristic pride, arrogance	Authentic pride, muted arrogance
Fitness	Greater fitness and reproduction	Greater fitness and reproduction

⍰But Avoid ‘Powerless Prestigious’

Don’t mistake prestigious for ‘powerless’.

Value without power-intelligence only makes you a bigger mark.
This study for example shows that people behave more dominant with submissive men, a cue of people’s innate exploitative nature.

Hence:

2. Be More Dominant

Meta-analyses show that trait dominance predicts leader emergence.
Dominance outperforms many other traits including conscientiousness and intelligence.

A dominant approach includes:

- **Expansive body language** while subordinates match with diminutive body language.
- **Getting bigger** helps, with a bidirectional relationship: higher-status men are perceived as larger
- **Lower pitch** or constant. Avoid raising your pitch since men who view themselves as weaker do it
- **Visual dominance**, defined as the ratio of looking while speaking to looking while listening
  - Look away more while listening: High-status and dominant spent equal time looking while speaking and listening, and looked less at subordinates (Ellyson et al., 1980)

High visual dominance was similar between dominant men and high-status men.

Trump often looked away while Carney spoke, while Carney often looked at Trump speaking

See:

- **Dominant body language**

⍰But Avoid 'Domineering Jerk'

The dominant 'works' in the right contexts.

Unfortunately, even the domineering approach 'can work in some contexts.
For example, research has long considered bullying a tool to gain power and social status (Olweus, 1993; Vaillancourt et al.; 2007).

But **the more domineering it turns, the less effective it becomes in free societies**. Especially if you want top-performing, high-value teams who can vote with their feet.
Plus, it's higher risk:

⚖ **Leadership based on value-taking dominance becomes shakier as the group grows.**

It's a mathematical property: the more the group grows, the more the leader's strength is outmatched by subordinates ('leveling coalitions').

It's true even in chimps, and even more so in humans.
This study and this meta-analysis show that social support, social skills and intelligence influence status more than

physical size and aggression.

3. Be *Both* Prestigious & High Power ⍰

A recent theory states that competence is the only way to status, underpinning *both* prestige and dominance.

We tend to agree, and take the best of both approaches for maximum effectiveness.
Here's how:

- ⍰ **Win-win mindset:** '*I seek power for myself, while elevating the best people around me*'
- **High competence**, socially, in life, and in your specialized domain
- ***Positive* Dominance** based on competence
  - Prosocial dominant leadership: give to givers, and (socially) punish the takers.
    Punishing freeriders earns respect, trust, and even more money
- ***Social* dominance**, less physicality, and more frame control, tonality, and sub-communication
- ***Balanced* dominance**, without being *domineering*. See: 'law of optimum balance'
  - Confident body language, without *over*-spreading
    Eg.:

Comfortable in one's shoes, subtly proud, without overdoing it

See more:

- High-power / high warmth,
- High-status behavior and speaking
- Avoid submissive behavior and low-power speaking

Or best of all:

- **Power University**, shows all the cues of positive dominance

4. Focus on The Foundations of Status

Here are the biggest secrets to gaining status in any group:

- **Be a high-value man** to gain status *anywhere*
- **Be high-status in larger society**, to be pre-framed as high-status

Foundations of Personal Value

High-value and high-status are different, but so interrelated we sometimes even used them interchangeably.

Status is a social construct governed by social exchanges, and high-value men get status because they can give back (Henrich, 2015).

Examples of universally valued traits:

- Confidence
- Optimism
- Competence

But also a good style, humor, and upbeat personality help.

Build value with our guides:

- **High-value men traits**
- Low-value traits to avoid

Foundations of Society-Wide Status

Most groups inherit status from the wider society, and society-wide foundations are almost universally valued:

- High-status job
- High income
- Resources
- Fame <— The true 'status hack' and superpower

5. Grow Socially Skilled

It's called social status because it's a game of *socialization*.

Start with:

- **Fix negative social value** like awkwardness and social anxiety
- **Calibrate and fit in**: social calibration is the true meta-skill of socialization

Common calibration issues include:

- Uptight in 'chill' cultures
- Too smart-sounding among lower classes
- Too formal/informal for the context
- Not masculine enough among prototypically masculine men

Then graduate to the true game of social power:

- **Interpersonal power dynamics**
- **Why you can gain status fast even if socially awkward**

> The Science of Social Calibration: 7 Steps to Mastery

6. Socialize Strategically For Status

Average men talk casually.

Men who advance socialize purposefully and gain status with a repeatable process.

⍰ How to Climb To The Top

Extroverts emerge as leaders more than introverts, so start right away:

1. **Start with lower-status individuals** to warm up
   - Calibrate to your level. If you're a beginner, start with 'wallflowers'
2. **Gain group intel** to facilitate your status acquisition.
   Eg.:
   - Who leads it, who organizes it?
   - ⍰⍰♂ ~~Don't ask about attractive women~~, it gives weird/sexual harasser vibes
3. **Display value** with confident body language, high-power smiles, etc.
4. **Work your way up** the status ladder in your subsequent interactions

Power Tip: Grab The Spotlight

If people take turns for public introductions, do this:

- Stand up
- Walk in front to face the group

It displays confidence and leadership.
You'd often be the only doing it, making you memorable.

Facing the group when introducing yourself is an immediate status boost

⍰⍰♂ Several people approach me when I've done it, including women.
And I'm still getting free invites to paid events.

Greet Prestigious Men, Avoid Dominants

The dominants' game requires submission—don't give it to them.

Avoid them at first and go instead for prestigious men.
They're more welcoming, and raise your status by association.

⍰♂Lucio's Experience: **Starting with the 'Yoda level member'**

Lucio:
When I first joined a running club, I approached the *oldest* woman.

I respected a 70+ woman who still runs marathons—and I bet *everyone else* also respects her.
Bonus points, she was a doctor (high SES).

Her friendship raised my profile and facilitated my next moves.

Approach The Leaders *After* You Displayed Value

And make it:

- **Natural**, when you're nearby, to avoid looking like you're chasing
- **Low-key**, like you don't even care they're leaders

⍰⍰♂ Why not starting from the top

When you approach the leader first you are:

- **Chasing** for value
- **Shamelessly climbing**, while effective men do it smoothly
- **Taking** because you're still a nobody

Exceptions apply, but 'straight to the top' is not the best default strategy for most.
It's better to make your move on the king *after* you grab the king's attention.

7. Pick The Right Groups, And Gain Group-Value

While some forms of value are universal, status is also relative.

Different groups and eras value different status symbols and traits (and signal value accordingly).

For example:

- Runners' group ➡ Speed/endurance, nutrition expertise
- Activist students' group ➡ Political activism, cannabis-sharing
- Work ➡ Competence, bottom-line impact, rank seniority
- Party friends ➡ Extroversion, 'fun', female friends

Closeness to leaders and networks are group-specific but valued in any group.

⍰♂Lucio's Take: **Focus on the foundations, de-prioritize group-specifics**

Lucio:
Single group status is low ROI because it's worthless outside of it.
And it makes you needier and dependent, limiting your freedom.

Focus on personal value and power-skills instead and you'll be good in any group.

Better than working on growing your value:

⍰⍰ Pick Based On Skills, Interests, and *Similarities*

Many men struggle with status because they stick with groups that randomness picked for them—school, neighborhood, or work.

A mismatch of skills and group-valued skills harms both status and acceptance

Instead, pick social circles that complement your interests and strengths:

- Smart ➡ Intellectual circles
- Handsome ➡ Party crowd or large circles
- Man ➡ Woman-dominated profession for extra attention

Pro tip: mind the similarities.

⚠ **Make your background, race, or gender wok *for* you**
Unfortunately, humans form ingroup/outgroups based on meaningless similarities and 'differences'. Be aware of covert devaluations. Don't fall for fake politeness and actively rebalance things.

8. Be Ready to Compete & Defend Yourself

Status is a scarce resource that people compete for.

The competition rules are contextual and we discourage nasty competing: it signals poor character, and there are better approaches.
But you must be ready to defend yourself.

If you do it well, you can gain status and respect 10x faster.

⍰ Self-Defense Example

> **Him**: (back pat) Thank you for coming. Enjoy the place <— High-status host attitude
>
> **You**: (touch him back) <— Neutralizes physical power move
> Thank you for organizing <— Judge compliment
> you guys are doing a great job <— Frames him as working for you

If you have power, let them play their dominant game, and checkmate them later.

> **Moe Greene**: (Walks in with 'big alpha male' attitude, aggressive)
> **Godfather**: (Understated power, advances without aggression)

Remember: dominance is a subset of power.
And strategy beats dominance.

Learn more:

- Undermining
- Covertly attacking
- Nasty social climbing
  - ⍰ Social climbing on friends
  - ⍰ Leaders' social climbing

Be Smart With Physical Treaths

Consider safety and long-term interests first
95% of fight 'victories' provide little/no benefits

Principle:

⚖ **The more status is negotiated with physical fights, the lower the group's payoffs**

However, brawling losses and excessive fear can still cost you status.

Here are some tips:

- **Take martial arts classes**, it will give you more confidence even without ever fighting
- **Back down without total submission**. Eg.: shake your head in disapproval to display continued judge power
- **Stick to your frame of verbal engagement** only
  - Shame the attacker as a 'brute'

- Reject the attacker's covert frame that the physical fight decides the outcome

A great example:

> **Attacker**: (seeks a physical fight)
> **Udy**: (confident and in control) Nobody's gonna do that, if that's your reaction, you can leave <— Rejects the fight with power, while maintaining control ⍰

Immediate respect for Udy.

⍰♂Lucio's Take: **I only retreated… But not displaying fear still increased my status**

Lucio:
All I did was walking backwards with my hands up as the attacker advanced.
'I must have lost a ton of status', teenager me thought.

But days later, a friend teaching another 'how to be a man' used me as an example: 'See Lucio with that guy? No fear.'

Even in retreat, resolve against a larger and aggressive was a net win (bigger attacker = bigger pelotas).

9. Be 'Positively Machiavellian'

'Emotional intelligence' is a popular item in status-related articles.
But while important, it won't take you far without good strategies.

Studies show that Machiavellians gain early status in group formation, and status researchers list 'political skills' as a status-attaining trait.

Some aspects of good strategies:

- **Develop alliances**, make friends that are both high-quality and helpful

- **Sub-communicate value** without bragging, a life skill in itself
- **Fake it till you make it**. It's *perceived* competence, signaled with *cues* like confidence, amount of talking, and pride displays

Many modern-day gurus 'inflate their competence' with dominant frames and various competence-inflating techniques

Note: we do not like nor endorse faking it without developing actual competence.
And strategic *thinking* beats tactics anyway (as we dig deeper in Power University).

⍰ Example: Leveraging Your Connections

> **Me**: Let's meet at the reception <— I want staffers to see I'm friends with their managers

Soon after, no more breakfast queues, and window table reserved. I'm sure it helped they saw me with their boss.

Frame Analysis: Summary and Review

Lucio Buffalmano · 11 June 2025 · Archived copy · Original

"Frame Analysis: An Essay on the Organization of Experience" (1974) by sociologist Erving Goffman is a microsociology exploration of how people interpret and give meaning to everyday experiences through mental structures called 'frames.' The book introduces key concepts like primary frameworks, keying, and fabrication to explain how individuals organize, manipulate, and navigate social reality.

Contents

- FULL SUMMARY
  - Introduction
  - Primary Frameworks
  - Keys and Keyings
  - Designs and Fabrications
  - Anchoring and Resource Continuity
  - Ambiguities and Misframings
- MORE WISDOM
  - Jokes are power moves
- CONS
- REVIEW

FULL SUMMARY

About the Author:
Erving Goffman (1922–1982) was a Canadian sociologist and one of the most influential thinkers in 20th-century social theory.
Known for his work on symbolic interactionism and the sociology of everyday life, Goffman pioneered concepts like impression management, face-work, and framing, making lasting contributions to how we understand human behavior and social interaction.

Introduction

Frame Analysis explores how individuals organize and interpret experiences by "framing" events. Goffman argues that what we perceive as reality is shaped by implicit rules or "frames" that define situations' meaning.

Goffman credits Bateson with the introduction of the word 'frame':

> And of course much use will be made of Bateson's use of the term "frame."
> I assume that definitions of a situation are built up in accordance with principles of organization which govern events-at least social ones-and our subjective involvement in them; frame is the word I use to refer to such of these basic elements as I am able to identify. That is my definition of frame. My phrase "frame analysis" is a slogan to refer to the examination in these terms of the organization of experience.

Key Concepts

- **Primary Frameworks**: Basic lenses (e.g., natural vs. social) used to classify occurrences.
- **Strip**: Any segment of ongoing activity, real or imagined, serving as raw material for analysis.
- **Frame**: The underlying, relational rules that make interaction meaningful.

Primary Frameworks

Goffman distinguishes two fundamental ways of interpreting events:

- **Natural Frameworks**: Events seen as unguided, purely physical processes (e.g., weather)
- **Social Frameworks**: Events viewed as "guided doings" shaped by human intentions, norms, and sanctions

Takeaways

- Individuals fluidly shift between frameworks when uncertainty arises (e.g., is that knock wind-blown or a visitor?)
- Frameworks are often tacitly understood, yet any moment can spark a need for reframing.

Keys and Keyings

Goffman introduces keying as the process of systematically transforming an activity into a different interpretive frame (e.g., "just playing" vs. a real fight).

Definition of Keying

1. Transformation of material already meaningful in a primary framework.
2. Acknowledged by participants as a deliberate shift in how they see "what's going on."
3. Bracketed in time/space by cues marking its start and end.

Types of Keying

- **Play**: Modeling serious activity as game (e.g., theatrical combat).
- **Rehearsal**: Staged dry-run distinct from the "real" performance.
- **Rekeying of Rekeyings**: E.g., film adaptation of a play, then turning that film into a musical

Takeaways

- Keyings add layers ("laminations") to interaction, each with its own "rim" signaling status (e.g., rehearsal vs. final show)

- Multiple, nested keyings are possible, each requiring clear framing cues.

Designs and Fabrications

Beyond playful transformations, some actors intentionally deceive others about “what’s going on”—fabrications.

Fabrication Defined

Deliberate structuring of an event so that targets form false beliefs about reality.

- **Operatives**: Those engineering the deception.
- **Marks**: Those the deception is aimed at.
- **Collusion**: Covert signals among operatives.

Examples

- **Casino Shills**: Starters who pretend to play blackjack to encourage real players, following a formal “rule-set” that secretly marks them as not genuine players.
- **Wartime Escape Practice**: POWs rehearsed covert signaling via music pauses to coincide with guard patrols.

Takeaways

- Fabrications require models drawn from primary frameworks but then introduce asymmetry in what different parties believe.
- Even fabrications can be rekeyed or nested within other deceptions.

Anchoring and Resource Continuity

Goffman shows that all frames presume resource continuity—the sense that elements of a situation trace back to a larger context where they originated by chance or design (e.g., chairs in a meeting trace to a manufacturer, not the meeting itself).

Ambiguities and Misframings

Even without intent to deceive, people can misframe situations:

- **Ambiguity**: Momentary doubt over “what’s going on”—a puzzle demanding resolution.
- **Illusion/Misframing**: Unintentional errors in framing, lacking any deceptive motive.

MORE WISDOM

Jokes are power moves

> The victim need not take the joke seriously, in fact, is obliged not to, but he must take seriously the fact that those who played him the fool thought it allowable and even appropriate to do so.

And Goffman aptly notes that some people are more often the butt of the joke, often a sign of low status and power:

> In any case, it seems that within any small social circle some members will be thought to be eminently available for this kind of teasing, and one or two others (often the most dominant) will be defined as off limits for such foolery.

CONS

- **Little practical takeaways**

REVIEW

Frame Analysis didn't live up to my high expectations.
I was hoping for more practical takeaways, or at least for a more solid theoretical foundation about frames and the construction of meaning, but I didn't find it here.

It may be entirely my fault.
I failed to find any substantive information, and I found myself skipping ahead at certain points.

While my issue is often taking too many notes, I struggled to underline and bookmark almost anything in *Frame Analysis*.

Maybe it's worth coming back to *Frame Analysis* in the future again and who knows, I may appreciate things that I failed to appreciate today.
But for now, and especially for people looking for more practical takeaways, our articles offer a more practical approach to frame analysis:

- **Frame analysis 101**
- **Frame control techniques**

Check the **best books** on frame control or get this book on Amazon:

RSD Blueprint Reloaded Review: Is Owen Cook Any Good?

Lucio Buffalmano · 11 June 2025 · Archived copy · Original

Blueprint Reloaded is a self-help and social skills course from Real Social Dynamics, led by Owen Cook (Tyler Durden). Spanning 80 hours, it builds on *Blueprint Decoded* to deliver Owen Cook's takes on high-status communication, charisma, and personal growth, targeting men aiming to master dating and inner confidence.

In this analysis, we'll explore what *Blueprint Reloaded* offers, who it's for, and whether it justifies its steep price tag. We'll also compare it to alternatives like **Power University** which offers a more structured and evidence-based approach for those seeking practical social mastery.

About The Author: RSD & Owen Cook

Real Social Dynamics (RSD) has a storied history.

Founded by Owen Cook and other key figures from the pick-up artist (PUA) community in the early 2000s, RSD initially gained popularity by popularizing Mystery's insights and teaching men scripted techniques to attract women.

Cook's personal story adds weight to his teachings.
He openly shares his struggles with social anxiety and rejection, framing his transformation as proof that anyone can rewrite their narrative.
More modern dating coaches found Cook's high-energy personality to be overly theatrical, but he has been an influential character for a generation of men.

Over time, RSD has pivoted toward a broader approach to self-help and personal empowerment, a shift epitomized by *Blueprint Reloaded*.

Strengths	Weaknesses
Emotional presence	Lacks power dynamics understanding
Reduces anxiety	Doesn't build status or respect
Breaking nice guy patterns	Doesn't take men to top-10% level
Lots of action	Results may not translate beyond nightlife

Bullet Summary

- **You need true core confidence to behave high value**: Your brain stops you from being a high value man in two ways:
  - It scans for environmental cues, and if they don't all say "you're high value", then you behave low value
  - Your own internal rules for what it means to be successful often tell you that "you're not successful yet", and thus you don't allow yourself to be high-value
- **To develop true core confidence, control your state and change your self-assessment**, starting with positive self-talk
- **Start by being indifferent to what others think of you**: so nobody can make you feel low-value. If you can go out and have a good time no matter what, you're doing great already

SUMMARY

Blueprint Reloaded is a behemoth of a course and it's largely a repackaged and updated presentation of the original *Blueprint Decoded*.
It includes:

1. High-Status Communication

This module is the main promise of the course: making alumni high-status with 'high-value communication'.

Cook teaches some foundations of vocal power like vocal projection and deliberate pacing, and proposes exercises with role-playing scenarios to practice these skills.

Also see:

- **How to speak high-status**

> Dominant Conversations: 10 Ways to Speak With Confidence

2. Energy Awareness

Here, things get a bit woo-woo.

Cook delves into the idea of "energy" in social interactions—how your voice, eyes, and posture broadcast your inner state.

It's about amplifying your presence through subtle cues, like holding eye contact a beat longer or varying your tone for impact.

This section lacks hard evidence and, in my opinion, also experience and logic.
For some, it's a game-changer; for others, it's fluff.

3. Advanced Dating Strategies

Echoing *Blueprint Decoded*, this module refines RSD's dating playbook.

Topics include the "beta state", fear of the alpha male, expressiveness, and storytelling to build attraction.
Cook goes beyond pickup lines, focusing on emotional connection and long-term dynamics.

Personally, I wished for more practical strategies and techniques.
Plus, I believe that personal connection benefits for a more grounded, slower-energy approach.

4. Personal Development

This is where Cook gets introspective, urging students to face their demons.

Topics range from processing trauma to embracing vulnerability as strength. The idea is to strip away societal masks and build confidence from within.

This overlaps with Cook's student course, so we dig deeper there:

- **Transformation Mastery: is it worth it?**

5. Public Speaking and Marketing

This module extends the course's reach into professional territory.

And, in my opinion, this is Owen Cook's main strength: he's a top-notch public speaker, he has the gift of gab, and he is great at capturing the audience's attention.
Finally, with Real Social Dynamics, he proved to be great at marketing.

Cook covers storytelling, audience engagement, and crafting win-win deals.

Exercises

The exercises in "Blueprint Reloaded" are designed to bridge the gap between a theory-heavy course, and practical improvements for the alumni.

While I found some to be obvious (e.g.: record yourself) and some less helpful (e.g.: affirmations), I still appreciate that if people actually follow through, they can get some real-world benefits with the practice.

- **Social Circle Mastery**: engage more people in low-pressure settings to make more friends
- **Daygame**: approach and interact with people in public places during the day
- **Inner Game**: journaling, self-reflection, and affirmations to help you develop a positive self-image.
- **Outer Game**: work your body language, grooming, posture, eye contact, and outfits

Criticism

Owen Cook is a polarizing character. If you love him, you'll like The Blueprint

Woo-Woo Content Doesn't Deliver Hard Skills

More logical men may not connect with the woo-woo approach of 'energy', 'vibration', or 'healing'—something that may be best left to clinical psychologists anyway.

But the problem is that even if you connect with that type of self-help, it still doesn't deliver hard skills like gaining status, respect, or leading your dates.

Lacks Power & Masculinity

Woo-woo generally appeals more to women, and Owen's high-energy attention-seeking approach may not best serve men who seek more masculine gravitas.

Overall, there is also little in terms of interpersonal power dynamics, and I believe that **you cannot be a high value man if you cannot behave high power**.

This is one of the main reasons why I don't connect with the material: it lacks masculine power.

Length, Fluff, and Overload

Owen Cook loves to talk and the program seems to lack a thought-out structure.

His tangents can stretch a 10-minute concept into an hour, and I personally don't find much value in off-the-cuff off-topics.

This results in lengthy talks that can feel dense and circular.
If you're not Owen Cook already, it may even bore you.

Esoteric Or... Pseudo-Science?

Sections like "energy awareness" or metaphors like "sheep vs. wolves" flirt with pseudoscience.

Without empirical or logical backing, they risk alienating pragmatic learners or anyone who prefers data and experience.

FAQ

Is the Blueprint Reloaded worth it?

If you resonate with Owen Cook's style and philosophy, *The Blueprint Reloaded* is worth considering—especially in light of many RSD videos having been removed. But if you're looking for a concise, technique-heavy course, you might be better off exploring other options.

Can you get The Blueprint Reloaded free?

No, but since Owen Cook repeats many of the same principles in his free videos you can get a good idea if The Blueprint Reloaded is for you by checking his YouTube channel.

Is Owen Cook legit?

Owen Cook (aka RSD Tyler) has been influential in the dating/self-development space, especially in the early "game" era. His strengths are confidence-building, reducing neediness, and getting people socially active.
However, his approach grounded on high-energy and 'getting in state' doesn't help men to develop the presence and masculinity of a high-value man.
If someone lacks social experience or is very inhibited, Owen Cook can be helpful to start out.
But for developing real-world social power, good relationships, and long-term status, his teachings are incomplete and sometimes counterproductive.

Reloaded VS Power University

To help you decide which one is best for you:

Outcome	Blueprint Reloaded	Power University
Status, Respect, and Attraction	More focused on 'states', and while RSD fans love that, it lacks practical strategies to reliably go from 'states' to 'results'	✅ Power University is more practical, tackling not only the 'inner game', but also practical strategies & techniques, with measured results.
Author charisma	✅ Owen Cook is more famous, higher energy, and is a more practiced public speaker. He grabs attention	Lucio Buffalmano is a fine speaker, but he focuses less on personality marketing and more on replicable systems
Ease of Learning	80 hour duration makes it long. Videos-only and abstract concepts like energy awareness may make it vague.	✅ Equally deep, but clearer examples, and text-based lessons with exercises make it easier to internalize and apply.

Outcome	Blueprint Reloaded	Power University
Price	✅ The Blueprint Reloaded dropped in price, making its cheaper versions now more affordable	Premium course with a premium price
Life usefulness	Cook provides better motivation and good insights on mindsets and self-esteem, but the lack of practical strategies and techniques weighs.	✅ Power University is built to deliver results for all the main areas that most men care about: confidence, respect, status, and attraction.

Review

Blueprint Reloaded is a great course for Owen Cook enthusiasts who appreciate his motivational approach and personality, but it falls flat for men who seek more practical advice on social skills, dating, and masculine power.

We have a different approach and style here at The Power Moves, and we wouldn't advise our readers and alumni to mimic **Owen Cook**.
Cook's over-the-top approach works to market to a certain demographic of men, but wouldn't work in most other contexts to gain status, respect, and attraction.

A more masculine and powerful presence also works better for many high-quality women, especially the non-party types who make for better long-term partners.

We also prefer a more rational, logical, and practical approach here. And a rational man's approach doesn't vibe well with *The Blueprint Decoded*.
Finally, while this course is advertised as 'advanced', I didn't find it advanced.

If after this review you feel like a more masculine and powerful program better supports your goal, **check out Power University**.

How to Get People to Respect You as a Man: 10 Proven Strategies

Lucio Buffalmano · 18 June 2025 · Archived copy · Original

How to gain respect as a man is one of the most important—and most misunderstood—goals in male self-development. Respect isn't built around being "empathic" or randomly *giving* respect; it's earned through power and mastery.

At *The Power Moves*, we go beyond generic self-help. We specialize in **male social dynamics, power strategies, and high-impact behavior** that commands respect in the real world—from boardrooms to dating to everyday interactions.

This guide breaks down exactly how to earn respect as a man— from foundational traits to advanced social tactics. Let's dive in:

Contents

- 1. Build An Empowered Mind
  - 1.2. Start With SELF-Respect
- 2. Conquer Your Fear of Confrontation
- 3. Enforce Your Boundaries
- 4. Be More Positively Dominant
  - 4.2. Be High Power
- 5. Be More Masculine
  - ⍰ How to Increase Masculinity for Respect
  - ⍰ Example: Unmasculine Friend
- 6. Add Value to Society
  - 6.2. Give, But Get Your Due (Strategic Giver)
- 7. Acquire Mastery (Competence)

- 8. Get Results, WIN
- 9. Seek Honor
  - 9.2. Avoid Being Sneaky
- 10. Demand Respect
  - 10.2. Demand Respect From Your Friends
  - 10.3. Demand Respect From Your Girlfriend
- ⍰ Bonus Mindset: Your Respect Must Be Earned
  - ⍰ Mindset: my respect means something
- SUMMARY

1. Build An Empowered Mind

The foundations always start with the mind.

Everything worth building must be built on strong foundations.

An empowered mind leads to empowered nonverbals, verbals, and socialization that naturally earn respect.

1.2. Start With *SELF*-Respect

You can't get respect without *self*-respect.

Demanding respect without inner self-respect is like demanding water holding a colander. It will disappear right after.

Foundational steps of self-respect include:

- **Increase your self-esteem**
  - Start with self-acceptance

  - Move to self-love
- ***EARN* your self-respect** first
  - Do what must be done (even when hard)
- **Change your self-talk**
  - ✕ *"I'm not sure I deserve a hello"* —> ✓ *"He' picked the wrong guy to disrespect"*

If you need help with this, check **Confidence University**.
This is a quick intro:

> **Lucio**: The foundations of self-respect start in the subconscious mind…

2. Conquer Your Fear of Confrontation

Too nice guys tell themselves they're 'respectful' when in truth they're afraid of confrontations, 'losing face', or 'being disliked' (people pleasers).

Start by facing the truth:

- ✕ I'm **respectful** of others ➡ No, you're just **scared**
- ✕ I'm a **nice guy** ➡ No, you're just **powerless**
- ✕ I don't date because **women like jerks** ➡ No, they **don't like pushovers** (nobody does)

Then, start working on the issues:

- ✕ Fear of bodily harm ➡ Take **martial art classes**
- ✕ Fear of confrontation ➡ **Train verbal altercation** in safe environments
- ✕ Fear of ostracization ➡ **Learn to make new friends** and allies

Remember that some fear is normal, natural, and healthy.
***Excessive* fear is the problem**.

3. Enforce Your Boundaries

Start with the mental basics:

- **Install assertive beliefs** and change your thinking patterns
  Eg.: ✕ *'I will annoy him if I ask him to lower his music'* -> ✓ *'He is being uncivil, I must ask him to lower his music'*
- **Expand your comfort zone**
  Eg.: Take public speaking classes

Then:

- **Call out disrespect**, always. Even when you don't have the 'perfect comeback'
- **Stand your ground** if they push back or deny
- **Leave and cut contact** or invite them to leave if they refuse to apologize

If you've been too nice all your life, consider time-limited 'over-correction'.

⁉ You're doing it wrong if you're constantly demanding respect

This is what many guys don't get:

Demanding respect should be exceptional because most people respect respect-worthy men.

Frequent disrespect is a warning signal.
Do some self-diagnostic: are you too nice, naive, or submissive in your nonverbals? If not, you may be awkward or overly combative, making enemies instead of friends.

4. Be More Positively Dominant

Once you build the mind, it's time to work on the outer aspects.
And interpersonal **dominance, power, and masculinity are the currencies of respect**.

Whether you want respect, attraction, status, or 'success', start sub-communicating more positive dominance:

- **Confident body language**, see here
  - Walk
  - Posture
- **Vocal and verbal power**, see here
- **Confident socialization**, see here

Dominant men get respect because dominance does the talking for you. You don't even need to *ask* for respect.

4.2. Be High Power

Power is dominance, *plus* social skills.
And social respect is grounded in interpersonal power dynamics:

✖ Low power = disrespect
✓ High power = respect

At the core, it's that simple.
Power-aware men see the subtle power moves, the undermining, or the passive aggression.
They address them fast and smoothly, and everyone respects that.

Also see:

- Frame control techniques

5. Be More Masculine

Masculinity is as fuzzy as it is important.

However you define it, a base level of masculinity is foundational for respect.
The general principle is:

⚖ **The more masculine the group, the more masculinity is needed**
⍰ To maximize respect be equally or slightly more masculine than your target audience

Two important notes:

- **Masculinity must be 'proven'**: An influential research theory suggests that contrary to womanhood, masculinity must be 'earned and upheld'
- **Masculine respect ≠ female attraction**: Men's deference grows with increasing masculinity, but female attraction is more nuanced and decreases after a certain threshold

⍰⍰ **Masculinity needs power and social competence**

Not all forms of masculinity earn respect. Autism has been conceptualized as ‘extreme male brain’, and ‘geekiness’ is also ‘masculine’. But they don’t give you respect.

⍰ How to Increase Masculinity for Respect

We address contentious aspects elsewhere, but to give you an idea:

- **Physical masculinity** includes genetic influences, but you can:
  - Stay fit, avoid excessive fat, especially with pear/round body shape (Gass and Seiter, 2022)
  - Weight train for muscular definition
- **Mental masculinity**
  - High self-esteem
  - Resilient self-esteem, despite criticism (Helgeson, 2020)
  - Ambition to achieve
- **Behavior**
  - Direct communication Eg.: Say what you prefer, without preambles
  - Task-oriented leadership
- **Nonverbals**
  - Lower expressivity (Fischer and Evers, 2013)
  - Less ‘social smiles’
  - More expansive posture
- **Avoid femininity**
  - Avoid over-vulnerability

Read more here:

- Masculine body language
- **How to be positively masculine**

⍰ Example: Unmasculine Friend

Re-created to respect the individual, but based on real texting:

> **Him**: (reaches out again to 'talk')
> **Me**: (put off by 'relationship talk')
> **Him**: (chases for 'clarifying')

In general, avoid:

- ✕ Excessive relationship talk
- ✕ Endless clarifications about past issues
- ✕ Asking for 'relationship rules'

⍰♂Lucio's Take: **Balance & Calibration for Best of Both Worlds**

Lucio:
Traditional masculine norms against self-disclosure and vulnerability can be costly at the extremes.

For example, they can keep friendships shallower, leading to psychological distress.

To combine masculinity and bond, follow the law of balance and **adapt your approach to context, goals, and characters**.
Be more genuine with trustworthy and empathic friends, and more 'traditionally masculine' in public.

In dating, be generally masculine and high-power.
But also have moments of empathy and fun for bonding and connecting. This is the 'perfect mix' most women never experience.

6. Add Value to Society

Principle:

⚖ **People respect contributors and despise scroungers.**

This is grounded in evolutionary psychology.
As social animals, we instinctively dislike cheats, freeloaders, and takers because cooperation is good for us, but also risky.

6.2. Give, But Get Your Due (*Strategic* Giver)

Nobody respects the chump who lets others take advantage of him.

'Smart givers' achieve their goals, while also adding value—TPM's ultimate goal ⍰.
Here's how to give, without being a fool:

- **Give because you chose to**
- **Give to those who give back** for win-win
  - Don't give to takers. It makes you a manipulated 'sucker'

- **Be strategic when giving to higher-value people**. Give to 'make up the difference', but ensure it turns win-win
  - Don't chase for crumbs like a simp
  - Don't brown-nose to autocrats and narcissists

Also read:

- **Enlightened collaboration**

Interpersonal Give & Take

Give and take isn't just material; it concerns *any* social exchange.

And it's part of the power dynamics we already mentioned.
To balance being respected and respecting others:

- **Be appropriately scarce** to ensure others respect your time
- **Balance reach-outs with reach-ins** to avoid chasing
- **Don't over-invest**
  - Take turns with location convenience
  - Give and take because nobody respects fools who are taken advantage of

Also see:

- Foundations of dating power dynamics

> Mastering Dating Dynamics: 5 Rules for Men to Attract Women

7. Acquire Mastery (Competence)

Mastery is the hard skills behind your behavior and beliefs.

Believing you deserve respect and demanding respect are foundational.
But it must go hand in hand with value and character:

- ✕ Belief, no value ⍰ **delusional**
- ✕ Demands, no value ⍰ **toxic entitlement**
- ✓ Belief + demands + value ⍰ **high-quality**

There are two types of competence:

- **Domain-level competence** zooms into a specific area (eg.: IT work)
- **General competence** (AKA 'life competence') in universally valued domains (wealth, health, relationships).
  - Social competence, related to everyday interactions
  - Mental resilience to endure through ups and downs
  - Strategic thinking to achieve goals
    Think about what you want, plan how to get there, and adjust as you go

Both are important.
But *life* competence may get the edge for a good life.

8. Get Results, *WIN*

Society respects winners.

People may not always *like* competent achievers, but nobody is indifferent to them.

9. Seek Honor

You gain honor by upholding socially valued values.

Precise values change with culture, but common ones are:

- **Keep your word**
- **Stand by your 'bros'** and allies
- **Enforce boundaries** of respect
- **Mind your reputation**

Honor matters more among men and in 'cultures of honor', where it's more closely tied to status.

Also read:

- **How to combine honor with effectiveness**

9.2. Avoid Being Sneaky

- Guilt tripping and emotional manipulation
- Manipulation tactics
- B*tch moves

While there is a time and place for almost anything, these should be *extremely* rare.
They **all communicate dishonorable character** and will lose you high-quality men's respect faster than the speed of light.

10. Demand Respect

After you *earned* respect, you can *expect* it and *demand it* if not forthcoming.

But most people do it wrong, wanting respect from random people.
Instead, **the best approach to getting respect follows the inside-out principle**, starting from your closest relationships.
Ie.:

1. **Family**'s respect sub-communicates high fitness because they know you best, from early on
2. **Friends**' respect sub-communicates power and social skills in unstructured groups
3. **Colleagues**' respect sub-communicates domain competence, social competence in structured groups, and earning potential
4. **Girlfriend**'s respect is foundational to attraction and sub-communicates dating and intersexual competence

For some techniques, see:

- How to handle 'invisible disrespect' (covert power moves)
- How to handle bad jokes

10.2. Demand Respect From Your Friends

Some steps:

- **Gain status**, be high-power/high-warmth to combine power with alliances
  ⍰ See: How to gain status
- **Dish it back**: If one-upping is part of your group's socialization, dish it back
- **Ensure there is foundational respect** behind the teasing

> **Lucio**: Disrespectful jokes aren't 'jokes', they're red flags and power moves, and you must check them

See 'how to make new friends' and 'how to gain status at will'.

10.3. Demand Respect From Your Girlfriend

Respect is a necessary precondition for attraction, both initially, and to *maintain* attraction in relationships

Some ground rules that support respect:

- **Zero tolerance for abuse**, either physical or verbal
- **Respect extends to your family and friends**
- **Support for your goals**, or at least not detrimental
- **Win-win mindset and behavior**
- **Publicly supportive**: No public drama, no power moves

⍰ Failure of Respect

> Nothing destroys a man's reputation like public disrespect from her girlfriend
>
> *TPM Principle*

Some women test men early on and will push farther and farther unless you stop it:

> **Girlfriend**: (drunk, romances another man) <— Shamefully drunk + disloyal = Highly disrespectful
>
> **Boyfriend**: (tries to make her behave) <— If he succeeds he regains some respect
>
> **Girlfriend**: (resists him) <— Public defiance + drama + back to disloyalty = destroyed reputation

The healthiest way to get her respect is being a win-win leader.

High-quality men don't worry about relationship respect because respect is the natural consequence of empowered, competent leadership.
Women *want* to follow capable, masculine leaders who lead for win-win.

⍰♂**Lucio's Take**: I lost all respect for the company's founder

Lucio:
High-power men lose respect for men who follow.

I once interviewed at a company whose (male) founder had relocated for love. The hiring manager asked, ‘Wouldn’t you move for love?’

Back then I needed that job, but there’s no escaping the ‘unwritten code of male respect’.
And I lost all respect for the founder. He couldn’t be my leader.

⍰ Bonus Mindset: Your Respect Must Be Earned

‘Giving respect’ is a common entry in online guides on how to get respect, including AI models:

Completed DeeperSearch 5m 39s
Tap to read • 71 sources

AI provided naive self-help after DeeperSearch and extended thinking

Key Points

- Research suggests integrity, competence, and reliability are foundational for gaining respect. How about power, value, and positive masculinity...
- It seems likely that mindsets like empathy and humility enhance how others perceive you.
- The evidence leans toward strategic actions, like active listening, boosting respect in interactions.

You can't trust AI on power dynamics. Even after a deep search, it provided weak advice on how to gain respect

However, **'giving respect to get respect' is naive self-help.**
The underlying assumption is that if you do good, you get good back.

But the truth is that you *lose* respect in respecting those who didn't earn it.
Our power-grounded advice is:

- **Be *civilly polite* to everyone**, unless they've given you a reason not to
- **Uphold your end of the bargain** to show respect with actions
  - Be punctual
  - Deliver what promised
  - Apologize when wrong
- **Be selective with your deeper respect**, only give it to men who earned it

⍰ Mindset: my respect means something

The respect of a high-quality man is a gift and a reward—only give it to worthy recipients.

> Your respect must mean something for it to mean anything.
>
> ✒ *TPM Proverb*

SUMMARY

Respect is different than attraction, status, and power, but it underpins them all.

You need a minimum of respect to achieve status and women's attraction.
Respect also *legitimizes* your power, increasing your influence.

We share extra real-life examples of respect-worthy men in our video:

For our complete system to gaining respect, status, and attraction, see:

The Psychology of Gender: Summary & Review

Lucio Buffalmano · 25 June 2025 · Archived copy · Original

The Psychology of Gender (2020) by Vicki S. Helgeson is a comprehensive, research-based textbook that explores how gender influences our thoughts, behaviors, relationships, and health. Drawing from psychology, sociology, and public health, it examines both biological and social foundations of gender—and how they shape real-world outcomes.

Exec Summary

- **Men and women are more similar than different**, but
- **There are important gender differences**
- **Differences are due to many factors** including biology, evolution, culture, socialization, and 'social roles' and social expectations
  - Differences change over time as cultures, social roles, and expectations change

FULL SUMMARY

About the Author:
Vicki S. Helgeson is a professor of psychology at Carnegie Mellon University and the director of the Gender, Relationships, and Health Lab.
Her research focuses on how gender-related traits and roles impact interpersonal relationships and health, and is especially known for her work on unmitigated communion and agency in chronic illness populations.

Trait / Domain	Men	Women
Verbal Ability	Slightly lower, but differences are small	Slightly higher on verbal fluency, reading comprehension, and writing
Math Ability	Equal overall; more at extreme high end	Equal overall; fewer at extreme high end
Spatial Ability	Better at mental rotation, spatial visualization, and navigation	Better at object location memory
Memory	Better at spatial location (some tasks)	Better at verbal and face memory
Aggression	More physical and direct	More relational (e.g., gossip, exclusion)
Emotional Expression	Less expressive publicly, similar in private, more likely to express anger	More expressive overall, especially for sadness and vulnerability, and in public
Help-Seeking	Less likely to seek help; more self-reliant	More likely to seek emotional and medical help
Communication Style	Report-focused, directive, solution-orientedTend to use assertive, task-oriented communication	Rapport-focused, collaborative, expressive. More likely to use qualifiers or tentative language
Friendship Style	Activity-based, instrumental support. Less emphasis on self-disclosure and emotional intimacy	Emotion-based, intimate, co-rumination

Trait / Domain	Men	Women
Achievement Motivation	Higher self-confidence in achievement domains; more likely to attribute success to ability	Lower self-confidence in some achievement domains; more likely to attribute success to effort or external factors
Health	More risky behavior, higher mortality rates from accidents & homicides; more substance abuse and externalizing disorders (e.g., antisocial)	More preventive care, better compliance, higher morbidity rates, higher rates of depression, anxiety, and eating disorders. More suicide attempts, but fewer deaths
Attraction & Relationships	Place higher value on physical attractiveness in mate selection; more likely to initiate relationships	Place higher value on resources and status in mate selection; more likely to prioritize emotional intimacy
Sex Role Strain	Pressure to suppress emotion, be dominant	Pressure to nurture, look attractive
Nonverbal Behavior	Less likely to smile or engage in prolonged gazing; more dominant nonverbals	More likely to smile, gaze, and use touch in social interactions; show higher interpersonal sensitivity
Leadership Style	More likely to adopt task-oriented, autocratic leadership styles	More likely to adopt democratic, transformational leadership styles

1: Introduction: Definitions

Helgeson kicks off by distinguishing sex (biological, rooted in genes and hormones) from gender (a fluid, socially constructed category tied to cultural expectations).

Gender roles—expectations tied to being male or female—often spark intrarole conflict (e.g., women balancing emotional expression with sensitivity) and interrole conflict (e.g., a male student torn between independence and group work).

Key Definitions

- **Sex**: The biological categories of female and male, determined by chromosomes, hormones, and anatomy.
- **Gender**: The social and cultural meanings assigned to being female or male—masculinity versus femininity.
- **Gender role**: The set of expectations and norms that society attaches to each biological sex. For example, the expectation that men be assertive and women be nurturing.
- **Sex vs. Gender**: Men and women differ biologically (sex), but societal roles (gender) shape behavior more variably.
- **Gender identity/gender-role identity**: One's internal sense of self as psychologically male or female (or, in some cases, both or neither).
- **Sex typing (gender typing)**: The process by which individuals acquire the behaviors, attitudes, and traits deemed appropriate for their sex in a given culture. Those who conform to these expectations are labeled "sex-typed," whereas those whose traits do not align are "cross-sex-typed."
- **Androgyny**: The combination of masculine and feminine traits within a single individual, resulting from high scores on measures of both masculinity and femininity.

2. Violating Gender Norms Is Costly

Both men and women 'pay a price' for violating gender roles.

Because gender roles are closely tied to status, men incur harsher repercussions for adopting behaviors deemed feminine (thus moving "down" in the status hierarchy), whereas women adopting traditionally masculine behaviors can be applauded (moving "up" in status).

My note: I'm not convinced about this explanation.
I think it's more because masculinity 'must be proven and upheld', while womanhood is more granted at birth.

3: Gender-Role Attitudes

Helgeson explores how attitudes shape gender perceptions, from sexism to stereotypes.

Attitudes toward Men's and Women's Roles

- **Traditional Gender Ideology**: The belief that a man's place is in the public sphere (work), while a woman's place is in the private sphere (home). Implicitly assumes men hold greater power.
- **Egalitarian Gender Ideology**: The belief that women and men should share roles equally—both can work outside and inside the home.
- **Transitional Ideology**: A middle ground wherein both sexes participate in work and family, but women still maintain primary responsibility for home, whereas men focus more on paid work.

Practical Takeaways:

- **Sexism comes in different forms be overt or 'modern'**.
  - Overt (e.g., women are less competent) versus modern (covert, denying discrimination)
  - Hostile (antagonistic) versus benevolent (paternalistic)
    Also see 'benevolent racism'

- **Benevolent sexism, despite its "positive" veneer, reinforces women's perceived inferiority**. "It justifies exploitation" (Jackman, 1994).

4: Sex-Related Comparisons: Observations

Here, Helgeson catalogs observed differences, emphasizing similarities often overshadow them.

5: Cognitive Abilities

Spatial Ability

- **Mental Rotation & Spatial Perception**: Moderate sex differences favoring men ($d \approx +.44$ to $+.60$), especially on tasks requiring rapid mental transformation of 3D objects (Voyer, Voyer, & Bryden, 1995; confirmed by later studies).
- **Object Location Memory**: Women outperform men ($d \approx +.27$) for eyes-on-table tasks, especially when objects are gender-neutral or feminine; men sometimes outperform women when objects are masculine (Voyer et al., 2007).
- **Navigation**: Men are more likely to use cardinal directions (north/east/south/west), whereas women favor landmark-based directions.

Mathematical Ability

- Historically, small sex differences favored men ($d \approx +.15$ in 1990), but gaps have narrowed over time due to educational reforms and societal shifts
- Recent large-scale standardized tests (SAT, TIMSS) show minimal or no reliable differences among most cohorts, except at the extreme upper tail (fewer females in the top 0.5%).
- **Most recent studies show no difference** but the variance in male scores remains slightly larger than in females.

Verbal Ability

Women typically score slightly higher than men on verbal fluency, reading comprehension, and writing tasks ($d \approx +.11–.21$), though differences are small and diminish with age.

- There is a small sex difference in verbal ability, favoring females.
- The size of the sex difference depends on the specific verbal ability
- Writing has a larger sex difference.
- One reason for the sex difference in verbal ability has to do with the fact that a larger proportion of males than females have verbal difficulties

Memory

- **Verbal Memory**: Women outperform men on tasks requiring recall of spoken words or stories (small to moderate effect sizes).
- **Nonverbal Memory**: Mixed findings, with some tasks favoring men (e.g., remembering spatial locations of objects) and others favoring women (e.g., remembering faces).

6: Social and Emotional Domains

Two types of aggression:

1. **Physical Aggression**: Men exhibit higher rates of direct physical aggression from adolescence onward (large effect sizes, $d \approx +.62$).
2. **Relational Aggression**: Women engage more in gossip, social exclusion, and rumor spreading—forms of indirect aggression. Adult data are more mixed.

However, the gender difference in aggression depends largely on arousal levels:

At low and high levels of arousal, sex differences in aggression are small. At medium levels of arousal, sex differences in aggression are largest.

Emotional Expression

- Women report—and exhibit—greater emotional expressiveness (d ≈ +.76 for self-report, smaller for observational measures). Facial expression studies (e.g., smile frequency) show women smile more than men in social contexts (d ≈ +.44). However, when emotion is internally felt, sex differences diminish; much of the gap reflects display rules and socialization

- Differences in emotional expressiveness vanish in one-on-one interactions but appear more prominently in group or public settings where gender norms are salient

Help-Seeking and Support

- Women are more likely to seek social support for emotional problems; men are more likely to seek instrumental help only when problems are severe (d ≈ +.30). Men's reluctance to seek help is linked to masculine norms of self-reliance
  - Muted emotions decrease support: failing to reveal one's emotions and problems makes it difficult for others to provide support when needed. Indeed, restricted emotions have been linked to reduced social support, which has been linked to increased psychological distress (Wester et al. , 2007).

- **Hep-Giving** Men help people they do not know, which is akin to helping society at large, whereas women help people they do know and with whom they have a relationship, such as family and friends
  - Men help more: according to an older meta-analysis of helping behavior (Eagly & Crowley, 1986). The effect was in the direction of males helping more than females (d = +.34). The 172 studies in this review measured actual helping behavior or the self-report of a commitment to engage in a helping behavior
  - Women more likely to volunteer: more recent literature concludes that men are more likely than women to help in situations of danger or emergencies, that women are more likely than men to help within the context of relationships (Dovidio & Penner, 2001) and in non-threatening situations such as volunteering (U.S. Department of Labor, 2009a)
  - Sex of the recipient: Males were more likely to help females than males, whereas females were equally likely to help females and males.
  - Situation: Males were more likely than females to help in situations of danger

Communication Styles

- Women use more "rapport-talk" (building connections, listening cues), whereas men use more "report-talk" (information exchange, problem-solving) (Tannen, 1990).

- Differences are often small and context-dependent—training (e.g., in mixed-gender teams) reduces miscommunication.

Sexuality

- **Women have more negative attitudes toward sex compared to me**n (Geer & Robertson, 2005). Even at younger ages, this seems to be true. A study of adolescents showed that males identified more benefits from having sex compared to females
  - Women reported more favorable attitudes than men toward gay men (study 1: d = -.18; study 2: d = -.14)

- Men report more sexual partners (study 1: d = +.36; study 2: d = +.15), more casual sex (d = +.38; d = +.18), more frequent masturbation (d = +.53; d = +.58), and greater use of pornography (d = +.63; d = +.46).

- Small differences appeared for the sex difference in sexual satisfaction (d = +.17; d = +.19), condom use (d = +.15; d = +.15), oral sex (d = +.06; d = +.16), and attitudes toward premarital sex (d = +.17; d = +.10)

Theories of Gender Differences

Theory	Description	Key Terms
Biological	Identifies genes and hormones as well as the structure and function of the brain as the cause of sex differences in cognition, behavior, and gender roles.	androgens, estrogens, corpus callosum, lateralization
Evolutionary	Extends Darwin's theory of evolution. Different social behaviors evolved in men and women because it was adaptive for survival and reproduction.	reproductive success, maternal investment, paternity uncertainty, interactionism
Psychoanalytic	Originally suggested that gender roles are acquired by identification with the same-sex parent. Today all all early relationships are emphasized.	Oedipal complex, unconscious processes, identification, object-relations theory
Social Learning	Contends that all behaviors—including those specifically related to gender role—are learned through reinforcement and/or modeling.	reinforcement, observational learning
Gender-Role Socialization	States that people and objects in the child's environment shape behavior to fit gender-role norms.	differential socialization, parental influence, sex typing
Social Role	Variant of gender-role socialization: differences in women's and men's behavior are a function of the different roles that women and men hold in our society.	agency, communion, nurturance, egoistic dominance
Cognitive Development	The child actively interprets and learns from the world. Social cognitive theory extends this by including social influences.	gender identity, gender constancy, categorization
Gender Schema	Contends that children acquire gender roles due to their propensity to process information into sex-linked categories.	gender schema, gender aschematic, androgyny

- Social role theory enjoys good empirical support and maybe the mainstream theory in current gender psychology.
  ⍰⍰♂ **Lucio's note:** roles have an impact of course, but I believe it may be overblown in gender studies
- Cognitive development theory fits well with social role theory since one must learn the social role
- Biological theory is 'harder science', but it's criticized when over-extended to explain complex behavior or when ignoring social and environmental factors
- Evolutionary theory is criticized in mainstream gender studies
  ⍰⍰♂ **Lucio's note:** but we believe here it provides strong foundations to explain structural differences, especially when it comes to reproduction-linked behaviors and attitudes (and many are)
- Psychoanalytic theory lacks empirical evidence, relies heavily on untestable concepts (e.g., Oedipal complex), and is not falsifiable and largely outdated in modern academic psychology

7: Achievement

Both genders strive for success, but men pursue status more, while women balance achievement with relationships and may fear success more, associating it with social costs.

Men's assertiveness aligns with agency, while women's communal traits can hinder bold pursuits.

Socially, parents and teachers reinforce stereotypes—girls nudged toward nurturing, boys toward competition (Kenney-Benson et al., 2006).

1 Academic Performance

- **Grades and Coursework**: Girls outperform boys in language, reading, and overall GPA; boys slightly

outperform girls in math and science courses only in certain regions or settings.
  - Gaps narrow in more egalitarian cultures, suggesting social factors heavily influence performance.

2 Interest and Motivation

- **Subjects of Interest**: Boys show greater interest in STEM fields and spatial tasks; girls show greater interest in language arts and social sciences.
- **Expectancy–Value Model**: Achievement depends on self-efficacy (belief in one's competence) and task value (perceived usefulness). Gendered expectations and stereotypes influence these perceptions early on

3 Occupational Aspirations and Choices

- **STEM Pipeline**: Fewer women pursue STEM majors, partly due to stereotype threat (fear of confirming negative stereotypes), lower self-efficacy, and lack of same-sex mentors.
- **Career Sex Typing**: Many vocations remain strongly "male-typed" (e.g., engineering) or "female-typed" (e.g., nursing). Efforts to reframe "necessary traits" (e.g., collaborative engineering) can reduce gender segregation.

4 Gender Disparities in Late Achievement

- **Glass Ceiling**: Although women now attain advanced degrees in nearly equal numbers, they remain underrepresented in top-level executive positions.
- **Work–Family Conflict**: Disproportionate family responsibilities can hamper women's career advancement. Supportive policies (e.g., flexible hours, parental leave) narrow this gap.

5 Confidence

> Evidence indicates that agentic self-definitions are related to men's self-esteem, and communal self-definitions are related to women's self-esteem.
> Men's self-esteem seems to be based on power, differentiating themselves from others, effectiveness, and independent action, whereas women's self-esteem is based on relationships and connections (Miller, 1991)

- **Women underestimate their abilities**: females earn higher grades in most subjects in school but evaluate their competence lower than that of boys—with the exception of language.
  Interestingly, women will defend other women's abilities but not necessarily their own. Collis (1991) refers to this as the "We can but I can't" paradox.
- The major factor that influences sex differences in selfconfidence is the nature of the task.
- Sex differences in self-confidence seem to be limited to masculine tasks; it is here that women tend to underestimate their performance and lack self-confidence.
- Part of the sex difference in self-confidence is due to women appearing less confident. Women are more reluctant than men to display confidence
- **Women's self-esteem is more affected by social feedback**: In Johnson and Helgeson (2002) study Women's self-esteem improved after positive supervisor evaluation and drastically decreased after negative evaluation. Men's self-esteem was unaffected by the feedback they received from their supervisor. Women also took the evaluation process more seriously, regarded the feedback as more accurate, and viewed their supervisors as credible sources.
  - Women are more influenced by feedback. Roberts and NolenHoeksema (1994, Study 2) study shows women's self-evaluation changed more than men's self-evaluations depending on feedback.
    Taken together, seems to me to mean to suggest 'thinner skin' or more fragile ego

Women evaluated their speech as more positive after receiving positive feedback and more negative after receiving negative feedback. Men's evaluations of their speech were relatively unaffected by the nature of the feedback they received. Source Adapted from Roberts and NolenHoeksema (1994, Study 2).

8: Communication

Helgeson notes women's superior non-verbal decoding (e.g., reading emotions), while men dominate physically (e.g., touching).

In leadership contexts, men lead boldly, women mediate—reflecting role expectations.

1 Conversational Styles

- **Rapport vs. Report** (Tannen, 1990):
  - **Rapport Talk** (more typical of women): Emphasizes connection, empathy, and mutual understanding.
  - **Report Talk** (more typical of men): Focuses on information exchange, problem-solving, and status assertion. This is 'high power speaking'
- Differences are context-dependent and often exaggerated by media; in mixed-gender teams, women may adopt report styles and vice versa when task demands shift.

2 Nonverbal Communication

- Women tend to maintain more eye contact, use more facial expressions, and adopt open body language. Men use more expansive gestures but less direct eye contact in mixed settings.
- Bachanneling differences: "Differences in listening cues (e.g., head nods, backchannels) can lead men to perceive women as more engaged, but women may perceive men's minimal nodding as disinterest".

3 Power Dynamics and Influence

- **Interruptions and Turn-Taking**: Men interrupt women more often in mixed settings, which can reinforce status hierarchies.

- **Persuasion**: Men rely more on factual evidence; women leverage relationships and consensus. In some contexts (e.g., negotiations), a combination of both strategies yields the best results.
- **High-power position allow the freedom to smile/not smile**: S*tatus was related to the freedom to smile rather than the tendency to smile, meaning that the high-status person could smile whenever he or she was in a good mood but the low-status person could not. The investigators suggested that people in positions of low power have constraints imposed on them in terms of how they behave; they are not as free as those in higher-power positions to express their feelings* (Hecht and LaFrance, 1998) <— This clicked and it's my current go-to explanation for the difference in smiling related to personal and rank-related power. Enlightening

4 Sex Differences in Workplace Communication

- **Feedback and Criticism**: Women receive more ambiguous feedback (e.g., "Not technical enough"), while men receive more direct feedback ("Your executable crashed"). Training managers on gender-neutral feedback can improve performance evaluations.
- **Women pay a price for power**: *a lack of communal characteristics is detrimental to women. When Hillary Clinton ran for the Democratic nominee for president of the United States, her strong, decisive, and overall agentic manner was judged harshly. Her ratings became more positive after a brief episode in which she shed a tear in response to an interviewer asking her how she was able to get out of the house everyday to hit the campaign trail. The expression of emotion reminded people of her communal qualities.*

Also see our articles:

- Why Hillary Clinton lost
- **How to combine power with femininity**
- **The curse of the successful woman** (in dating)

> Why Successful Women Fail At Dating (& How to Fix It)

9: Friendship

Friendships reveal intimacy gaps: women's are closer, with more self-disclosure, while men's are activity-based (Radmacher & Azmitia, 2006).

Men's friendships face some extra barriers—competition, homophobia, and emotional inexpressiveness—. The competition among men also leads to less disclosure, further impacting relationship closeness.

Cross-sex friendships offer men emotional support, women companionship, but face sexual tension—more so for men (Kurdek, 2008a).

1 Same-Sex Friendships

- **Women's Friendships**: Emphasize emotional intimacy, self-disclosure, and co-rumination (discussing problems repeatedly). While co-rumination strengthens bonds, it also increases risk for anxiety and depression.
- **Men's Friendships**: Focus on shared activities (sports, hobbies), mutual interests, and less overt emotional sharing. Support is often instrumental—helping fix a car or offering solutions.
- **Men can disclose more during activities**: In fact, self-disclosure between men usually takes place in the context of shared activities (Radmacher & Azmitia, 2006). Having something to do during the interaction may make men feel more comfortable self-disclosing.

2 Cross-Sex Friendships

- **Challenges**:
  - **Audience Challenge**: Concern about how others interpret the relationship (platonic vs. romantic).
  - **Emotional Bond Challenge**: Distinguishing between friendship closeness and romantic interest.
  - **Equality Challenge**: Hierarchies can emerge if one sex is perceived as having higher status.
- Both sexes report benefits from cross-sex friendships: diverse perspectives, broader social networks, and improved understanding of the other gender's experiences

3 Friendship at Work

- **Homophily**: Tendency to befriend colleagues of the same race, gender, or departmental "field."
- **Workplace Friendships**: Offer emotional support, career advice, and social resources—but may also introduce complications (conflicts of interest, gossip). Gender roles often dictate workplace friendship boundaries: men may avoid emotional topics, women may avoid discussing workplace politics if perceived as "backstabbing."

10: Romantic Relationships

- Men value physical attractiveness, women value status
- **Demand/Withdraw Pattern**: Common—one partner (often the woman) demands discussion; the other (often the man) withdraws. This pattern predicts greater marital dissatisfaction
  - **Conflict**: Women confront, men retreat
- **Emotional intimacy VS physical**: Women emphasize emotional intimacy as essential to sexual satisfaction; men more often focus on physical aspects. Marital quality correlates more strongly with women's perceptions of emotional closeness.
- **Men better assessed partner's infidelity**: Men were fairly certain that their partner either did or did not have sex with someone else, whereas women expressed more uncertainty. Men were much more accurate in detecting infidelity (75% vs. 41%), but slightly less accurate in detecting fidelity (93% vs. 96%)
- Women are more strongly affected than men by their partners
- **Power Play**: Emotional detachment gives men leverage; women invest more.
- **Increased masculine behavior 'allows' men to increase self-disclosure** One way in which men are able to be expressive in the context of relationships is by compensating with increased masculine behavior in other arenas, such as more instrumental behavior (Migliaccio, 2009).

Explanation	Supporting Evidence	Counter-Evidence
Evolutionary Theory	Cross-culturally men outweight attractiveness and women status Men's preference for physical attractiveness is not affected by culture gender traditionalityor by time Cross-culturally men rate domestic skills as more important than women	Attractive women are not paired with high status men

Explanation	Supporting Evidence	Counter-Evidence
Social Role Theory	Cross-cultural evidence that women rate status as more important than men Cross-cultural evidence that men rate domestic skills as more important than women Greater sex differences in mate preferences in cultures with distinct female and male roles	Sex differences in mate preferences reduced when men and women have less traditional gender-role attitudes Sex differences in mate preferences reduced over time as women's and men's roles have become more similar Cross-cultural evidence men rate attractiveness as more important than women
Social Construction Theory	Cultural differences in mate preferences Greater sex differences in mate preferences in cultures with distinct male and female roles	

11: Sex Differences in Health: Evidence and Explanations

The health paradox—women's higher morbidity, men's higher mortality—anchors this chapter (Mitra & Shroff, 2008).

- Health Split: Women live longer but ail more; men die sooner from risks.
- Behavior: Men's bravado (e.g., avoiding doctors) contrasts women's health focus.
- Biology: Women's physiology (e.g., less alcohol dilution) heightens some risks.
- **Help-Seeking Norms**: Masculine norms discourage vulnerability—men delay care until illnesses are advanced

Agency is the best predictor of health

> agency has been associated with greater perceived health, fewer physical symptoms, reduced psychological distress, reduced psychiatric problems, and better physical health (Ghaed & Gallo, 2006; Helgeson, 1994c). Agency also has been linked to a variety of good health practices, including physical activity, healthy eating, and good dental hygiene (Danoff-Burg, Mosher, & Grant, 2006). By contrast, communion is typically unrelated to psychological or physical health (Ghaed & Gallo, 2006; Helgeson, 1994c).Thus, some of men's lower morbidity rates compared to women may be explained by the male genderrelated trait of agency

However, as for everything, balance:

> unmitigated agency has been associated with reckless driving, substance use, binge eating, psychological distress, and overall lower levels of well-being (Danoff-Burg et al. , 2006; Ghaed & Gallo, 2006; Yu & Xie, 2008).
> Although communion is typically unrelated to health, unmitigated communion is associated with poor health, especially greater psychological distress, disturbed eating behavior, and poor health behavior (Ghaed & Gallo, 2006; Helgeson & Fritz, 1996, 1998; Helgeson et al. , 2007; Yu & Xie, 2008)

For the record, this is the difference:

Agency

- **Definition:** Focus on the self — independence, assertiveness, control, achievement.
- **Examples:** Ambition, leadership, self-reliance, competence.

- **“I act” / “I achieve.”**

Communion

- **Definition:** Focus on others — warmth, cooperation, connection, nurturance.
- **Examples:** Empathy, kindness, emotional support, belonging.
- **“I belong” / “I care.”**

Unmitigated agency and communion refer to extreme versions of each.

Trait	Healthy Balance	Unhealthy Extremes
Agency	Assertiveness, positive dominance, autonomy	**Unmitigated Agency**: Selfishness, over-dominance
Communion	Empathy, connection	**Unmitigated Communion**: Self-erasure, codependency

12: Relationships and Health

Marriage benefits health, more for men (Kurdek, 2008a).
Women’s caregiving burdens offset gains, while men lean on wives for support. Relationship quality hits women harder—e.g., marital conflict spikes their stress (Heyman et al., 2009).

- Support: Women give more, men receive—roles dictate health impacts.
- Divorce leads to declines in health for both sexes but more for men. “Widowers” (men) also often suffer steeper drops in health and well-being

13: Mental Health

Women report more depression, men more substance abuse (except only for sedatives).
Women ruminate, men externalize distress. Suicide flips: men complete it more, women attempt it (Phillips, Li, & Zhang, 2002).

1 Depression

- Women have roughly twice the lifetime risk of major depressive disorder compared to men, albeit men’s depression may be undiagnosed, and some of it self-medicated with alcohol abuse.
- Explanations include:
- **Biological**: Hormonal fluctuations (e.g., postpartum, perimenopause).
- **Psychosocial**: Women’s greater tendency to ruminate
- **Gender-Role Strain**: Rigid feminine norms (e.g., self-sacrifice, appearance pressures) exacerbate vulnerability

2 Eating Disorders (Anorexia, Bulimia, Binge Eating)

- Predominantly affect women (10:1 female:male ratio). Body dissatisfaction, internalization of Western beauty ideals, and perfectionistic personality traits fuel these disorders
- **Social Comparison** and **Self-Objectification**: Viewing oneself through an external lens predicts higher risk—women’s self-worth often tied to appearance

3 Suicide and Self-Harm

- Although more women attempt suicide, men die by suicide at higher rates (approx. 3:1), partially due to more lethal methods and potentially also by gender role where ‘getting it done’ is a more masculine ambition.

- **Help-Seeking Norms**: Men's reluctance to express vulnerability delays intervention
- **Depression and Substance Use**: Co-occurrence with alcohol/drug misuse is higher in men, increasing suicide lethality

MORE WISDOM

Hypermasculine Men More Dominant And Anti-Gay

> People who score high on hypermasculinity (extreme masculinity), have traditional gender-role attitudes, have a greater desire for dominance, and score high on benevolent or modern sexism have the most negative attitudes toward homosexuality (Kite & Whitley, 2003; Whitley & Egisdottir, 2000).
> This is not surprising because homosexual behavior is a threat to traditional beliefs about men's and women's roles. Men are less tolerant than women of homosexuality because violation of the male gender role has more negative consequences. Because the male gender role has a higher status in our society, there is more to lose by violating the role.

Lucio's note: hypermasculinity is a misguided measure
While I initially thought this was interesting and telling, I was appaled to find out that hypermasculinity is measured with questions that I'd largely consider to capture toxic masculinity.
I'm worried that any literature using this scale may be biased.

And...

Derogation of Evaluator Can Help Maintain Self-Esteem

> Men who received negative feedback appeared to prepare themselves psychologically for the upcoming evaluation by derogating the source of the feedback ("My supervisor isn't that smart") and the feedback system ("The evaluation process is not fair"). In general, the results of this study supported the laboratory findings

Women May Influence & Be More Influenced Because of Agreeableness

The author claims that women tend to be more easily influenced than men not because of some inherent 'influenceability', but because people tend to approach women with a more agreeable attitude that's generally more conducive to influencing others.

My note: Interesting theory, but not enough
It's a valid theory that made me reflect and I think there may be some truth to it.
However, men likely resist influence more because influence is about power.

On the other hand, women are also more able to influence:

> Although male respondents rated the female tentative speaker as less competent and less knowledgeable than the female assertive speaker, they were more influenced by her

Judge Power Dynamics Best Measure Relationship Power Dynamics

Albeit the author doesn't refer to them as 'judge power dynamics' or 'emotional power dynamics', that's what it boils down to (redacted for brevity):

> One of the difficulties with studies of the distribution of power in relationships is that they are based on self-report.
> A more creative methodology to assess power in relationships was developed (Wagner et al. , 1990).
> The investigators asked women and men to imagine they bought a fairly expensive product and their spouse either approved or disapproved.
> Respondents were asked to rate how good or bad they would feel in each situation. The discrepancy between how the person felt when the spouse disapproved versus approved represented "dependence on the other's agreement," which would reflect low power.

QUOTES

On differences being more provocative and marketing-friendly:

> If there are more similarities than differences between women and men, why does it seem that women and men are so different?
> Why do books like John Gray's (1992) Men Are from Mars, Women Are from Venus become best sellers if men and women are not opposites?
> Why did my father respond to the publication of this textbook by saying, "If you can figure out why men and women are so different, that would become a best seller!" One reason is that differences are more salient and more provocative than similarities

(the author seems to have a thing against Men Are From Mars :)):

> Aristotle had one theory of sex differences. Somewhat later, John Gray (1992) set forth another in Men Are from Mars, Women Are from Venus
> (…)
> These two theories about the origin of sex differences are quite different and hardly comparable. The first was developed by a famous world-renowned philosopher, the second by a person with a questionable educational background.

On men needing little relationship change besides…

> Another explanation for the wife demand/husband withdraw pattern is that it is wives who most often want change in the relationship.
> A study asked couples about the changes that they would like to see (Heyman et al. , 2009) (…) Women wanted spouses to participate more in household chores, be more involved in parenting, express more emotion, and spend more time with them.
> Men, by contrast, requested change in only one area—increased sex.

CRITICISM

Evolutionary theory could be better implemented

The author says:

> Among those who scored above 700 on the SAT math exam, the ratio of male to female was 13:1 20 years ago, but it is 2.8:1 today. There also is evidence that men's math scores are more variable than women's math scores (Halpern et al. , 2007; Hyde et al. , 2008), and the reason for this is not clear

One possible explanation, grounded in evolutionary theory, is that men are more likely to occupy the extremes of many trait distributions—both high and low—because the potential genetic payoff for men at the high end is much greater.

Unlike women, whose reproductive success is relatively stable and biologically constrained, men can father many more offspring if they achieve high status or success. This creates evolutionary pressure for greater risk-taking and variability, especially in traits like spatial or mathematical ability that historically contributed to status or resource acquisition.

Criticism of evolutionary theory are misplaced

Says the author:

> One limitation of evolutionary theory is the inability to explain behaviors that do not maximize reproductive success, such as homosexuality, adoption of children, and suicide.
> A second limitation is that evolutionary theory does not account for individual differences or cultural differences in behavior

I don't think those are limitations at all.

Evolutionary theory doesn't claim that every single behavior must directly lead to reproduction maximixation with perfect efficiency.
Rather, it explains how traits and tendencies that were adaptive on average across ancestral environments are selected for with a *tendency* towards effective survival and reproduction.

Her examples are also no evidence of evolutionary theories limitation.
Instead, evolutionary theory explains adoption quite well. It's a byproduct of people tendency to love and care for children.

And evolutionary theory doesn't have to 'account for individual differences' because it's not written anywhere that evolution should make every single organism the same.
As a matter of fact, evolution wouldn't exist in the first place if every individual was the exact same because evolution works based on genetic differences and mutations.

And again later the author writes:

> Today, I doubt that the majority of men are thinking about establishing paternity and the majority of women are thinking about their partners' ability to support a child when deciding whether or not to engage in sex

What's this supposed to mean, that evolutionary forces stopped operating in modern times?

The criticism also seems to stem, again, from not fully appreciating evolutionary mechanisms.
Cognitive processes meant to aid survival and reproduction are rarely conscious.

Some explanations felt ad-hoc rationalizations

For example:

> Men are less tolerant than women of homosexuality because violation of the male gender role has more negative consequences. Because the male gender role has a higher status in our society, there is more to lose by violating the role.

I'm not convinced that's the only or main reason.
Men are less tolerant than women of homosexuality because it's more costly for a man to be gay, than for a woman to be more 'sexually fluid'.

Also, since men aren't nearly as sexually fluid as women, a man who's into other men is more likely to be gay, rather than 'bi' or 'open-minded'.

Or in explaining the difference of suicide rate in China:

> China is an exception to the sex difference in suicide rates (…) A major reason is the low status of women (…) Second, there are no religious sanctions against suicide

However, the 'no religious sanctions' doesn't explain the difference because it applies to both men and women.
If the author had said that women tend to be more religious, which as far as I know is true, it may be more logically justified.
But it would still be a deficient explanation because many other countries with no religious sanction do not see higher suicide rates among women.

Some explanations felt over-reaching

The author dedicate a sizable portion of men's and women's different self-esteem levels to how teacher's feedback impacts pupils:

> When girls receive negative feedback, it is more likely to be related to their schoolwork than work-irrelevant domains; thus girls take negative feedback seriously. Boys, by contrast, are able to discount negative feedback because it usually has nothing to do with the intellectual aspects of their performance.

While this may, in part, explain the self-esteem gap and why women take evaluators' feedback more seriously, I was no convinced, and I wished the author bracketed with more hypothetical language.

And:

> Traditional gender roles partly explain these findings. In cultures where women and men have traditional roles, women gain weight due to childbearing; they also lack time for leisure exercise due to the burden of household chores

But women also have children in 'non-traditional' societies.
And the 'burden of household chores' IS exercise.

Sometimes socialization and nurture over nature

For example:

> Why is boys' play louder and more aggressive than girls' play? One possibility is the socialization hypothesis. Children may model same-sex play from parents. Aside from each other, mothers and fathers are typically

> friends with people of the same sex

Sure that may account for a sliver of the observed differences.
But… How about different genes and biology?

And worse yet in my opinion was:

> We are socialized to view members of the other sex as potential romantic and sexual partners.

I believe the opposite is true.
We are socialized to treat members of the opposite sex asexually but nature just 'gets in the way'.
As a matter of fact, some guys need to un-learn socialization to succeed in dating.

PROS

- **Good overview** of gender psychology, it was my #1 favorite handbook on the topic
- **Engaging format** mixing rigorous evidence with 'ease of reading'.
  It includes 'take home bullet points' to summarize the chapters, plenty of pictures, fun anecdotes, and even home exercises (I would have skipped those, but may be the author uses this as a textbook for her courses?)
- **Capable author** with knowledge, research experience and writing skills

REVIEW

The Psychology of Gender is a fantastic book for an overview of gender commonalities, differences, and the causes of those differences.

Although I found it to lean towards nurture and social constructionism, it made my short list of the best resources on this topic, and it's thus far my favorite handbook.
It's practical, almost as easy as a mainstream book, while still providing an evidence-based overview of the available literature.

It may be the resource on this topic, and it provided us with the most empirical evidence for our articles on masculinity.
And that's the highest compliment I can pay to any book.

The Routledge Handbook of Soft Power: Summary & Review

Lucio Buffalmano · 2 July 2025 · Archived copy · Original

The Routledge Handbook of Soft Power (2023) is a comprehensive overview of soft power theory and practice. It reframes soft power as a dynamic process shaped by intention, audience, and experience.

Contents

- FULL SUMMARY
  - Definitions of Soft Power
  - Shared Identity Is About (Soft) Power
  - Taking a Measure of Attraction-Based Influence
  - The Gift of Grace: Soft Power, Charisma, and Transatlantic Relations
  - Measuring Soft Power: Quantitative Analyses & Results
  - The Use of the Soft Power Concept in Empirical Studies
  - Russia's Authoritarianism Can Help Its Soft Power
  - A Study of Soft Power Rankings: Concepts, Method(ology), and Evaluation
  - States vs. Tech Giants: Who Is Wielding Soft Power?
  - It's a MAD World: Mutually Assured Delegitimization
  - Soft Power of First Ladies
- MORE WISDOM
- QUOTES
- ⍰⍰♂ Lucio's Analysis
  - I wished for more evidence, less philosophy
  - Some Conflicting Claims Left Me Wishing For More Consensus
  - Interesting Speculations & Questions, But Few Answers

- REVIEW

FULL SUMMARY

About the Authors:
Each chapter has a different author, and the main editors are:
Naren J. Chitty
Founding Director of the Soft Power Analysis and Resource Centre (SPARC) at Macquarie University, Australia. Chitty is a pioneer in soft power research, with a background in international communication and public diplomacy.
Li Ji
Associate Professor at the School of Journalism and Communication, Renmin University of China. Li specializes in media studies, public diplomacy, and soft power metrics, with a focus on China's global image and strategic communication.
Craig Hayden
Professor at Marine Corps University in the U.S. and an expert in public diplomacy, strategic communication, and international broadcasting. His work often examines U.S. foreign policy and the institutional practice of soft power through media and diplomacy.

Definitions of Soft Power

Soft power has been criticized for being a 'fuzzy term', so we list a few definitions:

> in Nye's words (2004, p. 6): 'Simply put, in behavioral terms soft power is attractive power'.

A simple definition of soft power, quoting Joseph Nye (2021, p. 201):

> 'Hard power is push; soft power is pull'.

Not everyone agrees the definition is fuzzy though:

> One of the mistakes often made when defining the concept of soft power is to argue that it is an all-encompassing term; it is not. It can be considered a *pull factor* associated with 'legitimate agenda setting, persuasion, the attractiveness of values' and the 'impression of kindness, competence or charisma'; this stands in contrast to hard power, which functions as a *push factor,* employing the 'use of force, payment and some agenda-setting based on it'

However, the difference between soft and hard power is not always obvious:

> However, soft and hard power resources are not as clear-cut and distinguishable as they may initially seem. They vary along a spectrum.
> The actor who generates soft power is also not always clear-cut.
> Hard power resources can generate soft power outcomes (Nye 2021, p. 201).

> Soft power, first coined by Joseph Nye, is defined as 'the ability to affect others through the cooptive means of framing the agenda, persuading, and eliciting positive attraction in order to obtain preferred outcomes' (2011a, pp. 20–21).
> By contrast with hard power, Nye (2004) claims that soft power gets the desired outcomes through attraction rather than coercion or payments.
>
> 'hard power threatens, soft power seduces. Hard power dissuades; soft power persuades' (Fraser 2003, p. 10)

> Soft power is ‘a synonym for all state-led activities in the international realm that do not involve military force’ (Flew 2016, p. 290)

Shared Identity Is About (Soft) Power

> Another fraught issue relates to power relations and deciding what constitutes cultural heritage. Given that power plays an essential role in the construction of heritage, symbols relating to the identity of the dominant cultural group often determine what constitutes shared heritage. This occurs often to the exclusion of the other identities, and decisions to exclude the heritage of ‘others’ within a community are not random, as parties often clash over such decisions (Blake 2015, p. 284).

Taking a Measure of Attraction-Based Influence

This opening chapter introduces the theoretical perspectives on soft power, framing it as attraction-based influence. It highlights the challenge of measuring its intangible nature compared to metrics like GDP and setting the stage for deeper theoretical discussions.

- Soft power centers on attraction and persuasion, distinct from hard power.
- Measuring soft power is difficult due to its intangibility.

Soft ‘depends’ more on the target

> [S]uccess in terms of outcomes is more in the control of the target than is often the case with hard power’ (Nye 2011, p. 83). Messages are refracted, accepted, or rejected through interpretation (Hall 1980). ‘Derridean interpretation is specifically counter-intentional. As Derrida explains in Dissemination, the deconstructive “reading must always aim at a certain relationship, unperceived by the writer”’ (Hogan 1990, p. 52).

The Gift of Grace: Soft Power, Charisma, and Transatlantic Relations

Ohnesorge explores charisma as a vital soft power component, focusing on transatlantic relations between Germany and the United States.

Drawing on Max Weber’s concept of charisma, the chapter positions charismatic leaders as agents who amplify national attractiveness.

It illustrates how U.S. presidents’ charisma has shaped transatlantic ties, both positively and negatively, providing a fresh lens on soft power’s personal dimension.

- Charisma boosts soft power by inspiring admiration.
- Charismatic men tend to lead during ‘moments of distress’ called ‘Charismatic Situation, (M Rainer Lepsius (1993, pp. 100–101)
  - External circumstances and results also contributes to charismatic leaders’ demise: Napoleon forfeited a considerable share of his personal charisma after Waterloo (Ohnesorge 2020, p. 123)
- Today charisma and soft power can be closely tied to oratory
- Charisma and soft power can be used for good or for ‘bad’. Osama Bin Laden was charismatic: he didn’t recruit followers with coercion and neither did he pay them
- Different audiences find different traits and people charismatic

Measuring Soft Power: Quantitative Analyses & Results

Irene Wu addresses the challenge of measuring soft power.

The chapter introduces the "Soft Power Rubric," which tracks behaviors like foreign public opinion and cross-border engagement, offering a practical framework for assessing soft power's effects.

- Quantitative tools measure soft power through behaviors.
- **Foreign public opinion creates foreign policy opportunities**:
  - Goldsmith and Horiuchi (2012) show that countries with a high opinion of US foreign policy were far more likely to send troops to join the United States in Iraq.
  - **Countries with soft power win more cooperation** from and increased trade with other countries. Further, they attract more students, tourists, and foreign direct investment.
- Coca Cola and Starbucks grew despite negative American sentiment (Datta, 2014), but visits to the US and studying to the US were significantly correlated to a favorable/unfavorable view of the US
- **The more a soft-power a country has, the more it exports** (Rose, 2016) *His 2016 study concludes that if an importer perceives an exporting country to be a positive influence in the world, then the importer buys more from that country, holding constant other factors such as common language, common land border, membership in the same regional trade agreement or currency union, and a former colonial relationship. Rose (2016) concludes that a 1 percent increase in perceived positive influence raises exports by about 0.8 percent.*
- The effect of sanctions on exports is smaller than soft power
- **Takeaway**: For countries interested in growing their soft power resources, the policy implications are to open their societies to more social interaction with foreigners, immigrants, international students, visitors, and foreign media. Opening up more, of course, may mean that their own society may change as a result.

Measuring Soft Power Is Difficult (Li Ji)

Li Ji tackles the difficulty of measuring soft power's intangible effects, proposing an audience-centered framework.

> The presumption of soft power effects is that soft power will be effective on subjects if they are attractive, charming, credible and trustworthy, in line with a range of behaviours (e.g. framing, agenda-setting and attraction) conducted by agents.

- Soft power's intangibility complicates measurement.
- Framing analysis assesses audience perceptions.

The Use of the Soft Power Concept in Empirical Studies

Novelli and Pereira critique soft power's application in empirical research, noting deficiencies in defining goals, audiences, and causal mechanisms.

- Empirical studies often lack clear soft power definitions.
- Soft power is highly contextual when it comes to effectiveness
- Many studies on soft power are of low quality

> Our systematic analysis of empirical studies that employ the concept of soft power confirmed expected shortcomings in the use of the concept.
> The most common problem was the vagueness regarding the causal mechanisms in action, i.e., how resources produce soft power, and how this soft power could be used to achieve political goals.
> Even among studies that addressed conversion mechanisms, a common approach was to only address how

> resources are converted into soft power, overlooking how a given state could accomplish a certain goal through this soft power – that when goals were even set out at all.

Russia's Authoritarianism Can Help Its Soft Power

The authors critique simplistic approaches that claim that framing the Russian state as authoritarian necessarily disempowers Russia's soft power:

> However, these premises seem to ignore a fundamental point: the authoritarian values associated with the Russian government may be attractive to certain audiences. Authors such as Jackson (2010), Ferguson (2012), Wilson (2015a), and Horvath (2016) have demonstrated how Russia's strategies for Central Asia, largely focused on proposing alternatives to Western models and values, have garnered support from local elites precisely because of their authoritarian content. Concurrently, these same strategies have yielded far worse results in Eastern Europe, where Russia's political model and values do not seem to be as effective in the eyes of increasingly pro-European Union domestic elites (Saari 2014).

A Study of Soft Power Rankings: Concepts, Method(ology), and Evaluation

Wang evaluates soft power rankings, analyzing five major projects' methodologies, but

advocating for improved ranking methods to capture soft power's nuances.

- Rankings vary in criteria and subjectivity.
- *There is only limited strategic value for investing in soft power resources for purposes of growing influence. All rankers failed to show causality between known soft power qualities and efficiency of strategic deployment of soft power strategies in terms of achieving intended outcomes*
- a soft-power measure that is credible to all, applicable to every country whatever the circumstances, is perhaps outside the realm of possibility. This does not mean the quest is useless. Indeed, it has value

States vs. Tech Giants: Who Is Wielding Soft Power?

Massa and Anzera explore the rivalry between states and tech giants in wielding soft power via online platforms. Tech companies' information control challenges state influence, urging adaptive strategies to maintain national soft power.

- Tech giants rival states in digital soft power.
- Tech giants promote many Western values, even with their platforms' rules and regulations, based on copyrights, and running on ads/capitalism
- Platform exercise 'invisible form of power' in selecting what to promote: *The most relevant case is algorithms, those computational mechanisms involved in selecting and hierarchizing content and preferences on behalf of users.*
- States must adapt to retain influence.

It's a MAD World: Mutually Assured Delegitimization

Manor examines how diplomats' online crisis framing can lead to mutual delegitimization.

When states engage in mutual delegitimization on social media, as seen in the 2014 Gaza War and Crimean Crisis, they may both suffer soft disempowerment. This dynamic leads to what the chapter terms MAD—Mutually Assured Delegitimization: a lose-lose scenario where all parties involved undermine their own credibility and soft power.

- Studies demonstrate that during crises, states use social media to create normative contrasts and to demonstrate an adversary's lack of adherence with accepted norms and ideals (Manor and Crilley, 2018a; Manor and Crilley, 2018b)
- 'Soft disempowerment' refers to 'actions, inactions and/or policies of a state that ultimately upset, offend or alienate others, leading to a loss of credibility and attractiveness' (Brannagan and Giulianotti, 2015, pp. 1152–1153)
  - Violation of laws and rules, typically exposed by the press (e.g., Qatar's bribery scandal during its World Cup bid).
  - Failure to uphold global norms and conventions, often highlighted by NGOs (e.g., Qatar's treatment of migrant workers).
- Social power is the ability to set standards, and create norms and ideals, that are deemed as both legitimate and desirable by the international community, without resorting to coercion or payment (Van Ham, 2013).

Soft Power of First Ladies

Marczuk investigates First Ladies' soft power roles in France and Poland, showing how their activities complement diplomacy.
First ladies' 'job' is to strengthen their presidential spouse's credibility.

The three powers of first ladies are:

1. **Benign Power –** Generated through kindness, compassion, and charitable engagement. First Ladies display this by supporting vulnerable groups, advocating for social issues like women's rights, and acting as social activists or goodwill ambassadors.
2. **Brilliant Power –** Arises from prestige, competence, and refined conduct. This is seen when First Ladies demonstrate diplomatic skill, charm, and etiquette in roles such as companion, aesthete, or surrogate during state visits.
3. **Beautiful Power –** Refers to moral beauty or charisma rooted in values, not appearance. It is displayed when First Ladies inspire through international roles, promoting cultural respect, credibility, and goodwill abroad.

I would have liked to see more evidence-backed analyses of first ladies' effects, including possible negative effects on their husbands.
For example:

MORE WISDOM

- Trump sapped US' soft power

> a reversed trend can be observed in the wake of the inauguration of Donald Trump, in whom Germans, in particular, had very little confidence (11% in 2017; 10% in 2018). Impressively attesting to the significance of the personality factor in soft power, the opinion of the United States declined during the same period of time from 57% in 2016 (Obama's last full year in office) to 35% in 2017 and 30% in 2018 (Trump's first two years in the White House). Trump, in short, was deeply harmful to the US image in Germany, and consequently – and contrary to his grandiose rhetoric – he did make America a good deal weaker in terms of its soft power, at least vis-à-vis Germany.

Also read more in our article:

- **How Trump makes US weaker and EU stronger**

> Why Aggressive US Foreign Policy Undermines Its Hegemony

- Cultural heritage reflects national identity as a soft power tool.
- Digitalization is a double-edged sword for states: it allows for more connectivity, but it reduces soft power control
- **National brand is…** : *As a "mental image of the country held by foreign people," a nation brand is "the total sum of all perceptions of a nation in the minds of international stakeholders, which may contain some of the following elements: people, place, culture/language, history, food, fashion, famous faces (celebrities), global brands and so on" (Fan 2010, p. 98).*
- **Covid quickly reshaped countries' 'national brand'**, framing effective crisis management as a civic virtue. Trust, transparency, and cooperation enhanced nations' images. Korea and Taiwan emerged as leaders. Donations later boosted donors' soft power, including for Russia.
  Later on bigger powers who developed and shared vaccines took the lead transitioning from medical diplomacy to pandemic soft power, offering insights into health crises
- **The contact hypothesis** (e.g., Pettigrew & Tropp 2006) proposed that increased interaction between people increases mutual understanding and decreases prejudice.
  - However, as Allport (1954) explained, reducing anxiety and prejudice and increasing empathy, requires conditions of contact such as equal status, common goals, and cooperation, otherwise…
  - Casual, and superficial contact will result in stereotyping.
- **Apologizing is crucial to mending relationships**: The most frequent reasons given by those with a negative impression of Japan were that the Japanese had not apologized and reflected on their history of invading China (77.5%)

QUOTES

A popular quote on 'power VS influence':

> All power is influence but not all influence is power, power being intended influence (Lasswell & Kaplan 1950)

We also agree with Bertrand Russell (1938):

> Power has many forms, such as wealth, armaments, civil authority, influence on opinion.
> No one of these can be regarded as subordinate to any other, and there is no one form from which the others are derivative. The attempt to treat one form of power, say wealth, in isolation, can only be partially successful.

On soft power being in the hands of the followers, quoting Bryan R Wilson (1975, p. 5):

> an illustrative example of the mandatory provision of such a followship, 'If a man runs naked down the street proclaiming that he alone can save others from impending doom, and if he immediately wins a following, then he is a charismatic leader: a social relationship has come into being. If he does not win a following, he is simply a lunatic'.

On the 'dark' power of soft power:

> Sure, he has a lot of soft power. He proved this when he brought down the Twin Towers. Bin Laden did not hold a gun to the heads of the people who flew the planes. He did not pay them either. They did it because they were attracted by his convictions.

Social media empower individuals and disempower journalists:

> The interaction of 'old' and 'new' media goes beyond international broadcasting. If the adoption of social media is disempowering for journalists and news organisations, by virtue of disintermediation, publics have been empowered to engage with foreign policy issues in innovative ways.

On Germany's great reputation:

> German soft power has made foreign leaders and publics confident that 'Germany will do the right thing'.

On the need for cooperation in global challenges:

> To borrow the analogy used by US President Franklin D. Roosevelt in the 1941 Lend Lease Act, you should lend your neighbours your garden hose if their house is on fire and thereby keep the fire from spreading to your house.

⍰⍰♂ Lucio's Analysis

Please note these aren't as much about the book itself, which is excellent, but more about the state of international relations in general:

I wished for more evidence, less philosophy

The early chapters are overly reliant on philosophical perspectives and theoretical contributions from individual thinkers, with limited empirical support.

The references to Max Weber, Kant, Aristotle, or Foucault aren't what I usually look for in a handbook.
There was also Machiavelli, and we love the construct here—but it's still not empirical evidence.

This risks portraying, or even showing, soft power as a largely conceptual construct, rather than one grounded in evidence or data.
Unfortunately, this may be exactly the case, and it's something I've noticed for international relations in general.

Some Conflicting Claims Left Me Wishing For More Consensus

While some chapters claimed a relationship between soft power and some measures of a state's success, others claimed a lack of causality between soft power, and achieving intended outcomes.

Somehow, I felt the latter was more correct, casting some questions about the state of the research literature in political science.

Interesting Speculations & Questions, But Few Answers

Compared to more mature social sciences like psychology, I found soft power research (and international relations in general) to provide fewer 'answers'.

For example, if you read a handbook on persuasion, you can walk away with many strategies and techniques to craft your messages for higher persuasion.

But if you were a top politician, a handbook on political science may not give you the same clarity on how to do a better job.

REVIEW

The Routledge Handbook of Soft Power stands as the first and currently unique multi-author book on soft power.

I'm thankful to the authors, glad I could read it, and I learned from it.

However, I can't deny I was hoping for something more 'concrete'.
What left me wanting more was not the handbook—authored by many accomplished scholars—but the state of the field itself. It feels relatively underdeveloped and still in need of a broader, more mature body of empirical research.

I look forward to their future work when stronger empirical foundations will hopefully yield more practical insights.

The Power of Framing: Summary & Review

Lucio Buffalmano · 9 July 2025 · Archived copy · Original

The Power of Framing (2010) by Gail Fairhurst explores how leaders shape meaning through deliberate language and messaging. Drawing on communication theory and real-world leadership, the book teaches how to use framing to influence perception, drive change, and inspire action.

Contents

- Key Takeaways
- Notes

- REVIEW

Key Takeaways

- **Become a *strategic* communicator**, calibrating your message to the audience and goal
- **Frame your mind well first**, with empowered thoughts, and then let good communication follow

Notes

About the Author:
Gail T. Fairhurst, Ph.D., is a professor of communication at the University of Cincinnati, specializing in leadership and organizational communication. An award-winning scholar and International Communication Association Fellow, she's authored Discursive Leadership and consulted for Procter & Gamble, Boeing, and others.

The Reality of Framing

Leaders don't just report facts; they craft perceptions.

The author proposes six Reality-Construction Rules you can use immediately:

1. **Control the context**— choose which facts and metaphors to highlight.
2. **Define the situation**— name it (e.g. "crisis," "turnaround"), and you shape how people will react.
3. **Apply ethics**— own your moral positioning; avoid misleading framing that erodes credibility.
4. **Interpret uncertainty**— in ambiguous moments, step in to make sense of events.
5. **Design the response**— figure out what "leadership" means in your role (Framing Tool 1.1) and persuade others you're delivering it.
6. **Control spontaneity**— prime your unconscious so that your in-the-moment reactions align with your intended message.

Practical Takeaways and Exercises

- **Map a past "critical incident"** in your own leadership to see where you could reframe more effectively.
- **Communications Style Inventory**: Assess your communication style—Expressive (emotion-driven), Conventional (rule-bound), or Strategic (context-savvy)—to pinpoint your framing strengths and blind spots.
- **Framing Tool 1.1: Designing Leadership**: Answer reflective questions about stakeholders, admired leaders, and personal experiences to define leadership in your context, sharpening your framing focus.
- **Framing Tool 1.2: Critical Incident Framing**: Analyze a past leadership challenge—how did you frame it, and was it effective? This exercise reveals how your words shape outcomes.

The 3 Communication Styles

Based on Barbara J. O 'Keefe's research on Message Design Logic:

1. Expressive Communication

> The Expressive says, " Because that ' s what I was thinking! " Expressives say what they are thinking with very little editing.

- **Goal:** To **express personal feelings or thoughts** honestly and spontaneously.
- **Style:** Raw, emotional, unfiltered.
- **When used:** In moments of authenticity, vulnerability, or emotional connection.
- **Strengths:** Builds trust, shows passion, humanizes the leader.

- **Risks:** Can backfire if off-message, impulsive, or perceived as inappropriate for the context.

 Use it when you need to build emotional credibility or rally others with genuine conviction.

---

2. Conventional Communication

> The Conventional says, " Because that is the appropriate thing to say for this situation. " Conventionals follow social norms for communicating with others

- **Goal:** To **conform to social or organizational norms** and expectations.
- **Style:** Safe, neutral, expected.
- **When used:** In formal settings (e.g. meetings, protocols, reports).
- **Strengths:** Maintains professionalism, reduces risk, supports stability.
- **Risks:** Can be bland, forgettable, or fail to inspire action.

 Use it when protocol matters, but be cautious if your message needs to stand out or move people.

---

3. Strategic Communication

> The Strategic says, " Because that is the best course of action given my strategic goals. " Strategics see situations as mutable, thus they understand that they play a major role in shaping the context.

This is the "framing" style central to the book, and it felt to me overlapping with the strategic predisposition of Machiavellians, while also adding an ethical layer (exactly what we do here at TPM):

- **Goal:** To **achieve specific effects**—influence perception, shape behavior, or guide decisions.
- **Style:** Purposeful, framed, audience-focused.
- **When used:** In leadership moments—change efforts, crises, major decisions.
- **Strengths:** Highly effective, persuasive, adaptable.
- **Risks:** May seem manipulative if overused or inauthentic.

 choose your words, symbols, and metaphors deliberately to lead people toward your goals.

Strategics find opportunities:

> that's what Strategics do. They make or find opportunities when the rest of us are usually rule or role-bound.

And they can use all styles to fit the situation:

> One other key issue regarding Message Design Logic concerns a leader's ability to use all three styles. Interestingly, O ' Keefe ' s work suggests that Expressives are usually Expressive most of the time. Conventionals can be either Conventional or Expressive, while Strategics can be all three given their chameleon-like language skills

Also read:

- How to be positively Machiavellian

> 15 Steps to Be A Good Machiavellian: Your Secret Playbook

A Frame Is *Both* Mind & Communication

Albeit seeming 'simple' after you read it, this was one of the deepest and most useful concepts:

> Is it a structured way of thinking or an act of communicating?
> In reality, it is both, because a frame is that mental picture, and framing is the process of communicating that picture to others.

The Art of Framing

Framing is a craft you can hone.
Four essential devices:

1. **Metaphors** ("turning the corner," "tightening the screws").
2. **Master frames** (overarching organizing ideas, e.g. "customer obsession" or "women helping women").
3. **Simplifying frames** (tunnel your audience's focus to one aspect, like "safety first").
4. **Believability frames** (evidence, testimonials, narratives that build credibility).
   • Combining devices (metaphor + master frame + data) multiplies impact.
   • Practical exercise: rewrite one of your stale slide decks by adding a central metaphor and anchoring each point back to it.

> master frames are more specific than ideologies, perhaps dealing only with one specific theme with broad appeal. But they have the potential to stir people to act. They are an ideology's best advertisement — and they can do as much for a corporate philosophy. There is often sloganeering involved, but it is not only a matter of wordsmithing. It is the encapsulation of a key idea and turn of phrase all at once.

The Leadership Context of Framing

Of this chapter, I mostly enjoyed the examples.

The best one was probably Bush after 9/11:

> **Bush**: (climbs on a fire truck next to a firefighter, when asked if he should leave, Bush puts his arm around him)
> **Random guy**: I can't hear you
> **Bush**: I can hear you, the rest if the world hears you, and the people who knocked these builduings down will hear from us all soon
> **Crowd**: USA, USA, USA

MORE WISDOM

Toxic people already know the power of framing

Something we agree with and it's part of our philosophy and mission:

> there is a large group of generally smart and articulate leaders out there who need to reflect on their communications and ethics a great deal more.

> They need to not take their communications for granted quite so much. They need to understand how our financial realities (and those of others) are created through their communications. They need to understand that untrustworthy leaders already understand all of this — and are betting that most others don't.

Strike a balance of power and warmth

Talking about Al Gore's loss to George W. Bush:

> In his first debate, he was coached to be an alpha male and dominate the interaction, which he tried to do through frequent interruptions of then-candidate Bush and violations of his personal space.
> When Gore was reviewed poorly for this, he was coached to be more affable for the next debate. Gore subsequently emphasized areas of agreement with Bush, but also adopted what many saw as an overly friendly demeanor.
> (…) Ironically, many pundits believe that Gore's best campaign performance was his concession speech, which is the only one he wrote himself.

QUOTES

On manipulative framing for marketing:

> the captains of Wall Street have had a boundless energy for repackaging discredited financial products with new legit – sounding names like " legacy loans," "legacy securities," "nonprime mortgages, " "high-yield debt, " and the like. Framing alone didn't produce this crisis, but communications played a central role. To add insult to injury, Harry Truman's maxim — " If you can't convince them, confuse them " — appears to have become the modus operandi of leaders asked to account for their firm's performance.

On strategics' higher persuasiveness:

> Because most leaders are Conventionals, they tend to underestimate the communications challenge of organizational change. By contrast, Strategics work the change into the very fabric of their organization by making the change relevant to the people and their job responsibilities, answering their questions, taking on their challenges, making connections, and getting them to feel a sense of enthusiasm for it.

CRITICISM

Tone Drift Towards Pop Psychology

The Mehrabian study on words being only 7% of meaning, the 'use or it lose' hyperplasticity from Norman Doidge, the mirror neurons… They felt a bit 2010's self-helpy.

- **Mehrabian's 7% rule** has been widely debunked when applied outside its narrow context (it was only about inconsistent verbal and nonverbal communication of feelings).
- **Norman Doidge's plasticity message** has been influential, but the idea that the brain is hyperplastic and easily rewired with effort is overly simplistic. 'Use it or lose it' can also be easily misinterpreted.
- **Mirror neurons** have been vastly overhyped as the key to empathy or imitation—solid science, but not the magic empathy bullet they were once claimed to be.

I appreciate and recognise that the author's goal with this book wasn't an academic treatise, that my criticism is

nitpicking, and that she accomplished her goal.

But I also can't deny that, in my eyes, some respect and authority was lost on those passages.

Terminology Was Off: Priming's Misuse

The use of 'priming' didn't feel right to me.

The author says that 'the more you prime, the stronger the bond' and 'priming is a little like putting on sunglasses on a sunny day'.

But that's not what's usually meant by 'priming' in psychology, which refers to activating certain mental pathways by exposing someone to related stimuli, typically leading to subtle and short-lived changes in perception, memory, or behavior.

Priming's effects are not massive. Persuasion scholars say that 'priming is too weak to have a strong effect in the real world'.

Instead, I think the author was referring to 'repetition', mental association-building (rewiring or strengthening neural pathways), or framing.

PROS

- Exercises
- Many case studies
- Templates
- Capable author: despite the criticism above, she is well-learned and a skilled communicator
- Several good ideas

REVIEW

The Power of Framing is a solid and practical resource on communication and persuasion.

I felt the book could gain with more accuracy on terminology and some evidence, but I took away some important notes, and that's the most important thing.

While it's not laser-specific on frame control techniques, that may be an advantage as it offers a broader approach to persuasion that may be even more useful to leaders.

Body Language: The Ultimate Guide For Men's Nonverbals

Lucio Buffalmano · 16 July 2025 · Archived copy · Original

Body language is one of the most powerful tools for projecting power, status, and confidence.

It shapes how others perceive you before you say a word.

At The Power Moves, we teach men advanced social dynamics to achieve goals and win at life.
This article gives you the foundations to master body language.

Contents

- What Is Body Language

  - Learn More

What Is Body Language

Body language is a form of nonverbal communication in which physical cues, rather than words, convey meaning.

Body language skills are foundational to a successful social life because they allow you to sub-communicate value and confidence without saying a single word.
Improving your body language will significantly improve your social life, career, and dating.

We can divide body language skills into two main categories:

- **Reading** *from* others (decoding). It supports social intelligence and provides the 'intel' to strategize and achieve goals
- **Communicating** *to* others (encoding) is more active, linked to agency, and supports power, and goal achievement.

They're two sides of the same coin, both supporting one another.

Channels of Nonverbal Communication

Nonverbal communication happens through channels like gestures, eye contact, and posture.

Channels, sometimes called *domains* or *modalities*, refer to *how* the message is sent.
The *APA Handbook* lists eight channels, and we add artifacts and chronemics for completeness:

1. **Kinesics** ⍰⍰♂ – Body movements, gestures, posture, and expressions (part of body language)
2. **Oculesics** ⍰ – Communication through eye contact and gaze (part of body language)
3. **Proxemics** ⍰⍰⍰ – Physical space and distance (part of body language)
4. **Haptics** ⍰ – Physical touch (part of body language)
5. **Appearance** ⍰⍰ – Physical characteristics and attire
6. **Paralanguage** ⍰ – Aspects of speech like tone, pitch, volume, and rate
7. **Chronemics** ⍰ – Use of time, especially punctuality
8. **Artifacts** ⍰⍰ – Objects or items like jewelry and accessories
9. **Olfactics** ⍰⍰ – Scent, odors, and smells
10. **Environment** ⍰ – Physical setting influences like lighting or décor

⍰ Body language is a category of nonverbal communication
Body language, an often misused term, includes several sub-channels and is only one element of nonverbal communication. We use 'body language' here as it's generally referred to in everyday language.

Dimensions of Body Language

The dimensions, sometimes called 'domains', refer to *what* the message conveys, regardless of what channel it came through.

These are the four most important body language dimensions for men

The literature tends to recognize four core dimensions of body language:

1. **Dominance–Submission** (AKA Agency or Power)
2. **Affection–Hostility** (AKA Affiliation/Communion or Warmth/Coldness)
3. **Calmness–Nervousness** (AKA Relaxation/Stress or Composure/Tension)
4. **Engagement-Withdrawal** (AKA Immediacy/Nonimmediacy)

⍰⍰♂ Lucio's note:
As per infographic above, I consider openness/closeness as important as the top 3 for men, and more important than engagement/withdrawal.

For an overview:

Dimension	What It Measures	Examples
Dominance vs. Submission	Power, status, control **vs**. yielding, deference	**Dominant**: expansive, upright, raised chin, hands on hips **Submissive**: slouching, bowed head, closed
Affection vs. Hostility	Liking, warmth **vs**. disliking, coldness, negativity	**Affectionate**: smiling, leaning in, nodding **Hostile**: glaring, frowning, eye rolls
Calmness vs. Nervousness	Ease and composure **vs**. stress or discomfort	**Relaxed**: smooth moves, reclining, steady gaze **Nervous**: fidgeting, clenched jaw, hesitations
Engagement vs. Withdrawal	Closeness, interest, participation **vs**. detachment, distance	**Engaged**: Open posture, leaning in, direct gaze, facing **Distant**: Closed off, leaning back, turning away

Let's dig deeper:

1. Dominance vs. Submission

This dimension relates to power and status.
Dominant cues signal power and control, while submissive cues signal yielding and defeat.

It's one of the **most important body language domains for men because it's foundational to respect, status, and attraction**.

But it's also relevant for personal safety because predators pick victims with submissive body language (Gunns et al., 2002; Wheeler et al., 2009). Strong body language makes you a harder target.

Trait	Dominant	Submissive
Posture	Upright, chest out, shoulders back; head level or chin up	Slouched or rounded; chin tucked down; constricted (e.g. legs together)
Gaze / Eye Contact	Steady, direct gaze; holds eye contact	Avoids eye contact or glances downward
Use of Space	Spreads out—arms on armrests, feet apart; center of a group	Keeps limbs close; gravitates to edges; yields way
Voice & Tone	Louder, steady, moderate-to-slow pace	Softer, higher pitch; faster or uneven pace; hesitations
Proxemics	Moves into others' space when appropriate; initiates touch	Maintains distance; rarely initiates touch

A good principle is:

⚖ **Display dominance that's appropriately calibrated to the given context and to your goals**

Overly submissive

Positively dominant

Overly dominant, with a hint of aggression

Two important sub-dimensions of dominance are:

- **Positive dominance:** associated with prestigious status and adding value
  - Taking up space, without overdoing it
  - Open body language
  - Genuine pride

- **Domineering**: associated with a value-taking approach to socialization, and more extreme cues
  - Encroaching on personal spaces
  - Staring down to intimidate or looking away to sub-communicate superiority
  - Barging through or walking away with little consideration

??? PRO Tip: smile with closed lips, and when you feel like
Drawing parallels with apes, van Hooff differentiates two uses of smiles: laughs for fun, and friendly smiles to appease. In humans, high-power men *decide* when to smile (Hecht and LaFrance, 1998)

Dominance and Open Body Language

Dominance is associated with open body language, but it's contextual, and a domineering approach may also adopt closed body language.

Closed body language can be high in dominance. Cues are contextual

2. Affection vs. Hostility

This dimension signals warmth, liking, or closeness versus distance or negativity.

Trait	Affectionate	Hostile
Posture	Leaning in and facing torward; relaxed openness	Rigid; body pulled back or turned away; Full frontal for aggression
Gestures	Gentle, flowing gestures; open palms; mirroring; nods to signal rapport	Pointing; clenched fists; head shakes; glaring, eye-roll, or looking away
Proximity	Moves closer, respecting comfort zone;	Keeps or increases distance; closes distance for aggression
Touch	Light, reassuring touches (hand on arm, shoulder); consensual and warm	Pushes away; abrupt or no touch; may use touch to intimidate

Principle:

⚖ **Display an appropriate level of warmth, and remain warm *with those who reciprocate***

Too affectionate, overly expressive, child-like

Positively warm, horizontal hand for a win-win handshake

Hostile, domineering, upper-hand handshake

⚠️ **Takeaway: be dominant and warm.**

High dominance and high affection are equivalent to our power and warmth approach, or what we'd refer to as 'positively dominant'

3. Relaxation vs. Nervousness

This dimension reflects ease under pressure vs. stress or discomfort.

Research indicates relaxation influences observer trust, and nervousness is a possible sign of deception (but don't jump to conclusions: it's not a reliable cue!).

Trait	Relaxed	Nervous
Posture	Upright but loose; open chest; shoulders down;	Hunched or stiff; shoulders raised; rigid spine; muscle tension
Gestures	Smooth, fluid movements; purposeful hand motions; natural nods	Fidgeting, leg bouncing, tapping (displacement signals); self-soothing; rapid nods
Facial Expression	Soft, neutral smile; relaxed jaw and forehead; steady eye contact	Tight jaw; furrowed brow; forced smile; rapid blinking; darting eyes
Voice & Tone	Even, moderate pace; consistent volume; clear articulation	Shaky voice; uneven pace; variable volume; hesitant speech

Principle:

⚖️ **Be relaxed most of the time, in most safe situations**

But be alert when safety and results are important.

Self-soothing, torso and feet pointing away, slight fear in the eyes

Relaxed and at ease, more confident gaze

Too ‘chill’ for most contexts. Disrespectful

4. Engagement vs. Withdrawal

Principle:

⚖ **Be appropriately engaged, without forcing or faking interest**

Trait	Engaged	Withdrawn
Posture / Orientation	Torso and feet toward speaker; leaning in; moves closer	Torso and feet turned away; leaning back; stays away
Facial Expression	Responsive expressions (nods, smiles, raised eyebrows); sustained eye contact	Blank or neutral face; limited smiling; looks away
Vocal Tone / Prosody	Warm, varied pitch; responsive intonation; backchanneling (“mm-hmm,” “yes”)	Monotone or flat tone; few back-channeling
Touch	Light, validating, appropriate touches (e.g., tap on arm)	Not initiating touch

5. Additional Dimensions

We can add several sub-dimensions and expressive/non-expressive and open/closed body are the most significant:

- **Open–Closed**: It relates to dominance and relaxedness, two dimensions it’s sometimes confused with
  - *Openness* signals receptiveness and confidence with arms uncrossed, chest open, palms visible
    Studies associate it with higher dominance, attractiveness, and persuasiveness
  - *Closed* signals defensiveness or discomfort with arms folded, hunching, hiding the palms
    Studies suggest it’s less persuasive
- ⚖ Principle: Adopt appropriately open body language

Arms crossed and leg twine

Open body language (one hand only in pocket is OK, especially if the thumb is out. Looks casual and more relaxed than both hands out)

- **Expressiveness vs. Reserved:** Animated facial expressions, and dynamic voice on one hand, and deadpan faces and flat tonalities on the other
  - Too Expressive: Emotional, needy, anxious, and generally low-power
  - Unexpressive: Rigid, uninterested, psychopathic, or ‘socially off’
  - ⚖ Principle: Be appropriately expressive, without overdoing it

⍰ Example: Think of Joe Rogan. Masculine and socially dominant, but very expressive

6. Bonus: Masculine Body Language

While not an official dimension and while individuals vary, consistent gendered patterns have been observed.

The differences are partly biological and partly socialized.
And the socialized part is even more important for status, respect, and attraction.

Avoid overly feminine body language because men pay a price for adopting behavior deemed as 'feminine'.

For a general overview:

Aspect	MASCULINE	FEMININE
Posture	Broader stance (feet shoulder-width, chest out).	More constricted stance, especially with legs. Feet closer together.
Gestures	Fewer, but larger and more expansive.	More frequent, smaller gestures
Facial Expressions	Less expressive, suppressing more emotions, fewer smiles	More expressive, smile more often (even when listening)
Touch	Less casual touch, but may use it for dominance; purposeful handshake	Lighter, friendly touches; 'resting hand handshake', no 'pumps' and little tension
Proximity	Larger personal space (especially with strangers)	Willing to stand or sit closer to during conversation, reflecting affiliative behavior

These are general trends, not rules. Exceptions and nuances apply.
For example, in professional settings, women tend to adopt more male-typical scripts, especially in high-power roles and male-dominated industries.

Some general tips to project masculine poise:

- ✅ **Stand with feet shoulder-width apart**
- ✅ **Sit and stand for comfort**: think 'comfortable, without being a caricature' for a good balance
- ✅ **Cross legs in figure-four**
  - ❌ Avoid leg-over-leg
  - ❌ Avoid excessive smiling

Overdoes it

Positively masculine

Elbows, legs, gaze are all improvable
Remember that it's all about calibration.
Calibration reads the room's power dynamics, allowing you to dominate or connect as necessary, without looking weak.

Finally, advanced players are fluid.
For example, leaning towards femininity puts nervous women at ease during first approach. And moments of strategic vulnerability can help bonding.

- Masculine body language
- Feminine body language

Improving Body Language Skills

Here are some practical tips to improve your body language skills:

Improve Your Decoding

- **Look at ALL signals (holistic approach)**: Avoid the common pitfall of body language tunnel vision. Consider character, reputation, incentives, context
  - **⍰⍰ Use context to predict future behavior**
    ⍰ Example: Domineering body language in a group signals status ambition with an 'as*hole approach'.
    Expect some power moves from them
- **Establish a baseline** based on typical behavior. Deviations from this baseline are more telling
- **Look at clusters** and patterns that point to the same conclusion
  ⍰⍰ Discordant cues may signal a conscious effort to project a certain image. Or the intention to deceive
- **Consider alternative explanations**. Gestures mean different things in different contexts. Crossed arms may simply one is cold

  - Disheveled looks may suggest low ambition… Or total freedom of someone who's already made it
  - Sculpted muscles may suggest ambition, but also narcissism or body dysmorphia.
- **Watch Face, Torso, Feet:** Notice fake smiles, a sign of low confidence and low-power
  ⍰⍰ Lead the interaction with nervous people, talk more, look away. Be chill and they will relax
  ⍰⍰If feet and torso point away, end it and move first before they end it themselves

Finally, beware of 'body language experts'.
A meta-analysis showed that people overestimate the significance of individual cues. 'Experts' tend to over-analyze and over-emphasize cues, sometimes missing the holistic picture:

> **Lucio**: This body language expert got it all wrong.
> Looking for individual cues, she missed the overall dynamics of high attraction

Finally, remember to look at social dynamics, not just individual body language.
For example, a good strategist sits beside his boss, rather than in front:

Sitting besides sub-communicates 'in-group cooperation', while sitting in front predisposes for a more competitive dynamic

Also see:

- Best resources to learn body language

Improve Your Body Language: The ABC

Improving your body language is a process of replacing negative habits with positive ones.

- **Increase self-awareness**: Pay attention to your body language in different situations. E.g.: How do you stand when nervous vs. comfortable?
  - Mindfulness: Be present in your interactions, notice how your body language
- **Maintain Good Posture:** Look at yourself in the mirror, note your areas for improvement, and address them

with correcting exercises

- **Prefer open postures:** Keep your hands visible, your shoulders relaxed, and your chest open
- **Relax:** Keep your facial muscles and body relaxed. Pay attention to shoulders and jaw
  - Control Nervous Habits: Remove 'displacement signals' like self-touching, tapping fingers, playing with your hair, or rubbing hands
- **Hold Eye Contact**. If you're a beginner, think about '60-70% of the conversation', breaking away to the side, during pauses, or while nodding
- **Command Your Space:** Aim for a 'positively dominant' balance. Sit and recline comfortably, without becoming a caricature
- **Manage Your Voice:** Vocal tone, pitch, and pace are crucial nonverbal cues. Speak clearly, at a moderate pace, and with a confident tone.
  How to speak with power

Check this:

- How to move with confidence

How to Master Body Language

Many resources recommend men to 'take more space', 'say less than necessary', or 'move slowly'.

While these generalizations are well-meaning and valid for many, they're also vague and mostly aimed at beginners.

Instead, maximum effectiveness requires that you **calibrate your body language** to the context and to your goals.

Great body language is calibrated to context and goals—usually between the two extremes of weak and try-hard

Contextual Calibration

For example:

- **Spread out more than your date**, but less than your boss

- **Lean in towards your boss** explaining something, less to your employee reporting
- **Hold your beer to the side in a nightclub**, not a champagne at a gala

The more advanced you become, the more calibrated you become.

Body Language Golden Balance

The ‘golden balance’ for body language almost always strikes a balance between extremes.

Where that balance falls depends on context and goals.

But to give you an idea:

⚖ **Men maximize body language on the more dominant, more relaxed, more open, and less expressive side of the spectrum.**
As per the ‘high-power and high warmth‘ model, go slightly more affiliative as well.

FAQ

Body language is often misunderstood, so let’s clarify common myths and misconceptions:

Is body language like an actual language?

Body language is not a true language in the linguistic sense — it has no formal grammar or fixed structure. It’s more fluid, context-dependent, and influenced by culture.
Still, body language plays a major role in communication, and there are many foundational universal patterns that people recognize and respond to.

What is the 7 38 55 rule?

The 7-38-55 rule refers to Albert Mehrabian’s research that 93% of communication is nonverbal and only 7% is verbal.
This idea comes from Albert Mehrabian’s research, but it is widely misunderstood and misapplied. The findings were based on highly specific lab conditions, with single words or short phrases combined with mismatched facial

expressions or vocal tones—*and only when communicating feelings or attitudes* (Mehrabian & Ferris, 1967; Mehrabian & Wiener, 1967).
It is not a universal communication rule, but rather a simplified pop-psychology trope.

What are the 7 types of body language?

The 7 types of body language are facial expressions, body movement, posture, gestures, eye contact, touch, and proxemics.
However, there is no definitive list, and the 'types' to include depend on the level of chosen granularity.

Is body language actual science?

Body language is a legitimate area of study within nonverbal communication and psychology, and there is substantial research linking physical expressions to emotions, intentions, and social dynamics.
That said, some popular teachings on body language drift into pseudoscience, exaggerating or fabricating claims that lack any solid empirical support.

Respect: What Is It, and Why It Matters

Lucio Buffalmano · 23 July 2025 · Archived copy · Original

Respect is the deference and regard others have for you, and it's a foundational building block for influence, status, leadership, and successful dating & relationships.

Especially for men, getting respect from others is not only a crucial step for social and life success, but it also underpins mental well-being and self-esteem.

This article distills what research says about respect, the traits that drive it, and how to become more respected.

What Is Respect?

Respect is the social assessment of an individual's respect-worthiness, typically reflected in behavior—ranging from deference and esteem to indifference or overt disrespect.

Respect overlaps with status, affection, and in part with popularity.
But they're also different.
Respect implies high regard, influence, and possibly reverence—even if you may not like them, and even if the recipient may not be popular.

You can think of respect-worthiness as on a scale:

Respect is on a 'bell curve continuum', and most relationships sit around the middle

The Three Types of Respect

There are several ways of categorizing respect, and we prefer this:

- **Value-based respect**: Based on social and mate value and the potential for adding value. It's grounded in social exchange theory
- **Integrity-based respect:** Based on reputation for integrity and honor
- **Power-based respect**: Based on status/rank, dominance, assertiveness, and the ability to inflict costs

The ideal leader embodies them all.
He's high power, but uses it with integrity and to add value to his followers and associates.

Respect-worthiness

Respect-worthiness includes traits and behaviors that elicit respect from others.

It's a concept we introduce to set a measure and goal for men's self-development.
Men can approach, asses,s and work on their respect-worthiness via two sub-categories:

- **Deserved** for personal qualities and personal value
- **Earned** with the ability to demand respect when not forthcoming

'Deserved' respect forms the foundations.
'Earned' respect is also not necessarily dominant or aggressive. Most often, it's about advanced social skills, sub-communication, and frame control.

Don't be a 'too nice guy': you need both value and power
Too nice guys who fail to get respect think their (supposed) 'good' character should be enough. They forget good character includes value, and that they must be able to *demand* respect.

Why Respect Matters—Especially for Men

Respect correlates with all the good things you want in life: status, attraction, influence, and earning potential.

1. Social Influence & Leadership

Whether in business, social settings, or dating, respected men lead—and their ideas are taken seriously.

Prestige-based status, which many scholars equate to respect, is a strong predictor of long-term group influence.

Respected men also experience less 'social friction', with fewer challenges and less pushback.
People defer more, interrupt less, and often try to win their approval rather than conflict with them.

2. Higher Mate Value

Respect is a precondition to attraction.

That means that respect alone does not guarantee attraction. However, **lack of respect makes attraction impossible**.
This holds true both in one-on-one dyads and in how women observe a man being treated by others:

- No *female* respect, no attraction
- No *social* respect, no attraction

And the opposite is true.
Gain her respect, get other people's respect, and her attraction increases.

This applies to both short and long-term.
Men who maintain respect in their relationship also tend to maintain attraction.

3. Better Relationships

Respect is a precondition for any healthy relationship.

Conversely, relationships without respect tend to be exploitative (lose-win).

They only survive with external pressures, manipulation, or constant chasing and value transfers (simping).

Importantly, **lack of respect invites predation and bullying.**
No respect makes you an easy target. And no respect for your character makes it *morally* right to take from you (Henrich, 2015)

3.2. Better Intimate Relationships

In intimate relationships, respect predicts relationship satisfaction more than love or liking.

Conversely, disrespect like contempt or constant criticism are reliable predictors of impending breakup.

> A relationship without respect is submission and self-betrayal.
>
> *TPM proverb*

4. Career and Financial Gains

Respect correlates with promotions, access to high-status networks, and leadership roles.

Together with social and mental empowerment, **respect is one of the 'unspoken rules' of management promotions.**

You may never hear 'I don't respect you' as the official reason for being passed over for promotions.
But respect is the #1 reason why too nice guys are not 'management material'.

5. Self-Esteem and Mental Health

As social animals, the quality of our social life impacts the quality of our mental life.

Sociomether theory posits that self-esteem tracks our social value.
If you're valued and respected, your self-esteem rises. If you're devalued and disrespected, your self-esteem decreases.

Several studies also found a link between low status and depression.

6. Group Cohesion & Goal Achievement

Individuals who earn respect also benefit the group.

Like attracts like, and respect-worthy men attract other respect-worthy men, who are more likely to be high-value contributors.

The positive effect of respect on group performance goes both ways: men who feel respected are also more

engaged, cooperative, prosocial, and even more innovative.

Traits That Afford Respect

Several traits and behaviors have been consistently linked with higher levels of earned respect.
Below are the most evidence-backed factors.

1. Competence and Mastery

According to Anderson & Kilduff (2009), groups quickly assign status and respect to individuals who demonstrate value.
This includes:

- Domain-specific skill (e.g., in work, sports, debate, leadership)
- Good judgment
- Problem-solving ability

2. Self-Confidence

Self-confidence promotes respect.

Confidence is a high-power trait that people admire and wish they had.
And people tend to read confidence as a sign of competence.

However, it's always best to combine confidence with true value and competence.
Bravado without ability may still win short-term attention, but it can undermine genuine long-term respect—especially from other high-value men who don't fall for the confident game.

3. Integrity and Moral Character

Even in competitive domains, people respect those who:

- Keep their word
- Act consistently with values
- Stand up for others or for what's right

In leadership studies, integrity consistently ranks as the most admired trait.

4. Emotional Control and Self-Mastery

Men who stay calm under pressure are respected more than those who panic, rage, or overreact.

Self-regulation signals maturity and composure, and ties into the ancient idea of "stoic masculinity."

5. Physical Presence and Body Language

Studies on embodied cognition and nonverbal dominance show that people assign higher status to those who:

- Stand tall and take up space
- Speak with calm, deliberate tone
- Move with intention rather than fidgeting

6. Assertiveness & Ability to Set Boundaries

Respect is a social construct, so social competence trumps non-social competence.

To give an example, an IT geek can be highly competent but may struggle with respect.

Men who allow others to walk over them lose respect fast.
Those who set limits—calmly and firmly—are perceived as higher status and less exploitable.

This includes:

- Saying "no" when appropriate
- Confronting disrespect

- Walking away from poor behavior

7. Contribution to the Group

We are instinctively programmed to track cooperators and cheats.

Cooperators contribute and add value, while cheats take from others and their communities.

We naturally dislike and wish to punish takers, while we naturally respect givers who benefit the collective—whether it's a team, friend group, company, or community.
In evolutionary terms, high-value males were often those who protected or provisioned others.

🤵♂️Lucio's Take: **Contribution is my ultimate yardstick**

Lucio:
My ultimate measure of someone's 'worthiness' is their contribution to humanity.

The ultimate question of life: did you give, or take?

Takers make humanity and us all worse off, while givers make humanity and us all better.
My ultimate goal for life is to give more than I took.

Givers get my respect.

8. Social Value

Social value is a catch-all category for all the traits that make a high-value man.

Just some examples:

- **Social skills**, including charisma, charm, etc.
- **Wealth**
- **High-status job**

- **Connections**, including friends and allies

Also see:

- **How to be a high-value man**

> The 10 Traits of High-Value Men (W/ Examples)

The Proximity Principle of Respect

Principle:

The importance of interpersonal respect grows with physical, material, and emotional closeness and interrelatedness

Evolutionary theories suggest cooperation emerged because repeated interactions with kin and tribesmen, the people closeset to us, was good for all—including for the 'selfish gene'.

The proximity principle suggests that the best approach to gain others' respect is to start from the people closest to you

The people closest to us also have a stronger impact in all these areas:

- **Psychological empowerment**: The closer people are to you, the more their respect impacts your inner life
- **Material returns**: Respect from colleagues, business partners, and professional networks support career growth and financial outcomes
- **Reputational impact**: The closer people are, the more their respect speaks about your social value.
  E.g.: people subconsciously think '*The people who know him best respect him, so he must deserve respect*'.
- **Life quality**: In general, respect underpins quality relationships, and quality relationships make for a better life

The people closest to you are your 'foundations' for self-respect, so **prioritize respect from the people close to you** ('inside-out approach').

Let's dig deeper:

Parental Respect

Evolutionary theories posit that parents invest more in high-potential children.
Parents know you best since you were first born.

Meaning:

Parental respect sub-communicates high genetic potential ('fitness'), while their lack of respect sub-communicates low fitness.

That means that, for example, your girlfriend's attraction tanks if your parents disrespect you.

I know, it's not 'fair' because poor parents may disrespect and undermine anyone.
But the world isn't fair, and you must address that as an adult.

Siblings Respect

Siblings share 50% of their genes, but evolutionary theories tell us we also compete for the family's attention and resources.

In broad strokes:

- **Respect from older brothers must be earned**
- **Respect from younger brothers must be maintained**

Older brothers, especially first-borns, hold several power-relevant advantages:

- **Established relationships** with parents and family create a stronger power base
  - Stronger bonds as parents often worry and bond more with their firstborn
- **Bigger size & brains** to dominate early competitions and be taken more seriously by the adults
- **Preferred heir** in many cultures, succeeding the father and/or taking over the family interests

You need a smart approach to shine, and still maintain positive relationships.
Principle:

⚖️ **The more you beat your brothers, the more you must make them feel respected**

This is especially important for younger brothers.
As an example from The Godfather:

Win competitions, but show respect for the defeated

> **Fredo**: I'm your older brother Mike and I was stepped over!! <— Mike 'overthrew' his older brother
> I can handle things, I'm smart! And I want respect!!! <— Fredo feels disrespected

⬆️ **Display *more* respect when you're beating your brothers**
Mishandling this relationship without 'power protecting' led Fredo to betray the Godfather.

Trump's family had similar dynamics.
Donald's brother was outshone, disapproved of, and spiraled into alcoholism and early death.

🤦♂️ I also experienced a situation of 'outshining' a brother. And hopefully managed them better.

Partner Respect

Public admiration from your partner supercharges your reputation while public disrespect destroys it.

Women naturally test men early on, and may later 'test your boundaries' to see what you allow and don't allow. Some women will keep pushing without ever stopping.

This is why you must **nip any disrespect in the bud**.

A good mindset of win-win is:

> ⍰ I expect respect because I respect you

Respect & Status

Respect and status are different but related:

- **Status**: Social position or rank within a hierarchy
- **Respect**: Positive regard for someone

Status hinges on social dynamics and hierarchical structures.
Respect, by contrast, is more associated with an individual's internal evaluation, and often includes elements of trust and admiration.

Construct	Status	Respect
Source	Groups	Individuals
Scope	Hierarchical	Non-hierarchical
Orientation	External recognition dictates behaviors and dispositions ("Outside-in")	Internal assessment dictate behaviors and dispositions ("Inside-out")

It's also possible to have one, but not the other.

One may occupy a high-status role by virtue of formal rank without necessarily commanding respect. And a leader may lose positional authority yet retain—or even enhance—personal respect among his former peers and subordinates.

In our 'alpha males article', this infographic highlights this disconnect:

That said, in real-life, status and respect are interrelated and feed into each other, with respect tracking and negotiation status.
For simplicity, you may picture that status is 'social respect and deference'.

Prestige vs. Dominance

Although scholars associate respect with prestige only, in everyday parlance, 'respect' includes deference and formality.

In this larger sense, different aspects of respect also map onto different aspects of status:

- **Earned respect** (prestige) yields admiration and influence
- **Fear-based respect** (dominance) yields obedience and power

Prestigious men are competent and value adding, gaining admiration and voluntary deference.
In romantic contexts, women prefer prestigious traits (skill, kindness, stability) for lasting relationships.

By contrast, dominant men gain respect through fear, intimidation, or coercion via rank or formal authority. Dominant men often display visible power cues: physical formidability (size, muscularity), aggressive posture and power moves, deep or loud voice, and a propensity for signaling anger.

In dating contexts, dominant men are more attractive than low-status men, especially for short-term mating. But it may come at a cost of long-term attraction or stability.

Respect based on coercion is also often skin-deep and fake. Dominance creates resentment and can turn into active aggression when the dominant man loses power.

Better to Be Feared, or Loved?

The dynamics of prestige and dominance recall the popular dichotomy of 'fear VS love'.

Machiavelli famously said that, if forced to pick one, a ruler should pick fear.

And he's right… If a *ruler* is *forced to choose*.

But you're not forced to choose.
And you're probably not a despot—nobody in the West is.

Machiavelli also convened that both are better.
We agree: go for the best of both.

Cross-Cultural Insights on Respect

Respect is universally valued across cultures, underlying its importance for *everyone*.

Many markers of respect, including competence and social skills, are universal.

But some traits can be culture-specific, and the expression of respect can vary.
For example:

- **Western cultures:** Emphasize assertiveness, individual achievement, and autonomy. Respect is more based on competence
- **East Asian cultures:** Value humility, deference, and harmony. Polite language, deference, and attentive body language are key
- **Middle Eastern and Latin cultures:** Often associate masculine respect with honor and reputation

These differences may impact leadership dynamics as well.
Leadership studies suggest collectivists may admire supportive leaders while individualists value confidence and independent work.

Since the foundations are shared, focus on the more foundational commonalities.

And then calibrate to cultural scripts for the last 20%.

Masculine Body Language: Move, Stand, Speak Right

Lucio Buffalmano · 28 July 2025 · Archived copy · Original

Masculine body language conveys confidence and earn you instant respect, attraction, and influence—without saying a word.

At The Power Moves, we've taught thousands of men the mechanics behind masculine presence—and how to wield it strategically to achieve goals.

This guide avoids the ungendered pop-psych fluff and teaches you how powerful men *actually* move.
Let's get into it.

Contents

  - 2. Calibrating to Goal Achievement

- 3. Advanced Calibration: Strategic Fluidity
- Next Level: The WINNING Man

Why Masculine Body Language Matters

People judge you in seconds—and much of that judgment comes from how you move, stand, and look, not what you say.

Masculinity is one of the foundations of a high-value man who attains status, respect, and attraction. Conversely, researchers say that **men incur heavy social costs for adopting feminine body language**.

And your nonverbal communication conveys masculine power before you even speak.
If you get this right, you gain:

- **Respect** from men
- **Attraction** from women
- **Influence** and **status** in any group

⍰♂Lucio's Take: **Prioritize power, and masculinity will follow**

Lucio:
Masculinity matters, and if you're lacking it, you must focus on it.

But remember it's a means to an end—a simple truth that sometimes goes missing in male self-development.

'Masculinity as a goal' can be overdone and look try-hard. The second risk is blind spots: to be effective, masculinity requires **calibration**, and effective **strategies**.

⍰ Think of it this way: you're already a man, you don't need to learn how to be one.
Focus on social and mental empowerment, and masculine body language will naturally follow.

How to Have Masculine Body Language

Here are the basics of masculine body language:

1. Stand Like a Leader

Posture is the foundation of good body language, and masculinity is no exception.

- **Straight spine**
- **Shoulders back**
- **Chest open**
- **Feet shoulder-width** or wider

Hands on hips is a typically high-power posture, but can be too much in professional settings and when you want to prioritize rapport and connection

2. Take Up Space

Including:

- **Elbows on armrests** or one elbow against a bar
- **Legs apart** or in 'legs four position' (below)

This body language pose is a good balance of natural spreading out for comfort, without overdoing it. It fits well in informal socialization

Spreading out is the most stereotypical advice when it comes to both masculine and dominant body language, and it's valid.
However, never forget:

⍰⍰ Balance & calibration: don't overdo it

An over-manspread is juvenile and try-hard in many settings, and unprofessional at work.

Overdoes it

Positively masculine

Elbows, legs, gaze ⍰⍰

3. Walk Like You Belong

Your walk displays your inner beliefs.
Men who walk like they own the place get treated like they do.

Key masculine cues:

- **Shoulder swag**, The *APA Handbook* calls it ”walking in 3D rather than 2D”
- **Steady brisk pace**, but not rushed
- **Longer stride** length
- **Arms swing** to pace your walk
- **Eyes straight on** or scanning *without fear*—not glued to your phone

⍰⍰ **Power move**: stand your ground, don’t jump out of people’s way. If on collision course, expect others to take their half-step out of the way

4. Facial Expressions: Keep It Cool ⍰

- **Hold eye contact** a second longer than average.
  In public, look ahead in the distance, out of focus, and *through* people
- **Blink less** frequently
- **Chin parallel** to the floor
- **Use a relaxed, slight, tight-lipped smile** to build intrigue
  - Eyes open for intensity, lower eyelids for seductivity

A slight, tight-lipped smile displays masculine confidence. With lower eyelids, it's seductive; with open eyes, it's intense

Avoid:

- ✕ **Looking away too fast**, especially if downward (submissive)
- ✕ **Smiling too often** or too broadly (approval-seeking)
- ✕ **Wide open eyes** (nervous energy)

⁉️ **Power move**: stare to enforce boundaries after a power move, without a single word.

5. Pick A Central Spot

Body language isn't just what you do—it's also **where you stand**.

- Claim central or forward-facing spots in groups
- Stand in visible spots in bars and clubs
- Look towards the center/main action ⁉️ (unless purposefully ignoring as a power move)

Centered, straight-looking, positive, and confident

On the edges, gaze down & away, pessimistic & withdrawn

⁉️ **Power move**: Stand slightly *off-center* to someone facing you to frame him as chasing you, while you act like a leader who remains open to the full group

I'm the one in the middle, and with the most obviously open body language

6. Start Slightly More Masculine

First impressions are critical: err on the side of power—it's the strategic optimum.

You can always mellow and tone it down later, and it's easier to 'come down', than 'go up'.
Starting too low in masculinity is costlier, and you face a bigger uphill struggle in changing impressions.

In Dating:

- Hold your frame even when she tests it
- More eye contact, fewer smiles
- Lean back first, lean in *after* investment

In Socialization:

- Be the first to move
- Be the first to take space
- Use long pauses to signal confidence and comfort with silence

At Work:

- Speak early in meetings, with calm tone and open gestures
- Take the seat with the most visibility (or strategically close to your boss)
- Keep your chin up and hands above the table

7. Speak Like A Man

Albeit not strictly 'body language', paralanguage is a fundamental part of nonverbal communication.

A masculine voice is:

- **Lower pitch** (Klofstad, 2012)
- **Higher volume** than average (Schmid Mast & Sczesny, 2010)

And avoid:

- ✕ Vocal fry
- ✕ Upspeak, or going up as if it were a question mark
- ✕ Tentative language and excessive backchanneling (Leaper & Robnett, 2011)

For more see:

- Low power speaking: stop doing these
- High power speaking: speak like a confident man

8. Avoid Generic & Ungendered Pop-Psychology

Generic, untailored advice is the bane of self-help.

For example, this advice is valid *only* if well-calibrated, and generally *not* associated with high masculinity:

- ⚠ **Mirror others**: men mirror *less*, women mirror more, and androgynous men mirror most (M. LaFrance and Ickes, 1981)
- ⚠ **Be expressive**: masculine men are *less* expressive and androgynous men most expressive (Narus and Fischer, 1982)
- ⚠ **Ask questions**: men use more *statements*, women ask more questions (M. LaFrance and Carmen, 1980)

Power-unaware generic advice is equally common.
Popular ones for confidence and body language include:

- ⚠ **Look people in the eyes**, high-status and dominant men look less at others when they speak (Exline, Ellyson, & Long, 1975)
- ⚠ **Speak less than necessary**, a valid 'law' from pop literature on power, but counterproductive during group formation, in bars or clubs, and among younger men

Of course, saying not to do any of the above would also be a useless generalization.
Masculine effectiveness is about when to do what, and how to do it (keep reading).

Masculine vs Feminine Body Language

While individuals vary, consistent gendered patterns have been observed.

Some differences are genetic, and some come down to cutlure and socialization. The latter is even *more* important for status, and likely also for respect, and attraction.

A simple principle here:

⚖ **Avoid feminine body language**
Men pay a price for behavior deemed as 'feminine'.

For a quick overview on feminine vs masculine body language:

Aspect	MASCULINE	FEMININE
Posture	Broader stance (feet shoulder-width, chest out).	Constricted stance, legs and feet closer together.
Gestures	Fewer, but larger and more expansive.	More frequent, smaller gestures
Facial Expressions	Less expressive, suppressing more emotions	More expressive
Touch	Less casual touch, but may use it for dominance; purposeful handshake	Lighter, friendly touches; 'resting hand handshake', no 'pumps' and little tension
Proximity	Larger personal space (especially with strangers)	Willing to stand or sit closer to during conversation, reflecting affiliative behavior
Smile	Fewer smiles in neutral situations	Smile more often (even when listening)
Voice	More monotone	Wider vocal pitch range and vocal variety

Of course, these are general trends, not rules. Exceptions and nuances apply.

But don't get lost in over-relativism: many nuances follow predictable and foundational power principles.
For example, women adopt more male-typical scripts at work, and especially in high-power roles and male-dominated industries.
It's exactly what you'd expect when higher masculinity is the group norm, expected, and necessary for advancing.

Masculine Optimum Balance

Masculine body language follows the principle of optimum balance, achieving maximum benefits within the two extremes of too feminine, and try-hard machismo.

Where exactly that optimum falls comes down to calibration for social context, calibration for goal achievement, and advanced fluidity.

Optimal masculine body language for most situations will fall close to that central position

1. Calibrating to Context

Remember that masculinity, like almost anything else, is all about calibration.

Calibration reads the room's power dynamics, allowing you to dominate or put others at ease as necessary, without looking weak.

As a principle and guideline:

⚖ **Be on the upper range of masculine body language that is appropriate for the context**

We advise the upper because 'higher masculinity than average' is good, and because the costs of 'not masculine enough' outweigh the costs of 'being too masculine'.

2. Calibrating to Goal Achievement

Advanced calibration considers the context, in light of one's goals.

Once you reach all your goals, you don't even need to care of how you come across.
This is why some wealthy older men dress poorly: they don't need to prove anything to anyone.

However, only smart calibration, smart action, and *caring* what others think will get you there.

Some tips:

- **Be more masculine than your dates**, for attraction
- **Be more masculin than the average**, for status
- **Tone it down at the office**, to prevent competitive higher ups to dislike you (you'll 'do you' once you overtake them)

3. Advanced Calibration: Strategic Fluidity

Finally, advanced players are never stuck with any 'mode'.

Instead, they span the full gamut depending on what best achieves their goals, given the context.

For example, leaning towards femininity puts nervous women at ease during first approach. And moments of strategic vulnerability can help bonding during relationship formation.

Some seducer types even lean on feminine body language.
See for example Russell Brand:

> **Russell Brand**: (moves with feminine body language)

⁉️♂ **Lucio's take**: I don't necessarily advise copying Russell (I wouldn't want to be him, for one). It's the *concept* of adaptive fluidity you want to adapt, not any specifc move or style.

Next Level: The WINNING Man

Men who understand and control their nonverbal communication rise faster.
They attract more interest, build better alliances, and command more respect.

However, the top men aren't merely able to strike masculine poses.
They're advanced strategists, fluid players, and mentally unbeatable.

We teach how in our flagship training program:

- **Power University**, the full blueprint for empowered men who achieve their life goals

Evolutionary Psychology: An Introduction – Summary & Review

FULL SUMMARY

About the Authors:
Lance Workman is a psychologist and professor specializing in evolutionary psychology, with a DPhil from the University of Sussex and extensive media and academic contributions.
Will Reader is a senior psychology lecturer at Sheffield Hallam University whose research focuses on social media, technology, and evolutionary theory.
Workman and Reader also edited *The Cambridge Handbook of Evolutionary Perspectives on Human Behavior*

1: Introduction to Evolutionary Psychology

Evolutionary psychology applies principles of Darwinian natural selection to understand the human mind.

Natural selection is based on differential reproductive success of heritable characteristics that vary in a population. The human mind, as a physical organ (the brain), is shaped by natural selection, and thus, behavior is also a product of evolution.

The key premise is that the mind, like the body, has evolved to solve problems faced by our ancestors in the Environment of Evolutionary Adaptedness (EEA).

Key Concepts

- **The Environment of Evolutionary Adaptation (EEA)**: The ancestral environment in which human psychological traits evolved, shaping our current behavior and cognition.
- **Proximate and ultimate levels of explanation**: Proximate explains how a trait works (mechanism), while ultimate explains why it evolved (function/adaptive value).
- **Heritable variability**: Differences in traits among individuals that can be passed down genetically.
- **Differential reproductive success**: The idea that some traits increase the chances of reproducing and passing on genes more than others.
- **Particulate inheritance**: The principle that genes are passed on as discrete units, not blended (Mendelian genetics).
- **Eugenics**: A controversial and discredited movement aimed at improving the genetic quality of a population, often through unethical means.
- **The Great Chain of Being (scala naturae)**: A historical, hierarchical concept ranking all living things from lowest to highest (e.g., minerals to God), not supported by modern biology.
- **Sociobiology**: An approach that applies evolutionary theory to explain social behavior, often criticized for being

overly genetic determinist.

- **Gene–culture co-evolution / dual-inheritance theory**: The view that genetic and cultural evolution interact and shape each other over time.
- **Naturalistic fallacy**: Mistakenly assuming that what is natural is morally right or desirable.
- **Moralistic fallacy**: Mistakenly assuming that what is morally desirable must also be found in nature.

A History of Evolutionary Thinking

1. Erasmus Darwin and Jean-Baptiste Lamarck proposed early evolutionary ideas; Lamarck's inheritance of acquired characteristics is largely discredited, though epigenetics offers a modern but limited twist (Haig, 2007).
2. Charles Darwin's *On the Origin of Species* (1859) introduced natural selection via heritable variability and differential reproductive success, with *The Expression of the Emotions in Man and Animal* (1872) extending this to mental processes.
3. Gregor Mendel's particulate inheritance (1865) laid genetics' foundation, later integrated into the modern synthesis with Darwin's work.
4. William James (1890) highlighted human instincts, countering views of humans as instinct-free compared to animals.
5. Francis Galton (1908) pioneered psychometrics and eugenics, applying evolution to psychology, though eugenics remains controversial.
   - Quote:
     More controversial was Galton's attempt to apply his scientific findings to help the greater good of society. He suggested society might be improved (with) a little selective breeding. He suggested that individuals who might benefit society (the innovators, the highly intelligent etc.) be encouraged to produce many offspring, and those whose traits are seen as less desirable (the less intelligent, the indolent etc.) be discouraged from reproducing, a controversial programme that he called eugenics
6. Sigmund Freud's (1914) id and unconscious motives align with genes influencing behavior.
7. The Standard Social Science Model (SSSM) dominated 20th-century social sciences, viewing humans as blank slates shaped by culture, reacting against biological determinism (Tooby & Cosmides, 1992).

Addressing Misconceptions

- **"More Evolved" Fallacy (Great Chain of Being):** The idea that some organisms are "more evolved" or that humans descended directly from chimpanzees and we're an 'upgraded species' is a misunderstanding. Instead, humans and chimpanzees share a common ancestor, and each species possesses unique adaptations suited to its evolutionary path
  ⍰⍰♂ **Lucio's note**: this is also similar to the misconception that evolution 'always moves towards a better version', which is not always the case
- **Nature VS nurture fallacy**: The field seeks to unify social sciences through Darwinian principles, acknowledging the impact of *both* nature and nurture, both of which also co-influence each other
- **Genes are 'inflexible'**: Genes must not necessarily lead to behaviour that is fixed and inflexible; flexibility is often built into the system, with behaviour being contingent upon the environment and genes, biology, culture and environment all influencing each other
- **Evolutionary psychology is 'bad'**: *We must not reject it simply on the grounds that some people have used it for nefarious means, any more than we should reject sub-atomic physics for its role in the production of nuclear weaponry. The fact that we do not like the implications of a particular theory does not affect its truth*

Methods for Reviewing Evolutionary Theories

1. Behavioural Genetics

This method uses twin and adoption studies to estimate how much genes contribute to various traits by comparing genetically identical individuals (e.g., monozygotic twins) with those who are not (e.g., dizygotic twins or siblings). While it helps establish heritability, it does *not* indicate whether a trait is an adaptation shaped by natural selection.

- Estimates genetic vs. environmental influences on traits (e.g., intelligence, personality, obesity, addiction).
- A genetically influenced trait is not necessarily adaptive.

2. The Comparative Method

This method examines whether similar ecological problems are solved in similar ways across species, particularly between humans and closely related animals like apes. It helps identify potentially adaptive behaviours by comparing with animals still living in environments similar to those of ancestral humans.

- Looks for functional analogies between humans and non-human species.
- Easier to evaluate adaptive value in non-human animals because their ecological context often mirrors ancestral conditions.
- Traits can be judged adaptive if they lead to increased reproductive success in these contexts.

3. Cross-Cultural Research

Cross-cultural comparisons test whether certain traits are universal across human societies, suggesting an evolved basis. It also addresses the heavy sampling bias in psychology research, which overwhelmingly draws from WEIRD populations (Western, Educated, Industrialized, Rich, Democratic; Henrich, Heine & Norenzayan, 2010).

- Universal traits may indicate evolutionary adaptations.
- Recognizes that some evolved traits only manifest under specific environmental conditions.
- Special focus is placed on *hunter-gatherer societies*, whose ecological conditions are thought to be closer to those of ancestral humans.
  - Example: Research into male aggression as an adaptation for mate competition is tested by observing reproductive success among more vs. less aggressive men in these societies.

4. Computational Modelling

This involves building abstract simulations where computer-based agents with different traits “compete” under evolutionary rules. It allows exploration of trade-offs and strategy dynamics that would be difficult to observe in real life.

- Models how different strategies perform in scenarios like competition for food or mates.
- Example: The hawk-dove game simulates cost-benefit trade-offs of aggression vs. submission (Maynard Smith, 1974).
- The most successful strategies (those that lead to the most “offspring”) help identify potential evolutionary stable strategies.
- Also used to study cooperation (Axelrod, 1984), personality differences, and cultural evolution (Laland, 2017a).

5. Palaeontological Evidence

Although behaviour doesn’t fossilize, ancient physical evidence—like skulls, tools, and art—offers indirect insights into ancestral behaviour, cognition, and social structure.

- Skull interiors provide evidence of possible language capabilities.

- Burial practices suggest social structures, warfare, or gendered reproductive strategies.
- Artefacts like tools and cave art indicate ritual, aesthetic sense, and possibly symbolic thinking.
- Evidence of art among Neanderthals (e.g., 60,000-year-old hand stencils dated with uranium-thorium; Hoffman et al., 2018) raises questions about cultural transmission or parallel evolution.

Additionally, metaphorical "fossils" may exist in our minds.
For instance, preferences for certain landscapes (e.g., rolling hills, rivers, vegetation) might be evolved adaptations for habitat selection, suggesting a universal aesthetic preference rooted in ancestral survival needs (Dutton, 2009).

Disciplines Applying Evolutionary Thinking

The authors outline five key disciplines that integrate evolutionary thought into the study of behavior, acknowledging their overlaps:

- **Ethology:** Observes animal behavior naturally, blending evolutionary and causal explanations (Lorenz, Tinbergen emphasized instincts; later focus on gene-environment interactions).
- **Behavioral Ecology:** Predicts behavior via cost-benefit models (e.g., foraging, mate-seeking), optimizing inclusive fitness with gene-driven flexibility.
- **Sociobiology:** Applies evolution to social behaviors like altruism and cooperation. Overlaps with behavioural ecology – in fact most of the names listed under sociobiology could also appear under behavioural ecology and vice versa.
- **Evolutionary Psychology:** Examines psychological adaptations shaped by evolutionary pressures.
  Lucio's note: Mesoudi in *The Cambridge Handbook* states it emerged in the 1990s as a fusion of sociobiological theory and cognitive science (Barkow et al., 1992; Buss, 2009; Pinker, 1997)
  Like sociobiology draws on ethology and behavioural ecology, but focuses on mental states rather than behaviour per se, emphasizing a mismatch between current and evolutionary environment
- **Cultural Evolution:** Studies cultural practices' evolution, akin to natural selection.

Main Ideas

Workman and Reader assert that evolutionary psychology bridges biology and psychology, offering ultimate explanations for behaviors that complement proximate analyses.

- **Proximate VS ultimate explanations:** proximate (how behaviors develop, e.g., biological mechanism) and *ultimate* (why behaviors exist, e.g., survival benefit) explanations differentiate traditional psychology from evolutionary approaches (Darwin, 1860).
- **Controversies**: Sociobiology (Wilson), eugenics, and politically charged debates. EP is criticized for being deterministic, reductionist, or politically motivated.
- **The modular mind**: The mind is composed of evolved, domain-specific modules (Cosmides & Tooby).

2: Principles of Evolutionary Change

This chapter explains how genetic inheritance underpins evolution and behavior, detailing mechanisms like natural selection, genetics, and epigenetics as the biological foundation for evolutionary psychology.

Natural selection, genetics, and epigenetics form a robust framework for behavioral evolution, with Genome-Wide Association Study (GWAS) highlighting that many genes are at play for most major traits (polygenic influences), and with gene-environment interplay.

Personality and intellectual ability are genetically inherited.
Given that **a third of all protein-coding genes are expressed only in the brain** (i.e. they only produce proteins here) many behavioural biologists believe that differences in personality and intellectual ability may, in part, be

traced back to differences in the genetic code that we inherit from our parents (Plomin et al., 2016)

Key Concepts

- **Natural Selection:** The cornerstone of evolutionary theory, natural selection, is explained as the differential survival and reproduction of individuals due to differences in phenotype.
  Traits that enhance survival and reproduction in a given environment are more likely to be passed on to subsequent generations.
  - Individual selection: Natural selection operating on individual traits that increase personal fitness.
  - Group selection: The idea that natural selection can act on groups, not just individuals. Largely discredited in its original form
  - Gene selection: The view that evolution acts at the level of genes, favoring those that replicate successfully.
  - The selfish gene: Richard Dawkins' concept that genes act in ways that maximize their own replication, even if this appears altruistic.
- **Genes**: Units of heredity made of DNA that code for proteins and influence traits..
  - Pleiotropic genes affect more than one trait or characteristic (i.e., it has multiple phenotypic effects). Many traits and most personality traits are 'pleiotropic', depending on many genes
  - Antagonistic pleiotropy: a single gene has multiple effects—some beneficial and some harmful—depending on the context, especially across different stages of life. For example, testosterone shortens men's lives but gives them broader chests and greater upper-body strength in early adulthood.
    It also means there may be no benefit for females living longer – this is simply a side effect of less testosterone.
  - Chromosomes: Structures within cells that carry genes; humans have 23 pairs.
  - DNA: The molecule that carries genetic information in all living organisms.
- **Genes and Inheritance:** Covers Mendelian genetics (segregation, alleles, meiosis, mitosis), protein production from DNA, and human genetic similarities, driving heritable variation (Mendel, 1865).
- **Heritable variation**: Differences in traits that can be passed from parents to offspring via genes.
- **Fitness**: an organism's ability to survive and reproduce in its environment, passing on its genes to the next generation.
  - Reproductive success: The number of viable offspring an individual produces, contributing to the next generation.
  - Inclusive Fitness**:** Extends reproductive success to kin, explaining altruism (Hamilton, 1964).
- **Mendelian genetics**: Principles of inheritance based on Gregor Mendel's work, explaining dominant and recessive traits.
- **Genotype VS Phenotype**: Genotype is genetic makeup of an organism, while the phenotype are the observable traits of an organism, shaped by genes and environment.
- **Mutation**: A random change in DNA that can introduce new genetic variation.
- **Heritability of characteristics**: The proportion of trait variation in a population due to genetic differences.
- **Genome-wide association**: A method that scans genomes to find genetic variants linked to traits or diseases.
- **Behavioural epigenetics**: The study of how environmental factors can change gene expression and affect behaviour.
- **Mutation and Genetic Drift:**
  - Random mutations introduce new genetic variation, happens *inside an individual organism*—for example, when a cell divides and copies DNA, sometimes a "typo" (mutation) occurs in the gene sequence. This creates new genetic variants (alleles) that were not there before.
  - Genetic drift happens *at the population level*, across generations *without being selected for* and due to chance

events in who reproduces and passes on genes.
It mostly affects smaller populations because in larger populations non-random, fitness-increasing mutation tend to win out

- **Behavioural Epigenetics:** A sub-discipline of behavioural genetics devoted to environmental affects on the activation of genes involved in differences between people in their behaviour.
  Ie.: Experiences modify gene expression, potentially transgenerationally (e.g., smoking fathers affecting children's eating habits) (Haig, 2007).
- **Environmental Influences:** Climate, diet, and social changes as selective pressures shaping adaptations.
- **Adaptation vs. By-product:** Distinguishes traits evolved for function from incidental outcomes.

Genes Are An Imperfect Recipe, Not A Blueprint

Genes are often described as blueprints for building the body, but a more accurate analogy is a **recipe** (Dawkins, 1982; Plomin, 2018).

Like baking a cake, the genetic code provides the instructions, while the environment—such as nutrition, upbringing, or social influences—acts like the oven's temperature and ingredient quality, shaping the final outcome.

This explains why identical twins, despite sharing a genome, are never really quite identical in personality.

There's no exact way to trace specific genes to specific traits, just as you can't reverse-engineer cake crumbs into the recipe.

Still, researchers can estimate how much genes contribute to individual differences.

How to Explain Homosexuality

Research shows **male androphilia is partly genetic and consistent across cultures** (Alanko et al., 2010; Vasey et al., 2020), suggesting an evolutionary explanation is needed.

The question of why male same-sex attraction (androphilia) exists despite lowering direct reproduction has led to several evolutionary hypotheses.
Most focus on how such traits might still contribute to genetic fitness.

Four main hypotheses exist:

1. **Kin Selection:** Androphilic males may help raise relatives' children, indirectly passing on shared genes.
   Evidence: Supported in non-Western cultures like Samoa and Indonesia (VanderLaan & Vasey, 2012; Nila et al., 2018), but less so in Western societies. Some scholars point out that Western societies are farther from our evolutionary past, so Samoans and Indonesians offer stronger evidence
2. **Sexually Antagonistic Selection:** SAS occurs when a gene boosts fitness in one sex but lowers it in the other. For male androphilia, the idea is that female relatives carrying the same X-linked genes may have higher fertility, but in males may be associated with same-sex attraction (Camperio-Ciani et al., 2004).
   Evidence: A number of studies appear to support this suggestion, including Camperio-Ciani et al. (2004) who found that mothers of androphilic men had an average of 2.7 babies whereas those of gynophilic men had an average of 2.3 babies
3. **Heterozygote Advantage:** Genes for androphilia might increase traits like empathy or sensitivity in heterosexual men, which are attractive to women and boost mating success (Zietsch, 2008).
   Evidence: Still speculative. '*It has some support from the finding that 'straight' men who are better able to identify with women are sexually more successful (Zietsch, 2008)'.*
4. **Fraternal Birth Order Effect:** The more older brothers a man has, the more likely he is to be androphilic, possibly due to biological maternal responses—seen as a variant of kin selection (Blanchard, 2018).
   Evidence: Replicated across cultures and studies (Blanchard, 2018). Each older brother increases the odds of

male androphilia by ~30%. Likely a biological effect in the maternal womb (maternal immune hypothesis). Doesn't explain all cases, but it's robust, well-replicated, and measurable.

In conclusion, the evolutionary origins of male androphilia remain debated.
Theories may not be mutually exclusive, and **a** combination of mechanisms likely explains its persistence (Vasey et al., 2020).

3: Sexual Selection

Sexual selection, distinct from survival-focused natural selection, shapes traits enhancing mating success, explored through mate choice and competition in animals and humans.

Key Concepts

- **Sexual selection**: A type of natural selection where traits evolve because they increase mating success.
- **Female choice**: When females select mates based on preferred traits, driving the evolution of those traits.
- **Parental investment**: The time and energy a parent puts into raising offspring, affecting mating strategies.
- **Handicap hypothesis**: Suggests costly traits (e.g., a peacock's tail) signal genetic fitness because only strong individuals can afford them.
- **Parasite theory**: Proposes that females choose mates with traits indicating resistance to parasites, promoting healthier offspring.
- **Muller's ratchet**: The process by which genomes of asexual organisms accumulate harmful mutations over time.
- **Tangled bank**: A theory that sexual reproduction increases offspring diversity, helping them exploit different ecological niches.
- **The Red Queen**: Suggests species must continuously evolve to survive against ever-evolving parasites and competitors.
- **Arms race**: Escalating evolutionary competition between species or sexes (e.g., between predators and prey or between male and female strategies).

Theories of the evolutionary origin of male characteristics

Theory and associated researcher	Theory proposes	Theory predicts
Runaway selection theory (Fisher, 1930)	Male adornments driven beyond original function by female preference for attractive features Male features not direct indicators of genetic superiority, i.e. 'sexy sons'	Females will choose males purely on grounds of attractiveness
Parasite theory (Hamilton and Zuk, 1982)	Male adornments arose to display lack of parasites to females Male features signify genetic superiority, i.e. 'healthy offspring'	Females choose male features that demonstrate a lack of parasites and hence genetic quality
Handicap theory (Zahavi, 1975)	Male adornments are chosen by females for their conspicuous and costly nature Male features signify genetic superiority, i.e. 'healthy offspring'	Females choose males which show conspicuous and costly adornments as a sign of genetic quality

The main theories are these, ⍰⍰♂ put in nested order by me (Lucio):

- **Fisher's Runaway Selection (sexy sons)**: once a feature has been chosen by females it may become progressively exaggerated with each generation since females will constantly be looking for individuals with the largest, brightest example of that feature.
  The runaway may stop once it becomes too costly for survival and reaches an attract/survival optimum. Eg.: the peacock tail can't grow larger (Zuk and Simmons, 2018).
- **Parasite Theory (good genes):** Mate choice reflects health and resistance to parasites. Brighter, healthier-looking mates likely have stronger immune systems (Hamilton & Zuk, 1982).
  That parasites kill more than predators may lend credibility to the parasite theory.
  - **Red Queen Hypothesis** (Van Valen, 1973): Related to parasite theories, it postulates that species must constantly evolve just to maintain their current fitness relative to co-evolving parasites, predators, or competitors — like running in place on a treadmill.
  - **Zahavi's Handicap Principle (costly/honest signaling):** relates to the 'god genes' theory. Costly traits signal genetic fitness because only strong individuals can afford them. The "handicap" proves quality — it's an honest, hard-to-fake signal (Zahavi, 1975).

Runaway/sexy sons VS Parasite theories/good genes have also been called 'sexy sons' versus 'healthy offspring'.
Both sexy sons and healthy offspring can claim some support from the experimental literature

Studies show more parasites often correlate with more male ornamentation, backing the good-genes view.
But cases like swordtail and platyfish fish, where females prefer traits no longer present, support Fisher's sensory bias idea.

Some traits may be both attractive and signal real fitness. For example, long swallow tails aid flight. Male–male competition may also play a role.

Examples like guppies, peacocks, and even potentially humans with testosterone show that **natural and sexual selection may pull in different directions and males might have to make compromises**.

In short, sexual selection is well supported, but its exact mechanism remains debated. Both theories (and sub-theories) are still in play and both may be valid.

Why We Have Sex: More Genetic Variation Means More Chances for Evolution

Although asexual reproduction is common and more efficient, sexual reproduction dominates in most multicellular species—despite its high costs.
These include:

- Losing half your genes in each offspring ("cost of meiosis")
- Wasting resources on non-reproductive males
- Energy spent on courtship and mating (Maynard Smith, 1971; Williams, 1975)

Given these disadvantages, sex must offer a powerful evolutionary benefit to persist. The leading idea is that sex creates genetic variation, which helps species adapt to threats—especially from parasites, as proposed by the Red Queen hypothesis.

In short: sex is costly, but it persists because the genetic diversity it creates improves survival in a constantly changing and hostile environment.

We Have Sex As Protection Against Parasites: Red Queen Theory

The Red Queen theory (Van Valen, 1973) proposes that sex and sexual selection evolved as responses to the constant evolutionary arms race between hosts and fast-evolving parasites. Species need to constantly adapt just to

maintain their fitness — “running to stay in the same place.”

This theory has gained strong support, especially through studies like Lively’s work on New Zealand snails, which showed that sexual reproduction is more common in environments with high parasite pressure (Lively, 1987; Lively et al., 1990; Morran et al., 2011). This suggests that sex provides genetic variation that helps offspring resist infections.

Although alternative ideas like competition between macro-organisms exist, current evidence favors the Red Queen’s focus on parasite-driven evolution, both for maintaining sex and possibly for shaping mate choice. Traits that signal parasite resistance may be key in what females look for in mates (Ridley, 1993).

Key Concepts

- **Female choice shapes men**: Female choice is a potent driver of evolution. ‘*even in cases where males are much larger than females, female choice plays a role in reproduction*‘.
- **Intrasexual vs. Intersexual Selection:** Competition within sexes vs. mate choice between sexes.
- **Parental Investment Theory:** The sex investing more (typically females) is choosier (Trivers, 1972).
- **Homosexuality may be adaptive**, maintained by selective pressures, especially in males (Vasey et al., 2020).
- **Cryptic Female Choice & Sperm Competition:** Females influence paternity post-copulation; sperm competes for fertilization.

⍰⍰♂ Lucio’s note: For more on sperm competition, we go deeper with both evidence and criticism in this review (also see ‘new sperm competition‘):

- ***Cambridge Handbook of Evolutionary Perspectives on Sexual Behavior***

4: The Evolution of Human Mate Choice

This chapter applies sexual selection to human mate preferences and strategies, using cross-cultural and comparative studies.

Robust evidence supports sex differences rooted in evolutionary pressures, with cross-cultural data advancing understanding, though controversies (e.g., rape’s basis) persist (Walter et al., in press).

Key Concepts

- **Sexual strategies theory**: Proposes that men and women evolved different mating strategies based on differing reproductive challenges.
- **Mate guarding**: Behaviors intended to prevent a partner from cheating or being poached by rivals.
- **Male provisioning hypothesis**: Suggests that male investment in offspring (e.g. food, protection) evolved to increase reproductive success.
- **Last common ancestor**: The most recent species from which two or more current species descended.
- **Male parental investment**: The time, energy, or resources males devote to offspring, which can vary across species.
- **Cryptic oestrus**: Hidden ovulation in females, making it hard for males to detect peak fertility—thought to encourage long-term pair bonding.
- **Sexual dimorphism**: Physical differences between males and females of a species (e.g., size, coloration). Usually this means larger size for males. Polygynous mating systems (one male to a number of females) generally lead to a large degree of sexual dimorphism since males compete for ‘the prize’ of a number of female mates. In monogamous species, the sexes may be very similar in size since men don’t compete for females. Once paired up, it does not pay a male to compete for further females.

- **Polygyny**: A mating system where one male mates with multiple females.
- **Polyandry**: A mating system where one female mates with multiple males.
- **Reproductive value**: The expected future reproductive output of an individual, usually highest in young females.
- **Sperm competition**: Competition between sperm of different males to fertilize the same egg, often influencing male anatomy and behavior.
- **Sexy sons**: A hypothesis suggesting that females may choose attractive males so their sons will also be attractive and have high reproductive success.
- **Coolidge effect**: Males (and sometimes females) show renewed sexual interest when introduced to novel partners.

Category	Description	Examples	Distribution
Monogamy	Individuals mate with one partner	Dwarf antelopes; **humans**	90% of bird species, but rare in mammals
Polygamy	More than one partner ⬇	Includes polygyny and polyandry ⬇	See below ⬇
Polygyny	A form of polygamy where individual males mate with more than one female	Bighorn rams; gorillas; elephant seals; wood frogs; **humans**	The most common mating system found in mammals
Polyandry	A form of polygamy where individual females mate with more than one male	African jacanas; red-necked phalaropes; Galapagos hawk; **humans**	Very rare; found in some bird species

As seen above, humans can adopt any mating system.
Humans are plastic in their mating strategies, and vary depending on cultures:

> Cross-cultural studies suggest that in reproductive matters we are a highly flexible species and that, unlike other species, our sexual strategy cannot easily be pigeonholed

Human Mate Preferences

- **Long term**: most of what both sexes want from a long-term partner is surprisingly similar.
  - Differences: As parental investment predicted (Trivers, 1972), men place greater emphasis on physical attractiveness and women place a premium on signals of wealth and status
  - Similarities: Both sexes require indicators of commitment and therefore, both men and women value love as of primary importance.
  - Women's preference and variability: *Yes, for long-term relationships women do want emotionally stable and dependable men who are well-off and of high status. But the relative importance of these features varies between cultures* (Benton, 2000; Buss and Schmitt, 2019).
- **Short term**: the authors don't delve as deeply into short-term preferences, but from what I know men to be more indiscriminate and 'lower the bar', while women may prefer sexier men and discount the importance of resources and provisioning

Although Buss' original is not recent, the pattern of sex differences revealed in mate choice criteria has been replicated in more recent times, suggesting Buss' findings are robust (Lippa, 2008; 2009, Walter et al., 2020; see also Archer, 2019.)

Characteristic	Men rating women	Women rating men	Sex difference	Cultural variation

Characteristic	Men rating women	Women rating men	Sex difference	Cultural variation
Love	2.81	2.87	low	low
Dependability	2.50	2.69	low	high
Emotional stability/maturity	2.47	2.68	moderate	moderate
Pleasing disposition	2.44	2.52	low	high
Good health	2.31	2.28	low	high
Education/intelligence	2.27	2.45	moderate	low
Sociability	2.15	2.30	low	moderate
Desire for home and children	2.09	2.20	low	high
Refinement/neatness	2.03	1.98	low	high
Good looks	1.91	1.46	high	moderate
Ambition and industriousness	1.85	2.15	high	high
Good cook and housekeeper	1.80	1.28	high	high
Good financial prospect	1.51	1.76	high	low
Similar education	1.50	1.84	moderate	high
Favourable social status	1.16	1.46	moderate	moderate
Chastity	1.06	0.75	low	high
Similar religious background	0.98	1.21	low	high
Similar political background	0.92	1.03	low	low

Note: Rating scores potentially vary from 0.00 (irrelevant or unimportant) to 3.00 (indispensable).
Source: Adapted from Buss et al. (1990).

Women's Attractiveness May Influence Her Promiscuity

Robert Trivers (1972) proposed that women adjust their sexual strategies based on their perceived attractiveness or "market value."

According to this view, less attractive women may engage in more casual sex because they may anticipate lower chances of securing a high-investing long-term partner.

In contrast, those who perceive themselves as especially attractive are more likely to pursue high-status mates who offer greater investment (Trivers, 1972; Wright, 1994). **<— ⍰⍰♂ Lucio's note**: Since this is such a touchy yet important topic, I'd suggest removing Wright. As a journalist, he may not have been an original source

Empirical support includes Walsh (1993), who found that women who feel less attractive report having more partners, and studies showing that the most attractive women tend to pair with the most powerful men (Kanazawa & Kovar, 2004; Symons, 1979).

Women Choose Commitment or Promiscuity Based On Men's Availability

Women's mating strategies shift based on context.

Evolutionary psychologists such as David Buss (2011; 2016) and Symons (1979) argue that women adjust their reproductive behavior based on the availability of investing males, their own age and attractiveness, and their ability to secure resources independently

In environments where male investment is low—such as post-war tribal societies (Symons, 1979) or inner-city areas with high male unemployment (Buss, 2011; 2016)—women may adopt short-term mating to gain small benefits

from multiple partners.

Evolution VS Culture: Eagly Criticism of Buss & Women's Preferences

Across cultures, women prefer partners with financial resources more than men do.

However, the strength of this preference varies by culture. For example, women in India and Nigeria value financial prospects more than women in Sweden or the Netherlands.

This cultural variation led Alice Eagly and colleagues to propose a social role explanation: **when women lack access to resources (e.g., through limited education or employment), they place more importance on a partner's wealth**.
Her research shows that women's preference for male resources decreases as their own financial independence increases (Eagly & Wood, 1999).

Initially, this challenged evolutionary explanations.
But today, there's general agreement—shared even by Eagly—t**hat mate preferences are shaped by both evolved mechanisms and culture**.
Evolutionary psychologists, including Buss, see human mate behavioural adaptations as structured to 'respond contingently to local social and ecological factors' (Kurzban and Haselton, 2006).

Also see:

- How Western social safety nets limit hypergamy

Major Insights

- **Love is a universal human experience**: Some thought of romantic love as a recent invention of Western culture (Symons, 1979; Jankowiak and Fischer, 1992), but evolutionary psychology destroyed this myth and it's something that everybody can experience (see e.g. Jankowiak and Fischer, 1992; Toates, 2014)
- **Male provisioning & 'cryptic oestrus' explains love**: humans can't be sure when women are fertile and many men invest in their women and children. This led to constant female sexual attraction which may well be a unique human feature and it may have led, in turn, to a unique long-lasting pair bond or, in colloquial language, 'love'
- **Female reproductive value VS fertility**: Fertility refers to the likelihood of producing an offspring from a given mating whereas reproductive value is the potential for future offspring production.
  It's an important distinction for men looking for either short-term sex, or long-term commitment. A 30-YO might be as fertile as 16-YO, but the 16-YO has higher reproductive value
- **Sex Differences in Mating Strategies:** Women favor resource providers, men youth/fertility cues, reflecting reproductive costs; pair bonds and male investment distinguish humans (Buss, 1994; Trivers, 1972).
- **Sperm Competition, sexual dimorphism, & mating systems:** Sexual dimorphism (different sizes between genders) and testes size indicate ancestral mating systems differences between chimpanzee (multiple mating, low sexual dimorphism, and sperm competition), gorillas (large sexual dimorphism, monopolization of females by the alpha, small tests and low sperm competition), and humans (in-between the two).
  Thus in males a large body size relative to females indicates polygyny (multiple mating partners for males) whereas large testes compared to closely related species indicates polygamy (multiple partners for both sexes)
- **Short-term vs. Long-term Strategies:** Dual strategies balance reproductive success (men) or resources (women) vs. stability (Baker & Bellis, 1990).
- **Paternity Uncertainty and fidelity:** Men focus on chastity and fidelity to ensure the child is theirs
- **Coolidge Effect & Cryptic Oestrus:** Male promiscuity and hidden female oestrus may reduce infanticide (Buss, 1989).

5: Cognitive Development and the Innateness Issue

Explores whether cognitive capacities are innate or learned.
A balanced view recognizes innate predispositions shaped by environment, with modularity accepted for basic functions, while neuroconstructivism, or development over time with experience, explains flexibility.

Key Concepts

- **Nativism**: The view that certain skills or knowledge are innate or biologically pre-programmed, similar to:
  - **Modularity/innatism**: The view that the mind is composed of distinct, specialized units (modules) evolved for specific functions.
    Ie.: the brain has pre-wired, specialized modules (like "language module" or "face recognition") that are largely inborn and universal. Development mostly reveals what's already built-in.
- **Constructivism**: The theory that development is an active process of building knowledge through interaction with the environment.
  Ie.: The brain starts more general and flexible, and builds specialized abilities over time through interaction with the environment and learning. Functions emerge, they're not preloaded.
  Similar to:
  - **Empiricism**: The belief that knowledge comes primarily from sensory experience and learning.
- **Epigenetic landscape**: A metaphor for how gene expression is influenced by developmental pathways and environmental factors.
- **Domain specificity**: The idea that certain cognitive processes are specialized for particular types of information (e.g., language or faces).
- **Imprinting**: A rapid, early form of learning in which an animal forms attachments during a critical period (e.g., ducklings following the first moving object).
- **Critical period**: A fixed developmental window during which specific abilities must be acquired (or they never will be).
  - **Sensitive period**: A more flexible window during which learning is easier or more effective, but still possible later.
- **Theory of mind**: The ability to understand that others have thoughts, beliefs, and perspectives different from one's own.
  Autism impairs theory of mind.
- **Neuroconstructivism**: The theory that cognitive development arises from dynamic interactions between brain development, experience, and environment.

Evolutionary Psychology Logic Supports Modularity

When a species repeatedly faces the same adaptive problem, natural selection would favor domain-specific mechanisms (i.e., modularity), because they're more efficient than domain-general ones.

An evolutionary perspective would support modularity. Ie.: '*A child who, at a young age, can communicate with others, recognise its family and show fear in dangerous situations will be more likely to survive than a child who develops these abilities much more slowly.*'

Important Concepts

- **Core Knowledge Systems in infants:** Infants show early grasp of objects, numbers, agents, suggesting innate modules (Pinker, 1994; Bushnell, 1982).
- **Theory of Mind:** Emerges around age 4, vital for social cognition, with variations in false belief understanding; impaired in autism (Baron-Cohen, 1995).

- **Autism and Modularity:** Autism may reflect impaired social modules, supporting modularity (Fodor, 1983).
- **Prepared Learning for adaptive skills:** Evolution primes learning of adaptive skills (e.g., snake phobias).

6: Social Development

Social development reflects evolutionary pressures for cooperation.
Life history and attachment theories are accepted, with ongoing social learning research.

Key Concepts

- **Life history theory** claims that, from an early age, children monitor their environment and make decisions about their future reproductive value and future strategies. Based on their assessment of the environmental conditions, they can choose to maximise current reproductive success or future reproductive success.
- **Ontogenetic adaptations**: Temporary traits in development that serve immediate adaptive functions (e.g., infant reflexes).
- **Deferred adaptations**: Traits expressed early that prepare for future benefits (e.g., play behavior for adult competence).
- **Conditional adaptations**: Traits that develop in response to environmental cues, adapting the individual to specific contexts.
- **Attachment styles**: Patterns of emotional bonding based on early caregiving, influencing later social and romantic behavior. Secure working models generally lead to more satisfactory and stable relationships in later life than insecure ones. Ainsworth proposed that there are three attachment styles, secure (Type B), insecure-avoidant (Type A) and insecure-anxious/resistant (Type C).
- **C–F continuum (Cooperation–Fast continuum)**: A range from cooperative/slow life strategies to fast, opportunistic ones.
- **Fast versus slow life history**: Fast strategies involve early reproduction, impulsivity, and low investment; slow strategies involve delay, planning, and high parental investment.
- **Principle of allocation**: Organisms must trade off between competing demands (e.g., energy for growth vs. reproduction).
- **Shared environment**: Environmental factors that contribute to similarities between siblings (e.g., same household, parenting).
  - **Non-shared environment**: Unique experiences that make siblings different (e.g., different friends or teachers).
- **Behavioural genetics**: Studies genetic and environmental influences on behavior using methods like twin/adoption studies.
- **Cooperation**: Behavior where individuals work together toward shared goals, often benefiting group survival and success.
- **Morality**: Social rules and norms evolved to regulate behavior and promote group cohesion and cooperation.

Genes Effect the Environment

Genes and environment don't act independently in shaping development.
Instead, genetic influences often shape the very environments people experience. B

ehavioral geneticists describe three main types of gene–environment interaction, showing that genes can help determine the kind of upbringing, treatment, and surroundings a person ends up with—meaning nature helps shape nurture:

- **Passive interaction**: Children inherit both their genes and much of their environment from parents. For

example, intelligent parents provide both genes and a stimulating environment (e.g., books, conversation).

- **Reactive–evocative interaction**: A child's traits (e.g., attractiveness) evoke different responses from others. Attractive children may be punished less or treated more positively, shaping their social experience.
- **Active interaction**: Children seek out environments that match their genetic dispositions—for instance, sporty kids gravitate to other active kids, and intellectually curious children look for stimulating peers or settings.

🤦♂ **Lucio's note: the other way around is also true**
For example populations maintained enzymes to digest milk only after farming developed

The Evolution of Cooperation & Morality: We're A 'Morally Cooperative' Species

Human cooperation extends far beyond kin-based altruism, involving shared goals, coordination, and cultural norms that enable large-scale collaboration—even among strangers.

From infancy, humans demonstrate proto-conversational turn-taking and shared attention, which form the foundation for coordinated efforts.
Unlike chimpanzees, young children actively re-engage partners, prefer collaboration even when solo work is easier, and develop, critique, and enforce norms—behaviors rooted in an early-emerging sense of collective "we."

For a long time, it was thought that morality contradicted the principles of evolutionary theory.
But morality may have developed alongside win-win cooperation.

Models of Morality

- **Fiske's model** defines morality through relationship types, with norms evolving to support cooperation (Rai & Fiske, 2011):
  - Community sharing (kin and group cohesion)
  - Authority ranking (hierarchy)
  - Equality matching (reciprocity)
- **Curry's game-theoretic model** adapts social dilemmas (e.g., hawk-dove, mutualism, exchange, contests, division) to show how moral rules resolve conflicts and distinguish between kin-based and non-kin cooperation. See the table:

Table 6.3 Oliver Curry's 'periodic table of morality'

Problem	Examples	Morals
Kinship	kin detection and incest avoidance, parental investment, rules against incest	obligations to kin, duty of parental care, prohibition of incest
Mutualism	coalitionary psychology, common knowledge, theory of mind; in-group favouritism	friendship, loyalty, conformity
Exchange	trust, gratitude, cheater detection, revenge and forgiveness	reciprocity, punishment, trust, gratitude, apology, forgiveness
Conflict resolution (Hawk-Dove)	status, dominance and deference, contests	virtues and excellences, Hawkish virtues (fortitude, bravery, skill, generosity, beauty), Dove-ish virtues (humility, respect, deference, obedience)
Conflict resolution (division)	equal sharing or sharing based on need	fairness, negotiation and compromise
Conflict resolution (possession)	territoriality, property law	property rights, theft

Both models have more in common than they differ.
Fiske underplays the differences between kin and non-kin interaction, and Curry underplays the hierarchical structure of human societies.
Both agree that morality evolved to enable humans to cooperate at large scales, employing norms to offset our innate selfish tendencies.

Key Points

- **Cooperation is strongly linked to morality**. *In fact, morality is one of the forces that drives us to cooperate. The reason why people cooperate fairly is either because they feel bad if they don't or because they fear being punished if they are caught cheating.*
- **Children are born wired for social interaction** *and quickly develop the motivation and skills to share their experiences and their goals with others. Unlike chimpanzees, which prefer to act alone unless it is impossible to do so (such as a hunt) children prefer to cooperate with others, even when it is not strictly necessary*
- **Attachment Theory:** Early bonds (secure/insecure) affect adult relationships (Bowlby, 1969).
- **Life History Theory:** Life history applied to attachment theory suggests that attachment style may be adaptations. Early environments shape fast (risk-taking) vs. slow (investment) strategies (Belsky et al., 1991; Chisholm, 1993).
  - Parents provide environmental cues: Life history theory suggests that genes build mechanisms that enable children to use their parents' behaviour as a way of choosing (unconsciously) a reproductive strategy. For example, an absent father may cue children to promiscuity and early reproduction, while a stable and doting family may predispose for stable relationships
- **Twin studies help us estimate the impact of nature VS nurture**: the amount of variation between individuals can be calculated by looking at the differences between identical twins reared apart on the trait because, since they are genetically identical, it follows that any difference between them must be due to the environment. The results of such studies estimate that the environment accounts for between 50-60% of the variation among them on a variety of traits and genes for 40–50%.
  - Genes may be under-estimated because genes have a secondary effect on life experiences. For example, attractive people are generally more assertive, a finding that is explained by the observation that attractive people are generally treated with more deference (Jackson and Huston, 1975)
  - Genes may also be underestimated 2 (Conditional adaptation theory): because instead of pre-programming everything, they equip us with modules for adapting to the environment.
    See below
- **Shared environment matters little**: *Behavioural genetics research using twin and adoption studies suggest that not only do all traits have a degree of heritability (often around 50 per cent), but the remaining variation in traits is accountable to the non-shared rather than the shared environment* (ie.: parents don't seem to make a large difference)

7: Kin Relationships and Conflict

Explains family altruism and conflict via inclusive fitness, focusing on kin dynamics.

Kin behaviors are central, with strong evidence for inclusive fitness and conflict; grandmother hypothesis and Cinderella Effect are supported, though culture plays a role.

Key Concepts

- **Inclusive fitness**: Total genetic success from one's own reproduction (*direct fitness*) **plus** helping relatives reproduce (*indirect fitness*).
  Inclusive fitness explains kin altruism

- **Direct and indirect fitness**:
  - *Direct*: Offspring produced by the individual.
  - *Indirect*: Extra offspring produced by relatives due to the individual's help.

- **Coefficient of relatedness (r)**:
  Probability that two individuals share a gene from a common ancestor (e.g., r = 0.5 for siblings or parent-child).

- **Kin altruism** (AKA nepotism):
  Helping relatives reproduce, even at a cost to oneself, because shared genes benefit (explains altruistic behavior toward kin). The tendency to provide aid to relatives appears to be related to the proportion of genes shared by common descent (i.e. the coefficient of relatedness – 'r').

- **Parental investment**:
  Time, energy, and resources parents invest to increase offspring survival and future reproduction.
  In some species a large number of offspring are produced but very few resources are provided for each ('r-selection'). In others, a great deal of effort is spent on each of a small number of offspring ('K-selection').
  - Life history: the context of human life history theory, these are also known as 'fast' and 'slow' selection. With important exceptions, humans and other primates are at the extreme end of K-selection (fewer children, high investment)

- **K- and r-selection**:
  - *K-selection*: Fewer offspring, high investment (e.g., humans).
  - *r-selection*: Many offspring, low investment (e.g., insects).

- **Parent–offspring conflict**:
  Evolutionary conflict: offspring want more resources than parents are selected to give (due to parents' need to divide resources across multiple offspring).
  - **Parental manipulation**: Parents influence offspring behavior to maximize their own inclusive fitness (may not always align with offspring's best interests).

- **Grandmother hypothesis**: Post-menopausal women increase their inclusive fitness by helping raise grandchildren rather than having more children themselves.
  - Grandmothers VS grandfathers: Due to the possibility of non-paternity, paternal grandparents are predicted to provide a lower level of investment than maternal grandparents.

Key Concepts

- **Hamilton's Rule:** rB > C drives kin altruism (Hamilton, 1964).
  Meaning: helping relatives (kin altruism) evolves when the genetic relatedness (r) times the benefit to the relative (B) is greater than the cost to the helper (C).
- **Kin altruism boosts inclusive fitness**
- **Poor parents under-invest in unhealthy offspring** when wealthy parents had children with medical and psychological problems they increased their investment, whereas poor parents provided the least parental care to the least healthy offspring (Bugental et al., 2013; Pelham, 2019).
- **Places with high infant mortality may lead to lower care**: A study of 150 nations found that countries with high parasite load and high infant mortality parents tend to invest less in each offspring and to encourage child labour (Pelham, 2019)
- **Parental Investment and Conflict:** Sibling rivalry and weaning conflicts arise from differing optima (Trivers, 1974).
  - Parents may manipulate into more cooperation: Alexander (1974) suggests parents might increase their

inclusive fitness by teaching appropriate moral code. In particular, parents tend to teach their children to behave benevolently towards each other
  - Mother-child interest conflict after one year when the mother may want to have another child, but the child may want to monopolize investment
  - Mother-daughter interest may conflict if the daughter has a child too soon when the mother is still of child-bearing age
- **Grandmother Hypothesis:** Menopause aids grandchildren's survival (Hawkes, 1998).
- **Kin Recognition:** Mechanisms (e.g., MHC genes, familiarity) support altruism (VanderLaan et al., 2012).
- **Cinderella Effect:** Stepparents' higher abuse rates reflect lower genetic investment (Daly & Wilson, 1988).

8: Reciprocity and Conflict Among Non-Kin

Focuses on non-kin cooperation and conflict, including reciprocal altruism and violence.
Reciprocal altruism underpins cooperation, supported by game theory and ethnography; conflict (e.g., Dark Triad, violence) is studied, with ethical debates ongoing.

Key Concepts

- **Reciprocal altruism – direct reciprocation**: Helping others with the expectation they'll help back in the future; a "you scratch my back, I'll scratch yours" dynamic.
  Direct reciprocation consists of self-sacrificing acts between two unrelated individuals that are based on delayed reciprocation
  - Rare in animals foundational in humans: some evolutionary psychologists consider reciprocation a foundational stone of human social behaviour.
- **Xenophobia**: Fear or distrust of outsiders or strangers, possibly evolved as a protective mechanism against unknown threats.
- **Gift economy**: A system where goods/services are given without explicit agreements for immediate or future returns, building social bonds and status.
- **Game theory**: A mathematical framework to study strategic interactions between individuals, it has been used by evolutionists to model the behaviour of humans and other species under simplified versions of social decision-making scenarios
  - Prisoner's dilemma: A game theory scenario where mutual cooperation is best long-term, but individuals are tempted to defect for short-term gain. Tit-for-tat was the most effective strategy:
  - Tit-for-tat: A simple and effective strategy in repeated games—start with cooperation, then match the partner's previous move in the next encounter (cooperate with cooperators or defect with defectors).
    It's an evolutionarily stable strategy (ESS), and humans develop it when playing repeated prisoner's dilemmas. It suggests that we seek cooperation but bear grudges when cooperation is not reciprocated.
- **Evolutionarily stable strategy**: A strategy that, if adopted by most of the population, cannot be beaten by an alternative strategy.
- **Stereotyping**: Overgeneralized beliefs about members of a group; may have evolved as a cognitive shortcut for social prediction.
- **Ethnocentrism**: Viewing one's own group as superior and using it as the standard to judge others; possibly evolved to promote group cohesion.
- **Dark Triad**: A cluster of three personality traits—Machiavellianism, narcissism, and psychopathy—associated with manipulation, callousness, and self-interest.

Prerequisites for reciprocal altruism

According to Trivers, reciprocal altruism requires:

1. **Reasonably long lifespan to repeatedly encounter specific individuals** and thereby allow for reciprocation to occur
2. **Cost/benefit arbitrage**: cost of altruism for the recipient should be lower than the benefit to the recipient
   ⍰⍰♂ **Lucio's note**: I don't see why this should be a strict requirement, since your cost of giving can be higher than the benefit of the recipient, but still pay off if the recipient's repayment outweighs your cost
3. **Ability to recognise each other** in order to both reciprocate and to detect cheats (non-reciprocators).

Freeriders threaten cooperation: remove them to keep a good-functioning group

Cooperation among non-kin is threatened by freeriders — individuals who benefit without contributing.

According to Tooby et al. (2006), cooperation could not have evolved unless mechanisms emerged to detect and manage freeriders. Once detected, two main responses are available: punishment (Price et al., 2002) and withdrawal of cooperation.

In public goods games, where individuals contribute to a shared pool that benefits all, cooperation starts high but declines as freeriding increases. A meta-analysis by Fehr and Schmidt (1999) found that contributions dropped from 40% to nearly zero across rounds, with 73% of participants making no contribution by the final round. Participants reported that freeriding by others led them to stop cooperating.

Allowing participants to punish freeriders drastically improves cooperation. When fines could be used, only 20% failed to cooperate in the final round (Fehr and Gächter, 2002). Real-world parallels appear in common-pool resource systems, where Ostrom (1990) found that all successful common-pool resources share effective monitoring and punishment systems. Punishment — or the credible threat of it — is therefore crucial to maintaining cooperation (Fehr and Gächter, 2000).

> The greatest cost that freeriders inflict is the loss of all the potential gains from n-party exchanges that otherwise would have been achieved if freeriding had not triggered antiexploitation motivational defenses among cooperators (Tooby et al., 2006)

Xenophobia may be adaptive

Xenophobia may be adaptive, and also help explain why many can be so easily indoctrinated into populism and nationalist ideologies.

Xenophobia may have developed with:

- **'Cheat detection' mechanisms**: If ancestral human societies were largely based around acts of kin altruism and reciprocation, then selective pressures would also have led to the evolution of psychological mechanisms to spot cheats and to be suspicious of strangers until we are reassured that they are not freeriders
- **Ingroup/outgroup**: the formation of a group identity can lead to positive in-group and negative out-group stereotyping.
  Our own view of ourselves – our self-concept – may also be constructed partly out of group memberships, so we tend to view our own groups as positive (Bierhoff, 1996)
- **Coalitionary aggression**: Some have controversially stated that xenophobia help form coalitions and it may have been an adaptive strategy

In Sherif's famous experiment, children divided into two groups readily formed started behaving gang-like towards the other, and only the introduction of an imaginary third group relieved the hostility (Sherif, 1956).

Sherif's experiment teaches us that **to stop inter-group conflict a common enemy is the solution to remove hostility and foster cooperation**.

Tajfel's subsequent studies suggest that we don't have to seek out like-minded compatriots, we just have to have something (anything) that allows us to feel part of a group and then discriminate in favour of some individuals on the basis of arbitrary and anonymous group membership alone (Tajfel, 1970).

> It seems that people will latch on to almost any cue to distinguish in-group and out-group members (John Archer, 1996)

Key Concepts

- **Direct and Indirect Reciprocity:** Tit-for-tat and reputation-based cooperation (e.g., !Kung San food sharing) (Trivers, 1971; Lee, 1968).
- **Costly Signalling Theory:** Prosocial displays boost status.
- **Machiavellian Intelligence:** Social manipulation drove brain evolution (Zeigler-Hill et al., 2016).
- **Jealousy gender differences:** Sex differences tied to infidelity concerns (Buss et al., 1992).
- **Dark Triad may be adaptive** in some contexts (Zeigler-Hill et al., 2016).
- **Freeriders:** Threaten cooperation, countered by cheater detection (Cosmides & Tooby, 1992).

9: Evolution, Thought and Cognition

Examines how evolution shaped reasoning, memory, and decision-making, emphasizing how an evolutionary approach can better help us understand why the mind works the way it does (ie.: focus on what it was designed to do).

Cognitive processes are ancestral adaptations; modularity and adaptive memory are accepted, with debates on domain-specific vs. general mechanisms.

Key Concepts

- **Computational theory of mind –** The mind is like a computer: it processes information through symbols and rules. Evolutionarily, it suggests natural selection shaped the brain to solve adaptive problems via mental computations.
- **Substrate neutrality –** The idea that computation doesn't depend on the material doing it (brain, silicon, etc.). Evolutionary relevance: mental adaptations can be understood in terms of function, not biology alone.
- **Episodic and semantic memory –** Episodic: memory of personal events; Semantic: general knowledge and facts.
  Evolution: episodic memory helps track social and environmental events; semantic memory aids in survival through stored knowledge.
- **Cognitive economy –** Mental efficiency: organizing information in a way that reduces processing effort. Evolutionarily adaptive for conserving energy and making fast decisions.
- **Typicality effect –** Some category members (e.g. robin as a bird) are judged faster/more "typical" than others (e.g. penguin).
  Evolution: may reflect prototype-based categorization that speeds up recognition and action.
- **Indicative and deontic reasoning –** Indicative: reasoning about what is true (logic/facts); Deontic: reasoning about what one should do (rules/obligations). E
  volution: deontic reasoning likely evolved to navigate social norms and cooperation.
- **The gambler's fallacy –** Mistaken belief that past random events affect future ones (e.g., "red hasn't come up, so it must now").

Evolution: may stem from evolved pattern-detection mechanisms misfiring in modern settings.

- **The hot hand fallacy –** Belief that someone on a winning streak is more likely to continue succeeding.
  Evolution: possibly linked to tracking social status or skill, which may have been adaptive in group dynamics.
- **Foraging theory –** Models how animals (including humans) search for and exploit resources efficiently, and since in nature streaks or patterns can mean something (e.g., a fruitful berry bush or a good hunting ground), our minds may have evolved to expect non-randomness.
  - Marginal value theorem – A principle in foraging theory stating when an animal should leave a resource patch: when the rate of resource gain falls below the average elsewhere. Applied to mate choice, information seeking, etc.

Main Ideas

- **Wason Selection Tasks:** Humans excel at social contract logic (Wason, 1966).
- **Visual Illusions Aren't Illusions But Features:** Adaptive "errors" (e.g., shadow illusion, "The Dress") reflect survival-tuned perception (Adelson, 1995).
  Our visual systems did not evolve to present us with a true description of the world, but to provide a useful description of the world that supports our actions upon it.
- **Intelligence evolved to help us survive and reproduce:** Evolved via social, ecological, and sexual pressures; practical intelligence often undervalued.
- **Adaptive Memory:** Prioritizes survival info (e.g., predators) (Nairne & Pandeirada, 2008).

11: The Evolution of Emotion

Emotions are universal adaptations modulated by culture, supported by functional and neuroimaging evidence. The authors present emotions as evolved response systems aiding survival and reproduction.

Key Topics

- **Basic Emotions:** Universal (e.g., anger, fear) with physiological/cognitive bases (Ekman, 1992).
  - Smile as appeasement: van Hooff sees two dimensions in pro-social gestures – 'friendliness' (smiling) and 'playfulness' (laughing).
    In this way smiling and laughter form a continuum with two dimensions. The silent bared-teeth display originated as an appeasing signal and later evolved into a friendly gesture.
- **Display rules modulate the 'appropriateness' of emotional expression** within a certain culture.
  People still generally feel the same emotions, but the outward display may vary
- **What's attractive varies by culture**: There is a great deal of scope for modification during development. In some cultures, for example, scars or tattoos are attractive while they're ugly disfigurements in others (Carlson et al., 2000).
  Cultures can also change rapidly.
- **Jealousy and Sexual Strategies:** Males focus on sexual infidelity, females on emotional (Buss et al., 1992).
- **Plutchik's Wheel:** Eight primary emotions, opposites, and combinations.
- **Functional Roles of emotions:** Fear avoids danger, disgust prevents contamination, joy boosts cooperation (Nesse, 1990; Fredrickson, 2001).
- **Some negative emotions may not be adaptive, but a cost to pay for their positive expression**: Bereavement may serve no adaptive function but the price we pay for love and attachment, similar to drug withdrawal.
  Determining which emotional states are adaptations and which are emergent properties will be a difficult task for researchers

12: Evolutionary Psychopathology and Darwinian Medicine

Applies evolution to mental disorders and health, viewing them as exaggerated or mismatched traits. Evolutionary psychopathology explains disorder persistence; Darwinian medicine gains traction, with depression and schizophrenia models debated but accepted, requiring ethical care.

The evolutionary logic of pathogen virulence

The virulence of a disease depends on how and how fast it's transmitted, and when it affects the recipients.

Paul Ewald proposed that pathogens spread through direct contact (like the common cold) tend to be less harmful, since keeping the host active helps transmission.

In contrast, those spread by vectors (like mosquitoes in malaria) can afford to debilitate or even kill the host, as transmission doesn't rely on the host's mobility.

> To put it crudely, killing the host may not matter as long as there are plenty of opportunities for the vector to take copies of the pathogen onto other hosts (Nesse and Dawkins, 2010).

Harmful genes may also be maintained in our species if the harmful gene has its effects after the age of reproduction.
Then, natural selection is unable to remove it from a population. In this way inherited diseases such as Huntington's chorea, which does not emerge until middle age, may be kept in the population.

Heterozygous advantage: sickle cell example

Some harmful genes are preserved in human populations because they provide benefits in certain genetic combinations.

A classic case is sickle-cell anaemia: having two copies of the gene causes illness, but having just one (heterozygous) provides resistance to malaria, offering a survival advantage in malaria-prone regions. This phenomenon is known as heterozygous advantage—when carrying two different alleles leads to greater fitness than having either allele alone.

This dynamics is similar to the 'sexually antagonistic selection' we saw earlier:

Heterozygous Advantage VS Sexually Antagonistic Selection

They're different concepts, but both explain how seemingly disadvantageous genes can persist in a population.

- **Heterozygous advantage** is about genotype combinations (allele pairing).
  Mechanism: Maintains genetic variation because the **intermediate genotype is the fittest**.
- **Sexually antagonistic selection** is about sex-based fitness tradeoffs.
  Mechanism: Maintains genetic variation because **it benefits one sex while hurting the other.**
  One theory explaining homosexuality was based on sexually antagonistic selection: it may help women be more fecund, but it costs to some men.

Depression = low status; Machs = high status

Research on vervet monkeys and humans suggests that serotonin levels are closely tied to social status and may play a role in depression.

In monkeys, alpha males had serotonin levels twice as high as subordinates, but when they lost their dominant position, serotonin dropped sharply, and their behavior changed—becoming withdrawn, rocking, and refusing to eat, similar to symptoms of depression in humans (Raleigh and McGuire, 1991; McGuire et al., 1997).

When treated with Prozac (an SSRI), these symptoms disappeared, and monkeys given Prozac became alpha males when the original one was removed (McGuire et al., 1997; McGuire and Troisi, 1998).

In humans, some studies classify males as either 'Machiavellians,' who are relatively aggressive and competitive, or 'moralists,' who are more deferential.
⍰⍰♂ **Lucio's note**: I find the researchers' choice of name to be sub-optimal. 'Dominant men' would have been a better fit than 'Machiavellians'.

For Machiavellians, social rank and serotonin levels are positively correlated, while for moralists the relationship is negative (Madsen, 1985; Madsen and McGuire, 1984).

This suggests that, like vervet monkeys, high-status pushy males tend to have higher serotonin.

Since low serotonin is linked to depression (Ray, 2018), these findings provide indirect support for Price's social competition hypothesis, which proposes that low mood can be an adaptive response to failure in gaining status.

While this hypothesis might be criticized for focusing on male-typical competition, women also compete for status in less overt ways (Cashdan, 1996; Campbell, 2002; 2006; 2020). If supported, the social competition hypothesis could help Darwinian medicine guide clinicians in identifying and understanding some forms of depression.

> 15 Steps to Be A Good Machiavellian: Your Secret Playbook

The evolutionary reason for psychopathy: leeching off of cooperators

Psychopathy, often considered synonymous with antisocial personality disorder (APD), is characterized by a lack of empathy, callous exploitation of others without guilt, low anxiety, and a preference for immediate gratification.

Evolutionary psychologists propose that **psychopathy may represent an adaptive "cheater" strategy that takes advantage of the widespread reciprocal cooperation in human populations**.

Such an argument for persons with APD has been considered by a number of evolutionists (Mealey, 1995; 2005; McGuire et al., 1997; Glenn et al., 2011) but is particularly associated with McGuire and Troisi (1998).

For such a strategy to persist, two key conditions must be met:

1. there must be a genetic basis for psychopathy
2. most individuals in the population must be cooperators or reciprocators

Empirical evidence supports these conditions, with studies showing higher concordance rates for APD in monozygotic twins compared to dizygotic twins, increased incidence in adopted children of biological parents with the disorder, and a five-fold increased risk among first-degree male relatives.

Psychopathy affects approximately 3% of adult males and 1% of females, with its higher prevalence in males potentially explained by stronger migratory tendencies that reduce detection.

Moreover, around half of psychopaths may remain undiagnosed, suggesting that this freeriding strategy can be effective and enduring within human populations.

Balancing and Shifting Theories of Psychopaths

Balancing and shifting theories build on the idea of psychopathy as an evolved cheating strategy by focusing on how genetic predispositions interact with environmental conditions to influence the development and expression of psychopathic traits.

The **balancing theory** proposes that certain genes create a vulnerability (diathesis) to psychopathy, which may be expressed depending on social environments—such as densely populated cities where exploitation is more advantageous, versus smaller, more intimate communities where such behavior is less successful. This view supports a bio-social interactionist model where the environment triggers genetic potential.

⍰⍰♂ **Lucio's note: modern societies must be careful**
This suggests that advanced societies' urbanization may increase the incidence of psychopathy.

The **contingent shift theory** suggests that all individuals possess modules that, when triggered by adverse environments (e.g., childhood abuse), can produce psychopathic traits.
Unlike the balancing theory, which sees only a minority genetically predisposed, this theory argues that psychopathy could potentially develop in anyone under the right conditions.

⍰⍰♂ **Lucio's note**: The prevalence hypothesis, also known as frequency-dependent selection, was missing in the paragraph but explained later.
It proposes that psychopathy can be an adaptive strategy only if psychopaths remain a small minority in the population. If too many individuals behaved this way, social cooperation and reciprocity would break down, making the strategy ineffective. Thus, natural selection maintains psychopathy at low but stable levels—around 1–3%—allowing it to persist as a successful "cheating" strategy without undermining social order.

Evidence linking psychopathy to evolved strategies is suggestive but not definitive, partly due to disagreements over genetic-environment interactions and the proportion of the population affected. Factors like high conflict and low parental warmth are correlated with psychopathy but don't conclusively prove it's an evolved adaptation.

Complicating the picture, Linda Mealey proposed two types of psychopathy: one largely genetic and independent of environment, and another emerging from perceived social disadvantage.
Additionally, psychopathy's role within the "Dark Triad" personality cluster alongside Machiavellianism and narcissism supports its adaptive function in some contexts.

Given its widespread cross-cultural presence, evolutionary explanations remain essential to fully understanding psychopathy, even as the details continue to be debated.

⍰⍰♂ Lucio's summary:

- **Psychopathy is biological**: Recent neurobiological studies highlight differences in brain structure/function in psychopaths (e.g., amygdala, prefrontal cortex), suggesting a biological basis.
  - Environment plays a role, but it's debated how much/in which circumstances
- **Psychopathy *likely* has an adaptive basis** but *only* in specific social and environmental contexts. Many researchers consider at least some aspects of psychopathy to be adaptive in evolutionary terms, especially in certain social environments. Psychopathy may confer reproductive or social advantages through manipulative, risk-taking, and exploitative behavior.
  - However, **it is not adaptive in all contexts** and carries costs that limit its prevalence.
- The **balancing theory** is the most widely supported framework, incorporating both genetic predisposition and environment
  ⍰⍰♂ **Lucio's note**: this seems to be the same as 'weather forecasting'/'conditional adaptation theory'
- **The prevalence hypothesis**—that psychopathy remains rare because it only works as an adaptive strategy when few individuals have it—**is well supported and largely accepted.**
- The **contingent shift theory** is **less supported** due to difficulties explaining prevalence and genetics.

Future research will likely refine these models, possibly supporting a nuanced view with multiple psychopathy subtypes and complex gene-environment dynamics.

Also see our investigation on a psychopath's worringly methodical fast-life strategy to reproduction:

- Psychopath's fast life sexual strategy

> Psychopaths' Sexual Strategy: Marauders of Sex

Life history approach to psychopathology

Marco Del Giudice's Fast-Slow-Defence (FSD) model is a new evolutionary framework for classifying psychopathology based on life history theory.

It categorizes disorders into three spectra:

- **Fast spectrum (F-type):** Linked to early, impulsive life strategies, associated with disorders like impulsivity and antisocial behavior.
- **Slow spectrum (S-type):** Linked to slower, more controlled life strategies, associated with overly controlled behavioral problems.
- **Defence activation (D-type):** Disorders arising from overactive self-protective emotional responses like anxiety, fear, and shame (e.g., social anxiety, eating disorders), overlapping with both F- and S-types.

The model challenges the traditional DSM approach by focusing on underlying adaptive functions and developmental dysregulation rather than symptom clusters. Though promising, it is still new and awaits further validation.

Why psychiatric problems persist

Evolution hasn't eliminated psychiatric problems because it's not designed to produce perfect mental health. Instead, it optimizes for reproductive success.
Randolph Nesse (2019) outlined six evolutionary reasons why psychological disorders persist:

1. **Trade-offs (Pleiotropy):** Some traits or genes have both benefits and costs; for example, the same trait that enhances creativity might also increase risk of mood disorders.
2. **Mismatch Hypothesis:** Our brains evolved for ancestral environments, and many modern stressors (e.g., social media, urban isolation) are evolutionarily novel.

3. **Trait Variation Argument:** Traits vary across a normal distribution, and while the law of optimum balance says that within a range many traits are adaptive, some people will naturally fall at maladaptive extremes (e.g., some anxiety is good to keep you alive, but a minority of people will naturally inherit very high anxiety, which is detrimental).
4. A) **Reproduction Over Health (compromise argument):** Natural selection favors traits that boost reproduction and *inclusive* fitness, even if they harm long-term health or mental stability.
   - B) **Exaggerated But Defensive Responses (compromise argument):** Pain, anxiety, and depression may be exaggerated but adaptive responses to real or perceived threats.
   - Examples: Having children can be very taxing on a woman's health and having high levels of testosterone is useful in young men, but it also puts a strain on a man's body, which is one reason why women, on average, live longer than men. But they both persist for the advantages they confer
5. **Evolving Pathogens:** Pathogens evolve faster than humans; while mostly relevant to physical illness, some brain infections or immune responses can contribute to mental disorders

Concepts

- **The symptoms caused by microbial parasites are adaptations** either of the pathogen to aid its multiplication or of the host to kill off or expel it.
  Understanding which symptoms are designed to destroy the pathogen or to spread it might inform treatment
- **Evolutionary arms race of parasite VS host**: The relationship between host and parasite has been portrayed as an evolutionary arms race of adaptation and counter-adaptation (Red Queen)
- **Mismatch Theory:** Modern conditions mismatch ancestral adaptations (e.g., obesity) (Nesse & Williams, 1994).
  Other explanations:
  - Genes that cause illness might also have positive facets associated with them – the pleiotropy argument;
  - Selection pressures act on increasing inclusive fitness, not on perfecting systems – the compromise argument;
  - Disorders might be viewed as the extremes of normal variation – the trait variation argument.
- **'Smoke detector principle' of anxiety**: it pays off to be anxious. The costs of being a little too anxious may well have been small when compared to the costs of not being sufficiently anxious
- **Symptoms as Adaptations:** Fever, pain as defenses.
- **Infectious Diseases:** Co-evolutionary arms race with pathogens.
- **Genetic Conditions:** Sickle cell aids malaria resistance.
- **Blue Eyes and SAD:** Possible resilience link (Workman et al., 2018).
- **Smoke Detector Principle:** Anxiety as overactive defense (Nesse, 1998).

13: Evolution and Individual Differences

Explores why traits like intelligence and personality vary, despite natural selection.

	Heritable variation	Non-heritable variation
Adaptive	• frequency-dependent adaptive strategies (e.g. Mealey's primary psychopathy) • genetically based niche filling	• early environmental calibration 'weather forecasting' (e.g. the Belsky/Chisholm view of attachment) • strategic niche specialisation (e.g. frequency-dependent strategies such as Mealey's secondary psychopathy)
	• variation because of changing environments	• environmentally based niche filling, e.g. peer socialisation (Harris), birth order effects (Sulloway)
Proposed effect of the individual variation	• differential susceptibility to rearing influences (Belsky, 2005)	• none yet proposed
	• variation due to fitness trade-offs (e.g. survival, reproduction, childrearing)	• chance variation due to incomplete specification of phenotype (see Pinker, 2002)
Non-adaptive	• phenotypic variation because of sexual recombination • by-product of an adaptation (e.g. homosexuality in men might be a side effect of genes which when in females increase their fertility)	• social learning (e.g. Social Learning Theory)
Maladaptive	• genetic abnormalities (e.g. Huntington's chorea)	• environmental trauma (e.g. foetal alcohol syndrome), physical or psychological trauma

Summary of the different accounts of individual variation depending on its source (heritable vs environmental) and its effect (adaptive, non-adaptive, maladaptive)

Innate ≠ genetic, because genes can't code everything

This was an aha-moment for me:

The brain is incredibly complex, with billions of neurons and trillions of connections. **Our genes don't contain enough instructions to fully specify everything** in this detailed wiring.
Even identical twins, who share the same DNA, have noticeable differences in their brains and personalities from birth.

These differences can't all be explained by environment or upbringing either—some seem to come down to **random chance**. Tiny events during development—like a neuron growing slightly differently, or a random mutation—can lead to variations in the brain's structure and function.

This kind of variation isn't shaped by evolution or adaptation; it's non-adaptive. It happens simply because building a brain (or body) from limited genetic instructions leaves room for randomness.

⁉️♂ Lucio's note: brain structure and personality is innate, but not everything that is innate is genetic
This also means that some differences between people are innate in the sense that they arise during development (before birth or early in life), but they are not genetic because they're not directly caused by differences in DNA.

Key Ideas

- **Personality:** From an evolutionary point of view we might think of personality as a behavioural strategy. Some people, for example, gain access to resources by dominating others, whereas others do it by being deferential
  - Traits: Personality tests usually measure 'traits' (or sometimes 'factors'; see later) – that is, enduring facets of a personality such as how 'outgoing' or 'liberal' a person is rather than states (Schultz and Schultz, 2005; Haslam et al., 2017).

> One possible account for the variation (of) personality is that some phenotypes might profit in certain

> conditions and others in quite different conditions.
> For example, speculatively, hard times might favour individuals who are likely to cooperate – there is a need to work together – whereas good times might favour individuals who are more selfish – since there is plenty for all.

- **Morally positive/negative traits may be unrelated to fitness**: Traits or factors that seem negative in some moral sense might well have positive effects on fitness.
  Eg.: agreeable people and trusting people may be more easily exploited, whereas cynical people might avoid cooperation in the face of freeriders
- **Many genes regulate most personality traits**: many aspects of individual differences such as personality and intelligence are likely to be highly polygenic (i.e. they depend on many genes, potentially thousands; Heck et al., 2009; Plomin, 2018)
  Differences in the big five between people are due, not to a small number of genes having a large effect, but to a very large number, each of which has a tiny effect (Sanchez-Roige et al., 2018; Plomin, 2018; Flint, Greenspan and Kendler, 2020)
- **Heritability:** Personality (30–50%), intelligence (up to 75%) (Turkheimer, 2000).
  - Genetic heritability may be higher than 30-50%: Early environmental calibration theory suggests that the non-heritable portion of personality may at least partly be explained by evolved, environmentally contingent cognitive and emotional mechanisms that sample the world and affect the phenotype based upon a best-guess prediction of the future.
    The environment matters, but rather than 'pounding us into shape', it selects a phenotype from a battery of alternatives (Myers and Bjorklund, 2020).
- **'Weather forecasting' and early environmental calibration theory** (Myers and Bjorklund, 2020):
  Personality may only be partly genetically specified natural selection cannot entirely specify a successful phenotype for all different environments. So genes specify psychological mechanisms that are capable of tuning or calibrating a personality that better fits the environment in which an individual develops
  - Secondary psychopathy may develop with environmental interaction and gene–environment interaction. Unlike primary psychopaths, largely genetic and fixed, secondary psychopaths inherit a predisposition that may only express under growing up in harsh environments, densely populated areas, or places where cheating is easier and less likely to be detected. This makes secondary psychopathy a conditional adaptation shaped by early-life experiences (Mealey, 1995).
- **Niche-Fitting Hypothesis:** Specialization based on ecological demands.
- **Intelligence helps survival and reproduction**
  - Definition: *[I]ntelligence is the ability to reason, plan, solve problems, think abstractly, comprehend complex ideas, learn quickly, and learn from experience* (Plomin, 2018)
  - General VS specific: there is a long-standing debate as to whether there is a single underlying general intelligence (g), several multiple intelligences or some combination of both of these
  - Intelligence and niche-fitting: for those who adhere to the multiple intelligences view, variation in intelligence can be explained by 'niche fitting', specializing in spatial tasks, linguistic tasks, or understanding people
  - Sexual Selection for Intelligence**:** Signals good genes.

14: Evolutionary Psychology and Culture

The authors examine culture-evolution interplay, viewing humans as cultural animals.
An integrated biology-culture view is advocated; gene-culture coevolution is accepted.

Key Concepts:

- **Superorganic**: Culture exists above individuals as a system with its own dynamics (general);
  Evolutionary: sees this as misleading, favoring individual-level evolved mechanisms instead.
- **Cultural Transmission**: The passing of cultural traits between people or generations (general);
  Evolutionary: studies the evolved learning biases that make transmission possible and efficient.
- **Evoked VS Transmitted Culture**:
  - Evoked culture: Cultural differences that arise from universal psychological mechanisms responding to different environments (e.g.: recall fast and slow life histories)
  - Transmitted Culture: Traits passed down through imitation or teaching, regardless of environment (general);
    Evolutionary psychology sees this as shaped by evolved preferences for social learning.
- **Dual-Inheritance Theory**: Humans inherit both genetic and cultural information;
  Evolutionary: partially overlaps, but tends to focus more on gene-driven mechanisms than cultural evolution per se.
- **Gene–Culture Co-evolution**: Genes and culture influence each other's evolution (general);
  Evolutionary: uses this to explain traits like language or lactose tolerance evolving from cultural practices.
- **Memes and Memetics**: Ideas or behaviors that replicate and spread like genes (general);
  Evolutionary: is cautious, viewing memes as illustrative but often lacking explanatory power.
  - Culturegens: Hypothetical units of cultural information;
- **Imitation and humans' superior imitation**: The chapter opens highlighting how a human child imitated to a much larger degree than a chimpanzee (Kellogg and Kellogg, 1933)
  Evolutionary: views it as an evolved, adaptive learning strategy, especially useful in childhood and high-stakes tasks.
- **Cultural Drive**: Culture itself accelerates evolutionary change by altering environments (general);
  Evolutionary: acknowledges this feedback loop as a driver of human uniqueness.
- **Gene-Culture Coevolution:** Mutual influence (e.g., lactose tolerance) (Laland & Brown, 2002).
- **Cumulative Culture:** Builds across generations, unique to humans.
- **Evoked & Transmitted Culture:** Environment triggers vs. imitation (Boyd & Richerson, 1985).
- **Cultural Evolution:** Rapid societal changes vs. slow biology.

Cultural Adaptations & Transmission: Human's Superpower?

Culture benefits us by enabling us to change our behaviour extremely rapidly to fit environmental conditions.

Boyd and Richerson argue that this potential for rapid adaptation is one reason why the mind evolved an ability to generate and sustain culture.

For example, if temperature dropped dramatically many organisms, ill equipped by natural selection, might freeze to death unless cold-resistant mutations arise.
Humans, with their second mode of inheritance, can develop new technologies or approaches and pass them on to their offspring, enabling them too to survive. The ability to pass the new tech ('technological inheritance') is crucial and what differentiates humans from other species

Speed of Changes Dictates the Viability of Cultural Transmission:

Mathematical models suggest that cultural transmission is only adaptive when environmental change occurs at a moderate pace — not too fast and not too slow.

If the environment changed too quickly, inherited knowledge would become obsolete. If it changed too slowly, genetic evolution could keep up, making culture unnecessary.

⍰⍰♂ Lucio's note: the too fast/too slow may be misleading because culture is superior in almost all 'speeds'
The speed of most changes probably fits within the range of superior cultural adaptations. And this is even truer with more advanced technology and increasing human capabilities.
Think for example, of the recent COVID pandemic: despite the extremely fast changes, humans were still able to craft a vaccine.
And despite the current temperature changes relatively slowly, it's still too small a change and too fast for human evolution to adapt.

Boyd and Richerson argue that human culture likely evolved during the Pleistocene, when climate fluctuations created the ideal conditions: changes were significant but gradual enough that passing on knowledge (like shelter, tools, or hunting techniques) gave a survival advantage. However, this remains circumstantial rather than definitive evidence.

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Women have casual sex (almost) like men IF SAFE

⍰⍰♂ **Lucio's note**:
I've seen several arguments and counter-arguments for this batch of studies and this is the first time I've read something close to a final resolution

One of the most well-known studies on sex differences in casual sex was conducted by Clark and Hatfield (1989).

Attractive male and female students asked strangers of the opposite sex if they'd sleep with them. About 75% of men agreed—0% of women did.
The result strongly supported evolved sex differences: men are more open to casual sex, while women are more selective due to higher reproductive risks.

Later replications mostly confirmed the original pattern, even across decades of social change (Buss, 2016; Schmidt, 2017; Walter et al., in press).

But things change with Baranowski and Hecht.
Their research addressed women's safety concerns by showing vetted photos with backstories and asking if participants would date or sleep with each person. **In this safer setup, women's willingness to date and have sex almost matched men's**. However, men still selected more partners overall—suggesting men are less selective, not just more interested.

David Buss, David Schmitt and Donald Symons all consider that this difference in behaviour with regard to casual sex reflects differing psychological adaptations in men and women.
But context—like safety and control—can shift women's choices significantly.

Results from Baranowski and Hecht (2015) demonstrating that men chose to meet significantly more women compared to women choosing men, both to date and to agree to have sex with. Error bars represent ±1 SEM

Key Studies:

- **Clark & Hatfield (1989)**
  – *Method:* Students asked strangers to have sex.
  – *Result:* 75% of men said yes; 0% of women did.
- **Replications (Buss, 2016; Schmidt, 2017; Walter et al., in press)**
  – *Method:* Variations of the original setup over decades.
  – *Result:* Results mostly replicated—men more willing than women.
- **Baranowski & Hecht (2015, Germany)**
  – *Method:* Participants rated vetted opposite-sex photos for dating or sex.
  – *Result:* Women's consent matched men's when safety was assured, but men still chose more partners.

⁉️♂ Lucio's note: I missed how the chart and the authors' claim can match
It's not fully clear to me why the authors say that '*Interestingly, however, men wanted to meet significantly more potential partners than women*'. If by 'meeting' the authors refer to the chart's 'date' condition, then it's not a *significant* difference in my opinion.

Human cooperation depends on the environment

> Speculatively, hard times might favour individuals who are likely to cooperate – there is a powerful need to work together to eke out a living from a hostile environment – whereas good times might favour individuals who are somewhat more selfish – since there is plenty for all, individuals can more easily lead a productive life on their own.
>
> If we imagine that the environment favours cooperators, then this phenotype will profit at the expense of more selfish individuals.
>
> If such conditions were to obtain for a long period of time then selfish individuals would probably die out, but

> if the environment fluctuates back and forth comparatively rapidly (over a cycle of, say, 100 years or so) then under different conditions the selfish individuals might find themselves at a fitness advantage and their numbers would increase at the expense of cooperators

We're getting less intelligent

This is something that worries me for the future of humanity:

> That the brain developed despite these costs is clear evidence that the brain didn't get bigger by accident, there must have been advantages in order to outweigh these costs. In fact, there is some research which suggests that our brains have been shrinking for the past 10,000 years or so (Liu et al., 2014). This may be because nowadays we have less need to be individually smart, relying increasingly on the products of culture and teamwork. Whatever the reason, if this research turns out to be correct it shows that evolution gives us the size of brain we need and no bigger.

Coolidge effect is cross-cultural

One key psychological gender difference is men's stronger response to novel sexual partners, also called 'Coolidge effect'.

The Coolidge effect—a rapid return of sexual interest when a new female is introduced—is now known to be a cross-cultural feature of human males (Symons, 1979; James, 1981; Hamer and Copeland, 1998).

Interestingly, a small number of studies suggest that, at least for rodents, females may also demonstrate a Coolidge effect, albeit to a lesser extent (Lester and Gorzalka, 1988).
As for human females the question currently remains open as any such studies remain to be published.

This supports the idea of an evolved tendency toward non-full-monogamy, since this adaptation may be hard to explain without an evolutionary history of 'straying'.

⍰⍰♂ **Lucio's note: the coolidge effect may be stronger among men with unrestricted sociosexuality**
As part of an adaptation package to orient more towards short-term and uncommitted relationships, and sexual escapades.
Also see our article on 'cad psychology':

> Womanizers Psychology: The 10 Types of Players

Industrial societies must suppress kin-reciprocity (nepotism)

> Canadian evolutionary anthropologist Jerome Barkow has suggested pre-industrial societies are a lot closer to our evolved psychology than industrial societies (which he calls 'complex societies'). He suggests that, **in order for industrial societies to work, kin-selected altruism has to be suppressed and labelled 'corruption' or at least as 'nepotism'** (Barkow, 1989)
> Moreover, it is when these complex societies break down, as in revolution, that such strong nepotistic tendencies reemerge (Barkow, 1982).

I believe that more than for 'industrial societies', this is true for democracies and *well-functioning* societies.

QUOTES

On the inherent 'eugenics' of reproduction and sexual market dynamics:

> In a sense, all sexual beings participate in a form of eugenics, albeit unconsciously. There is evidence to suggest (see Chapters 3 and 4) that when an animal (including a human animal) selects a sexual partner it does so, among other things, on the basis of characteristics that are indicative of good genes

On survival VS reproduction:

> If natural selection is survival of the fittest then we can think of sexual selection as 'survival of the sexiest'

On big VS small and the misunderstanding of 'big being more dangerous':

> It's not the big organisms that are most likely to kill you, it's the ones you can't even see

On cooperation VS competition and competition trumping cooperation:

> But whereas cooperation is well documented in many species, competition is rife in all. Animals, in a sense, compete to become ancestors

On the importance of social status hierarchies:

> The hierarchical structure of human societies which, surely, is one of the most important reasons why, for good or for bad, humans dominate the globe.

On fear as an evolutionary emotion:

> If there is one core emotion that has clear survival implications it must be fear. People who have no fear do not make for good ancestors

On the power of evolutionary psychology to convince sensible and smart men with the power of its logic and data:

> As an anthropologist from the cultural relativist school, Brown did not believe in cultural universals and bet Symons that he could find a culture in which each of Symons' proposed universal sex differences was reversed. He didn't win the bet. In fact, he completely revised his opinions. After studying a large number of cultures Brown discovered that there were more than 200 characteristics common to all cultures

Lucio's Analysis

The book is great, and here are some suggestions for the authors to consider for the next editions:

Include SDO to homology/coalitionary aggression

A reference to social dominance theory and its measure (social dominance orientation) will help readers bridge the gap from evolutionary psychology, to social psychology and power dynamics.

Add a note to 'rate of change for cultural transmission to work'

The current framing of 'perfect sweet spot' between too fast/slow for environmental change may risk overstating the limits of cultural transmission.

In reality, culture often remains superior to genetic adaptation across a wide range of change speeds.

Most real-world environmental shifts likely fall within a bandwidth where cultural solutions remain adaptive—and often vastly more efficient—than waiting for genetic evolution. This is especially true today, with the exponential growth of technology and communication.

Consider the COVID-19 pandemic: despite being a fast-mutating virus, humans developed and distributed effective vaccines within a year.
On the other hand, climate change is relatively slow on a generational scale, yet still too fast and too subtle for genetic adaptation to offer any viable solution.

It is culture—through science, policy, and organized action—that remains our best practical response.

I'd love for the authors to amend the text accordingly (or criticize this point if they find it invalid).

Speaking of which:

Expand cultural evolution

I'm biased because after reading Henrich's work, I think that evolutionary psychology is still underestimating the impact of culture on evolution, civilization, and growth trajectory.

That said, I'd love the authors to include Henrich's work and talk more on cultural evolution and its potentially growing impact on human societies:

- **The Secret of Our Success**
- **The WEIRDest People in the World**

They can find some extra space by cutting the following:

Streamline and simplify

Including:

Cut Some Tangents

The book is too good to leave any low ROI paragraphs hanging around.

I felt the book could be even better, replacing some tangents with more evolutionary psychology, or completely removing them.
For example:

- **Person-first language movement** stemming from 'autistic people'. It's an important advancement of civilization and humanity to amend our everyday language, but it's tangential
- **Birth order research** could be streamlined
- **Margaret Mead**: She features twice, both times including the criticism of her work and once even the evolution of her thought. Yes, maybe she's been overly vilified, but in my opinion her impact has still been largely negative.
  I may be right or wrong, but the point is that discussing individual authors should not be part of the text, in my opinion
- **Trim out the 'defending evolutionary psychology' angles**: Sometimes I feel it can come across as defensive, for example that *'early environmental calibration (…) provides further artillery against the view that evolutionary thinking is necessarily deterministic*. The authors are perfectly right, but I don't think we need any artillery. We can let science do the talking.
  - **Consider removing ethical notes:**

For example:

> in a subject that treats relationships in such a cold and calculated light, it seems reassuring to discover that both men and women value love as of primary importance (…) When we consider less permanent affairs things begin to look less romantically rosy.

And a bit later:

> Before we begin to feel let down by the lack of fidelity that this suggests for our female ancestors we should also bear in mind that it takes two to recombine their genes: both sexes are equally tainted by such findings!

I smiled at this, and we all understood what the authors meant.
Not sure though, whether it belongs here, also because this may be misconstrued as judgmental towards women.

Add brief descriptions to the list of 'key concepts' opening each chapter

Given the target audience and the strengths of this book, I'd consider making some parts of the book even more approachable.

Some ideas:

- **A list of 'key concepts and definitions' before each chapter**. The authors already provide a list, a fantastic approach to 'prime' the brain for the upcoming learning. A quick summary for each will make it even more useful. You can move the glossary definitions to that opening paragraph
- **Combine all related concepts into one single chapter**. For example, psychopathy and balancing theory are spread across at least two chapters. Combine them all in the chapter where you discuss psychopathy the most.
- **Group similar and sub-theories together.** For example, I believe the handicap principle is part of the larger 'good genes' principle. Combine them together
  - Introduce all relevant terms or variations first, then use the most widely recognized one. For example, note that Zahavi's handicap principle is now "honest signaling," and use "honest signaling" thereafter.
- **Add a 'common misunderstanding section'**, which may be very helpful for freshmen who dabbled into pop-psychology before starting uni.
  eg.:
  - 'Great chain of being' and 'continuous improvement' instead of a messy random walk that the environment weeds out, etc.;
  - 'Storytelling fallacy', or the tendency of many people to come up with a just-so story and passing it for evolutionary psychology, a popular approach that undermines the validity of evolutionary psychology, etc.)

Deepen the basics, including pictures and diagrams

It was perfectly done with the example of 'blueprint VS recipe'.
Do the same for topics like:

- **Genes vs. DNA vs. Alleles vs…** : these concepts and how they work are all fuzzy for beginners, clarify it them
- **Genetic VS biologic**, a subtle difference that took me years to grasp
- **Evolutionary stable strategy**

To avoid overloading the text, cut down on the history of Charles Darwin and Mendeleev.

Rank Theories From Largest Contributors to Smallest

To improve clarity on complex topics, present the main, most well-supported drivers first—those with the strongest empirical backing and largest effect sizes—and then list additional or more speculative contributors.

You could also add a final table with a ranking.
Yes it's simplistic, but it may help students organize information.

For example, discussing altruism, this is how a tabled rank may look like:

Theory	Impact	Explanation
Kin selection (inclusive fitness)	Very high	Altruism toward genetic relatives evolves when helping kin (rB > C) still propagates shared genes.
Direct reciprocity	Very high	In repeated interactions, helping others pays off because they'll return the favor later.
Misdirected kin selection	Speculatively high	Cooperative behavior triggered by evolved kin-detection mechanisms (e.g., familiarity, similarity, proximity, emotional closeness), evolved in small kin-based tribes but triggers even without genetic relatedness
Indirect reciprocity (reputation)	High	Acts of helping build a good reputation, which attracts aid from third parties.
Network (spatial) reciprocity	High	Emergent property. Cooperators cluster together in networks or colonies and collectively outcompete isolated defectors.
Multi-level (group) selection	Moderate	Groups of cooperators outperform groups of defectors, so cooperative traits spread with the winning groups/coalitions.
Enforcement (punishment)	Moderate	Emergent cultural byproduct. Punishing or excluding defectors imposes costs on cheats, stabilizing cooperative behavior.
Parochial/Ingroup altruism	Moderate/low	Preferential help for in-group members, often paired with hostility toward outsiders.
Green-beard effects	Low	Rare "tagged" genes recognize and favor copies of themselves, leading to targeted cooperation.
Partner choice	Low	Cooperative partners are favored over selfish ones. 'Cooperative' signaling is a consequence. Its strong effect on long-term dating is offset by short-term mating and forced copulation

"Evolutionary Drivers of Altruism, Morality, and Cooperation: A Ranked Framework"
(by Lucio Buffalmano)

⚠ Revisit the claim of nonpaternity rates

The authors write:

> Also in England, via genetic testing, Baker and Bellis (1995; 2014) have found that about one in five children could not be the offspring of their supposed fathers.

The authors quote Robin Baker, the author of *Sperm Wars*, a book that, back then, I found to raise some important red flags.

One in five seemed hard to believe based on what I knew.
So I asked ChatGPT for confirmation, which replied:

> That claim is misleading. Modern genetic studies in England and other Western countries do **not** support a 1-

> in-5 (20%) non-paternity rate

AI mentioned studies supporting rates of around 1-4% and reaching up to around 30% *only when paternity is already disputed* (e.g., men requesting tests due to suspicion).
That is in line with what I had previously seen and read.

I think the authors referred to cases with pre-existing doubts, but they could make it clearer to avoid possible misunderstandings.

REVIEW

Evolutionary Psychology: An Introduction is one of the best available books on evolutionary psychology we've read and reviewed.

It may be the best introductory book to the field of evolution and evolutionary psychology.

It distills complex evolutionary principles into a clear, engaging guide to how evolution shapes the human mind and social behavior.

Check the **best evolutionary psychology books** or **get this book on Amazon**:

48 Laws of Power — Chapter-by-Chapter Summary

Lucio Buffalmano · 3 August 2025 · Archived copy · Original

The 48 Laws of Power by Robert Greene is a provocative book on strategy, manipulation, and realpolitik. A mix of historical examples and ruthless strategies, it blends sharp insights with entertaining storytelling.

⍰⍰ For the complete master guide, see the main **48 Laws of Power guide**.

Contents

- Law #1: Never Outshine the Master
- Law #2: Don't Put Too Much Trust in Friends – Learn to Use Your Enemies
- Law #3: Conceal Your Intentions
- Law #4: Say Less Than Necessary
- Law #5: So Much Depends on Your Reputation – Guard It with Your Life
- Law #6: Court Attention at All Costs
- Law #7: Let Others Do the Work, but Always Take the Credit
- Law #8: Make Other People Come to You – Use Bait if Necessary
- Law #9: Win Through Actions, Never Through Argument
- Law #10: Infection: Avoid the Unhappy and Unlucky
- Law #11: Learn to Keep People Dependent on You
- Law #12: Use Selective Honesty and Generosity to Disarm Your Victims
- Law #13: Appeal to Self-Interest, Never to Mercy or Gratitude
- Law #14: Pose as a Friend, Work as a Spy
- Law #15: Crush Your Enemy Totally
- Law #16: Use Absence to Increase Respect and Honor
- Law #17: Keep Others in Suspended Terror: Cultivate an Air of Unpredictability

- Law #18: Do Not Build Fortresses – Isolation Is Dangerous
- Law #19: Know Who You're Dealing With – Do Not Offend the Wrong Person
- Law #20: Do Not Commit to Anyone
- Law #21: Play a Sucker to Catch a Sucker – Seem Dumber Than Your Mark
- Law #22: Use the Surrender Tactic: Transform Weakness into Power
- Law #23: Concentrate Your Forces
- Law #24: Play the Perfect Courtier
- Law #25: Recreate Yourself
- Law #26: Keep Your Hands Clean
- Law #27: Play on People's Need to Create a Cultlike Following
- Law #28: Enter Action with Boldness
- Law #29: Plan All the Way to the End

- Master Power Today

Law #1: Never Outshine the Master

> Always **make those above you feel comfortably superior**. In your desire to please and impress them, do not go too far in displaying your talents or you might accomplish the opposite—inspire fear and insecurity. Make your masters appear more brilliant than they are and you will attain the heights of power.

- ✓ **Observance: Nicolas Fouquet**, Finance Minister to Louis XIV, threw a massive party at his castle. The King felt outshone and had him arrested on trumped-up charges
- ✕ **Transgression: Galilei** dedicated the discovery of Jupiter's Moons to the Medici family, winning a position

as their official philosopher, securing safety and funding.

Reversal: Escaping Mediocre Leaders

Strict adherence to this law risks stagnation under average bosses.
High-value individuals must outshine without triggering backlash to advance fast.
See this reel for more.

Also see:

- Laws for Top 0.1% Men (who don't want to be obedient employees)

Law #2: Don't Put Too Much Trust in Friends – Learn to Use Your Enemies

> **Be wary of friends**—they will betray you more quickly, for **they are easily aroused to envy**. They also become spoiled and tyrannical. But hire a former enemy and he will be more loyal than a friend, because he has more to prove. In fact, you have more to fear from friends than from enemies. If you have no enemies, find a way to make them.

If you help them because they're friends, they will feel like they got a handout, and even need to thank you for making them feel bad.

Work requires some distance, Robert Greene says. You must be free to judge whoever furthers your interests the best. And you can't do that with friends.

Former enemies instead have an incentive to prove their new loyalty.

Law #3: Conceal Your Intentions

> Keep people off-balance and in the dark by never revealing the purpose behind your actions. If they have no

> clue what you are up to, they cannot prepare a defense. **Guide them far enough down the wrong path**, envelop them in enough smoke, and by the time they realize your intentions, it will be too late.

- ✅ **Observance: Ninon de l'Enclos**, a famous courtesan who advised a Marquis on a seduction. She told him to be vague and attend parties with other women to pique the target's interest. By the time the target realized she was being pursued, she was already hooked.
- ❌ **Transgression:** Marquis de Sevigné, who eventually blurted out his intentions to a countess too early; she was instantly bored and the "spell" was broken.

Law #4: Say Less Than Necessary

> When you are trying to impress people with words, the more you say, the more common you appear, and the less in control. Even if you are saying something banal, it will seem original if you make it vague, open-ended, and sphinxlike. **Powerful people impress and intimidate by saying less**. The more you say, the more likely you are to emit something foolish.

⁉️♂️ Lucio's Note:
This is contextual and not always true. Modern influencers gain fame through lots of talking.
See this reel:

> **Lucio**: In most new groups, leadership goes to the person who speaks firsts, and more

Law #5: So Much Depends on Your Reputation – Guard It with Your Life

> Reputation is the cornerstone of power. Through reputation alone you can intimidate and win; once it slips, however, you are vulnerable, and will be attacked on all sides. **Make your reputation unassailable**. Always be alert to potential attacks and thwart them before they happen. Meanwhile, learn to destroy your enemies by opening holes in their own reputations. Then stand aside and let public opinion hang them.

⁉️♂️ **Lucio's note**: Reputation is a social currency that can be spent if returns are great.
⁉️ **How to apply the laws** ↗ (video opens in YouTube)

⁉️ Example

Keanu Reeves has a reputation for not wanting credit for his donations, yet he is famous for his 'anonymous' donations.

Law #6: Court Attention at All Costs

> Everything is judged by its appearance; what is unseen counts for nothing. Never let yourself get lost in the crowd, then, or buried in oblivion. **Stand out.** Be conspicuous, at all cost. Make yourself a magnet of attention by appearing larger, more colorful, more mysterious than the bland and timid masses.

Invisibility equates to powerlessness.

Law #7: Let Others Do the Work, but Always Take the Credit

> Use the wisdom, knowledge, and legwork of other people to further your own cause. Not only will such assistance save you valuable time and energy, it will give you a godlike aura of efficiency and speed. In the end your helpers will be forgotten and you will be remembered. **Never do yourself what others can do for you.**

Law #8: Make Other People Come to You – Use Bait if Necessary

> When you force the other person to act, you are the one in control. It is always better to **make your opponent come to you**, abandoning his own plans in the process. Lure him with fabulous gains—then attack. You hold the cards.

⍰ Example

To pitch my garage to a neighbor interested in the flat, I use the flat as bait:

I use the flat -which she wants- as bait to make her come to me for what I want.

Law #9: Win Through Actions, Never Through Argument

> Any momentary triumph you think you have gained through argument is really a Pyrrhic victory: The resentment and ill will you stir up is stronger and lasts longer than any momentary change of opinion. It is much more powerful to get others to agree with you through your actions, without saying a word. **Demonstrate, do not explain.**

- ⍰ **Observance: Michelangelo**. When the mayor of Florence complained that the statue's nose was too big, Michelangelo pretended to fix it, dropped marble dust he had hidden in his hand, and the mayor was satisfied with the fake action.
- ✕ **Transgression: Mucius**, a Roman who tried to argue his way against a superior. Despite being right, he angered his superior and was flogged (recalling Law #1).

Law #10: Infection: Avoid the Unhappy and Unlucky

> You can die from someone else's misery—emotional states are as infectious as diseases. You may feel you are helping the drowning man, but you are only precipitating your own disaster. The unfortunate sometimes draw misfortune on themselves; they will also draw it on you. **Associate with the happy and fortunate instead.**

Helping the unhappy and unlucky is also a risk if they're ungrateful. They will turn their backs on you.

You’re never guaranteed gratitude for helping thte unhappy and unluckly

Law #11: Learn to Keep People Dependent on You

> To maintain your independence you must always be needed and wanted. The more you are relied on, the more freedom you have. **Make people depend on you for their happiness and prosperity** and you have nothing to fear. Never teach them enough so that they can do without you.

Law #12: Use Selective Honesty and Generosity to Disarm Your Victims

> **One sincere and honest move will overbalance dozens of dishonest ones**. Open-hearted gestures of honesty and generosity bring down the guard of even the most suspicious people. Once your selective honesty opens a hole in their armor, you can deceive and manipulate them at will. A timely gift—a Trojan horse—will serve the same purpose.

Law #13: Appeal to Self-Interest, Never to Mercy or Gratitude

> If you need to turn to an ally for help, do not bother to remind him of your past assistance and good deeds. He will find a way to ignore you. Instead, uncover something in your request, or in your alliance with him, that will benefit him, and emphasize it out of all proportion. He will respond enthusiastically when he sees something to be gained for himself.

- ⍰ **Observance: Ruler Castruccio Castracani** didn’t ask for a treaty based on friendship when he wanted to take a city; he showed the citizens how joining him would make them significantly richer and more secure than their current lord.
- ✕ **Transgression: The Melians** argued that it was “right” and “honorable” for Athens to leave them alone. The Athenians replied that “the strong do what they can and the weak suffer what they must,” and destroyed them. Honor and mercy meant nothing to the powerful.

Law #14: Pose as a Friend, Work as a Spy

> Knowing about your rival is critical. Use spies to gather valuable information that will keep you a step ahead. Better still: Play the spy yourself. In polite social encounters, **learn to probe**. Ask indirect questions to get people to reveal their weaknesses and intentions. There is no occasion that is not an opportunity for artful spying.

Law #15: Crush Your Enemy Totally

> All great leaders since Moses have known that a feared enemy must be crushed completely. (Sometimes they have learned this the hard way.) If one ember is left alight, no matter how dimly it smolders, a fire will eventually break out. **More is lost through stopping halfway than through total annihilation**: The enemy will recover, and will seek revenge. Crush him, not only in body but in spirit.

This law echoes Machiavelli's quote on power:

> Men should be either treated generously or destroyed, because they take revenge for slight injuries – for heavy ones they cannot.

Law #16: Use Absence to Increase Respect and Honor

> Too much circulation makes the price go down: The more you are seen and heard from, the more common you appear. If you are already established in a group, temporary withdrawal from it will make you more talked about, even more admired. You must learn when to leave. **Create value through scarcity.**

⍰⍰♂ **Lucio's note:** like all other laws, this is highly contextual, and **it only works when you're already high value.** Nobody misses a scarce low-value man; they're rather glad if he's not around.

Law #17: Keep Others in Suspended Terror: Cultivate an Air of Unpredictability

> Humans are creatures of habit with an insatiable need to see familiarity in other people's actions. Your predictability gives them a sense of control. Turn the tables: **Be deliberately unpredictable**. Behavior that seems to have no consistency or purpose will keep them off-balance, and they will wear themselves out trying to explain your moves. Taken to an extreme, this strategy can intimidate and terrorize.

Law #18: Do Not Build Fortresses – Isolation Is Dangerous

> The world is dangerous and enemies are everywhere—everyone has to protect themselves. A fortress seems the safest. But isolation exposes you to more dangers than it protects you from—it cuts you off from valuable information, it makes you conspicuous and an easy target. Better to circulate among people, find allies, mingle. You are shielded from your enemies by the crowd.

- ⍰ **Observance: Louis XIV** forced the nobility to live with him at Versailles. He was never isolated; he was the center of a crowded court, which allowed him to hear every rumor and control every rival.
- ⍰ **Transgression: Ch'in Shih Huang Ti** became so paranoid that he built a labyrinthine palace and never let

anyone know where he was sleeping. He became isolated from reality, his ministers lied to him, and his empire crumbled shortly after his death.

Law #19: Know Who You're Dealing With – Do Not Offend the Wrong Person

> There are many different kinds of people in the world, and you can never assume that everyone will react to your strategies in the same way. Deceive or outmaneuver some people and they will spend the rest of their lives seeking revenge. They are wolves in lambs' clothing. Choose your victims and opponents carefully, then—**never offend or deceive the wrong person.**

Law #20: Do Not Commit to Anyone

> It is the fool who always rushes to take sides. Do not commit to any side or cause but yourself. By maintaining your independence, you become the master of others—playing people against one another, making them pursue you.

> Neutrality preserves optionality.
>
> *Lucio Buffalmano*

Law #21: Play a Sucker to Catch a Sucker – Seem Dumber Than Your Mark

> No one likes feeling stupider than the next person. The trick, then, is to make your victims feel smart—and not just smart, but smarter than you are. Once convinced of this, they will never suspect that you may have ulterior motives.

Appear less intelligent to lower others' defenses.

Law #22: Use the Surrender Tactic: Transform Weakness into Power

> **When you are weaker, never fight for honor's sake; choose surrender instead**. Surrender gives you time to recover, time to torture your conqueror, time to wait for his power to wane. Do not give him the satisfaction of fighting and defeating you—surrender first. By turning the other cheek you infuriate and unsettle him. Make surrender a tool of power.

Surrender strategically to recover strength and strike, avoiding futile battles for honor.

Law #23: Concentrate Your Forces

> Conserve your forces and energies by keeping them concentrated at their strongest point. You gain more by finding a rich mine and mining it deeper, than by flitting from one shallow mine to another—intensity defeats extensity every time. When looking for sources of power to elevate you, find the one key patron, the fat cow who will give you milk for a long time to come.

Focus on a single, high-impact goal rather than scattering efforts.

Law #24: Play the Perfect Courtier

> The perfect courtier thrives in a world where everything revolves around power and political dexterity. He has mastered the art of indirection; he flatters, yields to superiors, and asserts power over others in the most oblique and graceful manner. Learn and apply the laws of courtiership and there will be no limit to how far you can rise in the court.

Master social navigation:

- Practice nonchalance: Make talent seem effortless.
- Be frugal with flattery: Use subtle praise.
- Arrange to be noticed: Cultivate a distinctive yet subtle style.
- Adapt to your audience: Tailor your approach to hierarchy.
- Avoid bad news: Let others deliver it.
- Keep distance from superiors: Respect their boundaries.
- Be self-observant: See yourself as others do.

Law #25: Recreate Yourself

> Do not accept the roles that society foists on you. Recreate yourself by forging a new identity, one that commands attention and never bores the audience. **Be the master of your own image** rather than letting others define it for you. Incorporate dramatic devices into your public gestures and actions—your power will be enhanced and your character will seem larger than life.

Shape your own identity rather than accepting others' labels. John Gray's reinvention as a "relationship expert" illustrates this:

Started with a B.A. in "science of creative intelligence", realized "relationships" was far more lucrative and:

- Called himself a "relationship counselor"
- Bought a PhD
- Fluffed up his counseling experience
- Told a story that prospects can relate to
- Joined "American Counseling Association"
- Became president of his own relationship institute

-Story of every identity fabricator

Law #26: Keep Your Hands Clean

> You must seem a paragon of civility and efficiency: Your hands are never soiled by mistakes and nasty deeds. **Maintain such a spotless appearance** by using others as scapegoats and cat's-paws to disguise your

> involvement.

Law #27: Play on People's Need to Create a Cultlike Following

> People have an overwhelming desire to believe in something. Become the focal point of such desire by **offering them a cause, a new faith to follow**. Keep your words vague but full of promise; emphasize enthusiasm over rationality and clear thinking. Give your new disciples rituals to perform, ask them to make sacrifices on your behalf. In the absence of organized religion and grand causes, your new belief system will bring you untold power.

Law #28: Enter Action with Boldness

> If you are unsure of a course of action, do not attempt it. Your doubts and hesitations will infect your execution. **Timidty is dangerous: Better to enter with boldness**. Any mistakes you commit through audacity are easily corrected with more audacity. Everyone admires the bold; no one honors the timid.

See a case study from recent politics here.

Law #29: Plan All the Way to the End

> The ending is everything. Plan all the way to it, taking into account all the possible consequences, obstacles, and twists of fortune that might reverse your hard work and give the glory to others. By planning to the end you will not be overwhelmed by circumstances and you will know when to stop. Gently guide fortune and help determine the future by thinking far ahead.

- ⍰ **Observance: Bismarck**. He planned the unification of Germany decades in advance. He knew exactly which wars to start to reach his specific goal. He never let the excitement of a small victory distract him from the final map.
- ⍰ **Transgression: Napoleon III** lived in a fantasy world of "glory." He started wars without a clear exit strategy, leading to his humiliating capture by the Prussians because he hadn't planned for a stalemate.

Law #30: Make Your Accomplishments Seem Effortless

> Your actions must seem natural and executed with ease. All the toil and practice that go into them, and also all the clever tricks, must be concealed. When you act, act effortlessly, as if you could do much more. Avoid the temptation of revealing how hard you work—it only raises questions. Teach no one your tricks or they will be used against you.

Hide the hard work to project natural talent, in adherence with the law of social effort.

Law #31: Control the Options: Get Others to Play with the Cards You Deal

> The best deceptions are the ones that seem to give the other person a choice: Your victims feel they are in control, but are actually your puppets. **Give people options that come out in your favor whichever one they choose**. Force them to make choices between the lesser of two evils, both of which serve your purpose. Put

> them on the horns of a dilemma: They are gored wherever they turn.

Law #32: Play to People's Fantasies

> The truth is often avoided because it is ugly and unpleasant. Never appeal to truth and reality unless you are prepared for the anger that comes from disenchantment. Life is so harsh and distressing that people who can manufacture romance or conjure up fantasy are like oases in the desert: Everyone flocks to them. There is great power in tapping into the fantasies of the masses.

Avoid harsh truths; craft appealing narratives to draw followers.

Law #33: Discover Each Man's Thumbscrew

> Everyone has a weakness, a gap in the castle wall. That weakness is usually an insecurity, an uncontrollable emotion or need; it can also be a small secret pleasure. Either way, once found, it is a thumbscrew you can turn to your advantage.

- ✅**Observance: Cardinal Richelieu** dominated the French court by knowing everyone's secret weakness and used these "thumbscrews" to keep the royal family in check. <— ⁉️♂ **Lucio's note**: it wasn't just thumbscrews or the king could have him executed. Richelieu had real power
- ✖ **Reversal:** When dealing with a person who has no obvious "thumb-screw" (those with total self-control), you must find the one thing they *do* care about, like their pride or a specific child.

Law #34: Be Royal in Your Own Fashion: Act Like a King to Be Treated Like One

> The way you carry yourself will often determine how you are treated: In the long run, appearing vulgar or common will make people disrespect you. For a king respects himself and inspires the same sentiment in others. By acting regally and confident of your powers, you make yourself seem destined to wear a crown.

Project confidence to earn respect. Christopher Columbus demanded leadership despite lacking credentials, securing his legacy.

Law #35: Master the Art of Timing

> **Never seem to be in a hurry**—hurrying betrays a lack of control over yourself, and over time. Always seem patient, as if you know that everything will come to you eventually. Become a detective of the right moment; sniff out the spirit of the times, the trends that will carry you to power. Learn to stand back when the time is not yet ripe, and to strike fiercely when it has reached fruition.

See mafia bosses' slow movements here.

Law #36: Disdain Things You Cannot Have: Ignoring Is the Best Revenge

> By acknowledging a petty problem you give it existence and credibility. The more attention you pay an enemy,

> the stronger you make him; and a small mistake is often made worse and more visible when you try to fix it. It is sometimes best to leave things alone. If there is something you want but cannot have, show contempt for it. **The less interest you reveal, the more superior you seem.**

Law #37: Create Compelling Spectacles

> Striking imagery and grand symbolic gestures create an aura of power—everyone responds to them. Stage spectacles for those around you, then, full of visual-points and radiant symbols that heighten your presence. Dazzled by appearances, no one will notice what you are really doing.

Use dramatic imagery to distract and inspire, enhancing your aura of power.

Law #38: Think as You Like but Behave Like Others

> If you make a show of going against the times, flaunting your unconventional ideas and unorthodox ways, people will think that you only want attention and that you look down upon them. They will find a way to punish you for making them feel inferior. **It is far safer to blend in and nurture the common touch**. Share your originality only with tolerant friends and those who are sure to appreciate your uniqueness.

⍰⍰♂ **Lucio's note**: this is more defensive in nature, and in contrast of 'enter action with boldness'. True mastery of the law involves acquiring strategic thinking for effective calibration.

Law #39: Stir Up Waters to Catch Fish

> Anger and emotion are strategically counterproductive. You must always stay calm and objective. But if you can **make your enemies angry** while staying calm yourself, you gain a decided advantage. Put your enemies off-balance: Find the chink in their vanity through which you can rattle them and you hold the strings.

Law #40: Despise the Free Lunch

> What is offered for free is dangerous—it usually involves either a trick or a hidden obligation. What has worth is worth paying for. **By paying your own way you stay clear of gratitude, guilt, and deceit**. It is also often wise to pay the full price—there is no cutting corners with excellence. Be lavish with your money and keep it circulating, for generosity is a sign and a magnet for power.

Law #41: Avoid Stepping into a Great Man's Shoes

> What happens first always appears better and more original than what comes after. If you succeed a great man or have a famous parent, you will have to accomplish double their achievements to outshine them. Do not get lost in their shadow, or stuck in a past not of your own making: **Establish your own name and identity by changing course**. Slay the overbearing father, disparage his legacy, and gain power by shining in your own way.

Law #42: Strike the Shepherd and the Sheep Will Scatter

> Trouble can often be traced to a single strong individual—the stirrer, the arrogant underling, the poisoner of goodwill. If you allow such people room to operate, others will succumb to their influence. Do not wait for the troubles they cause to multiply, do not try to negotiate with them—they are irredeemable. Neutralize their influence by isolating or banishing them. Strike at the source of the trouble and the sheep will scatter.

- ⍰ **Observance: Pizarro and the Incas**. Pizarro realized that the entire Incan Empire was built around the cult of the Emperor, Atahualpa. Instead of fighting the army of 80,000, he captured the Emperor. The army was paralyzed and easily defeated.
- ✕ **Transgression: Corinth** failed to stop the rise of Athens because they focused on minor border skirmishes rather than neutralizing the Athenian leadership directly.

See toxic employee strategies.

Law #43: Work on the Hearts and Minds of Others

> Coercion creates a reaction that will eventually work against you. You must seduce others into wanting to move in your direction. A person you have seduced becomes your loyal pawn. And the way to seduce others is to operate on their individual psychologies and their weaknesses. **Soften up the resistant by working on their emotions**, playing on what they hold dear and what they fear. Ignore the hearts and minds of others and they will grow to hate you.

See *The Art of Seduction*.

Law #44: Disarm and Infuriate with the Mirror Effect

> The mirror reflects reality, but it is also the perfect tool for deception: When you mirror your enemies, doing exactly as they do, they cannot figure out your strategy. The Mirror Effect mocks and humiliates them, making them overreact. By holding up a mirror to their psyches, you seduce them with the illusion that you share their values; by holding up a mirror to their actions, you teach them a lesson. Few can resist the power of the Mirror Effect.

Law #45: Preach the Need for Change, but Never Reform at Once

> Everyone understands the need for change in the abstract, but on the day-to-day level people are creatures of habit. Too much innovation is traumatic, and will lead to revolt. If you are new to a position of power, or an outsider trying to build a power base, **make a show of respecting the old way of doing things**. If change is necessary, make it feel like a gentle improvement on the past.

Introduce change gradually to avoid resistance, respecting human attachment to habits.

Law #46: Never Appear Too Perfect

> Appearing better than others is always dangerous, but most dangerous of all is to appear to have no faults or weaknesses. Envy creates silent enemies. It is smart to **occasionally display defects, and admit to harmless vices**, in order to deflect envy and appear more human and approachable. Only gods and the dead can seem perfect with impunity.

⍰⍰♂ **Lucio's note**: appearing perfect can make you look unbeatable, discouraging your opposition from even trying.

Law #47: Do Not Go Past the Mark You Aimed For: Learn When to Stop

> The moment of victory is often the moment of greatest peril. In the heat of victory, arrogance and overconfidence can push you past the goal you had aimed for, and by going too far, you make more enemies than you defeat. Do not allow success to go to your head. There is no substitute for strategy and careful planning. **Set a goal, and when you reach it, stop.**

Law #48: Assume Formlessness

> By taking a shape, by having a visible plan, you open yourself to attack. Instead of taking a form for your enemy to grasp, keep yourself adaptable and on the move. Accept the fact that nothing is certain and **no law is fixed**. The best way to protect yourself is to be as fluid and formless as water; never bet on stability or lasting order. Everything changes.

Stay adaptable, like a Machiavellian, embrace fluidity to remain resilient.

- ⍰ **Observance: Miyamoto Musashi** never fought the same way twice, adapting his style to the opponent. His enemies could never prepare for him because he had no predictable form.
- ✕ **Transgression: The Spartans**. They were the most powerful land force in Greece, but were rigid and eventually 13outmaneuvered by the more adaptable Thebans and Athenians.

Master Power Today

The 48 Laws of Power is a good entry point for power intelligence, but real-life success in the modern world requires strategic thinking and advanced calibration. For **modern applications** and practical tools check out:

The Routledge Handbook of Great Power Competition: Summary & Review

Lucio Buffalmano · 6 August 2025 · Archived copy · Original

The Routledge Handbook of Great Power Competition (2025) offers a comprehensive, interdisciplinary framework for understanding geopolitical rivalries. The volume examines how major powers exert influence through military, economic, and ideational means, making it a critical reference for navigating the return of great power politics.

FULL SUMMARY

About the Author:
Various authors for each chapter, and the main editors are:

Brian C. H. Fong is a Full Professor at the College of Social Sciences, National Sun Yat-sen University (Taiwan). He specializes in international relations, governance, and U.S.–China rivalry. Fong is also the founder of the Great Power Competition Research Network and the author of *US–China Rivalry: Great Power Competition in the Indo-Pacific*.

Ja Ian Chong is an Associate Professor in Political Science at the National University of Singapore. His research focuses on state formation, external intervention, and East Asian security. He is the author of *External Intervention and the Politics of State Formation: China, Indonesia, Thailand, 1893–1952*.

Intro: We're Back With Great Power Competitions

After the end of the Cold War, the USA and the West focused on the enlargement of the world's free community of market democracies.

The belief was that we had entered a new stage of world cooperation and limited competition.
But, alas, it was not the case:

> Washington elites from both Democratic and Republican parties perceived great power competition as "a thing of the past" (Colby and Mitchell, 2020: 118).
>
> (…) the post-Cold War period of the 1990s and 2000s witnessed the marked decline of great power competition studies as many people in the West frmly believed that they had "entered a world in which there is little chance that the major powers will engage each other in security competition, much less war" (Mearsheimer, 2001: 1).
>
> Subsequent developments however showed that the decline of great power competition— and relevant scholarly research—in the 1990s and 2000s was historically abnormal, rather than normal

Chapter 1: Great Power Competition – An Analytical Framework

In Chapter one Brian C. H. Fong lays the intellectual foundation for the entire volume by introducing a structured framework for analyzing great power competition in today's shifting global order.

The Context: From Post-Cold War Optimism to Strategic Rivalry

Brian Fong begins by tracing the arc of great power studies:

- After the Cold War, many scholars believed the **era of great power conflict had ended**, giving way to a liberal international order led by the U.S.
- But the rise of **China and Russia as assertive actors**—along with regional powers like Iran—has ushered in a new era of strategic rivalry since the 2010s.
- This shift was formalized in U.S. doctrine by the **2017 National Security Strategy** and the **2018 National Defense Strategy**, which declared "great power competition" the central challenge to American security.

Fong argues that far from being an aberration, competition between great powers is the **historical norm**, not the exception.

Two Conceptual Lenses on Great Power Competition

Fong outlines two major ways scholars define great power competition:

1. **Rivalry Short of War**:
   Competition is antagonistic but stops short of open conflict. States seek relative gains in influence, wealth, and status through military posturing, economic tools, and ideological soft power (Mazarr et al., 2018; Brands & Nichols, 2020).
2. **Spectrum of Relations**:
   Rather than a binary of peace vs. war, great power relations exist along a **continuum**—from cooperation → collaboration → competition → confrontation → full-scale war (Burkhart & Woody, 2017; Lynch III, 2020). On this spectrum, competition represents **conflicted interests that haven't yet escalated to violence**.

Fong adopts this second view, arguing it offers **greater analytical precision** for understanding modern international behavior.

The Framework: Three Core Dimensions

Fong's framework organizes great power competition around three key questions:

1. Who competes? — Actors

- **Great Powers**: e.g., U.S., China, Russia
- **Middle Powers**: e.g., Italy, Japan, Australia, South Korea
- **Small States**: like Estonia and Finland
- **Quasi-State Entities**: such as Greenland, Okinawa, and Taiwan
- **Non-State Actors**: including terrorist groups, militias, and transnational crime networks

Modern great power competition is not purely state-centric. Power is negotiated through an interactive game involving multiple levels and players.

2. How do they compete? — Mechanisms

Fong highlights three primary influence tools:

- **Military Mechanisms**: deterrence, force posture, proxy warfare, arms sales
- **Economic Mechanisms**: trade agreements, sanctions, foreign investment, financial systems
- **Ideational Mechanisms**: soft power (culture, diplomacy) and sharp power (disinformation, ideological campaigns)

These tools reflect **both material and symbolic power**, operating across visible and invisible domains.

3. Where do they compete? — Domains

Competition occurs in both **territorial** and **non-territorial** spaces:

- **Territorial Domains**: regions (e.g., Indo-Pacific, MENA), subregions (e.g., South Asia), contested zones (e.g., Taiwan, Ukraine)
- **Non-Territorial Domains**: cyberspace, outer space, supply chains, global finance, and international institutions

This spatial expansion shows that power projection is now about standards, connectivity, and systems, not just land or borders.

Chapter 2: Mainstream Theories

Mainstream theories of great power competition draw from three dominant paradigms in International Relations (IR): **realism**, **liberalism**, and **constructivism**.

- **Realism** sees the international system as anarchic, with states pursuing survival and power.
  "*Realist theory naturalizes great power competition as a logical and inevitable outcome of states' quest for relative power*"
  Key subtypes include:
  - *Offensive realism*, emphasizing power maximization (e.g., Mearsheimer)
  - *Defensive realism*, stressing balance and restraint (e.g., Waltz)
  - *Power transition theory*, which warns of war when rising powers approach parity with hegemons (Organski & Kugler)
  - *Hegemonic war theory*, positing systemic war as an inevitable result of shifting power balances (Gilpin)
  - *Neoclassical realism*, blending systemic factors with unit-level variables like leadership perception and domestic politics
- **Liberalism** argues internal characteristics of states matter more than structural pressures. State preferences emerge from domestic and transnational social forces.
  - It emphasizes cooperation, institutionalism, and peace through interdependence and democratic governance.
- **Constructivism** challenges materialist assumptions, highlighting the role of identity, ideas, and norms in shaping state behavior.
  - Different identities lead to diverging threat perceptions.
  - The concept of "great power" is not fixed but socially constructed.

Each paradigm provides distinct insights:

- Realism explains power struggles well but lacks normative context.
- Liberalism emphasizes cooperation but underestimates realist behavior.
- Constructivism captures ideational factors but can underplay material constraints.

A pluralist synthesis is often necessary to fully understand the dynamics of great power rivalry.

Two Conceptions of Power

There are two conceptions of power:

1. Power as capabilities (resources)
2. Power as influence (outcome)

The author says that power as influence makes it difficult to assess the balance of power a priori since the balance can only be observed after the outcome. And it can also lead to absurd observations, like North Vietnam being more powerful than the USA because the latter failed to influence the outcome of the Vietnam War.
This is why most realists adopt the first conception of power as capabilities, which emphasizes its material aspect (Gilpin, 1981, p.13; Mearsheimer, 2001, pp.57–60; Waltz, 1978, pp.191–192).

My note: outcome remains a valid measure
And it's not 'absurd' that Vietnam was more powerful than the USA in that specific context, and related to that specific outcome.
Vietnam was willing to commit and sacrifice more. Given these constraints, Vietnam was more powerful in influencing the outcome.

Security Dilemmave: How Defensive Moves Precipitate Wars

> The security dilemma is one of the most important contributions of the realist paradigm to IR theory.
>
> One cannot properly understand great power competition without considering the security dilemma, which says that, in anarchy, measures taken by one state to increase its security will decrease the security of other states (Herz, 1950; Jervis, 1978).
>
> For instance, **NATO sees its eastward expansion after the Cold War as defensive and non-threatening, but Russia sees it as a security threat.** China sees its arms build-ups as "purely defensive", but the United States and others view them as threatening.
>
> At the heart of the security dilemma is uncertainty about intentions.
> States cannot be certain about the present intentions of another state, and even if they are, there is no guarantee that its intentions will not change in the future (Mearsheimer, 2001, p.31). This uncertainty in an anarchic environment triggers the security dilemma.

Chapter 3: Critical Theories

Critical theories in IR, rooted in the thought of Robert Cox, Antonio Gramsci, and Karl Marx, question the foundational assumptions of mainstream IR.

Critical theories argue that **power inequalities are embedded in the system**, and true change requires systemic transformation—not just balancing or cooperation.

- Cox distinguishes between "problem-solving" theories (which accept the status quo) and "critical" theories (which challenge it).
- Critical theorists view power as both material and ideational—requiring consent, not just coercion (Gramsci's *hegemony*).

Key Streams of Critical Theory:

- **Marxism**:
  - Emphasizes class struggle and capitalist exploitation.
  - Views the state as a tool of the ruling class to preserve inequality.
  - Critiques realist use of "great power competition" as ahistorical and power-serving.
- **Frankfurt School**:
  - Max Horkheimer and others promote "immanent critique"—exposing contradictions within the current system to enable change.

  - Criticizes realism for legitimizing the status quo.
- **World-Systems Theory** (Wallerstein, Arrighi):
  - Divides the world into core, periphery, and semi-periphery zones.
  - Sees global capitalism as the driving force behind competition.
  - Power is embedded in global class relations, not just state capabilities.
- **Neo-Gramscianism**:
  - Views neoliberalism as a transnational hegemonic order.
  - Suggests that today's "great power competition" operates within and reproduces this capitalist order.
  - Promotes counter-hegemonic struggles through civil society and "war of position."
- **Post-structuralism**: The goal is to show how meaning is constructed and how power is exerted through the ascription of meaning as well as how such meaning-making is context-dependent
  - ⚠ Careful of great power competition as a frame: as Machiavelli stated, the very concept can serve to justify a perception of threat that allows state elites to extract resources from the population for the purpose of building up military power

Chapter 4: Actors

This chapter expands the concept of "actors" in great power competition beyond just great powers to include **middle powers**, **quasi-states**, and **non-state actors**.

- **Great Powers**: Defined by capabilities, ambitions beyond borders, and recognition by others.
- **Middle and Small Powers**: Often navigate between great powers, sometimes aligning, sometimes resisting.
- **Quasi-States**: Entities with partial sovereignty or limited recognition (e.g., Taiwan), whose actions can shift competitive dynamics.
- **Non-State Actors**:
  - *Terrorist groups*, *MNCs*, and *tech firms* can influence geopolitics.
  - Influence depends on how much attention states pay to them and whether they affect key competitive interests.

Actions and Behavior:

- Great powers use institutions, norms, and military/economic tools to shape global rules in their favor.
- Lesser actors sometimes aggregate influence or become flashpoints (e.g., Ukraine, Palestine, Taiwan).

Smaller Power As Allies Are Crucial

> Great powers whose designs have more support from larger numbers of smaller powers can limit the challenges presented by rivals, shape rules that they can force rival great powers to accept to some degree, or even exclude adversaries from certain geographic or issue areas.

And:

> Collective smaller power compliance may provide a great power with the gains of being able to dominate an area without having to pay the costs of administering a territory and its population from day-to-day.

Conversely, 'smaller' players can cause lots of troubles, especially if they ally:

> Collectively, smaller powers can help facilitate or severely complicate the ambitions and plans of even great

> powers.

And smart smaller powers can play bigger powers against each other in a bidding war that benefits them.

Chapter 5: Military Influence Mechanisms

Military Influence Mechanisms (MIMs) are tools used by Great Powers to influence others below the threshold of war. These include:

- **Deterrence** (central concept): Requires credible force posture, readiness, and communication.
  - *Deterrence by punishment*: Threatening retaliation.
  - *Deterrence by denial*: Making success prohibitively costly.
- **Compellence**: Forcing an actor to change behavior via threat or limited use of force.
- **Assurance and Reassurance**: Calming allies or adversaries to shape behavior or reduce escalation.
  - *Assurance*: (AKA alliance-related assurance) aimed at allies, to persuade them of the solidity of a defence commitment (Knopf, 2012; Brooks and RappHooper, 2013).
    Often takes the form of public declarations of ongoing commitment to defend allies (ie.: American pledges of Nato's Article 5)
  - *Reassurance* (AKA deterrence-related assurance (Knopf, 2012)): is aimed at a potential adversary.
    Can go together with deterrence because Schelling "any coercive threat requires corresponding assurances" (Schelling, 2008, 74). This involves a choice: harmful consequences (deterrence) or no cost if the opponent refrains (reassurance)
- **Force Posture**: Strategic deployment and readiness to demonstrate capability and resolve.
- **Military Readiness**: Ability to rapidly deploy effective forces.
- **Alliances and Military Aid**: Used to shape alignments and build influence.
- **Proxy Wars and Limited Interventions**: Project power and test adversaries without full-scale war.
- **Cyber and Space**: Emerging domains for competition, particularly for intelligence and deterrence signaling.

Military influence is not just about brute force but about **shaping perceptions and calculations**. MIMs support both coercive and cooperative strategies, depending on context.

Chapter 6: Economic Influence Mechanisms

This chapter explores how states use **economic power** to shape international outcomes, drawing on both classical theories and contemporary strategies.

Key Theoretical Approaches:

- **Marxian Theory of Imperialism**:
  - Capitalism drives imperial rivalry as states seek markets and resources (Lenin, Luxemburg).
- **Gramscian Theory of Hegemonic Cycles**:
  - Economic power must be legitimated ideationally; hegemonic orders mix material dominance with ideological consent.

Economic Tools in Practice:

- **Trade Policy**: Market access and trade agreements can incentivize or punish.
- **Sanctions**: Deny adversaries critical resources and financial flows (e.g., U.S. sanctions on Iran and Russia).
- **Investment and Aid**: Promote dependencies and shape preferences (e.g., China's Belt and Road).

- **Currency and Finance**: Control over global currency systems (e.g., dollar dominance) creates leverage.
- **Supply Chains and Technological Standards**: Setting global rules on digital infrastructure or rare earths is a form of structural power.

Economic tools often have **dual-use potential**—they can build cooperation or deepen rivalry depending on how they're wielded and perceived.

Chapter 7: Ideational Influence Mechanisms

This chapter reframes great power competition as a contest not only over resources or territory, but also over **ideas**, values, and legitimacy.
It introduces a conceptual framework distinguishing between:

- **Soft power** (legitimation): attracting others through values, culture, and diplomacy
- **Sharp power** (delegitimation): undermining others' credibility through disinformation or ideological warfare

Four types of ideational tactics:

- **Promotion**: using soft power externally (e.g. cultural exports, global media)
- **Renewal**: using soft power internally to reinforce domestic legitimacy
- **Containment**: using sharp power externally to discredit rivals
- **Fortification**: using sharp power internally to defend against foreign influence

The chapter argues that **great power status depends not only on material capabilities, but also on the ability to shape meaning, legitimacy, and narratives** in both domestic and international arenas.

Modern Geopolitical Dynamics

We skipped the chapters on regional power dynamics.

They were the most interesting to read and I learned a lot, but they're also the most time-sensitive.
And since we write for timeless wisdom that applies to millennia past as much as for the millennia to come, we skipped them (with the exception of the chapter below).

But get the book if you're interested in geopolitics because they're very worth it!

Chapter 15: Central and Eastern Europe

This chapter focuses heavily on **Russia's invasion of Ukraine** and the **restructuring of European security**.

Historical Roots:

- Region was under Soviet dominance during the Cold War.
- NATO and EU expansion into former Soviet bloc countries triggered Russian anxiety and eventual confrontation.

Key Themes:

- Russia seeks to reclaim a **sphere of influence**, especially over Ukraine, Belarus, and the Caucasus.
- The West views Ukraine as essential to the **post–Cold War liberal order**.
- **NATO enlargement**, although framed as democratic choice, is seen by Russia as an existential threat.

The war in Ukraine is more than Putin's ambition—it reflects **deep Russian elite consensus**. Going forward, a **new Iron Curtain** may divide Europe politically, economically, and militarily.

USA Expanded NATO to Keep EU Divided

Just like we wrote in our article on American leadership, the US 'defended' Europe also to maintain its influence on the continent:

> In the early 1990s, eforts to "Europeanize" European defense gained steam.
>
> France wanted to turn the Western European Union (WEU), the nascent military arm of the European Community (the forerunner of the European Union), into a full-fedged security organization. Policymakers in Washington viewed this as an attempt to lever the Americans out of Europe.
>
> The Clinton administration thus decided that NATO (in which the USA played the dominant role) ought to remain the lynchpin of European security.

And:

> In other words, NATO enlargement served two central objectives of American foreign policy: to promote democracy and to sustain US infuence over European security and political affairs (Layne 2000; Shifrinson 2020; Schake 1998

The West Shares Some Blame In Ukrainian Conflict

This is a highly contentious thesis I've held, and I recognize the good reasons why many may find distasteful.

However, the book confirms that, *seeing it from Putin's perspective*, the West 'forced his hand' to act.
Note that this does not justify Putin's action of course, and it's now best for EU to do its best to win that war.

That being said, I believe that a war at European's doorstep was at least foreseeable, and likely avoidable:

> The leadership of the newly independent Russian Federation suggested that the Central and Eastern European states should assume a role similar to that of Finland during the Cold War: politically independent and militarily neutral.
> (…) policymakers in Moscow made it clear that the post-Soviet space was considered to be Russia's own exclusive sphere of infuence.
> It is important to stress that this position was shared not only by hawkish nationalists and neo-communists, but also by many of the more liberal members of the Yeltsin administration (Götz 2022, 1736–1740)

> After all, there are good military-strategic reasons for states to exert some form of control over their geographical vicinity.
> Moreover, Russia's ruling and intellectual elite continued to think of their country as a great power with a legitimate right to a regional sphere of infuence and a major say in the formation of Europe's post-Cold War order (Radchenko 2020; Götz & Staun 2022, 485–486).

> Yeltsin demanded "to get a clear understanding of your [Clinton's] idea of NATO expansion because now I see nothing but humiliation for Russia if you proceed" (Memcon 1995)

> Moreover, in 2002, the Bush administration withdrew from the Anti-Ballistic Missile (ABM) Treaty and announced plans to deploy ground-based ballistic missile interceptors in Poland and a tracking radar base in the Czech Republic (Stent 2014, 72–75).
> (…) Seen from Moscow's perspective, the US missile defense infrastructure threatened to undermine Russia's

> second-strike deterrent capability. In response, Russia started to engage in a large-scale modernization program of its nuclear arsenal (Götz 2019c, 812–814)

> the Bush government worked energetically for Georgia and Ukraine's membership in NATO.
> (…) This was opposed by several NATO states (…) out of fear that it might provoke Russia.
> The summit ended with a half-baked compromise, declaring that Georgia and Ukraine "will become members of NATO" (…)
> This was probably one of the biggest diplomatic blunders of modern times. NATO efectively signaled its intent to enlarge at some unspecifed point in the future, yet it failed to provide any concrete security guarantees for Georgia and Ukraine. As a result, Russia was emboldened to act sooner rather than later.

> Rightly or wrongly, the color revolutions came to be seen by Moscow as part of a broader US-led efort to remove pro-Russian regimes from power and to replace them with Western-oriented leaders (German 2020). Some in Moscow even speculated that the color revolutions were a "dress rehearsal" for a regime change in Russia.

> As a result, tensions were near a boiling point in late 2021 and early 2022. Given Ukraine's civilizational and geostrategic importance for Russia, any government in Moscow would have most likely increased its pressure on Kyiv—though not necessarily embarked on a largescale invasion.

If avoiding a major war was a priority, and I believe it was, then EU should have better thought on how to go about its eastward expansion while 'showing more respect' for Russia.
And maybe consider when/how/if to expand to Ukraine.

Contemporary Multipolarity Started With The Financial Crisis

> The USA, China, and Russia are presently engaged in a struggle for dominance within the international order.
>
> Layne has argued that unipolarity enabled China to reap economic growth by bandwagoning with the USA, but its long-term goal was not to maintain the status quo of the US-led system; instead it sought to 'convert its economic gains into military capabilities that would allow Beijing to contest American preponderance' at a future time (2012, p. 205).
>
> By the 2010s, years of speculation over a US decline, combined with the economic impacts of the Global Financial Crisis, signalled to China and Russia that unipolarity was over and the time had arrived for them to challenge US power and the liberal world order.
> So convinced that China's time had arrived, Xi Jinping walked away from Deng Xiaoping's cautionary approach of 'Hide your strength; bide your time; never take the lead' and in 2021 told provincial and party leaders that 'time and momentum are on our side' (cited in Rudd 2022, p. 9).
>
> This has occurred despite US–China Strategic Engagement being built on the belief that by bringing China into international institutions it would be socialised into the established liberal world order (Goddard 2020).

Chapter 23: International Institutions

My Note: We must defend democratic international institutions to promote global cooperation
This was one of my favorite chapters, and I consider it of crucial importance for the future of humanity to preserve global cooperation.

In this chapter Anna Hayes analyzes how great power competition unfolds in the arena of international institutions—the global rules-based systems, organizations, and norms that structure international politics.

These include institutions like the United Nations (UN), World Trade Organization (WTO), International Monetary Fund (IMF), World Bank, and a range of norm-setting forums in digital governance, arms control, and development.

Rather than viewing institutions as neutral platforms, the chapter reveals them to be arenas of contestation, where rising powers like China, Russia, and India seek to challenge or reform the existing liberal order, while established powers—primarily the United States and its allies—seek to defend and preserve it.

The chapter grimly paints China and Russia and anti-democracy, autocratic states that the West must defend against if it wants to uphold multilateralism, global trade, and the rule of law.

In a subsequent chapter, noticing the differing values of Western powers and China/Russia, the authors write:

> Hence, it is imperative that the defenders of the liberal world order seek to strengthen and reinvigorate the very things that make it so appealing: fairness, efectiveness, and democratic principles within operational structures. In addition, they must ensure international institutions remain both sites for and agents in international cooperation.

I couldn't agree more.

Theoretical Foundations

International institutions are not just background infrastructure. They:

- Reflect **power structures**, especially Western dominance since WWII.
- Serve as **mechanisms of soft power**, where norms, rules, and practices reflect the interests and values of dominant actors.
- Are strategically **used and contested** by both status quo and revisionist powers.

Approaches to Changing International Institutions

Rising powers employ a range of strategies to reshape international institutions to better reflect their interests.

These strategies fall into three main categories: power bargaining, distributive strategies, and integrative strategies.

Each has varying degrees of effectiveness depending on the context, credibility of the actor, and alignment with the interests of defender powers.

Power Bargaining
• Uses threats and pressure to force defender states to accept reforms
• Most common in classic power transition theory
• Can succeed in gaining concessions but often escalates tensions and creates backlash

Rhetorical Coercion
• Publicly shames defenders by highlighting their hypocrisy or violations of shared norms
• Effective when norm violations are clear and the shaming actor is credible
• Fails when the challenger is seen as self-interested or hypocritical

⁉ States claiming lack of voice or unfairness often do so strategically, not out of genuine concern, to extract concessions through delegitimation.

Principled Persuasion
• Argues that reforms will improve institutional legitimacy and efficiency

• Can work when challenger and defender preferences already align
• Rarely successful in high-stakes or politically contested domains

Strategic Co-optation
• Offers material benefits or side payments in exchange for support
• Helps build coalitions and reduce resistance
• Often costly for the challenger and can backfire if seen as transactional or manipulative

Strategy	Description	When It Works Best	Limitations
Power Bargaining	Threats or leverage to force change	When challengers have significant hard power	Escalates tension, seen as confrontational
Rhetorical Coercion	Shaming for norm violations	When challenger is credible and norms are clearly breached	Fails if the accuser appears self-interested or hypocritical
Principled Persuasion	Rational appeals for better governance	When preferences are already aligned	Weak impact when interests diverge
Strategic Co-optation	Incentivizing support through benefits	When challengers can offer attractive, credible rewards	Resource-heavy, may be imbalanced or unsustainable

Revisionist powers (e.g., China, Russia) typically prefer power bargaining and rhetorical coercion, especially when seeking major institutional change.

Reformist powers (e.g., India, Brazil) tend to use persuasion and co-optation to seek incremental adjustment.

China Is A Revisionist Power, But Prepared A Fallback Plan

The text paints China as agreeing with some of the current world order, especially the one based on trade.

However, China's angle is 'state above individuals', so it pushes back against free market and individual rights. It's an authocratic approach to trade.

So while China seeks to reform (or distort) contemporary institutions, it's also crafted its own institutions and alliances to set its technology and values as the baseline for a new order:

> If China cannot recalibrate existing, American-supported, international political and security organization norms and procedures, then it will move onto these new organizations where its defnitions and norms serve as the baseline

How to Maintain Cooperation & Rule of Law

> Hence, Tallberg and Verhaegen concluded that rather than trying to reshape institutions based on the many voices of the emerging powers, instead e**nhancing the legitimacy of international institutions is best achieved by ensuring they are underpinned by good governance and enshrine the principles of fairness, effectiveness, and democracy.**
> Such an approach ensures that there is open discussion and inclusion of all voices (remembering that those voices are typically representing the interests of their home state, not necessarily what is best for all member states), and that decision-making is carried out via consensus

Later in the chapter, the authors state that this approach also works best because it's more attractive for the smaller powers that prefer to gravitate around the richer and open democracies, rather than the autocratic powers.

MORE WISDOM

War makes a good case for world governance

States can function like small tribes, in part cooperating, but also competing and sometimes, unfortunately, going to war.

If humanity is to move beyond war, especially important in an era of greater capability for destruction, supra-national bodies to arbiter disputes are fundamental:

> War is always a possibility in a system without a central government that exists above states to arbitrate disputes. In this environment, military force becomes the ultimate arbiter of disputes. At the heart of great power competition is the pursuit of power

Multipolarity With Squabbling Power Can Frustrate Global Cooperation

> (…) wrangling over foundational differences between rivalrous great power norms and ideals frustrates international consensus, neuters joint policy (…) and fragments once cohesive systemic global arrangements.

The USA Opted For Freedom & Mutual Benefits to Retain Soft Power

> Hence, while one might believe that a unipolar state has free reign to do as it pleases, the period of US unipolarity was not one of unregulated US hegemony.
>
> Instead, due to the constraints of the rational-legal authorities built into the global order by the USA in the postWorld War II period, unipolarity saw US foreign policy goals centred upon the promotion of democratic values and the continuation of the rules-based order (Finnemore 2009).
>
> Martha Finnemore has argued that the USA took such an approach to 'induce acquiescence or support from others, thereby legitimating their power and policies' (2009, p. 62). Therefore, the USA sought to increase its influence and appeal via enticement and persuasion, not coercion (Jervis 2009)

This 'pull approach' worked, and smaller powers *wanted* to follow USA's leadership, strengthening the whole system:

> Moreover, under US unipolarity, international institutions played a critical role in advancing openness and interconnectedness via globalisation, further advantaging US interests but also the interests of other states that shared similar values and global outlook (Ikenberry et al.2009).
>
> Hence, the appeal of the free-market system and democratic model drew much support from other states, due to the benefts they derived from them, which in turn reinforced the legitimacy of the US-led system (Finnemore 2009)

It's Unsure Whether Unipolar, Bipolar, or Multipolar Are Safer

> Some realists focus on the static indicators of the balance of power to assess the likelihood of war.
>
> Many argue that bipolarity (two great powers) is less war-prone than multipolarity (three or more great powers).

> In a bipolar system, balancing is more efficient because each pole can be laser-focused on the other; there is less chance of miscalculation (Mearsheimer, 2001; Waltz, 1978).
>
> Others assert that multipolarity is less war-prone because more states can join forces to balance the aggressor and because there is less hostility among the great powers (Deutsch & Singer, 1964; Morgenthau, 1978).
>
> Still others argue that unipolarity is the most peaceful because there is only one great power in the system and other states will avoid confronting the behemoth (Wohlforth, 1999).

Unfortunately, to me this is a further reminder that International Relations as a field still more based on theories, rather than evidence.

Comtemporary Great Power Competition Is Between Democracy & Authoritarianism

USA, China, and Russia are the contemporary great powers, and they stand for very different values and visions for humanity:

> Both China and Russia are revisionist powers, they are illiberal, and they both regard liberal values such as democracy, freedom of expression, and human rights as threats to their continued existence (Ikenberry 2022). (…)
> Ikenberry has characterised both Russia and China as being opposed to the existing international order, undergirded by openness, multilateralism, and a rules-based order, arguing that they seek an international order 'hospitable to regional blocs, spheres of infuence, and autocracy [that] protects authoritarian rule from the threatening forces of liberal modernity' (Ikenberry 2022, p.58)

Discussing the 'space race', the authors write:

> Competition between great powers is likely to result in the opening of frontiers on the Moon and other celestial objects rich in mineral resources and to force development of new technology with unforeseen "knock on" economic effects.
>
> It is also a contest between different visions of the human future, one liberal and the other authoritarian.
>
> **What humanity becomes or fails to become over the next century will be determined in great part by the outcome**

Europe Must Unite For Freedom, & Its Own Good

First off, the authors correctly highlight that Europe has the potential to become a great power, but isn't there yet:

> Many wonder whether Europe might soon rise as a great power in the emerging international order.
>
> Variants of this question have been asked for decades as post-World War II European integration fowed from the romantic vision of a Europe transcending confict and forming an ever-closer union.
>
> But the crowning jewel of the European integration (…) struggled to present a cohesive whole.
>
> From 1993 to 2022, the EU never cleaved together politically, militarily, or even economically to the degree necessary to meet the three-feature defnition of a global great power.(Lynch, 2020) It has remained an

> important, but lesser-tier, player in the emerging new era of great power competition shaped by the USA, China, and Russia

I believe that a federal EU is good for European states, and good of the world.

For example, when Trump's first presidency started pulling away from free world leadership, other Western countries stepped in:

> Despite the Trump-era turbulence, or rather because of it, the European Union and Japan stepped up to preserve the multilateral global order, defending interdependence and international institutions; mini-lateralism then grew across the Indo-Pacifc region (Fogarty & Park 2019; Tirkey 2021).

However, the text was written before Trump's second term, which has moved closer towards authoritarianism and a 'law of the jungle' approach to politics.

And to uphold a global order based on win-win, trade, and the rule of law, it's best to have a united EU. Several beacons of freedom are better than only one.

QUOTES

A quick historical excursus:

> From Athens–Sparta rivalry in ancient Greek times, Rome–Carthage rivalry in the 3rd century BC, French–Habsburg rivalry in the 16th to 18th centuries to Britain–Germany rivalry before World War I, Britain– Germany rivalry before World War II, and USA–Soviet Union rivalry throughout the Cold War, diferent great powers have competed against each other in diferent historical contexts. Great power competition is therefore a norm—rather than an exception—in international politics (Brands, 2017)

Power wins, not rationality:

> Power inequalities are always already stacking the game. That is also why liberals are naive in expecting rational interests to prevail, unless they are the interests of the powerful

Ideas are about power:

> Ideas are not neutral. Instead, the way we think and the way in which we communicate our thoughts has efects in the real world and becomes ammunition in struggles of power

Theories are also part of power dynamics and influence:

> While all theory may not be ideology, all theories can be used in the service of ideology

On the danger, but NOT inevitability of war:

> War between great powers during times of relative transition is not inevitable, but it is a persistent threat.

⍰⍰♂ Lucio's Analysis

Note on the Importance of Preserving Global Cooperation

While this volume focuses on the dynamics of great power competition, it is essential to emphasize that the future of humanity depends on *managing* that competition, and on sustaining meaningful global cooperation.

Major existential challenges—climate change, pandemic preparedness, nuclear proliferation, and AI safety, among others—cannot be addressed unilaterally, or by squabbling states or blocs.
These require collaborative governance and effective international institutions capable of aligning diverse interests toward shared goals.

As technological advancement accelerates and ambitions such as space colonization become more feasible, we cannot export tribalist mindsets and behaviors to new frontiers.
Without a foundational value of cooperation, we risk replicating the same cycles of conflict in more dangerous or irreversible contexts.

Researchers, scientists, and intellectuals have a particular responsibility to remind us of all of this imperative. If we analyze competition without this reminder, **we risk normalizing destructive competition** as the status quo and, even more worrisome, 'unavoidable'.

Long term, cooperation will determine whether we survive and thrive as a species.

I hope the authors will add a similar note to their already excellent work.

Other Suggestions

- **I'd suggest removing any references to historical exceptionalism that may overlook similar patterns in earlier eras or regions.**

For example, change sentence structure like '*contemporary great power competition is no longer monopolised by the great powers*', because it never was and smaller tribes and marauders always played a role.

Or '*the USA enjoyed an unprecedented unipolar moment*', which I don't think is unprecedented—Rome after Carthage's destruction and some periods of the Han dynasty were unipolar in their regions.

- **International relations and potentially political science in general seems more theoretical and less empirical (reduce philosophers' mentions)**

This is not a criticism of the book, which is excellent, but more about the state of international politics as a field.

For example, take this paragraph:

> Others assert that multipolarity is less war-prone because more states can join forces to balance the aggressor and because there is less hostility among the great powers (Deutsch & Singer, 1964; Morgenthau, 1978). Still others argue that unipolarity is the most peaceful because there is only one great power in the system and other states will avoid confronting the behemoth (Wohlforth, 1999).

In my opinion, when theories dominate with little mention of empirical support for one or another—or even the mention of future research to gain more clarity, then you have a field that's more theoretical than empirical.

I'd suggest the authors consider reducing the amount of space dedicated to philosophers.

REVIEW

The Routledge Handbook of Great Power Competition is a fantastic exploration of geopolitical power dynamics, starting from general theories and moving to historical and contemporary events.

I enjoyed reading it, I learned a lot, and I'm grateful to the authors.
In 2025 it even made our 'best books on power' list.

Finally, it also helped us improve some of our articles on soft power and geopolitics, and also indirectly confirmed several of our Power University strategies.

Best Social Skills Courses in 2026: Win Status & Respect

Lucio Buffalmano · 9 August 2025 · Archived copy · Original

Looking for the best social skills courses to boost your confidence, communication, and influence?

Whether you're aiming to build deeper relationships, earn respect, or boost charisma, we've ranked the top programs to help you succeed

Expert in power dynamics and social strategies, *The Power Moves* ranks each course based on effectiveness, student results, and real-world impact.

Leading the list is **Power University**, a proven system for mastering status, persuasion, and high-level social success.

Let's dive in.

Contents

- 5. Authentic Assertiveness
- 4. The Art of Charm Bootcamp
- 3. Charisma University
- 2. People School
- 1. Power University
  - Who is Power University for?
- ⍰ Comparison of Best Social Skills Courses

- FAQs

5. Authentic Assertiveness

Creator: TJ Guttormsen

Summary: The Authentic Assertiveness course is a concise 3.5-hour program teaching you to speak confidently, handle conflict, and communicate clearly. It's ideal for everyday interactions and building assertiveness.

Our Review: This course shines for its high rating and practical approach to assertiveness. It's perfect for those who want to stand their ground without being aggressive, but it lacks the strategic depth of our top pick for high-stakes results.

Pros:

- ✅ **Concise** and **practical** for daily use.
- ✅ Focuses on a **crucial competence** for beginners and too-nice-guys alike.

Cons:

- ❌ Brief
- ❌ More advanced and ambitious men may **wish for more depth**
- ❓ Less focus on advanced social strategies.

4. The Art of Charm Bootcamp

Creator: AJ Harbinger and Johnny Dzubak, founders of The Art of Charm.

Summary: *The Art of Charm Bootcamp* is an intensive, hands-on program focusing on real-world social skills like conversation mastery, networking, and building confidence. It combines in-person workshops (or virtual equivalents) with practical exercises to improve social fluency in professional and personal settings.

Our Review: Quality bootcamps deliver real-life experience and in-person feedback that's crucial to anyone who must still develop 'social intelligence', or what we call here the 'feel' for social dynamics.
The Art of Charm specifically provides an immersive format that includes role-playing, live feedback, and networking practice. However, its premium price and intensive format may not fit all schedules or budgets.

Pros:

- ✅ Highly **interactive** with live coaching and role-playing.
- ✅ Focuses on **practical skills** like networking and conversation.
- ✅ Tailored for **real-world** social success.

Cons:

- ❌ High **cost** (starting at ~$2,000 for workshops).
- ❌ Requires significant **time** commitment.

3. Charisma University

Creator: Charlie Houpert, founder of Charisma on Command.

Summary: *Charisma University* is designed to boost your charisma with over 10 hours of video content. It covers basics of body language, storytelling, and first impressions, making it great for social settings and personal interactions.

Our Review: *Charisma University* excels at grabbing attention in social situations. Charlie's practical exercises are fun and effective, but the course is pricey and less focused on strategic social advancement compared to our top

picks.

Pros:

- ✅ Fun, **engaging** content.
- ✅ Strong focus on charisma and f**irst impressions**.
- ✅ **Practical exercises** for real-world application.

Cons:

- ❌ **Pricey** for the content at $597.
- ❌ High energy approach **not for introverts**.
- ❌ Less suited for **workplaces, dating**,

2. People School

Creator: Vanessa Van Edwards, author and founder of Science of People.

Summary: *People School* is a year-long program with 12 modules focused on professional social skills. It teaches nonverbal communication, rapport-building, and workplace influence, ideal for career-driven individuals looking to excel in professional settings.

Our Review: *People School* is a solid choice for professionals who want to decode body language and build stronger workplace relationships. Vanessa is a skilled and engaging teacher—perfect for women, her feminine style may be less suited for men wishing for more masculine gravitas.

Pros:

- ✅ Very good for **nonverbal cues**.
- ✅ Practical for **professional settings** and leadership.
- ✅ **Engaging**, high-energy delivery.

Cons:

- ❌ Delivery is **not tailored for men**.
- ❌ Expensive at $1,495.
- ❌ Lacks **advanced strategies** for manipulators, aggressive men, and 'shortcuts' to success

1. Power University

DISCLAIMER: We are the creators of Power University, so this entry comes from an insider's perspective. We aim to keep the description objective by focusing on the curriculum and documented alumni's results.

Creator: Lucio Buffalmano, social strategist and founder of The Power Moves.

Summary: *Power University* is a comprehensive program diving deep into interpersonal power dynamics. It teaches you to influence, negotiate, and lead with confidence, delivering real-world results like status, respect, and women's devotion.

Our Review: for ambitious men who want to dominate life, not just get along or be liked.
Lucio's framework is backed by science, personal experience, and alumni's results—with both quantitative surveys and qualitative reviews.
If you're serious about getting the most out of life, this is your blueprint. But it may not be for beginners and men who prefer 'getting along'.

Pros:

- ✅ **Advanced** strategies and '**hacks**' to achieve goals, 10x faster
- ✅ **Foundational life competences**, including 'darker' on
- ✅ **Proven** real-life **results** most men want (8x more respect, 7x more attraction)

Cons:

- ❌ Higher **price** point ($979–$9,979).
- ❌ Not tailored for **women**: from version 9 onward, it focused on men.
- ❌ Not suited for **beginners** seeking basic skills.

> "Power University gave me the tools to negotiate a 20% raise and command respect in every room I enter. It's a game-changer."
>
> — *Power University Student*

Who is Power University for?

Power University isn't about small talk—it's about mastering the social chessboard.

Unlike other courses, it focuses on power dynamics and strategies to advance in life, gaining respect, status, promotions, and quality dating options.

Lucio Buffalmano's framework delivers 8x more respect and 7x more attraction, according to students. If you want to play at the top, this is your course.

⍰ Comparison of Best Social Skills Courses

For a quicker overview:

Course Name	Best For	Price	Rating	Length
Power University	Advanced social skills, goal achievement, life success	$979–$9,979	9.2/10	Comprehensive
Authentic Assertiveness	Assertiveness, communication	$124.99	4.7/5	3.5 hours
Art of Charm Bootcamp	Social confidence, conversation	~$2,000	High (testimonials)	Intensive (workshops)
Charisma University	Charisma, first impressions	$597	9/10	10+ hours
People School	Professional settings, social charm, women	$1,495	4.4/5	~2 hours/week for a year

- **Best social skills books**, including the most beginner-friendly

How to Choose the Right Course for You

Pick based on your goals and budget:

- **Advanced life competence for achievement**: Power University
- **Assertiveness focus**: Authentic Assertiveness
- **Real-life training**: Art of Charm bootcamp (or any real-life bootcamp).

- **Youthful extrovert charisma**: Charisma University
- **Women and professional settings**: People School

Start with the course that matches your ambitions, and practice consistently to see results.

Final Thoughts

Social skills are your edge—whether you're chasing a corner office, deeper relationships, or unshakable confidence.

Fortunately, we live in a world with hundreds of courses to learn social skills.
Some are stuffed with social skills cliches, motivational speeches, and basic 'tips'. However, there are a few that truly stand out and can change lives—we shared some here.

Power University leads for those who want to *win*, not just participate. Enroll in one of these top courses today and take control of your social destiny.

FAQs

What is the best online course to improve social skills?

The most advanced social skills course to date is Power University. It's built for those who want more than small talk—they want to win in social dynamics, earn respect, and develop real power. Unlike fluff-filled courses, Power University breaks down the psychology of status, persuasion, and social strategy. For career success, dating, or leadership, it's the most comprehensive and actionable course available.

Are social skills courses worth it?

Yes—if you pick the right one. A well-structured course pays off for life: better relationships, stronger career moves, higher confidence, and more respect. But generic or theory-heavy courses often waste time. That's why we reviewed only the most effective and practical programs, led by those with real-world credibility.

How long does it take to improve social skills?

You'll see noticeable changes in weeks, especially with behavior-based, practical training. But full transformation—like overcoming people-pleasing or building high-status habits—can take months. That's why top programs (like Power University) offer lifetime access and continuous updates, supporting real, lasting change.

Which course helps with shyness and social anxiety?

Courses with exposure drills and mindset rewiring work best. SocialSelf.com, previously known as SocialPro, offers some courses tailored for social anxiety and shyness and may be worth looking into. When you want to go further—tackling confidence, status, and attraction—Power University may be a good next option, starting with easier exercise-based modules that build assertiveness and self-respect.

Science of People vs. SocialPro: Which is Better for Learning People Skills?

Science of People and SocialPro both offer valuable training but serve distinct purposes. Science of People provides interpersonal communication skills ideal for professionals, women, and general social interactions. SocialPro, now SocialSelf, specializes in overcoming shyness and social anxiety, helping beginners build fulfilling friendships. For men seeking advanced social skills to gain status, respect, and attraction, Power University is the best choice. It focuses on power dynamics, assertiveness, and practical strategies tailored for men who want to lead and succeed.

Can social skills be learned, or are they innate?

Social skills are 100% learnable. Yes, some people are naturally extroverted and start with a good sense for social and power dynamics—but the most socially skilled people often trained hard. Just like fitness, the right techniques and consistent practice outperform “natural charm.” The key is choosing a course that teaches real-life strategies, not just theory.

Confident Body Language For Men: Status Cues

Lucio Buffalmano · 13 August 2025 · Archived copy · Original

Confident body language is how men signal strength, status, and self-assurance—without saying a word.

Whether you're walking into a room, leading a meeting, or meeting someone new, your posture, eye contact, and movement tell people how to treat you.

This guide breaks down the most important nonverbal cues of high value, confident men—based on field-tested social strategies, body language science, and over a decade of research from *The Power Moves*.

Let's dive in.

Contents

- What's Confident Body Language
  - Low vs. High Confidence Body Language
- How to Appear More Confident
  - 1. Posture: Straight and Relaxed (Not Stiff)
  - 2. Head and Chin: High (Not Tilted)
  - 3. Eye Contact: Direct (Not Overbearing)
  - 4. Gestures: Open and Deliberate
  - 5. Stillness: The Power of Calm
  - 6. Facial Expression: Proud and Controlled
  - 7. Stance: Grounded and Ready
  - 8. Touch and Contact: Sparing and Strategic
  - 9. Advanced Power Move: Angle Away
  - 10. Entry and Movement: Own the Room

- Balance & Calibration For Confident Winners
  - Balanced Confident
  - Calibrated Confidence

What's Confident Body Language

Confident body language is the nonverbal display of self-assurance, lack of fear, and appropriate level of dominance.

Confident body language is the first impression you never say, and the constant reminder of your social value and self-esteem.
It signals to others that you:

- Deserve **respect** in meetings or social settings
- Have **social status**, or are accustomed to getting it
- Are **attractive**, or trust yourself to attract high-quality partners
- Command **authority** in leadership and negotiation

Conversely, a lack of confidence cues signal the opposite.
With low confidence nonverbal cues, you risk being underestimated, overlooked, or dismissed—even if you have the best ideas or intentions.

Direct eye contact, head level, shoulders relaxed and back, arms away from body, shoulder-wide stance. One hand in pocket and shifting weight on one leg would add a touch of 'chill and cool' vibe. But overall, it's a high-confidence body language pose

Low vs. High Confidence Body Language

Cue	Low Confidence	High Confidence

Posture	Hunched over, head hanging, arms and legs crossed or away	Stand tall, chest open, head up
Eye contact	Looking down and away, breaking eye contact downward	Hold gaze 60–70%, break eye contact up or to the side
Gestures	Constricted, self-soothing touches or hugs, hand clasping, tics	Visible palms, gestures emphasize speech, fluid movement
Facial expressions	Forced smiles, reactive or exaggerated expressions	Genuine smiles when he feels like,

Compare lower confidence body language poses:

❓ Low Confidence Body Language Examples

There is almost no time and place to strike any of the above poses for an ambitious man. The first is insecure, the second is feminine, and the third is submissive. All can be categorized as low power/confidence

⍰ High Confidence Body Language Examples

The third one is slightly too open, but if he is sitting behind a table it can work well as an in-between pose

How to Appear More Confident

Here's a quick step-by-step guide to adopt a confident body language, going from most basic to most advanced:

1. Posture: Straight and Relaxed (Not Stiff)

- **Stand tall** with an erect spine, chest up and subtly forward
- **Roll shoulders back and down**; avoid over-flexed posture that reads as try-hard
- **Sit back and comfortably** with legs apart or crossed in 'figure four' (below) and a slight lean to show self-reliance

⁉️ **Start with good posture** before anything else, it's the foundation of confident body language. Many men must do postural exercises to rebalance hunched shoulders, lordosis, or forward head.

2. Head and Chin: High (Not Tilted)

- ✅ Keep your **head level** and or chin slightly up
- ❌ Avoid drooping (submission) or cocking the chin up (unnecessary challenge)

⁉️ **Power move:** nod slowly, or upward for extra confidence.
Example:

> **Confident body language**: (Nods up once)
> **Unconfident body language**: (Nods down, fast, many times)

3. Eye Contact: Direct (Not Overbearing)

- Maintain **steady eye contact 60–70%** of the time
- **Break gaze slowly**, not abruptly
- **Break gaze to the side**, not below (submissive). Break it above to signal power

⁉️ **Power Move**: to signal higher status, look more often when speaking and away when they speak (Dovidio et al., 1988)

Both have good and confident body language. The politician on the left is more erect, but still sub-communicates lower status by turning toward and directly looking at Trump, while Trump faces the camera and only looks sideways

4. Gestures: Open and Deliberate

- **Extend gestures** away from your body for power—no T-rex arms
- Use **visible palms** to increase warmth and trust
- **Move slowly** in general, but speed up if needed. Remember that for good communication gestures underscore your words

Confident body language supports verbal production with consonant gestures, achieving the dual goal of sub-communicating value, and increasing communication effectiveness

5. Stillness: The Power of Calm

- ✕ **Remove fidgeting** because it signals high anxiety and low confidence—high-status men project calm
- ✕ **Avoid self-touching**, clasping, or self-hugging
- ✓ **Be deliberate** in your movement, trim out the purposeless, keep the purposeful

⏸ **Power move**: pause two seconds before acting. Stillness signals thoughtfulness, mental power, and control

While overall this is good and confident body language, that belt clasping is a bit too tight and may signal discomfort and anxiety. In doubt, *rest* your hands instead of clasping

6. Facial Expression: Proud and Controlled

- Display a **slight, confident smile**
- **Alternate serious looks** for gravity—no constant grin

A tight-lipped, slight smile that sub-communicates self-confidence, and self-contentment, without needing others to

like you

A confident facial expression may be best approached with our favored ‘inside-out approach’. Such as, by working on your internal self-esteem first.
Believe your life is great, believe that anyone would gain if you entered their lives, and your face will say that for you.

Here’s a good primer:

- ▯ **How to be confident**, a video lesson

7. Stance: Grounded and Ready

- Keep your **feet shoulder-width**
- Keep weight evenly distributed between toes and balls of your feet

Careful not to overdo the ‘manspreading’, it’s juvenile and try-hard for most contexts. It works here because he’s leaning in, showing interest and warmth, and his hands covering the crotch take the edge off, without turning into male bravado

8. Touch and Contact: Sparing and Strategic

- **Initiate confident touches**: firm handshake, light pat on the back
- **Limit contact** to high-value moments—too much undermines power

This is a perfect mix of high confidence body language, leadership to initiate touch, and warmth/love

⍰ 9. Advanced Power Move: Angle Away

In general, confident body language is also open body language, which includes facing toward and dead-on.

However, you don't always want to communicate you're open, appreciative, or trusting of someone.
Or you may not want to communicate that you're at the same level.

In those cases, **adopt a confident body language, while angling away to sub-communicate that they must still win you over**.

Example:

Confident body language cues like straight spine and head, hands visible and out, and taking up space. But his slight away angle sub-communicates he is not yet fully bought in

Use the lean-away power away with:

- **Negotiations**, to sub-communicate unneededness and other options
- **First meeting or approaching a woman**, to avoid chasing, and avoiding the 'crotch display' overload

⍰⍰ 10. Entry and Movement: Own the Room

- **Enter like you own it**, which you can do in two ways:
  - Pause at the threshold, strike a cool pause, let people see you, scan confidently, then deliberately walk to your chosen location
  - Move like it's your home, without doubts, but moving slowly and without rushing
- **Display value right away**.
  - Have all eyes on you if it's a small place (see Obama below). If not:
  - Engage the coolest-looking person in your circle. If alone, ask someone '*How's the night going*'
- **Stand for at least 2 minutes**, sitting too soon feels like you're trying to disappear

Here's a good example of owning the room with confident body language (although at times overdoing the dominance):

> **Obama**: (enters like he owns it, steals the show, and pulls a power move)

Balance & Calibration For Confident Winners

Remember that everything is about **balance** and **calibration**.

Balanced Confident

Balance means that *good* confident body language sits on a continuum between low-confidence and trying too hard.

See here for example:

Great body language is calibrated to context and goals—usually between the two extremes of weak and try-hard

The optimum balance signals that you're a man who deserves respect, but also gives respect.
The best way to do is with balance, calibration, and mixing *both* power and warm cues.

Calibrated Confidence

At the most foundational level, calibration means you adapt to the cultural norms to be 'one of them' and fit in.

However, that's only the beginner level.
You 'fit in', but don't gain status and attraction.

At the more advanced level, calibration means that you adapt your nonverbal communication to best achieve your goals, given the context.

When you switch from thinking about 'how to have confident body language' to how do I best achieve my goal, you'll join the Olympus of the winning strategists.

Our training program is designed to turn good men into competent winners.
Power University teaches alumni how to think, talk, and behave like a confident winner, and how to achieve any goal they want:

- **Power University** turned thousands of men into confident winners

Best Social Skills Books for Advanced Strategists

Lucio Buffalmano · 17 August 2025 · Archived copy · Original

Are you searching for the **best advanced social skills books** to elevate your influence and master high-level social dynamics?

At The Power Moves, we've reviewed *dozens* of courses and books on social skills, leadership psychology, and power dynamics, establishing ourselves as a leading authority in personal and **social empowerment for men**.

This curated list of the top 8 books and resources will guide you from average social skills to becoming a charismatic leader who commands respect and achieves goals.
Whether you're aiming to lead teams, navigate complex social strategies, or climb the social ladder, these resources are your blueprint for success.

Once you master the basics of social interaction, it's time to climb to the top.

Contents

- 8. The New Psychology of Leadership
- 7. The Book of the Courtier
- 6. The 48 Laws of Power
- 5. The Art of Worldly Wisdom
- 4. Red Flags
- 3. Who's Pulling Your Strings?
- 2. Influence: The Psychology of Persuasion
- 1. Power University
- Conclusion

8. The New Psychology of Leadership

By Alex Haslam, Stephen Reicher, and Michael Platow
Summary | Amazon

Leadership is the pinnacle of **advanced social skills**.

The New Psychology of Leadership redefines what it means to lead, emphasizing identity-based leadership where influence stems from shared group identity.
It's a science-backed guide for aspiring leaders who want to inspire and unite teams effectively.
Perfect for those transitioning from "good" to "leader" in social dynamics.

Stage 1: Clueless
When you lack social skills, you add no value, may even *take* value, and people avoid you.

Stage 2: Average
With average social skills, you're neutral—people don't avoid you, but they're not thrilled you're there either.

Stage 3: Good
At this level, you add value, make friends, and people seek you out.
You also start mastering social strategies to get what you want from life.

Stage 4: Leader
At the highest level, people don't just want you around—they want you to *lead* them.
These books guide you to that stage.

7. The Book of the Courtier

By Baldassare Castiglione
Summary | Amazon

Baldassare Castiglione's *The Book of the Courtier* is the Godfather of strategic social climbers.

The courtier is ethical yet calculated, building reputation, gaining favor, and achieving goals with charm and strategy.

This Renaissance classic teaches you to navigate social hierarchies while adding value, making it a top pick for advanced social skills.
Ideal for those aiming to lead with sophistication and purpose.

6. The 48 Laws of Power

By Robert Greene
Summary | Amazon

A cornerstone of power dynamics and social manipulation, *The 48 Laws of Power* is a must-read for understanding high-level social strategies.

While it doesn't offer a step-by-step system, its laws can be eye opening on the realities of influence and control. Ideal for those who are still stuck in "nice guy mode" and need to graduate to "strategic" level with some needed Machiavellianism and power dynamics.

The 48 Laws of Power drew from our next book on the list:

5. The Art of Worldly Wisdom

By Baltasar Gracián
Summary | Amazon

Baltasar Gracián's *The Art of Worldly Wisdom* is a timeless collection of maxims for navigating social and political landscapes with finesse.

Written in the 17th century, its aphorisms teach strategic thinking, discretion, and social maneuvering—perfect for aspiring leaders.

This book is for those who want to master advanced social skills while maintaining integrity.

4. Red Flags

By Wendy Patrick

Summary

If our two previous entries teach you how strategists (and manipulators) operate, this book teaches you **strategic self-defense to enjoy a happy and fulfilled life.**

Red Flags is a critical guide for spotting manipulative behaviors and toxic personalities. It equips you with the tools to identify takers and protect your assets.

---

3. Who's Pulling Your Strings?

By Harriet Braiker
Summary | Amazon

Harriet Braiker's *Who's Pulling Your Strings?* is a masterclass in resisting manipulation and asserting control over your life.

It teaches you to recognize manipulative tactics and build psychological resilience, crucial for men navigating high-stakes environments.

This book is a must for those seeking to understand manipulation dynamics and protect themselves.
Pair it with *Red Flags* for a robust defense against toxic players.

---

2. Influence: The Psychology of Persuasion

By Robert B. Cialdini

Summary

Influence: The Psychology of Persuasion is a seminal work on how to persuade and navigate social exchange dynamics.

Robert Cialdini's six principles—reciprocity, commitment, social proof, liking, authority, and scarcity—are essential for leaders aiming to sway others ethically.

Backed by psychological research, it's a top leadership psychology book for mastering influence.

1. Power University

By Lucio Buffalmano

Overview | Body Language of Power | Body Language of Submissiveness

Power University, The Power Moves' flagship course, is the definitive resource for mastering **advanced social skills**.

Distilling insights from all the books above, plus exclusive research, it offers a comprehensive system with videos, real-world examples, and practical exercises.

Trusted by thousands, it transforms you from a good social operator to a strategic goal-achieving machine. Preview its cutting-edge approach in the linked articles and take your skills to the elite level.

Warning:
If you're at the "social burden" level, start with beginner-friendly books like *The Social Skills Guidebook* (see our best social skills books list).
Once you're ready for advanced strategies, *Power University* is your next step.

Edit:
Our community changed our perspective.
You may save time and achieve a higher ROI by starting with advanced resources.
Read more here.

Check Out Power University Here

Conclusion

These **advanced social skills books** are your roadmap to becoming a confident man who gains status, respect, and attraction.

From understanding power dynamics to resisting manipulation, they'll help you climb the social ladder and achieve your goals.

Start with the book that matches your level and consider *Power University* for the ultimate leap to 'life winner' stage.

How to Read Body Language (And Actually Understand It)

Lucio Buffalmano · 20 August 2025 · Archived copy · Original

Reading people's nonverbal cues gives you an edge in dating, deals, and life.

Body language speaks the truth and reveals true intent. Learn to read it, and influence, power, and attraction are yours for the taking.

This no-BS guide decodes body language to help you get status, respect, and attraction.

Contents

- 7. Common Pitfalls & How to Avoid Them
  - ⍰ Case Study: Body Language Decoding Failure
- 8. Next Level: Create The Cues You Want
- FAQs
  - Get to The Next Level

Intro: Why Reading Body Language

Reading people's body language gives you an unfair advantage in life.
Superior decoding skills provide the intel to enact superior strategies to achieve your goals—whether to influence, attract, or out-negotiate others.

For example, body language cues of attraction, respect, or deference tell you how much leverage you have.
And when things aren't going your way, body language intel allows you to correct course and turn things around.

Psychology researchers also state that it helps us choose trustworthy partners, avoid unnecessary conflict, and understand social hierarchies—key for cooperation and social success.

Here's how to read body language:

1. Get the Baseline: People's Default State

This guy's defaults are probably high dominance, mid openness, and low anxiety

Most folks have a 'natural baseline'—their default body language.
Your first job is to identify their *default* for accurate reads.

While some authors simplify 'default' as a single pose, **default body language is a series of common body language poses and expressions**.

For example, a shy guy's range of defaults may include various degrees of limited eye contact, body angled away, and a lowered head.

There are two types of default body language:

- **Baseline body language**: when nobody's watching
  ⍰⍰ Use it to read significant changes
- **Common body language poses**: when they're actively socializing
  ⍰⍰ Use it to read characters

2. Decode Power Cues In Body Language

The most important dimensions of how to read body language relate to power cues.

High power in others is not a threat if it's contextually appropriate, or accompanied by warmth

Like it or not, if you're an ambitious man, social power is key.
It negotiates respect, status, and attraction. Even if you don't care about power, it's still crucial to good and healthy relationships.

⍰ Example: Low Power vs. High Power Body Language

Try to decode the low power head tilt in the right picture below.
What does it sub-communicate?

High power body language signaling confidence and status

> **Head tilt** ⍰⍰ I'm clueless, and low status. I have no agency, and I will acquiesce with anything you say or do.

The lowered eyelid also sub-communicates low energy and passivity.
If you added a slight smile and more interest, that head tilt would communicate attraction towards a higher power individual ⍰⍰.

How to Read Body Language for Power: TPM Framework

Focus on these two simple clusters:

- **Empowering**: nods, nervousness, or looking down all signal you're higher power.
  They give you status, respect, and attraction ⍰⍰
- **Disempowering**: touching, eye roll, or smirk.
  They undermine status, respect, and attraction ⍰⍰

Get disempowered, and you're a low-status L.
Get empowered, and you're a winner.

As simple as that sounds, it's how life works.

Our whole website teaches how to master the game of power to conquer life.
Here are a couple of body language-related guides to get you started:

- **Confident nonverbals** in socialization
- High power hands in pocket poses
- Alpha male body language poses to spot posturing

Decode Aggressive Intent For Self-Defense

Reading body language is part of **situational awareness** and crucial for physical self-defense.

Typical body language cues of aggressive intent or impending attacks include:

- **Clenched fists**
- **Furrowed brows**
- **Stepping into personal space**
- **Reaching behind their back** or into pockets, potentially pulling tools

Pursed lips signal an effort to bottle in rage, head tilt signals anger-related tension, and clenched fists signal anger and a possible intent to attack

Note: Most men are evolutionarily programmed to read the signs of physical aggression. Their problem is not missing the signs. Their problem is being too scared at the *smallest* sign.

3. Target the Big Five Body Language Clusters

To read body language fast, focus on clusters of high-impact cues:

1. **Facial Expressions & Eye Behavior**
2. **Posture & Orientation**
3. **Arm & Hand Gestures**
4. **Leg & Foot Movements**
5. **Vocal Tone & Pace**, while not strictly ‘body language’, they’re still crucial
   ▯ How to speak with power and authority

Posture & Orientation

- **Leaning In**: Interest, engagement
- **Leaning Back**: Discomfort, doubt
- **Torso or Feet Angle**: Open=invite, turned=avoid

Planted foot▯▯. Torso, eye contact, hand clasping, sad expression ▯▯

Leans in, direct gaze, slight smile, mid-openness

Face & Eye Behavior

Early research listed seven universal expressions, but later research added extra complexity.

For effective decoding, stick to our simple approach to **focus on empowering VS disempowering expressions**:

- **Empowering**: Smiles, eyebrow flash, happiness, etc.
- **Disempowering**: Contempt, disgust, hubristic pride, derisive laughter, etc.

Taken with the verbal context, this is laughing *at* you. It's a power move that undermines your status

Eye Behavior

- **Blink Rate**: Fast=stress, slow=control
- **Eye roll**: Superiority and disdain

'Pupil dilation' for interest or arousal is also valid, but:

⍰♂Lucio's take: **Ignore pupil nonsense, focus on power**

Lucio:
Avoid low-ROI cues.
For example, pupil dilation never made a difference for me—and I dated better than 99% of men.

Also **ignore NLP nonsense on eye-direction** (Gass and Seiter, 2022).

Focus on bigger and easier signals instead: respect, compliance, etc.
Better yet, **focus on positive dominance**, confident language, and leading.

Arm & Hand Gestures

- **Blocked Chest (arms crossed)** = defense or discomfort
- **Open Palms** = honesty and receptivity
- **Steepled Fingers** = confidence and thought

This pose signals **high engagement** (leaning forward, direct eye contact) with **confidence** (steeple, erect spine, legs and feet apart, strong eye contact)

Leg & Foot Movements

- **Pointing Feet** = direction of interest
- **Shuffling or Tapping** = impatience or anxiety
- **Stance** = comfort level (open/wide vs crossed/constricted)

Of course, each of these cues must be read together with everything else, and with context in mind.

⍰Example:

Try to guess what the nonverbals in the picture below could mean.

He's looking at you, but his legs and feet are pointing away.

Confident and high-stauts body language. Legs and feet pointing away signal that he's **not fully bought in**. He may not fully trust or respect you (and considers himself to be 'above you')

4. Read From Macro to Micro: Context Is King

Body language cues means different things depending on context.

And while both high-level macro (context and character) and low-level micro (cues) influence each other, we advise going from macro to micro.

For example:

- **Leaning in** means
  - ⍰ Interest if you're talking (empowering)
  - ⍰ Hostility if they're talking with raised voice (disempowering)

- **Looking away** means:
  - ⍰ Low confidence from shy people (neutral)
  - ⍰ Disdainful superiority from domineering men (disempowering)

⍰ Case Study: Decoding Nonverbal Communication In Context

Guess what the body language pose below communicates.

Then, ponder how the meaning could vary depending on context.

This pose is **dominant** and leans towards **aggression**. But it's also **high interest**. Context tells you what it means to you.

Here's how context plays a role:

- **Empowering** if you're sharing a story he's mesmerized by and interrupts to ensure he gets it right
- **Disempowering** if he interrupts to say it's all nonsense. That signals no respect, low trust, and imminent disengagement

But the truth is that snapshot readings are insignificant to achieve life-goals because social dynamics evolve.

For the skilled strategist, disempowering cues quickly move to the dustbin of history as they actively manipulate contexts to achieve their goals.
The real skill is to **actively shape contexts in your favor**.

Imagine for example, the man above says:

> **Him**: (leaning in, interrupting) WTF, wait, that doesn't make sense <— Aggressive and disrespectful
>
> **You**: (sideways look) It's not supposed to as this point. But if you let me finish, it will (unwavering gaze, slight smile) ⍰⍰ You're interrupting at the wrong time and it's not cool. We can still talk, but you must backtrack
>
> **Him**: (leaning back, pulls hand back and down) Ehehe OK, sorry <— Realizes he was out of line. Now he respects you more

The men we train here don't just read context, they *shape* the context to gain status, respect, and attraction.

5. Train For Nuanced Body Language Signals

Many guides on reading body language present simplified or exaggerated examples.

They're good for understanding a concept, and perfect for starting out.

But they're not realistic.

You seldom see 'hands akimbo' for example. And almost never see managers with their feet on the table and hands behind their head.
And since most people actively try to manage impressions, you rarely see full congruence of all cues.

Unlike textbook examples, **real-life body language speaks in whispers**: nuanced poses, mixed cues, and shifting contexts.
And that's great. Learn to read nuanced body language, and you'll gain an almost unfair advantage in life.

⍰ Case Study: Mixed Body Language In Negotiation

Read this body language and try to adapt your negotiation strategy off of it:

Confident upper body, confident hands distance, but **anxious feet and hands**

⍰⍰ **Strategy: Push for more concessions from him**. He's trying to look confident, but his apprehension betrays his weaker position.

In general:

- **Look for 'unnatural stiffness'**. The picture above feels stilted: he's trying too hard to adopt a pose. In those cases:
- **Trust the negative cue** the most since people seek to present the best image
- **Watch for microexpressions of aggression**, signals of anger, disagreeableness, or even high psychopathic traits

⍰ Example of Micro Expressions

> **Him**: (Raises lip to display teeth) <— ⍰⍰ High aggression and hostility

⍰ See it live here.

6. Detect Nonverbal Cues of Deception

Meta-analytic research points out these cues of deception:

- **Pressed lips**: Liars press their lips (as if holding back) more than truth tellers.
- **Lower logic**: Liars' stories are more discrepant, ambivalent, and have less plausibility and logical structure.
- **Uncooperativeness**: Liars are rated as less cooperative in conversation, with more unpleasant facial expressions and negative statements
- **Nervousness**: Liars sound more uncertain and appear more nervous, including more fidgeting
- **Fewer corrections and admission of memory lapses**: Truth tellers correct themselves and admit forgetting something more often
- **Unrelated tangents**: Liars mention more peripheral or unrelated events.

You can read the full list here, but first please note:

⚠ **Signals of deception are unreliable, potentially misleading, and lying detection hardly improves with training** (Akehurst et al., 2004)

Worse yet, the liars you're least likely to catch are the most likely to be dangerous.

For example, Machiavellians are more credible even as kids—let alone after decades of practice.
Hence, focusing on deception cues, you may suspect nice guys, but over-trust the 'cheating pros'.

What's a better approach, then?
This:

⍰♂Lucio's Take: **Look at Character & Incentives**

Lucio:
A focus on deception cues can backfire—and some of them are of little use.

For example, despite lies being common, 'biting one's lip' is extremely rare—like, are you grilling a baby over stolen cookies?

Apprehensive people, the safest people to trust, also display deception cues when they're honest but highly invested.

Solution: to judge trustworthiness, **ignore arcane cues and focus on *character***. Character is based on deeper and stronger signals like track record, takers' red flags, and dark triad traits.

Then look at whether interests align or diverge.
Never trust poor characters when interests diverge.

7. Common Pitfalls & How to Avoid Them

- **Single Cue Fallacy**: Never judge based on one twitch. Look for 2–3 cues
- **Projection Error**: Don't assume your feelings match theirs
- **Cultural Blindspot**: Some gestures vary globally. Know your audience
- **Tunnel Vision**: Look at the forest, not at individual trees

The advanced level is to let your subconscious do the work for you and assess the overall vibe.

Of course, beginners may need to first focus on cues for some time.
However, remember that the ultimate destination is to forget cues, and absorb vibes.

As obvious as this may seem, several body language experts get this wrong:

⍰ Case Study: Body Language Decoding Failure

> **Lucio**: This body language expert looked for specific attraction cues, and got it wrong—proof that single cues

> mislead, but power dynamics never lie

8. Next Level: *Create* The Cues You Want

Learning how to read body language is a foundational skill, but action drives results.

Reading body language is passive.
You may become the best body language decoder in the world, but without skilled action, you won't go far.

Instead, **real power comes from *eliciting* the positive signs you want.**
Learn how to get the influence, respect, attraction, or connection you want. And their body language *follows*.

Our website is built to deliver these skills.
See for example:

- How to be a high-value man
- How to gain status
- **Power University** for the quickest shortcut to life mastery

FAQs

How do I improve my ability to read body language effectively?

To improve your ability to read body language, start with mindful observation in everyday interactions and try to decode people's nonverbal communication, focusing on clusters of signals and paying attention to consistency and context.

How do I read open versus closed body language?

Open body language includes gestures that literally open up the body—like uncrossed arms, wide shoulders, and head level.
Closed body language includes defensive or withdrawn cues, such as crossed arms, turned-away feet, or minimal eye contact.

How can I tell if someone is lying using body language?

Cues like pressed lips, nervous fidgeting, or distancing may suggest deception, but they're unreliable. Skilled liars mask these signs. Instead, assess character (track record, red flags) and incentives. If interests diverge, don't trust poor characters, as meta-analyses show lie detection is tough even with training.

Do cultural differences affect body language interpretation?

Yes, some gestures differ by culture. But many cues—like confidence through posture or discomfort via fidgeting—are universal. Focus on the social meaning rather than rigid interpretations.

What are the top body language cues to watch for?

The most reliable body language cues are the ones that people are least likely to consciously alter, like torso and feet orientation, microexpressions, and cues of anxiety. Smiles or eye contact are less reliable because people often fake them to manage impressions.

What body language shows someone likes you?

Open body language—leaning in, mirroring your posture, steady eye contact, or smiling—signals attraction or liking. They may also point their feet toward you or use open palm gestures.

Best Robert Greene Books: Ranked & Reviewed by Lucio Buffalmano

Lucio Buffalmano · 24 August 2025 · Archived copy · Original

Robert Greene is one of the most influential modern authors on power, strategy, and human nature. His books blend historical storytelling with psychological insights, offering lessons on influence, competition, and mastery.

At *The Power Moves*, we've studied Greene's work in depth — using his ideas, challenging them where needed, and integrating them into our own power-centric approach to personal development.

This guide reviews all of Robert Greene's books in order, explains the best order to read them, highlights their pros and cons, and shows how to apply (and adapt) his ideas in real life.

Intro: Robert Greene Books

These are Robert Greene's books in chronological order:

1. **The 48 Laws of Power** (1998)
2. **The Art of Seduction** (2001)
3. **The 33 Strategies of War** (2006)
4. **The 50th Law** (with 50 Cent) (2009)
5. **Mastery** (2012)
6. **The Laws of Human Nature** (2018)
7. **The Daily Laws** (2021)

Book	Theme	Key Concepts
The 48 Laws of Power	Power dynamics, strategy, self-preservation	Conceal intentions, don't trust friends, maintain a good reputation
The Art of Seduction	Influence, attraction, psychological manipulation	Seem an object of desire, mix pleasure with pain, escalate with a bold move
The 33 Strategies of War	Military principles, psychological warfare, social games	Pick your battles, use *covert* warfare, frame your war as holy and just, negotiate while advancing
The 50th Law	Fearlessness, realism, self-reliance	Embrace the inevitability of death to overcome fear
Mastery	Achieving expertise, life's task, intuition	Find your passion, pick a great mentor, expand your knowledge in related fields to innovate

Book	Theme	Key Concepts
The Laws of Human Nature	Understanding human behavior, self-awareness	Become self-aware, learn and integrate your dark side, learn to read people's characters
The Daily Laws	Daily wisdom, distillation of previous works	Practice daily to internalize good habits and thinking patterns

And now let's deep dive into each of Greene's books:

1. The 48 Laws of Power (9/10)

Greene's breakout work — a compendium of 48 "laws" distilled from history. Each law is illustrated with examples of leaders, generals, and schemers, mostly from the ancient world.

⍰ Pros

- **Memorable** rules and historical vignettes — highly readable and quotable. It didn't become a best-seller by chance
- **Compelling page-turner**, probably the most compelling and entertaining book on power and strategies
- **Practical examples** that make abstract power concepts concrete.
- **Top intro to power dynamics** and advanced social skills like interpersonal power dynamics, strategy, manipulation, etc.

⍰ Cons

- **Unscientific**: Heavy on anecdote, light on academic rigor — some patterns are persuasive and some less so, but not scientifically validated
- **Uncalibrated**: Although the laws are supposedly 'universal', they're not. And without calibration, they backfire
- **Sneaky ⍰**: Sometimes described as amoral or "Machiavellian", some laws are just sneaky and low quality.
- **Cynicism is costly**, and the laws' focus on the dark side can turn readers into overly cynical men.

- **Lowers life quality**. Some readers who are too young, beginner, or socially unskilled to understand that humans are both good and bad may overly focus on the negatives, missing out on life
- **Cynicism undermines cooperation**, a necessity for power. Cooperation and defection co-exist, so you must be careful. But humans dominated the world with cooperation, you can't succeed without it

Our review

The single most influential Greene book, and the one that defines his reputation. Use it to sharpen your ability to spot manipulation and strategic moves, but pair it with ethical reflection and strategies that include cooperation and win-win.

⁉️ **Takeaway**: Read for pattern recognition and strategic polish, not as a guide for life

Learn more:

- 48 Laws concise summary
- Modern 48 Laws to apply the laws in the modern world
- 48 Laws vs. Power University: our students weigh in on which one is better

---

2. The Art of Seduction (9.5/10)

A deep dive into seductive archetypes and strategies, framed with historical and literary examples.
After his successful debut, this second Greene book extended his reach into dating power dynamics and established him a renowned expert in the 'darker arts' of influence and control.

⁉️ Pros

- **Advanced psychology** of love and emotional and seduction dynamics

- **Useful beyond seduction**, including for marketing, politics, influence, and social strategies
- **Dark psychology** at its seductive finest
- **Some helpful dating tips** for advanced players and some for beginners on avoiding some 'anti-seducer' traps (e.g.: tight wad, brute, suffocator)

⍰ Cons

- **Unscientific**, without empirical evidence, and sometimes contradicted by research (for example, 'vanity' listed as 'anti-seductive' isn't necessarily a death knell when you consider narcissists' dating success)
- **Lacking experience** and relying on third-party accounts and texts. The author doesn't seem to have or leverage his own real-world experience
- **Impractical for modern dating** where masculine leadership, dominance, and faster action determine success.
  - Potentially counterproductive for beginners, since 'chasing with abandon' is more likely to make you a simp than a successful seducer
- **Downplays mate value,** which is crucial to seduction. Psychology without positive dominance and mate value rarely leads to seduction

See our short on this topic:

> **Lucio**: Psychology makes an advanced seducer, but power and attractiveness what make for effective dating

Our review

Less about effective dating than about control, seduction, and leverage. Excellent for advanced strategists and seducers.
Beginners looking to improve their dating lives may want to first start with different dating books.

⍰⍰ **Takeaway**: Learn the psychology, but remember that seduction ultimately hinges on the masculine 'bold move', from leading to escalating

---

3. The 33 Strategies of War (8.5/10)

Applies principles of military strategy to business, politics, and personal life.

⍰ Pros

- **From military to life strategies** with many principles that transfer to everyday life
- **Advanced psychology** analyzing the war for influence and framing
- **Entertaining** read

⍰ Cons

- **No military experience**, military experts may have some reservations
- **Competition above cooperation**, same for Greene's previous books. But true grand strategies develop alliances first. Only later, they even take on any enemy when victory is assured
- **Selective historical examples**, rather than a coherent narrative on waging war

Our review

A strong competitive strategy playbook and another book gem by Robert Greene.

⍰⍰ **Takeaway**: Prioritize wealth and alliances as the backbone of winning wars, rather battles. That's how you build empires.

---

4. The 50th Law (8/10)

A blend of memoir and motivational guide, built around the theme of fearlessness. Uses 50 Cent's life and business career as the central case study.

⍰ Pros

- **High-energy**, short lessons on risk-taking and resilience.
- **Interesting tactics** more related to intimidation and street posturing that you wouldn't find in other Greene's books
- **Street power dynamics** through the history of a famous rapper and former dealer. Although some may wonder how truly open 50 Cent was

⍰ Cons

- **More motivational** than strategic
- **50 Cent's not an ideal role model**, and not for his dealer's past, but by looking at his closest relationships
- **Celebrity PR piece**, or that's how it may feel to some readers

Our review

Punchy and inspirational, and I loved it.
But although I like and respect 50 Cent, I'd rather avoid the fate of his personal relationships. A bitter divorce and a son who hates you doesn't seem the peak of success to me.

⍰⍰ **Takeaway**: Learn fearlessness from this book. But pick better women and develop better relationships with your children.

5. Mastery (7.5/10)

Focuses on competence, becoming world-class in any field through apprenticeship, practice, and long-term dedication.

⍰ Pros

- **Power-aware angle**, covering the psychological aspects of mentorship that many others leave aside
- **Competence is power**, or at least a fundamental component of it. This was a major missing part in Greene's previous book, more focused on manipulation tactics and various games

⍰ Cons

- **Unscientific**, with no empirical evidence for Greene's method of 'finding one's passion' or 'developing skills'
- **Superseded by empirical books** like *Peak*, written by a researcher, or *Ultralearning*, with more firsthand experience

Our review

Mastery is Greene's least manipulative book, and provides a unique angle in the literature of skill acquisition. Robert's distinctive approach blends psychology and power dynamics—an important reality rarely addressed in this field.
Learn more on competence here ↗

⍰⍰ **Takeaway**: Admit and accept that mentors are ahead of you. Accept a lower status role while you learn, but remember that your goal is to surpass him.

---

6. The Laws of Human Nature (9/10)

An ambitious attempt to map recurring human motives, patterns, and social behaviors, using psychology and history.

⍰ Pros

- **Golden nuggets** on human nature
- **Unique take on self-development** as one of the very few books that challenges readers to tackle the dark side of human nature both in others and in ourselves
- **Useful for self-awareness**, social intelligence and, like most of Greene's books, for power intelligence

⍰ Cons

- **Unscientific** and Freudian/psychoanalytic psychology, which is not exactly the most empirically supported
  - Lacks evolutionary psychology, a field that many believe provides the true foundations to understand 'human nature'
- **Non-coherent** narrative that sometimes reads as a list of observations

Our review

A unique take on self-help that stands out in a field often too aspirational—and too naive to explore humanity's darker nature.
Not Greene, fortunately, and not this book. This is a much-needed, 'power-aware' approach to men's self-improvement.
While we don't agree with everything, we appreciate, enjoy, and largely support Greene's approach to self-development—in many ways similar to our own at TPM.

⍰⍰ **Takeaway**: true self-development requires that you look deep not only into people's darker motives, but also your own darker side

7. The Daily Laws (7/10)

A collection of daily meditations drawn from Greene's books, each paired with a practical prompt.

⍰ Pros

- **Short**, consumable lessons for daily reflection.

⍰ Cons

- **Mostly recycled material.**
- **Shallower** compared to his other books.

Our review

A helpful companion to Greene's main works, best used as a daily reminder rather than a primary source.

Books Like Robert Greene's Books

Books similar to the ones written by Robert Greene tend to be quality but simple introductions to complex themes, striking a necessary tradeoff between accessibility and complexity (the 'Best-Seller Quality Tradeoff™').

Some of them are:

- ***The Prince*** (Machiavelli): The Godfather of realpolitik
- ***The Art of Worldly Wisdom*** (Baltasar): The blueprint of *The 48 Laws*, almost too similar for comfort

- ***The Dictator's Handbook*** (Bueno de Mesquita): A more empirically sound guide for dictators and a lucid analysis of political power dynamics
- ***Games People Play*** (Berne): Analyzing some common dysfunctional patterns of interpersonal relationships
- ***Influence*** (Cialdini): The Godfather of modern persuasion books, based on social exchange dynamics and its practical applications
- ***Meditations*** (Marcus Aurelius): The OG of 'enlightened power', combining power and life philosophy
- ***The Social Strategist*** (Scarlett & Buffalmano): A beginner-friendly introduction to more advanced social skills like positive dominance and frame control

Although strictly not books, also consider:

- **The Power Moves**, this website, which applies power dynamics to men's self-development and self-advancement
- **Power University**: a multimedia course providing a proven and scientific hands-on blueprint for men's social and life success

And:

- **Best books on power**, for a full reading list on power

FAQ

Which Robert Greene book should I start with?

For beginners, The 48 Laws of Power (1998) is the best Robert Greene book to start with. It's his most iconic work, introducing power dynamics and strategy through 48 principles explained with historical examples. Its engaging style makes it highly accessible as well as entertaining to read.

Are Greene's books based on research?

Robert Greene's books are not based on empirical scientific research.
Instead, they rely heavily on historical examples, classical works like Machiavelli's The Prince, and older psychoanalytic thinkers like Freud and Jung, which are less empirically sound due to their lack of experimental validation.

What are all Robert Greene's books, in order?

Robert Greene's books, in publication order, are: The 48 Laws of Power (1998); The Art of Seduction (2001) The 33 Strategies of War (2006); The 50th Law (2009, co-authored with 50 Cent); Mastery (2012); The Laws of Human Nature (2018); The Daily Laws (2021).
These books reflect Greene's focus on power, strategy, and human nature, though some critics note later works may revisit earlier themes, reducing originality.

What are Robert Green's books about?

Robert Greene's books explore power, strategy, and human behavior using historical and psychological insights. Greene's books share overlapping topics and all deploy the same proven Greene method: distill patterns from history, package them as sharp rules, and illustrate them with vivid stories.

What's Robert Greene's best book?

The best Robert Greene book depends on your goals. *The 48 Laws of Power* is often considered his masterpiece for its broad appeal and insights into power dynamics, ideal for professional and social strategies. Alternatively, Mastery excels for those seeking personal growth and skill development, with a less controversial tone.

What books are similar to Robert Greene's books?

Similar books include: *The Prince* (Machiavelli), *The Dictator's Handbook* (Bueno de Mesquita & Smith), *Games People Play* (Berne), and *The Art of Worldly Wisdom* (Baltasar).
For a practical next step, Power University applies a similar power-centric approach in a coherent system for succeeding in life and gaining status, respect, and attraction.

Best Robert Greene Books: Lucio's Top 3

These are the best Robert Greene books:

1. ***48 Laws*** as the most practical and eye-opening
2. ***The Art of Seduction*** is Greene's most advanced and refined work. But *too* advanced for most and less practical and effective for modern dating
3. ***The Laws of Human Nature*** is a gem of self-development, finally bringing some power dynamics and realness to the self-help industry

And divided by themes:

- **For power & competition:** The 48 Laws of Power
- **For human nature & self-development:** The Laws of Human Nature
- **For social cunning:** The Art of Seduction

How to read Robert Greene: best order

Defensive & practical:
48 Laws of Power → 33 Strategies → Art of Seduction

Strategic & competitive:
48 Laws → 33 Strategies → The 50th Law

Skill-building & mindsets:
Mastery → Laws of Human Nature → The Daily Laws

Open vs Closed Body Language: Read People, Signal Status

Lucio Buffalmano · 27 August 2025 · Archived copy · Original

Open body language is one of the clearest signs of confidence, comfort, and social power.

From job interviews to dating and leadership, understanding and using open body language helps you appear more trustworthy, approachable, and dominant—all without saying a word.

In this guide, you'll learn exactly what open body language looks like, how it differs from closed body language, and how to use it to your advantage.

This is a stereotypical open body language pose for a man. Perfectly suited for 'management by wandering around' to display power and approachability. But showing your hands is important in many other contexts

- FAQ
  - Advanced Mastery

What's Open Body Language

Open body language refers to physical cues like relaxed posture, uncrossed arms and legs, exposed torso, and expressive hand gestures that signal comfort, emotional openness, and confidence with

To properly understand open body language, we must contextualize it within the continuum of open-to-closed body language.

Open Body Language Continuum

Open body language is part of the 'open/closed' body language continuum with physical cues like relaxed posture, uncrossed arms and legs, exposed torso, and expressive hand gestures.

At the other end of the continuum, closed body language signals the opposite: discomfort, defensiveness, or low confidence.

Open vs. Closed Body Language

Open and closed body language represent one of the five main body language dimensions besides dominance, warmth, calmness, and interest.

Let's compare each:

Trait	Open Body Language	Closed Body Language
Posture	Upright, relaxed spine, head up, shoulders back	Slouched, tense, head down, shoulders rounded
Arms & Hands	Uncrossed arms, open palms, expressive gestures	Arms crossed, hands hidden, constricted gestures
Legs & Feet	Legs uncrossed, feet flat or pointed toward others	Legs crossed, feet turned away
Torso Orientation	Chest open, facing the person	Turned away, torso shielded
Facial Expression	Relaxed face, genuine smile, steady gaze	Tense face, tight lips, minimal or fake smiles

Trait	Open Body Language	Closed Body Language
Eye Contact	Direct, steady, calm gaze	Avoidant, darting, excessive blinking
Proximity	Comfortable closeness, grounded	Withdrawal, sitting at edges, leaning away

A typical closed body language pose arms and legs is this:

Not *terrible* body language, but stereotypically closed off, and crossed legs take away from it

Open Body Language and Power

Open body language signals power and status because it overlaps with dominant body language, which tends to be open and spread out.

However, openness and dominance are not the same, and it does not follow that 'the more open, the more dominant'.

Ultimately, while confident body language tends to be open, context determines when openness signals confidence, power, and status.

For example:

Although arms close off the torso, this is still a high-power position. It suggests confident defiance

How to Optimize Open Body Language

Let's learn now how to adopt an open language:

1. Adopt an Open Baseline

While the best body language to adopt depends on context, in general, **men should lean towards a more open body language baseline.**

How open depends on context, but to give you an idea, this spectrum applies to many social contexts:

Not terrible, but legs too open for many contexts

Good balance

Erect spine and, head level, right elbow ⍰⍰, hands OK, but legs ruin it ⍰⍰
The middle image strikes a good balance of openness for a high-status, dominant man.

Don't overdo it: constant openness is low value
Constant openness can sub-communicate you're always free and always ready to entertain anyone who comes along. Remember: high value people get busy with their goals and mission and aren't always open to the whole world

2. Execute Daily Action With Open Poses

Once you adopt a good baseline, it's time to focus on daily actions.

Many of our daily actions tend to close off our body language, including:

- Working on a laptop
- Checking the phone
- Checking the time

Be more conscious of how do you all of them until it becomes second nature

Good head position, but two arms ⍰⍰

Not terrible, but improvable

Upgrade: quick glance *to the side*

Check the time on the side, arm up, and with a glance. It's a small detail, but details add up.

Action	Open Body Language	Closed Body Language
Check Phone	Eye level	Crouched towards phone
Check Time	Slightly to the side, eye level	Crunched in front of torso
Hold Drink	To the side	In front of torso
Standing	Hands on hips	Both hands deep in pockets

3. Strike A Balance of "Optimal Openness'

Remember, the goal is never to be 'as open as possible', the goal is to be *appropriately* open.

For example, none of these are 100% open or extremely open, but they are ALL good open body language poses:

Despite some poses featuring crossed legs or arms, they're still solid open body language poses for men, in their given context.

Also see:

- Law of optimum balance
- Social calibration

4. *Feel* Open & Confident, Let Body Language Follow

While adopting certain poses may help to feel differently, it's more effective to go from the mind to the body.

Such as, **focus on feeling confident and open, and let body language follow naturally.**

The gift of closeness: listen to your subconscious
The more advanced and accomplished you become, the less you want to force yourself to 'change your state'.
If you're not feeling open towards someone or in a certain place, there may be good reasons for it. Consider *staying* close, cutting contact, and moving to better people and places.

5. Strategically Switch Between Open & Closed

Just like the goal is not to be 'as open as possible', the goal is not to always display open body language.

You shouldn't be open to everyone or any idea—that's naive.

Instead, advanced players know that **body language is a tool of advanced frame control**, and strategically switch between open and closed body language.

Do the same and match your body language openness to your goals.
Open up for good people and when persuading, and close down when you disagree, dislike someone, or are busy with your things.

Some examples of using nonverbal openness for strategic sub-communication:

Context	Strategic Open Signal	Strategic Closed Signal
Initial introductions	Lean in slightly and face frontally for confidence and respect	Look away and speak little to display distance or superiority
Negotiations	Palms up, nods and silences to increase rapport	Angle away, lean back and check the time to display unneededness
Group settings	Prolonged eye contact, smile, and face toward to display approachability	Unfocused gaze towards the crowd, hand in pocket to display you're not

Advanced power move: close up slightly to signal high value that's not for everyone to enjoy

6. Power Move: Strategically Send Mixed Signal

Open books are dull.

Advanced players maintain power by never giving themselves fully, keeping others on the edge in nagging suspicion.

Some examples:

- Open torso but legs pointing *away*
- Lean in but stroking your chin in doubt (judge power move)

Open torso, fully relaxed, straight gaze, but torso slightly leaning away and feet pointing away. Sub-communication: you have a chance, but you don't have my full approval yet

FAQ

What is open body language?

Open body language refers to nonverbal cues—like uncrossed arms and legs, open torso, and visible palms—that signal confidence, comfort, and emotional openness. It's the body's way of showing that you are receptive, secure, and socially engaged.

What is closed body language?

Closed body language includes nonverbal cues that signal discomfort, insecurity, or emotional withdrawal—such as crossed arms, crossed legs, hunched shoulders, and avoiding eye contact. It often suggests someone is defensive, anxious, or not open to connection.

What's the difference between open and closed body language?

Open body language shows confidence and approachability through relaxed and exposed movements, while closed body language signals discomfort or defensiveness with crossed limbs, hunched posture, and withdrawn gestures. Open cues invite connection; closed cues create distance.

Why is open body language important?

Open body language builds trust, signals confidence, and increases influence. It makes you appear more credible in job interviews, more attractive in dating, and more authoritative in leadership. People subconsciously respond better to open cues.

Is open body language always better?

No. While generally positive, constant openness can signal neediness or low value if overused. High-status individuals calibrate their body language to the context—being open when it builds rapport and closed when it commands respect or deters unworthy attention.

Robert Greene Review: Power, Genius, and Limitations. Lucio's Uncensored Take

Lucio Buffalmano · 31 August 2025 · Archived copy · Original

In the realm of self-development, few authors cut through the fluff like Robert Greene.

His books dissect power, manipulation tactics, and human nature with compelling prose and superb storytelling—drawing from history's conquerors, seducers, and geniuses.

But does his work truly help you become a powerful man with status, respect, and attractive mates, or is he just a good marketer?

In this comprehensive review, we analyze Robert Greene's background, expertise, and quality of advice. You'll be the final judge.

Who Is Robert Greene? Biography

Robert Greene was born on May 14, 1959, in Los Angeles to Jewish parents, the younger son in a modest family.

He first attended Berkeley but transferred to the University of Wisconsin–Madison for his B.A. in classical literature.

Before hitting the bestseller lists, Greene hustled through roughly 50 jobs: construction worker, translator, magazine editor, even a Hollywood scriptwriter.

In 1995, while at an Italian art and media school called Fabrica, he met book packager Joost Elffers. Their collaboration birthed *The 48 Laws of Power* in 1998, catapulting Greene from obscurity to notoriety.

Today, Greene resides in Los Angeles with his partner, filmmaker Anna Biller.

Approach, Method, and Influence

Greene's bibliography is a realpolitik view of human nature and relationships built on a single, sobering premise:

Humans are fundamentally selfish, engaged in a constant, often unconscious, struggle for power.
That struggle is often covert, leading to manipulation, deceitful appearances, and passive aggressiveness.

Method

Robert Greene research centers around biographies, classical thinkers, and historical books.

To write his books, he deploys the same proven approach that worked so well for him:

- **Find patterns** from history and notable figures and turn into…
- **Memorable rules**, aphorisms, catchy 'laws', and timeless archetypes. Then present it with…
- **Amoral framing**, without casting judgment of 'good or bad', then back it up with…
- **Storytelling**, with vivid examples and stories that well embody the concept

Influences

Greene's main sources are biographies, history books, and early psychology theorists like Jung and Freud.

Hence, Greene's takes on human nature are often psychoanalytic, touching on themes like shadow, repressed desires, and childhood experiences and traumas.

At The Power Moves **we'd like to see more personal experience and hard science.** Fortunately, Greene has two important qualities to help make up for that: he is intelligent and has a strong intuition for power dynamics.

Key Themes

- **Power Dynamics** among individual actors
- **Appearances vs. Reality**, a constant game of deception to look nicer while hiding one's true motives (similar to Goffman's sociology)
- **Power Awareness** as a necessity to survive and thrive in a competitive world of self-interested players
- **Emotional Intelligence** to see through others' emotions and control your own.

- **Strategic Thinking** and social maneuvering. Strategy often beats raw force in Greene's work
- **Human (dark) Nature** that governs people's behavior. Greene sees characters as largely unchanging
- **Competition**, an omnipresent background force, as people vie for power, status, and control

⍰ Pros and Unique Insights

A chart first comparing the strengths and weaknesses of Greene's work and approach:

Category	⍰ Strengths (Pros)	⍰ Limitations (Cons)
Masculine power	✅ Focus on strategy and interpersonal/social dynamics	❌ Lacks masculine dominance & self-reliance
Realism & Worldview	✅ Focus on selfishness is a helpful wake-up call to dispel naive illusions	❌ Can foster over-cynicism when in truth reality is *both* dark and bright
Psychology	✅ Deep insights into the "darker" aspects of personality psychology	❌ Anecdotal. Focusing on Freud/Jung misses decades of eye-opening research findings
Nuances	✅ Includes one example of the law working, and one for failing	❌ Lacks calibration. Misapplication can lead to appearing sociopathic or inept
Modern Applicability	✅ Many principles are timeless, and some others only require basic calibration	❌ The game has changed in many areas. 'The Art of Seduction' under-delivers today
Practicality	✅ More practical than most motivational and 'feel-good self-help'	❌ Lacks 'how tos' with clear action/reactions, a higher-level system to apply the principles

1. Dark Realism

Greene's primary strength is his realism on the human's darker side.

If, on one side, a focus on the darker side of human nature risks biasing the analysis on the negative side, we find this approach still has significant merits.

Namely, **Grenee provides a much-needed reality check for 'too naive' individuals**.
Realism is what we admire the most about Greene and share with him 'truth' as one of our founding values.

2. Power Intelligence

Robert Greene is a sharp, penetrating observer of interpersonal power dynamics, manipulation, and the psychology behind human behavior.

As someone with both natural predispositions and years of focused study in these fields, I can say that Greene is light-years ahead of most.
And even as an expert, I could draw novel insights from his work.

It's this power awareness that lets Greene turn old historical examples into timeless masterpieces.
Anyone else trying the same without science or first-hand experience would fail miserably. Greene succeeds because of his high "power IQ."

3. Accessible & Clear

Greene's rich stories not only entertain, but also make his principles easier to understand and remember.

And while not "scientific" in an empirical sense, capable analysis can still gain credibility from historical events.
In a sense, they're part of an *enlarged experience*: not first-hand, but drawn from observing other people's experiences.

Greene's masterful storytelling may also be the secret to his success.
They're beginner-friendly entry points to complex dynamics, while providing a sense of authority and timelessness.

4. Empowering

By exposing manipulative tactics and the "dark side" of human behavior, Greene's work equips readers to identify and defend against malignant players.

Greene's power-aware work may be even *more* important for self-preservation than for gaining power.
Indeed, while many powerful men are already somewhat power aware, "good men" aren't. These good men need resources like Greene and The Power Moves the most.

5. Unique & Superior Takes

In a self-help industry dominated by motivational speakers and feel-good gurus, Greene is the wake-up call you might not want, but probably need.

The power-centric approach peculiar to Greene and few others represents <1% of self-help, but it may account for 80% of success within competitive environments.

⍰ Criticisms and Limitations

Greene's work isn't flawless. Critics argue it's unscientific, overly cynical, and risky if misapplied.

1. Unscientific and Anecdotal

Greene's work is unscientific: anecdotal evidence and storytelling sell well, but lack empirical proof.

This is not to say Greene's work is not 'true' or not useful.
To the contrary, we believe a high-IQ, power-aware mind can produce accurate analyses and useful advice from observation alone.
However, ignoring scientific findings misses the opportunity to refine those observations.

At parity of IQ and power-awareness, scientific data improves accuracy and efficacy.
This is why at The Power Moves we use a three-pillar method that includes science, together with experience and critical thinking.

⍰♂Lucio's Take: **I respect Greene's choice and take great intuition over poor pop-psychology**

Lucio:
Properly using empirical data is harder than it looks.

It requires the reader to understand how science works, understand pros and cons of different research methodologies, grasp some basics of statistics, look at the full literature, and then put everything into the context of their observations and experience.

Few people can do that well, and many authors who claim to be 'science-backed' only end up with poor analyses and advice.

In short, **Greene's power-aware eye is superior to many 'science-backed' self-help authors**.

The issue may be compounded by a tendency to jump to definitive, sometimes not sufficiently nuanced, conclusions.

2. Limited Personal Experience

While Greene reads through biographies and history books, he leverages little first-hand experience.

One, for example, may note that the*48 Laws of Power* was written with little successful experience climbing social hierarchies.
Or for *The Art of Seduction,* one may note that Greene doesn't seem to be a womanizer himself and that a long-term partner doesn't provide much womanizing experience.

Robert Greene's long-term partner, feminist filmmaker Anna Biller

DeMarco calls teaching something without personal experience the 'paradox of practice'.

For a more practical review of Greene's work that may be disproven by research or experience, see:

- 48 Laws of Power Criticism
- Art of Seduction Criticism

3. Limited Practicality for Real-World Results

Greene's work excels in raising first awareness, but is not optimized to deliver real-life results.

For example, one of our alumni writes:

Bel

I had read lots of books by Robert Greene before getting to know The Power Moves, and while I enjoyed them very much, the improvement in my life I got from those was essentially insignificant. They are more of a historical/literature review on themes of power, and contain little actionable material. I think their usefulness to me was in priming my mind to the feeling that something was going on that I did not understand, and it was mostly hurting me.

On the other hand, I got to know Jordan Peterson thanks to The Power Moves, and his philosophy was and is a nice addition to what I learned from the former. I think Peterson is an outstanding person. And much of what Peterson teaches is really really useful, including the key concept (also in TPM) that unless you are able to fully think as an evil person, you already lost. But I doubt I would have understood much had I not read TPM first.

In the end, The Power Moves and Power University is simply the best source on how to become aware of power dynamics and use them to protect yourself and advance in life. It is the detail of the explanation and the comprehensiveness of the content that makes a difference.

One thing that instead made a huge difference for me before getting to know The Power Moves was reading about narcissism and other personality disorders. That made a real difference, but only in allowing me to distance myself from bad people. I understand malevolence fully now.

TPM on the other hand taught me (and is continuing to teach me) how to interact with these bad people from a position of power: which is infinitely more useful, because you simply can't always distance yourself.

> **PU alumnus**: I read lots of books by Robert Greene and while I enjoyed them very much, the improvement in my life was insignificant

And this alumnus notes that what he found missing was the exact steps on what to do and say.

Greene is not supposed to provide a system to help men advance. It may not even be his goal.
But it's good for men looking for real-world results to be aware of this potential limitation.

4. Risk of Misinterpretation, Cynicism, and Self-Handicap

While Greene's works offer invaluable understandings, translating theory into effective action requires strategic calibration.

Without calibration, **blind application of Greene's laws can lead to negative outcomes**.

Subreddits focused on Greene's work or dark psychology are replete with examples (pro tip: avoid communities full of beginners).

So here's a quick table to help you avoid some basic misinterpretations:

Greene's Original Law	Fail	Win
Law 1: Never Outshine the Master	Blindly suppressing one's talents, leading to stagnation and mediocrity, especially with average bosses.	✅ Frame output as beneficial to the master and make him feel good. Learn all you can, but strategically move past ASAP
Law 2: Never Put Too Much Trust in Friends, Learn How to Use Enemies	Distrusting good people, underusing alliances, missing opportunities to align interests, leading to isolation	✅ Cultivate a strong network, align interests, increase scope for win-win, but understand self-interest, and prepare for fallouts
Law 3: Conceal Your Intentions	Constant deception, a reputation for fakeness, loss of trust, poor relationships, lower mental health	✅ Conceal intentions in competitive or adversarial situations, and build trust with good people when interests don't diverge

Greene's Original Law	Fail	Win
Law 4: Always Say Less Than Necessary	Seeming uncommunicative or aloof, *losing* status when speaking up displays confidence and competence	✅ Say less when it enhances mystery or authority, but speak up confidently when beneficial. Focus on *impact* and goals, not quantity.
Law 24: Play the Perfect Courtier	Pandering to powerful big egos keeps you in their shadow, over-focusing on others' feelings and thoughts is feminine and low power	✅ Pursue power and excellence, prioritize goals and respect over being liked, and manage politics to make allies and minimize obstacles
Law 46: Never Appear Too Perfect	Deliberately underperforming undermines you; hiding capabilities misses opportunities for status, reputation, and attraction	✅ Be relatable in 1:1s and privately strive for excellence. Make others think you're untouchable: followers will flock, and competitors won't even try

Note: Greene most likely understands the nuances perfectly well. It's the readers who may misunderstand

- Does the 48 Laws work?

4.2. Focus On 'Dark Side' Can Eclipse The Light & Lower Life Quality

While humans can be selfish and dark, we can also be bright and uplifting.

Indeed, science suggests that humans became the dominant species thanks to superior cooperation. And cooperation evolved because it's good for the (selfish) individual.

I'm sure Greene may agree with that, but since his work focuses on the darker side, readers may 'over-correct' from too naive, to too cynical.
So **learners harm themselves if they over-focus on competition to the detriment of cooperation.**

That comes with important costs, since studies show that over-cynicism is costly in mental health and personal relationships.
Instead, the optimum balance is to accept a healthy dose of cynicism, and be a *smart* cooperator.

🤔Lucio's Take: **Greene may have shifted to cynicm after a naive pahse**

Lucio:
Greene shares that in his younger years, he was on the far left of the political spectrum.

Being on the far left may suggest that one doesn't fully appreciate human motivation and selfish tendencies.
That, in turn, may predispose one to a naive approach to life that leaves one vulnerable to exploitation and power-related mistakes.

Greene indeed first thought of 'never outshine the master' after having been fired for an office politics faux pas.

Those early poor experiences may have shifted him towards over-correction, and cynicism.
But some idealistic naivete sometimes still transpires in more modern videos.

5. Low Dominance & Masculinity

Greene's emphasis on strategy over dominance may leave crucial dimensions of men's power unexplored:

- **Interpersonal dominance**. High-power behavior, confident talk, and masculine body language are cornerstones of men's success, including for status, respect, and attraction
- **Self-reliance**: while social reputation is crucial, a masculine 'sigma type' may focus on himself and his goals while caring less of what others think
- **Masculine honor** and straight talk beat 'playing the perfect courtier' for a respected leader

In a YouTube video Greene's criticism of a popular, highly masculine guru feels more ideological and preachy than analytical (e.g.: 'masculine men are nice').
While we share his doubts about that figure's character and methods, his dominance has undeniably fueled his success.

> **Lucio**: While we may sympathize with Greene's criticism of more flamboyoant masculine behavior, the behavior itself is masculine. and it can be a valid approach to achieving success

It's possible that Greene's own temperament and life experience, including a long-term partnership with a feminist filmmaker, influence his approach in these areas.

FAQ

Who is Robert Greene

Robert Greene is a Jewish American author renowned for his bestselling books on strategy, power, seduction, and human nature. Born on May 14, 1959, in Los Angeles, California, he holds a B.A. in classical studies.
Greene had a string of around 50 jobs before his breakthrough publication of "The 48 Laws of Power" in 1998, followed by six more best-selling books. He is a multilingual Zen Buddhist and lives in Los Angeles with his long-time partner, filmmaker Anna Biller.

Is Robert Greene a psychologist

No, Robert Greene is not a psychologist. He does not hold any formal degrees or licenses in psychology or related fields. His educational background is in classical studies, with a B.A. from the University of Wisconsin-Madison. Greene's books, while also exploring human behavior and motivation, are rooted in historical analysis, philosophy, and personal observations rather than psychological research.

Is Robert Greene married

No, Robert Greene has been in a long-term relationship with filmmaker Anna Biller since the 1990s, without official marriage. The couple lives together in Los Angeles, and it appears they have no children. Greene maintains a private personal life, rarely discussing details publicly.

What's Robert Greene's net worth

Robert Greene's net worth is estimated at around $7 million as of 2026. This wealth primarily stems from millions of book sales across his seven international bestsellers, including "The 48 Laws of Power" and "Mastery," as well as royalties, speaking engagements, and consulting work. Additional income sources may include YouTube advertising, public speaking, and media appearances.

Robert Greene & Lucio Buffalmano

Given the overlap between Greene and Buffalmano, a comparison table may be helpful to help you decide who to prioritize for your self-development:

Aspect	Robert Greene	Lucio Buffalmano / TPM
Core focus	Power, seduction, strategy, and Machiavellianism — largely in competitive contexts.	Interpersonal power dynamics in everyday life for men's empowerment, plus frameworks for both dominance and win-win cooperation
Approach	Historical case studies and timeless aphorisms distilled into "laws" and strategies.	How-to guides, modern examples, and a course with 'hacks' and system designed to develop competence and deliver results
Ethics / honor	Amoral framing; focus on manipulation and strategy, less emphasis on cooperation and alliances as power sources.	Realistic-holistic, including the power of cooperation. Stresses the risks & costs of long-term amorality. Combines cold strategy with an 'honorable approach' for best of both worlds

Aspect	Robert Greene	Lucio Buffalmano / TPM
Interpersonal dominance	Addresses manipulation and influence in general terms, less focus on daily, 1:1, and moment-to-moment dominance dynamics.	In-depth coverage of verbal and nonverbal dominance, status games, and frame control in live interactions.
Application	Readers must translate rules to modern, everyday scenarios on their own.	Step-by-step applications for modern contexts — dating, business, leadership, negotiations, and conflict resolution.
Scientific grounding	Based on anecdotes and literature, not on empirical testing.	Scientifically grounded — peer-reviewed research with real-life testing and experience. Plus continuous refinement.
Best suited for	Men and women seeking power principles, awareness, and historical perspective.	Men seeking an actionable system for winning respect, influence, and attraction in today's world.

Conclusions: Is Robert Greene Legit?

Robert Greene is a keen observer of power dynamics, social strategies, and manipulation, and his work is an excellent starting point for understanding human nature and power.

His prose and storytelling are unmatched, placing him in a category of his own when it comes to blending narrative appeal with depth of wisdom.

For men seeking practical empowerment, a more systematic, science-grounded approach—one that also covers cooperation and actionable "how-tos"—is essential for turning awareness into real-world results.

10 Books Better Than The 48 Laws of Power

Lucio Buffalmano · 7 September 2025 · Archived copy · Original

If Robert Greene's *The 48 Laws of Power* left you hungry for more insider secrets to influence, strategy, and domination, you're in the right place.

We've reviewed hundreds of books to handpick the ten most powerful reads to deepen your mastery of power dynamics—no fluff, just hard-hitting insights.

Ready to increase your status and power?
Let's dive in.

Note: The following books were personally studied and vetted by **Lucio Buffalmano**, a social scientist. Unlike many lists, his recommendations are based on science-backed analyses and first-hand reviews.

Contents

- 1. The Art of Worldly Wisdom
- 2. Power: Why Some People Have It and Others Don't
- 3. The Prince
- 4. Influence: The Psychology of Persuasion
- 5. The Power Broker
- 6. The Social Strategist
- 7. The Dictator's Handbook
- 8. Who Is Michael Ovitz?
- 9. Games People Play
- 10. The Presentation of Self in Everyday Life
- Bonus: From Laws & Books to a Complete Power System
- Somewhat Similar…
  - Other Robert Greene Books
  - ✕ Avoid These: Not Like 48 Laws of Power
  - Learn More

1. The Art of Worldly Wisdom

The blueprint for *The 48 Laws*—its structure and themes—bears a striking resemblance to this 1647 collection of 300 maxims.
The Art of Worldly Wisdom offers life and social strategy tips remarkably similar to many of Greene's law, but includes many more gems as well.

Pros

- **Most similar** to *The 48 Laws*
- **Great guide to social skills**, more than 'mere' manipulation, blending effective Machiavellianism with value-adding approaches
- **Advanced guide** with insights on social exchange, cooperation, and honor

Cons

- **Needs better editing**; some titles don't match content, and wording can be cryptic.
- **Outdated** views like national stereotypes and physiognomy claims that are both unscientific and illogical
- **Unmemorable laws**, probably the reason why Baltasar is forgotten, and *The 48 Laws* became a best-seller

Compared to The 48 Laws: Our Review

The Art of Worldly Wisdom is a masterpiece of realpolitik and human insight, predating and inspiring Greene's laws with its profound maxims on power and strategy.

Its maxims are not as catchy or straightforward as the 48 laws, which may have limited its reach.
And it's still only a list of laws, without an overarching system and a how-to for turning insight into real-life results.

But overall, fantastic book.
And if you're looking for something like The 48 Laws to read next, *The Art of Worldly Wisdom* is your next best pick.

2. Power: Why Some People Have It and Others Don't

Jeffrey Pfeffer's guide explains why power is essential for success and offers practical strategies for building it through networking, self-presentation, and navigating corporate politics.

⍰ Pros

- **Actionable**, making it highly applicable for career advancement.
- **Better-researched** and more empirically sound than Greene's.
- **Holistic,** including the costs of powerlessness

⍰ Cons

- **Downplays competence** in favor of politics, while we prefer an approach that maximizes *both*

⍰ Compared to The 48 Laws: Our Review

Power: Why Some People Have It and Others Don't is one of the best books on power, bar none.

It's not as catchy as *The 48 Laws*, but it's more empirically sound and, even more important, more practical.

3. The Prince

This Renaissance classic is the godfather of realpolitik, advising rulers on acquiring and maintaining power through cunning, pragmatism, and occasional ruthlessness.
It inspired much of Greene's work.

⍰ Pros

- **Timeless insights**, original source of the Machiavellian construct
- **Encourages facing reality head-on**
- **Surprisingly honorable**, promoting strategies that empower good people against bad actors.

⍰ Cons

- **Less relevant for modernity**, focusing on princely rule rather than everyday interpersonal dynamics.

⍰ Compared to The 48 Laws: Our Review

The Prince better blends the darker arts with 'soft power pull approaches', and value-adding goals and aspirations.

For that, it's probably closer to The Power Moves. But younger folks used to high stimulation may find it slower and harder to connect with: it's an old text after all, and not as captivating as The 48 Laws.

4. Influence: The Psychology of Persuasion

A more scientific dive into six principles of persuasion—reciprocity, commitment, social proof, authority, liking, and scarcity—backed by research and first-world experience among marketers and salesmen.

Pros

- **Well-researched**, written by an academic who also went 'in the trenches', thus mixing science with experience
- **Practical and well-structured**: with psychological triggers for quicker, smarter decision-making.
- **Influence & self-defense**, covering both angles and help people defend themselves against malignant players

Cons

- **Power missing**: principles like authority and influence are rooted in interpersonal power dynamics and status. Presenting them as such would improve understanding
  - Power-protection missing: It wasn't "because" that made the photocopy request persuasive, as claimed—it was the power-protection strategy behind it
- **Social exchange missing** as the systemic dynamic behind principles like reciprocation, obligation, and even scarcity

Compared to The 48 Laws: Our Review

Influence is a powerhouse for understanding persuasion.
We still prefer handbooks, but *Influence* is closer to *The 48 Laws*, and it's still more scientific, more pragmatic, and **more effective for sales and marketing**—and potentially persuasion in general.

On the other hand, *The 48 Laws* is more 'power aware' and superior for competitive settings and everyday life.

5. The Power Broker

A monumental biography of Robert Moses, detailing how he amassed immense authority to reshape New York through public works, showcasing cunning, legal mastery, and interpersonal dominance.

Pros

- **Thorough**, offering detailed insights along Moses life
- **Showcases key traits missed by 48 Laws**, like competence, dominance, masculinity, and endless energy
- **Alpha male type psychology** of ultra-driven men

Cons

- ***Too* thorough**, it can overwhelm most readers. I doubt many would finish the book version. Consider our summary, built around its core nuggets of wisdom
- **May portray Moses overly negatively**: men like him, after all, build things. Including empires

Compared to The 48 Laws: Our Review

The Power Broker is more 'real life' than *The 48 Laws*, and more modern too—no kings and queens, but real masculine men vying for power and influence.
It also includes several basic 'strategies' missing in *The 48 Laws*: competence, dominance, and an 'alpha male type' of character and leadership.

But while Greene makes his nuggets of wisdom readily available in an easy list, this book requires the reader to infer the strategies by themselves.

In brief, while *The Power Broker* better showcases power dynamics in the modern world, most lovers of *The 48 Laws* won't connect with this book.

6. The Social Strategist

A beginner-friendly introduction to more advanced social skills like positive dominance and frame control. This 6-chapter book ties foundational social success principles with more advanced power dynamics and strategies.

Pros

- **Covers the nuances** and exceptions to standard advice, like when aggression or passiveness trump assertiveness
- **Beginner-friendly guide**, with end-of-chapter summaries and action steps for practical applications
- **Unique advice** compared to standard self-help, like value exchanges and frame control.

Cons

- **Only an introduction**, providing just a taste compared to deeper resources like The Power Moves and Power University.
- **Lighter on darker topics** such as motives and manipulation tactics
- **Exercises & summaries** may bother the reader who doesn't want to be guided and re-told

Compared to The 48 Laws: Our Review

The Social Strategist is more of an actual social skills guide, which may be more useful to beginners who lack basic calibration and who'd badly misapply *The 48 Laws*.

The 48 Laws though is more focused on the darker side, providing a stronger wake-up call for too-nice guys.

7. The Dictator's Handbook

A more empirically sound realpolitik guide for dictators and a lucid analysis of political power dynamics. This 2011 book reveals how leaders' self-interest drives policies, explaining why dictatorships enrich cronies while democracies foster prosperity.

Pros

- **Revolutionary approach** explaining political outcomes through leaders' needs and selfish interests
- **Eye-opening** on socio-political dynamics
- **Practical**… in case one wanted to become a dictator (don't!)

Cons

- **Overly cynical view of politics** as pure self-interest, ignoring pro-social human tendencies (even in rare enlightened dictators, sometimes).
- **Biased toward democracy**, potentially overlooking possible benefits of top-down command (eg.: prevent tragedies of commons).
  - May understate how even democracies can act like masked autocracies favoring the elite.
- **Data can be tough to ascertain**, for example, on concepts like the "resource curse" and indexes measuring policy effectiveness.

Compared to The 48 Laws: Our Review

The Dictator's Handbook is more of a real-world text for adults: less entertaining, but deeper.

The 48 Laws of Power though is more focused on *interpersonal* dynamics, so it's superior for men looking for an edge in everyday life and not interested in politics.

8. Who Is Michael Ovitz?

Michael Ovitz's 2018 autobiography chronicles his rise as a Hollywood super-agent, co-founding the powerhouse Creative Artists Agency (CAA), while unveiling the raw power plays, influence tactics, and shrewd maneuvering that defined his career in the entertainment industry's cutthroat elite.

⍰ Pros

- **Raw, insider's view** of high-stakes business dynamics
- **Rich with actionable insights** on reading people, building alliances, and managing perceptions
- **Serves as a cautionary yet empowering tale**

⍰ Cons

- **Omits some personal details** on key events, like a pivotal intervention, leaving readers craving more substance on critical turning points
- **Misses the costs of long-term over-Machiavellianism** as the author doesn't explicitly connect his fallouts, poor relationships, and his overly calculative approach

⍰ Compared to The 48 Laws: Our Review

Who Is Michael Ovitz? offers an important edge over The 48 Laws because the author speaks from firsthand experience in contemporary settings.

I find this book to be **the perfect pairing with *The 48 Laws*** because it shows both how useful *and* harmful a Machiavellian approach to life can be.
Ovitz proves our TPM approach of combining Machiavellianism with an honorable approach is the best mix to get the best of both worlds.

9. Games People Play

Berne analyzes some common dysfunctional patterns of interpersonal and toxic relationships. This 1964 psychoanalytical work uncovers the motives and dynamics of everyday interactions.

Pros

- **Pioneering** analytical look at everyday social games, bringing professional tools to common interactions.
- **Useful** descriptions of relationship patterns can also help readers fix them

Cons

- **Overly Freudian explanations** tying everything to childhood and parents, limiting broader applicability.
- **Excessively dark view** of life as a web of traps

Compared to The 48 Laws: Our Review

Games People Play is superior to spotting toxic interpersonal dynamics when you seek brighter goals like self-development or better relationships.

But *The 48 Laws* is otherwise superior for competitive settings, strategy, and self-advancement tactics.

10. The Presentation of Self in Everyday Life

Erving Goffman's seminal work draws parallels between theater and human interactions. Although he never refers to manipulation or reputation, he explores how individuals and teams perform roles to manage impressions and create desired perceptions.

⍰ Pros

- **Brilliant social dynamics analysis**, particularly in managing impressions
- **High social awareness** with some insights confirmed by later research (e.g., "civil inattention")
- **Rich with practical examples** from everyday life

⍰ Cons

- **Less practical** since his work is more sociological-descriptive

⍰ Compared to The 48 Laws: Our Review

It's odd how *The Presentation of Self in Everyday Life* can be so different from *The 48 Laws* while still touching on similar topics.

The main difference is that Greene discusses impression management as the pursuit of power, while Goffman mentions social expectation, roles, and team goals.
Both are right, and Goffman can be helpful to help overcome over-cynicism.

I'm partial to Goffman as this was my favorite book during university and, in hindsight, a harbinger of TPM. But *The 48 Laws* takes the crown when it comes to usefulness and practicality.

Bonus: From Laws & Books to a Complete Power System

Not a book, but a structured training program for those who want to move beyond more theoretical approaches.

Books similar to The 48 Laws of Power all suffer from the ”Best-Seller Quality Tradeoff™’.
The tradeoff suggests that to become popular and appeal to the masses, they must necessarily simplify, generalize, or entertain at the expense of depth, nuance, and calibration. That means that **books like*The 48 Laws of Power* tend to be less effective for men who want top-1% results.**

Power University is different in that regard. It’s an advanced social skills and power-dynamics curriculum grounded in **empirical research** and refined through real-world application, with outcomes validated by post-program surveys of its alumni, including measured gains in respect, confidence, status, and attraction.

⍰ Pros

- **Delivers outcomes** supported by post-program alumni surveys, including gains in respect, confidence, status, attraction, and leadership
- **Practical** frameworks designed for real situations in dating, career, and social life
- **Research-based** principles translated into repeatable, real-world skill development

⍰ Cons

- **Effort-intensive**; not for those unwilling to apply themselves
- **Focused on men**‘s development from upgrade 9.0

⍰ Compared to The 48 Laws: Our Review

Go for Power University if you want skills, real-life results, and if you’re serious about success.
Stick to *The 48 Laws* and the entries above if you prefer knowledge, books, and a good narrative together with your learning.

Read more:

- **48 Laws vs. Power University**

> 48 Laws VS Power University: What’s Best to Advance In Life?

Somewhat Similar...

- ***The Art of War***, often listed as ‘similar to the 48 Laws’, but the age shows
- ***Meditations***: The OG of ‘enlightened power’, combining power with life philosophy

- ***Propaganda***: impression management from a state and PR perspective. Like Greene: good intuition, but no empirical evidence
- **Top books on power dynamics**, for a full reading list on power

Other Robert Greene Books

Similar to *The 48 Laws* and not included in the main list because readers likely know them:

- ***The 33 Strategies of War*** focuses on military campaigns, but plenty of takeaways for everyday life and interpersonal competitions
- ***The Art of Seduction***: Dark psychology in its most seductive form. But don't take it as a dating manual, and work instead on mate value, male leadership, and male dominance
- ***The Laws of Human Nature***: Possibly the best from Robert Greene, blending his usual focus on humans' dark side with self-development content
- ***The 50th Law*** for a sprinkling of 'street smarts' with 50 Cent's biography

For an overview of Robert Greene books, including pros and cons and in which order to read them, see:

https://thepowermoves.com/robert-greene-books

⍰ Avoid These: *Not* Like 48 Laws of Power

Many Internet lists are recycling the same titles (⍰⍰♂ Lucio's opinion: they're asinine).
Here are some popular 'like the 48 laws of power' entries that, in my opinion, are NOT similar to *The 48 Laws*:

- ***Principles***: ⍰⍰♂a book about *denying* will to power, and allegedly based on a lie. Read our version: 'Machiavellian principles: life and work'
- ***Atomic Habits***: ⍰⍰♂*nothing* about power dynamics or interpersonal strategies
- ***Think and Grow Rich***: ⍰⍰♂the only overlap is the author's amoral effectiveness to turn woo-woo and made-up stories into a best-seller
- ***How to Win Friends and Influence People***: ⍰⍰♂basic social skills focused on likability and power-protecting. Not ideal for good guys
- ***Thinking, Fast and Slow***: ⍰⍰♂what's even the connection there? Maybe 'both books are books'?

Turn Theoretical Laws Into Real-World Results

The Cambridge Handbook of Evolutionary Perspectives on Sexual Psychology: Summary & Review

Lucio Buffalmano · 10 September 2025 · Archived copy · Original

The Cambridge Handbook of Evolutionary Perspectives on Sexual Psychology (2022) is Volume 1 in a three-part series. It lays the theoretical foundations for understanding human sexual behavior from an evolutionary perspective, while Volumes 2 and 3 focus on male and female adaptations, respectively.

Contents

- FULL SUMMARY
  - Chapter 1: Natural Selection
  - Chapter 2: Sexual Selection
  - Chapter 3: Inclusive Fitness Theory

FULL SUMMARY

About the Author:
This volume is edited by Todd K. Shackelford, a leading evolutionary psychologist and prolific researcher in human sexual behavior and conflict.
He also edited the excellent *Oxford Handbook of Evolutionary Psychology and Romantic Relationships*.
Each chapter is authored by a subject-matter expert, ensuring the content reflects the latest research and specialist insight in each area.

Chapter 1: Natural Selection

In this opening chapter, Sedlacek walks us through the logic of natural selection as the bedrock of evolutionary thinking. She first dismantles the myth of "nature as a conscious selector," showing instead that selection is an inevitable consequence of three simple preconditions:

- **Variation** in traits among individuals;
- **Heritability**/inheritance of those traits;
- **Differential reproductive success** tied to those traits.

> As long as there is variation, inheritance, and nonrandom differential reproduction, it is a logical consequence that some entities will become more numerous than others over the course of generations

From there, she explains how adaptive features—whether wings, eyes, or mating psychology—inevitably accrue over countless generations, bit by bit, through the blind but inexorable filter of what best propagates its own genetic "instructions." Along the way, she addresses common stumbling blocks—teleology (the impulse to see purpose in every trait), genetic determinism (the false dichotomy of "nature versus nurture"), and the idea of "optimal design"—by showing that adaptations are always local solutions, tailored by past environments and constrained by historical legacies.

Also worth noting:

- **Genes aren't selected directly**; they code for traits (phenotypes) shaped by environments. Sexual desire, for instance, evolved for reproductive edge, not as a standalone "lust gene."

The Myth of 'Survival of The Strongest'

The author also tackles common misunderstandings related to the 'survival of the fittest' argument, claiming that 'fit' only refers to fit to the environment, not necessarily in 'healthy' or 'strong'.

And survival only matters as long as it increases reproduction:

> (…) another misleading implication of the "survival of the fittest" mantra: the idea that survival is of paramount importance.
> The truth is that **survival serves reproduction**. An organism's survival ultimately means nothing to natural selection without reproductive success.
> (…) natural selection only "cares" about survival insofar as it benefits reproductive success

Chapter 2: Sexual Selection

Atari brings Darwin's second great insight—sexual selection—into sharp focus. Unlike natural selection, which prizes survival, sexual selection prizes reproductive success, often at the expense of survival. Two main engines drive it:

- **Intrasexual competition** (most often male–male combat using weapons like antlers or tusks);
- **Intersexual choice** (most often female mate choice for ornaments like peacock tails).
  He traces the history of the concept—from Darwin's bold proposal, through Victorian skepticism (Wallace's rebuke of "fanciful female aesthetics"), to its integration into the modern synthesis—and shows how both competition and choice sculpt the dizzying variety of mating strategies, from cricket chirps to courtship dances.

Signaling Value: Hamilton Paraside vs. Zahavi's Handicap Principle

> The Hamilton–Zuk hypothesis differs from Zahavi's handicap hypothesis in that, although both rely on males offering real signals of quality, the ornament is seen as a trait to directly display health rather than as a handicap.
> According to this theory, the more strongly parasites have played a role in a species' ancestry, the greater the pressure to signal lack of parasites.
> The Hamilton–Zuk hypothesis raises a fundamental question about the signals that animals display. For this hypothesis to hold, it is necessary for males to be "honest" signalers. Put differently, for females to benefit from the signals that male ornaments provide, it is crucial that these ornaments correlate with parasite resistance (rather than only appearing to be related).

Atari states that the Hamilton–Zuk hypothesis has been received favorably, but more empirical evidence is needed.

Both the parasite and handicap theories relate to signaling mate value, but another theory of ornamentation is not related to value at all:

> One important question is whether males' ornamentation evolved simply to make them attractive to females or whether they serve as honest signals of quality.
> The former argument can be traced to Fisher

In brief, these theories are not mutually exclusive, and they can all have contributed and be true at the same time. For a deeper overview, you can also check our review of *Evolutionary Psychology: An Introduction* (chapter 3).

Measuring Male Intrasexual Competition Propensity: A Psychological Predisposition

The Intrasexual Competition Scale (ICS) measures how much people see same-sex interactions as competitive, especially in the context of mating.

It focuses mainly on rival derogation: envy, jealousy, and putting down same-sex rivals.
It found no average sex differences, but **high scores are more likely to compare with same-sex peers, feel**

competitive, and act on it.

Men with high ICS scores:

- **More likely to use steroid**s (especially with less training experience).
- **More motivated by appearance enhancement** (e.g., cosmetic surgery).

The ICS lacks balance and the Intrasexual Rivalry Scale (IRS) improves on this using two tactics (self-promotion + rival derogation) and adding four mating domains from the KASER model (Kindness/dependability, Attractiveness/sexuality, Status/resources, Education/intelligence).

Findings from both scales:

- **No sex differences** in total scores.
- **Scores decline with age**—younger people are more competitive.
- **Higher scores in men with low SES background** and women with high SES background.
- **Father absence linked to higher female competitiveness** and more short-term mating behaviors (flirting, makeup use, etc.).

Men who score higher:

- More status-driven and rival-sensitive.
- More likely to enhance their appeal or undercut other men.
- More active in competitive or mate-seeking environments.

Low scorers are less rival-focused, more indifferent, or long-term oriented.

Lucio's note: enlightening and important psychological measure
It's the first time I stumbled upon this scale, and it matches my observation. The fact that high scorers also use more steroids suggests that high scorers focus on muscle because they're focusing on sexual competition (something I consider ineffective and in some cases point to low intrinsic self-esteem).
I consider it an important psychological measure to understand people, behavior, and mating strategies

Human Sperm Competition

- Sperm competition likely arose in response to **female infidelity**, considered the most plausible ancestral context (Smith, 1984).
- Data show **some level of concurrent partnerships among women**, especially in younger age groups—for example, 15% of British women aged 16–24 reported overlapping sexual partners in the past year (Johnson et al., 2001); similar findings were reported in the U.S. (Laumann et al., 1994), China (Yan et al., 2009), and Iran (Honarvar et al., 2016). **<— ⍰⍰♂ Lucio's note**: Surprised about China and Iran, but I still suspect modern dating is much different from ancestral dating
- While not all concurrent relationships involve double-mating, **some likely do**.

Evidence for male physiological adaptation:

- **Men adjust sperm quantity** based on perceived sperm competition risk. Fewer sperm are found after recent contact with a partner, and more sperm after a longer absence (Baker & Bellis, 1989).
- Men produce **a higher percentage of motile sperm** when exposed to images implying high sperm competition (e.g., 2 men + 1 woman), compared to control images (Kilgallon & Simmons, 2005).

Psychological and behavioral adaptations:

- Men show **increased sexual motivation** after being physically separated from their partner—possibly to

counter sperm competition risk (Shackelford et al., 2002).

- **Mate guarding and copulation frequency** increase when female partners are more attractive (Pham et al., 2014) or spend more time around other men (Pham & Shackelford, 2013).
- **Men with lower quality sperm mateguard more (tradeoff hypothesis)** (Leivers, Rhodes, and Simmons 2014): *men who performed fewer mate retention behaviors produced higher-quality ejaculates, having a greater concentration of sperm, a higher percentage of motile sperm, and sperm that swam less erratically. Men's expenditure on mate retention and on the ejaculate may represent alternative routes to paternity assurance in humans* **<— ⍰⍰♂ Lucio's note**: interesting, but was based on a small sample of 45 and evidence is mixed, see below
  - Evidence is mixed: *In conceptual replication attempts of the study by Foo et al. (2018) and Leivers et al. (2014), it was revealed that there was no relationship between ejaculate quality and (1) physical strength (DeLecce, Shackelford, Fink, & Abed, 2020) or (2) mate-retention behaviors (DeLecce, Shackelford, Zeigler-Hill, Fink, & Abed, in press)*

However, findings are not all consistent:

- A study found **no improvement in ejaculate quality** when men imagined partner infidelity compared to a control condition (Pham et al., 2018).
- Many **nonhuman sperm competition studies** involve designs that are not replicable in humans (e.g., tracking fertilization success across multiple males) (Price, Dyer, & Coyne, 1999).

In evolutionary terms:

- **Humans are mid-level competition**, likely falling between gorillas (low sperm competition; single-male harems) and bonobos (high sperm competition; group mating) (Zuk & Simmons, 2018).
- While not under extreme pressure, **humans are not free from selection related to sperm competition**. Both behavioral and physiological evidence suggests **moderate evolutionary relevance**.

⍰⍰♂ **Lucio's note:** I tend to agree with this overview:

> While there are other contexts in which sperm competition might have occurred, Smith (1984) argued that, compared with female infidelity, these contexts may not have occurred frequently enough in our evolutionary history to cause selection pressures for adaptations to sperm competition

⍰⍰♂ **Lucio's note:** I'd also argue that biology here limits the physiological response. If sperm takes months to produce, how responsive can it really be to short term stimuli right before release?

⍰♂Lucio's Take: **Why I have doubts regarding sperm competition**

Lucio:
Sperm competition is a fascinating topic. After reviewing Baker's flawed book on the subject, newer studies and authors convinced me to reconsider and give more weight to its potential impact in humans.

Still, several important questions remain—questions that, for now, limit how much I believe sperm competition truly shaped human evolution:

- **Pair bonding is a powerful evolutionary tool** that reduces the need for sperm competition in the first place.
- **Universal expectations for loyalty** add emotional and social controls that restrict women's freedom to "sperm shop"—especially in our evolutionary past. A woman would have to hide not just from her partner, but also from his kin, allies, and possibly the tribe as a whole.
- **Female mate choice sidesteps sperm competition altogether.** A woman in love wants the man she's bonded with to father her children. And a woman confident in her judgment prefers her chosen man to be the father. Some women do pursue sex for its own sake, but the more restrained and conscious choosers still limit the scope for post-mating competition.
- **Biology 1 – Timing:** It can take less than an hour for sperm to reach the egg. Even if we allow for a few hours or a day, that short window places a major constraint on the opportunity for sperm to compete.
- **Biology 2 – Egg bottlenecks:** In fertile windows, the egg is a bigger bottleneck than sperm. Most healthy men have more than enough viable sperm to fertilize an egg. If the egg is the bottleneck, the system simply doesn't lend itself to discrimate against sperm

Unless these points are more fully addressed, I remain cautious about assigning sperm competition a major role in human evolution. Plus, modern sperm competition may happen far more in sperm banks than 'in nature'.

Women Have Less to Gain From Multiple Partners

And it comes down to being the 'larger investing sex':

> This larger minimum investment decreases the reproductive value of multi-partner mating.
> Hence, compared with the opposite sex, the less heavily investing sex benefits more from seeking numerous

> sexual partners, whereas the more heavily investing sex benefits more from enhancing its capacity to support offspring.

In simpler words, for humans it means that if a woman has already found a guy whom she believes to be of high mate value, it doesn't make sense to add 3 more random sexual partners, especially after she may already be pregnant or already caring for an infant.

⍰⍰♂ Lucio's note:
If we dig deeper, she may still gain somewhat with sperm selection, or by keeping backup options. But the general point is valid, and sperm selection is contentious, of smaller added value, and this strategy also entails much higher risks.

Chapter 3: Inclusive Fitness Theory

Fitzgerald and Lorentz introduce us to Hamilton's revolutionary insight: organisms may propagate their genes not only through direct reproduction, but also by helping kin who share those genes.

They unpack the math of **Hamilton's rule** (rB > C), illustrating how altruistic behaviors—warning calls, cooperative breeding, even self-sacrifice—can evolve when the genetic payoff in relatives outweighs the cost to oneself.

Common Confusions

Inclusive fitness theory is often misinterpreted in 3 key ways, leading to confusion about how natural selection works on genes related to social behavior:

1. **Misinterpreting "r" as "percentage of total genes shared"** between two individuals.
   In reality, *r* is the probability that the recipient of an altruistic act carries the same gene that caused the altruist's behavior (Hamilton, 1964).
2. **Conflacting Inclusive Fitness with Kin Selection and altruism**
   Many assume inclusive fitness only covers kin-based altruism. But inclusive fitness includes mechanisms like jealousy or parent–offspring conflict that aren't purely cooperative (Park, 2007; Dawkins, 1979; Buss, 2015).
3. **Misusing Hamilton's Rule to predict behavior**
   People often wrongly apply Hamilton's rule ($c < br$) to predict individual behavior. But the rule describes when a *gene* will be selected by evolution—not whether someone will act altruistically. It's a gene-level equation, not a psychological theory (Hamilton, 1964; Buss, 2015; Park, 2007; Dawkins, 1979).

Interesting notes:

- **People are more likely to rescue their romantic partner when they have a biological offspring together** *than when they only have adopted children or no children together – even when statistically controlling for emotional closeness between the altruist and recipient (Fitzgerald et al., 2010) – indicating that the probability of genetic inheritance may influence altruistic decision making among kin*
- **Mothers become more tolerant of investing resources in offspring as they age** (Beaulieu & Bugental, 2008), suggesting that parents may wish to hoard resources for future reproductive opportunities (Schlomer, Del Giudice, & Ellis, 2011)
  - Older mothers also provide more physical and verbal affection to their young children than younger mothers do (Bornstein & Putnick, 2007).
- **Male sexual jealousy decreases when the other man is a sibling**, but it was the opposite for women

Chapter 4: Adaptive Problems in the Domain of Human Sexuality

Asao maps out the landscape of the "adaptive problems" our ancestors faced in mating—and hence the selection pressures that shaped our sexual psychology.

- **The most costly reproduction, the choosier mate selection**: The more costly producing an offspring is – in terms of time, metabolic expenditure, and other resources – the more selective an animal should be when choosing a mate
- **Parental investment is a trade-off with mating effort**: offspring survival versus mating effort
- **Disease risk vs multiple partners**, balancing the rewards of variety against pathogen exposure.

Chapter 5: Adaptations, By-products, and Spandrels

Flegr tours the taxonomy of traits in evolutionary biology:

- **Adaptations**, which exist because they solved specific problems;
  - **Exaptations**, traits that evolved for one function but were later co-opted for another. Technically, all adaptations are exaptations because evolution doesn't start from scratch
  - **Postadaptations**: traits that were once adaptive in past conditions but have lost their original fitness benefit due to environmental or lifestyle changes; they may remain as vestiges or have reduced function today.
- **By-products**, neutral leftovers that hitchhiked on adaptive traits;
- **Spandrels**, incidental architectural features with no direct function.
- **Rudiments and atavisms**, traits inherited from ancestors—rudiments appear in all individuals but may no longer function (e.g., human appendix), while atavisms occur rarely due to special allele combinations (e.g., human tails); these may have been adaptive in ancestors but often lack function now (Flegr, 2025).

And something I particularly agree with:

"Just-so-story" pitfall: assuming every trait is an adaptation—and offers a rigorous checklist (complexity, efficiency, heritable variation, costs) to distinguish genuine adaptations from evolutionary side effects.

The Savanna Principle May Be Wrong

The savanna principle suggests humans evolved mainly in African savannas, shaping our mind and body.

But this idea might be wrong for two main reasons:

1. **Savannas may just preserve fossils better** than tropical forests, so fossils mostly come from savannas even if humans lived elsewhere more.
2. **Species adapt quickly only right after they form** (as per genetic theory), then become "frozen" and change little despite environmental shifts. Since our closest relatives live in tropical forests, it's likely humans originated there and adapted mostly to forests, not savannas.

If so, many traits we think fit savanna life are actually exaptations (traits evolved for other reasons) or postadaptations (traits that no longer fit our current environments) (Heerwagen & Orians, 1993; Tooby & Cosmides, 1990; Roberts et al., 2016).

Group Selection: From Reviled, to Back In Vogue

Group selection then fell out of favor after Maynard Smith and Williams showed that individual selection is usually stronger.
But in the 1980s new models showed group selection can matter, especially in species with frequent group extinctions and reformations (Alexander & Borgia, 1978; Shanahan, 1997).

Some traits may have evolved mainly through group rather than individual selection (D. S. Wilson & Sober, 1994).

Some traits and connected social dynamics that may have evolved this way:

- **Altruism within groups**: Helping behaviors that benefit others at a personal cost.
- **Group cooperation and coordination**: Behaviors that improve group success but may reduce individual gain.
- **Punishment of defectors or cheaters**: Sacrificing to maintain group norms.
- **In-group loyalty** and **out-group hostility**: Traits that benefit the group in intergroup competition.

Example: A jackdaw gives a warning call to alert others of a predator. This helps the group but puts the caller at risk.

Stability-Based Sorting (SBS) vs Natural Selection

Stability-Based Sorting (SBS) is an evolutionary process where only the most stable things stick around—whether or not they reproduce.

Contrary to natural selection, which only works on traits passed to offspring, SBS doesn't need inheritance or reproduction.
If something is stable and long-lasting, it stays; if it's unstable, it disappears.

The author claims that SBS can produce 'safety catches' that may not increase individual fitness, but that protect the species in the long term-for example, decreasing reproduction when resources become scarce.

All surviving species in the long run would carry these SBS, say the author.

⍰⍰♂ **Lucio's note: still can't see how this would work**
It's a novel and bright idea I had never thought of or read about. It sounds plausible and deep, potentially holding the keys to long-term survival (including for humans).
I'm still wrapping my head around it, and I'm not sure how it could work in practice. It seems a case of 'good for the group' vs 'good for the selfish individual'.
In the author's example, when resources become scarce, selfish players wouldn't be eliminated if they aren't already carrying SBS and they would out-reproduce the SBS-carrying individuals and quickly take over (and lead the species extinct).
I suppose the SBS may evolve 'randomly' and lie dormant. But here's the step I don't get: how would it spread across every single individual?

Chapter 6: Evolved Psychological Mechanisms: Properties and Evidence, Misconceptions and Mismatches

Pearson and von Hippel lay out what makes a psychological adaptation:

1. **Domain-specificity**—specialized "if-then" decision rules for ancestral challenges;
2. **Computational complexity**—processing inputs (cues) into outputs (behaviors) with clear design features;
3. **Cross-cultural robustness**—present across societies unless modern environments mask them;
4. **Developmental sequencing**—emerging at ages when they became functional ancestrally.

They tackle misconceptions—like confusing general intelligence with evolved modules—and explore how **mismatches** between ancestral and modern environments (e.g., contraceptives, social media) can hijack once-adaptive mechanisms, leading to disordered outcomes.

Interesting notes:

- **Error Management Theory** (EMT; Haselton & Buss, 2000): we may have evolved to favor the least costly

error via a collection of biases in our perception and cognition

- **Humans cooperate more than any other species**: Although cooperation is widespread in nature, human cooperation exceeds that of all other species in the scale and range of cooperative activities (Melis & Semmann, 2010)
- **We believe there's more competition than there truly is**: Internet and social media can lead us to believe we have more competitors than we do in reality, causing our jealousy mechanisms to misfire beyond adaptive utility
  <— Lucio's note: the same is true for mating options though, and we may believe we have more options than we truly have

Chapter 7: Parental Investment Theory

Pazhoohi deconstructs Trivers' landmark insight: because eggs cost more than sperm, females typically invest more per offspring, leading to sex-differentiated mating strategies.

Key predictions in humans include:

- **Women's greater choosiness** as part of the high-investment sex (usually females);
  - **Mate-value assessment** weighting cues to genetic and investment potential (e.g., resources, fidelity).
- **Men's greater competition** as part of the low-investment sex (usually males);

He reviews empirical tests—from human speed-dating studies to courtship in fish—showing broad cross-species support.

Chapter 8: Parent–Offspring Conflict

Salmon and Hehman explore how mothers and their offspring can have divergent genetic interests: each child benefits from more resources than the mother can afford to give to all her young.

They detail the **"weaning conflict"**, sibling rivalry, and even genomic imprinting—where maternal and paternal gene copies are differentially expressed to tilt resource allocation. They also examine human evidence: breast-feeding duration, sleep arrangements, and parent-child bargaining over food and attention.

- **Genetic imprinting**: Paternally inherited genes influence infant behavior in ways that increase demands on the mother, and maternally inherited genes influence infant behavior in ways that reduce demands on the mother
- **Weaning conflict**: Offspring want to nurse longer than is optimal for the mother's future reproduction, leading to resistance and conflict during weaning.
- **Sibling rivalry**: Siblings compete for parental attention and resources, often using crying, aggression, or manipulative behavior.
- **Different mate choice criteria for parents/children**: parents prefer attractiveness for their partners, but resource holdings and family background for their offspring. Whereas offspring often focus more on attractiveness and sense of humor (Apostolou, 2008a, 2008b, 2011a; Buunk, Park, & Dubbs, 2008; Perilloux, Fleischman, & Buss, 2011).
  Parents may prefer more resources to keep more for themselves and their other offspring, and benefit from stronger networks
- **Different mate strategies preferences**, with parents accepting short-term strategies more for themselves than for their children, and especially daughters (Apostolou, 2009)

Chapter 9: Theory and Evidence for Reciprocal Altruism

Takano and Ichinose revisit Trivers' proposal that nonkin can evolve cooperation through repeated interactions and the shadow of the future.

They explain the math of iterated games (Tit-for-Tat, Grim Trigger) and how reputational information, punishment, and social networks stabilize reciprocity.

The 5 Drivers of Cooperation

Five theoretical mechanisms for the evolution of cooperation have been proposed (Nowak, 2006):

1. kin selection
2. direct reciprocity
3. multilevel selection
4. indirect reciprocity
5. network (spatial) reciprocity

Theoretical and experimental studies have provided evidence for these mechanisms (Rand & Nowak, 2013).

In another review, we prepared this overview, adding a few other sub-drivers that have also been proposed:

Theory	Impact	Explanation
Kin selection (inclusive fitness)	Very high	Altruism toward genetic relatives evolves when helping kin (rB > C) still propagates shared genes.
Direct reciprocity	Very high	In repeated interactions, helping others pays off because they'll return the favor later.
Misdirected kin selection	Speculatively high	Cooperative behavior triggered by evolved kin-detection mechanisms (e.g., familiarity, similarity, proximity, emotional closeness), evolved in small kin-based tribes but triggers even without genetic relatedness
Indirect reciprocity (reputation)	High	Acts of helping build a good reputation, which attracts aid from third parties.
Network (spatial) reciprocity	High	Emergent property. Cooperators cluster together in networks or colonies and collectively outcompete isolated defectors.
Multi-level selection (group)	Moderate	Groups of cooperators outperform groups of defectors, so cooperative traits spread with the winning groups/coalitions.
Enforcement (punishment)	Moderate	Emergent cultural byproduct. Punishing or excluding defectors imposes costs on cheats, stabilizing cooperative behavior.
Parochial/Ingroup altruism	Moderate/low	Preferential help for in-group members, often paired with hostility toward outsiders.
Green-beard effects	Low	Rare "tagged" genes recognize and favor copies of themselves, leading to targeted cooperation.
Partner choice	Low	Cooperative partners are favored over selfish ones. 'Cooperative' signaling is a consequence. Its strong effect on long-term dating is offset by short-term mating and forced copulation

Two Strategies to Assess Others

Two main strategies for assessing reputation are:

- **Image scoring**: people assign reputation based on visible cooperative or defective actions. It's cognitively simple and common in experimental settings (Milinski et al., 2001).
- **Standing strategy**: considers context—e.g., defecting against a defector doesn't lower one's reputation. It's more nuanced but requires more memory, so less often used in practice (Milinski et al., 2001).

Chapter 10: Life History Theory and Mating Strategies

Figueredo and Peñaherrera-Aguirre introduce life history theory: organisms face trade-offs among growth, reproduction, and maintenance.
They apply the fast–slow continuum to human mating:

- **Fast strategies** (early reproduction, short-term mating, high offspring number) often emerge in harsh, unpredictable environments;
- **Slow strategies** (delayed reproduction, long-term bonds, high parental investment) thrive under stable, resource-rich conditions.

They highlight links to risk-taking, impulsivity, attachment styles, and illustrate cross-cultural and individual-difference evidence.
However, there is a limit to Life History (LH) influence. It strongly influences, but doesn't fully determine, specific mating strategies like promiscuity or precocity, so treating them as interchangeable is a mistake.

The Dark Core of Dark Triads

> In a more detailed examination of the lower-order facets of the dark triad, it was found that there were two more specific components that could be analytically extracted, jointly labeled the dark core, that accounted for much of the substantive content of the latent higher-order common factor underlying the dark triad, and that these were reducible to the traits manipulation and callousness.

Chapter 11: Sperm Competition Theory

DeLecce examines post-copulatory sexual selection from the sperm and fertilization point of view.
She reviews male and female adaptations and current theories and evidence.

Humans show mild sperm competition adaptations—testis size, ejaculate volume—suggesting ancestral tendencies toward polygynandry.

Potential supporting evidence for sperm competition:

- **Double mating increases with 'experience':** For women reporting fewer than fifty lifetime copulations, 17.5 percent reported having double mated at least once. This percentage increases steeply with sexual experience: 71.8 percent of women reporting more than 1,000 lifetime copulations reported double-mating at least once Baker and Bellis (1995).
- **13% of American college women copulated with two different men in 24h**: Gallup, Burch, and Mitchell (2006) found that 13.4 percent of a sample of American college women copulated with two men within a twenty-four-hour period at least once, and 8.3 percent copulated with two men simultaneously at least once.
- **Sperm competition scenarios are among the top female fantasies**: Price and Miller (1984) found that sexual fantasies involving sperm competition (multiple men simultaneously and sex with someone who's not the partner) were among the top ten most popular fantasies. **<— ⍰⍰♂ Lucio's note**: this was an interesting piece of evidence. However, fantasies don't translate 1:1 to reality and, hence, to evolutionary forces
- **Cuckoldry may suggest sperm competition**: A meta-analysis of thirty-two published studies from Western cultures documented that 3.1 percent of children are genetically unrelated to their social father (Voracek, Haubner, & Fisher, 2008). However, non-Western samples may face higher cuckoldry rates, like 48 percent of in indigenous Himba (Scelza et al., 2020).
  29.8 percent of men with low paternity confidence (e.g., those disputing paternity), compared to 1.7 percent of men with high paternity confidence, are genetically unrelated to their child (Anderson, 2006) **<— ⍰⍰♂ Lucio's note:** Cuckoldry may be an area of sperm competition, but not necessarily. 3.1% is not an extreme rate. And

Women who prefer the partner/affair partner may purposefully avoid sex with the non-preferred partner during fertile windows, or use protection, thus actively avoiding sperm competition.

- Men evolved preferences for choosing 'low sperm competition partners': the author claims that men's evolved preferences to avoid high sperm competition risk women for long-term is is a genetic indicator of moderate sperm competition exist in men as well <— ⍰⍰♂ **Lucio's note:** this is not a 'genetic indicator', it's a *possible* indicator for which other theories offer more encompassing ultimate explanations, such as that a low risk woman is a low risk for cuckoldry, which *may* include sperm competition, but is *not* the same as sperm competition

Interesting Notes:

- **Little link between markers of mate value and sperm quality**: A recent meta-analysis found little connection between sperm and markers of phenotypic quality like intelligence, attractiveness, voice pitch, and masculinity (often measured by finger length ratio) (Jeffery et al., 2016). The author advises to standardize methodologies for measuring both phenotypic traits and ejaculate quality

⍰⍰♂ Lucio's note: Female partner's choice is not sperm competition

Writes the author:

> The IPC proclivity model proposes that women manipulate the time between their IPCs and their EPCs. Gallup et al. (2006) found that 64.1 percent of women delayed indefinitely an IPC following an EPC and suggested that women may be actively avoiding sperm competition (…) Either possibility (female avoidance of sperm competition or female manipulation of male precedence) provides further evidence of an evolutionary history of sperm competition in humans.

I disagree: one is about sperm competition, the other is about female choice.
If women delay indefinitely, they've already *chosen* their favorite man, and actively minimize, or outright avoid sperm competition.

⍰⍰♂ Lucio's recap: the evidence didn't convince me about the centrality of sperm competition
Little of the proposed evidence seemed to directly back sperm competition, and some of it only suggested the *possibility* of sperm competition.
To the authors, I'd also suggest a stronger speculative wording for some of the supporting evidence. Including the 'cunnilingus to smell opponents' semen' series that was an interesting interpretation, but that felt highly speculative to me.

Chapter 12: Sexual Conflict Theory

Candolin surveys the tug-of-war between male and female reproductive interests.

She explains how male persistence can override female choice (harassment, deception), and how females evolve resistance strategies (choosing deceptive males against, signaling unavailability).

This evolutionary arms race fuels ever-escalating displays, manipulation, and counter-manipulation, from water striders' genital shields to human "peacocking" and mate-guarding.

Sexual conflict, over time and with the constant male vs female coevolution increases the odds of speciation.

Key Concepts

- **Definition**: Sexual conflict occurs when the evolutionary interests of males and females diverge (Arnqvist & Rowe, 2005; Chapman, Arnqvist, Bangham, & Rowe, 2003; Hosken, Archer, & Mank, 2019; Parker, 2006)
- **Why it occurs**: This divergence arises from the fact that males and females are genetically different and

therefore have different optima for many traits (Lessells, 2006)

- **When it occurs**: When the ideal optima cannot be achieved for each sex, a conflict situation arises. This occurs during reproduction when the two sexes interact and the fitness of one sex depends on both its own traits and strategies and that of its partner
- **Example**: conflict over mating rate, with males attempting to mate with as many females as possible, while females are more choosy and reject most mating attempts (Andersson, 1994)

The Bateman gradients for males and females. Women have lowers potential reproductive rate compared to men. Men can increase their reproductive rate and fitness by mating with more women (as they can rapidly produce many sperm) while women are restricted by the time it takes to produce each egg. Thus, women reach a threshold when more matings will not increase the number of offspring produced.

We used to believe mating was monogamous and fully cooperative...

Originally, mating was seen as cooperative, based on monogamy and shared reproductive interests (Darwin, 1871).

In the 1970s, Trivers highlighted differing parental investment interests, and Parker expanded on the evolutionary roots of sexual conflict.

In the 1990s, Holland & Rice introduced sexually antagonistic coevolution, sparking experimental research.

Molecular studies later confirmed frequent extra-pair copulations and partner-harming reproductive traits, solidifying sexual conflict as a central concept in evolutionary biology.

> Today, the theory of sexual conflict is widely accepted and cooperation is seen as only one extreme along a gradient from mostly cooperation to mostly conflict between the sexes.

Two Types of Sexual Conflict:

- **Intralocus Sexual Conflict**: *Same* gene, affecting males and females differently (typically morphological, physiological, or hormonal)

Occurs when the same genes influence traits in both sexes but optimal trait values differ for males and females (e.g: increases male fitness but might reduce female fitness, and vice versa). This creates a genetic "tug-of-war" that limits how well each sex can evolve toward its fitness optimum, reaching a **compromise**
  - ⍰⍰ Sex-limited gene expression may sidestep the compromise adn bot sexes volve traits toward their phenotypic fitness optima (Cox & Calsbeek, 2009; Ellegren & Parsch, 2007; Rice, 1984)
  - Example: red bill coloration improves male zebra finch mating success but harms female viability (Price & Burley, 1994).

- **Interlocus Sexual Conflict**: *Different* genes in males vs. females (often behavioral like mate guarding, female evasion, extra pair copulation, etc.)
  Arises from direct male–female interactions where traits that benefit one sex harm the other, leading to antagonistic coevolution (an evolutionary arms race)
  - Example: male seminal proteins that suppress female remating vs. female resistance traits (Chapman, 2006; Holland & Rice, 1998).

Sexual conflict drives an evolutionary arms race: males evolve traits to boost fertilization success, females counter to avoid unwanted mates, leading to ongoing coevolution.

Battlegrounds of Sexual Conflict

- **Male persistence vs. female resistance over mating decisions.** Males evolve tactics to overcome female reluctance—like harassment, forced copulation, sneaky mating, or exploiting sensory biases—while females evolve ways to avoid or resist these tactics.
- **Male tactics to win fertilization inside the female.** Males may guard mates, use toxic seminal fluid, insert mating plugs, or physically harm females to prevent remating. Females counter with cryptic choice: ejecting sperm, selective storage, or immune rejection.
- **Males chemically alter female behavior or fertility.** Seminal proteins can reduce female receptivity or fecundity. Females may evolve resistance to these manipulations, creating a molecular arms race.
- **Parents battle over who invests more in offspring.** Since care is costly, each sex tries to offload effort onto

the other. This results in manipulative behaviors like hormone deposition, care withholding, or even destruction of the partner's other broods.

- **Ongoing conflict through offspring investment.** Females may abort offspring from undesirable males. Males may commit infanticide to induce females to reproduce again. Conflict persists even after mating is "over."

Sexual Conflict is Unlikely to Be Fully Resolved

> Interlocus sexual conflict could be resolved if the evolutionary fitness interests of the two sexes become aligned. This requires monogamy, with the two partners entirely dependent on each other. However, strict monogamy is uncommon and perfect alignment of interests is thus unlikely to be achieved in most mating systems.

Intralocus conflict can be resolved when males and females evolve distinct genetic controls over shared traits, such as sex-specific gene expression or dominance.
For example, Atlantic salmon use sex-dependent dominance to mature differently. However, interlocus conflict and genetic correlations can limit this resolution, so how often sexual conflict is fully resolved in nature remains unclear.

The direction of sexual conflict also depends on the environment, which shapes the intensity of sexual conflict. Factors like temperature, food, density, or habitat complexity modulate costs of mating, male harm, or female resistance—altering the evolutionary dynamics of conflict.

Chapter 13: Cross-Species Comparisons

Escobar, Arcediano, Bell, and Truax champion the value of comparing sexual psychology across taxa.

By examining mating systems in birds, fishes, and mammals, they tease apart which features of human mating are uniquely human versus shared ancestral traits.

They show, for instance, that **pair-bonding**, **sexual size dimorphism**, and **cooperative breeding** each co-vary with ecological variables.

Chapter 14: Cross-Cultural Methods in Sexual Psychology

Butovskaya addresses the challenges and rewards of studying sexuality across human cultures. She outlines methods—from ethnographic observation to standardized surveys (e.g., the Sexual Strategies Scale)—and discusses sampling, translation, and ethical considerations. By pooling data from over 50 societies, cross-cultural work isolates universal features of sexual psychology (e.g., jealousy triggers) from cultural inventions (e.g., arranged marriage norms).

- **Passionate love is typical of individualistic societies**: *Whereas passionate love (intense and arousing) is emphasized in individualistic cultures, companionate love (tender and affective) is praised in collectivistic cultures (Feybesse & Hatfield, 2019)*
  - Eastern cultures emphasize financial prospects (Thomas et al., 2020, p. 17)
- **Collectivistic societies had higher levels of marital satisfaction**, providing evidence for collectivistic values as favorable for a satisfactory marriage (Dobrowolska et al., 2020)
- **Passion is highest in short relationships, but commitment is highest in longer relationships**: Level of passion was highest for the shortest relationship duration, and lowest for the longest duration. Up to one year couples had lower commitment, which gradually increased with duration (Sorokowski et al., 2021, p. 112)
- **Even height preferences are culturally flexible**: in societies with free mate choice, people tend to prefer taller men (and this preference aligns with actual partner height), while in more polygynous or arranged-marriage

societies, this preference is weaker or absent, showing height preferences vary with social and cultural context (Fink, Neave, Brewer, & Pawlowski, 2007; Pawlowski, 2003; Sorokowski & Butovskaya, 2012; Sorokowski et al., 2015; Stulp et al., 2013).
Read more in 'exceptions and dating success'

In general, the author rightly claims that we need more intercultural studies, and some more surprises may be in store.
For example, while Western men could assess grip strength from gait, Maasai people found physically stronger walkers to be weaker (Fink et al., 2017a, 2017b, 2019).

Chapter 15: Behavioral Genetics

Luoto and Woodley of Menie delve into genetics of sexual traits—mate preferences, sociosexual orientation, sexual orientation. Using twin, adoption, and GWAS studies, they estimate substantial heritabilities (often 30–50%) on mating-related traits.
They also discuss gene–environment interplay, and highlight that genetic influence does not imply immutability.

- **Love and pair bonding are parts of a broad reproductive strategy** of long-term attachment, influenced by basic reward circuitry and genetic factors (Acevedo et al., 2020; Bode & Kushnick, 2021; Luoto et al., 2019a)

Top 10 Replicated Findings From Behavioral Genetics

1. Most psychological traits are partly genetic.
Genes significantly influence traits like personality, intelligence, and mental health.

2. No trait is 100% genetic.
Even traits with high heritability—like height or executive function—are still shaped by environment.

3. Many small genetic effects matter.
Traits are influenced by many genes, each with a small impact.

4. Links between traits are often genetic.
When traits go together (e.g. anxiety and depression), it's often because they share genetic roots.

5. Intelligence becomes more heritable with age.
Genes play a larger role in intelligence as people grow up (the Wilson effect), but this may reverse in old age.

6. Long-term stability is mostly genetic.
When traits stay the same over time, it's mostly due to the same genes continuing to have an effect.

7. Even environments are partly genetic.
People shape their environments in ways that reflect their genetic tendencies (e.g. choosing stimulating settings).

8. Genes influence how we interact with environments.
We don't just passively receive experiences—we seek out or create environments that match our genetic inclinations.

9. Siblings experience different environments.
The most influential environmental effects are unique to each individual, even in the same family.

10. Mental disorders are extreme versions of normal traits.
Disorders aren't categorically different—they reflect the extreme ends of the same genetic influences seen in everyone.

Chapter 16: Sex Differences and Sex Similarities

Engelbrecht and Edlund synthesize decades of research on male–female psychological differences.
They emphasize both **overlapping distributions** (e.g., general intelligence) and **moderate, replicable gaps** (e.g., spatial rotation favors males; empathy favors females).

To summarize the authors' take:

> Are men and women more similar than they are different?
> The answer is, in some ways, yes. The common challenges of mating and reproduction have created mutual preferences for (mostly) monogamous mating, and partners who are healthy, kind, and intelligent.
> (…) However, there are clear and obvious differences in sexual psychology arising from the different stakes held in the reproductive process by men and women.

Noteworthy Findings

- **Femininity is associated with lower desired partners**: men's and women's scores on femininity were associated with lower numbers of desired partners (Tate, 2011)
- **Testosterone plus personality are both associated with number of desired partners**: levels of testosterone are associated with men's and women's desires for the number of sexual partners desired as well as measures of personality (Puts et al., 2015)
- **New relationships and partner choices are emerging**
  - People still prefer monogamy, but new relationships are emerging: *Consensual nonmonogamy (and polyamory in particular) allows participants to engage in multiple sexual and/or romantic relationships simultaneously, representing a more ethical approach to pluralistic mating strategies (Mogilski, Memering, Welling, & Shackelford, 2017).*
  - Coparenting: while only for gay in the past, a small number of straight men and women now opt for this family model as well, and the mate selection may be more based on parenting qualities
  - Sperm donation: Research on selection criteria for donor sperm already suggests differing mate preferences when reproduction is the only thing on the table. Whyte and Torgler (2015) noted that women rate psychological qualities such as character highly, even beyond physical characteristics like attractiveness. Resources are less important, and similarity of looks matters more to younger mothers than older ones
- **? Fertile women are more attracted to sexier men**, whereas women who are in the nonfertile phase of their cycle are particularly attracted to men who show signs of being good fathers. This happens entirely within the context of the relative value of the mate that the woman has as a primary partner (if their partner is high quality, they are especially attracted to them during the luteal phase; Shimoda, Campbell, & Barton, 2018) <— ⍰⍰♂ **Lucio's note:** caution here, based on the latest *Oxford Handbook* these findings related to dual sexuality and ovulatory shift are mixed and the effects rather mild

Women's Preferences Don't Change Much With Equality

The author says that sex differences in mate preferences don't seem to be influenced by economic and cultural conditions, and points to availability and preference for resources as an example:

> For instance, Wood and Eagly (2002) have suggested that women's preferences for resources are driven by their own relative inability to obtain resources themselves.
> This approach would suggest that the difference between men and women would disappear once society did not consistently have women earning less than men. However, recent research (Zhang et al., 2019) debunked this explanation by showing that there were no meaningful differences between samples collected in countries with high and low levels of gender equality

However, little later, the author acknowledges that it does make at least *some* difference:

> Increased equality and economic opportunities for women has an effect on this (Eagly & Wood, 1999), but a regression analysis by Zentner and Eagly (2015) suggests that women would need to earn far more than men in a society for the difference in preference to be eliminated.

I'd note that the difference doesn't need to be eliminated to have a major impact.
And I'd be careful here to distinguish preference vs. *behavior*:

⍰⍰♂ Lucio's note: preference doesn't always translate into behavior. Distributed resources still likely have important impacts
Of course the preference remains that of the handsome, wealthy, dominant, but deeply in love with her.
But I'd argue that even if the *preference* doesn't go away, the *behavior* changes. Smaller need for resources may still change dating *dynamics* and *behavior*.
For example, we may see more women as breadwinners, more women with younger and attractive but poorer men, and fewer women who 'mate switch' based on resources

⍰⍰♂ Lucio's Overview: Studies on Men vs Women's Receptivity to Casual Sex

Drawing both from this handbook and from previous handbooks, here's a summary and overview:

- **Clark & Hatfield (1989): huge gender differences**
  Found a large sex difference in receptivity to casual sex—75% of men agreed to sex with a stranger vs. 0% of women. Equal numbers agreed to a date. Interpreted through Parental Investment Theory: men gain more from multiple partners, while women face higher reproductive costs.
- **Voracek et al. (2005): smaller difference**
  Partial replication in Germany with older participants and more varied public settings. Women were more receptive than in the original study, suggesting that context (age, culture, location) can moderate the sex difference—though men were still more receptive overall.
- **Baranowski & Hecht (2015): addressing safety concerns lead to an even smaller difference still**
  Replicated the effect in a more naturalistic, party-like setting. Women were significantly more willing to agree to casual sex when the setting felt safer, but men continued to be more likely to accept all types of offers.
- **Schützwohl et al. (2009): requestor's attractiveness makes a difference**
  Found that the requestor's attractiveness significantly influenced receptivity, especially for women. Men's already-high baseline left less room for change, while women's responses varied more with partner traits.
- **Edlund et al. (2021): requestor's attractiveness makes a difference 2**
  Confirmed that attractiveness had the strongest effect on women's willingness. Sexual orientation didn't significantly alter receptivity. Again, men remained more consistently open to casual sex.

These findings, combined with hormonal and evolutionary evidence (e.g., testosterone levels, Parental Investment Theory, and the Sexy Son Hypothesis), **support the conclusion that men are generally more open to casual sex**, but that **this difference is flexible and moderated by context, safety, and partner quality**.

Chapter 17: Individual Differences in Sexual Psychology

Figueredo and Salmon show that variation in mating psychology is not just between sexes but within them.

Some individuals adopt more **unrestricted**, short-term mating strategies; others favor **restricted**, committed approaches.
They link this variation to personality (Big Five traits), life history (fast–slow), attachment styles, and environmental cues—illustrating how plasticity and strategy diversity are themselves evolved adaptations.

Life History And Deception

Variation in life history (LH) strategies plays a key role in individual differences in sexual psychology.

Cognitive sexual schemata range from convergent-interest strategies, where males see their reproductive interests as aligned with females', to divergent-interest strategies, where these interests are viewed as conflicting (Malamuth, 1996).

Slow LH strategists are convergent-interest schemata favoring long-term relationships and cooperative biparental care, while fast LH strategists lean toward divergent-interest schemata, which are less compatible with long-term parenting (Malamuth, 1998).
In simpler words, this means that **short-term fast life history strategies are inherently less long-term cooperative**. It's not a stretch to think they may be more antagonistic, win-lose and potentially predatory and deceptive.

Figueredo and Jacobs (2010) expanded this model to social behavior, suggesting **slow LH strategists prefer mutualistic social strategies based on reciprocal altruism** with kin, nonkin, romantic partners, and offspring. These slow LH strategists favor stable, long-term cooperative relationships typical of predictable environments. **Fast LH strategists adopt antagonistic social strategies** (Brumbach, Figueredo, & Ellis, 2009; Brumbach, Walsh, & Figueredo, 2007; Ellis, Figueredo, Brumbach, & Schlomer, 2009).

Mate Value

Mate value refers to traits that make individuals attractive as partners (e.g., physical attractiveness, resources, parenting ability, status).
People with higher mate value tend to secure higher-value partners, especially in long-term relationships (Buss, 2002; Schmitt, 2003).

In **short-term mating**, the dynamics are different:

- **Lower mate value women** can sometimes access **higher mate value men** for casual sex.
- But **lower mate value men** are often **excluded entirely** from short-term mating opportunities (Van Straaten et al., 2009).

People tend to **adjust their mating strategies** based on their own perceived mate value (Kirkpatrick & Ellis, 2006). For example, attractive women show stronger preferences for masculine and high-status traits in men, especially in long-term contexts (Feinberg et al., 2006; Buss & Shackelford, 2008).

For **females and short-term mating**, the evidence is mixed:

- Some studies find **no clear link** between a woman's mate value and her pursuit of short-term sex (Mikach & Bailey, 1999).
- !? Others show that **physically attractive women** (e.g., with ideal waist-to-hip ratios) are more likely to engage in **unrestricted sociosexual behavior** (Brewer & Archer, 2007). **<— ⍰⍰♂ Lucio's note**: I've seen other sources claim that lower mate value women engaged in more casual sex while higher mate value women pair up with high status men, which makes more logical sense. I only read the abstract of that study, but there may be a mixup. The study referred to *facial* attractiveness, and the unrestricted sociosexuality was inferred by the raters, which isn't enough to claim that attractive women are more unrestricted. I'd encourage the authors to double-check that

Perceived mate value also plays a role:

- **Women who experience rejection** lower their standards and become **less choosy**. **<— ⍰⍰♂ Lucio's note**: this means more unrestricted and open to casual sex
- Conversely, **being accepted** boosts a woman's self-assessed mate value and makes her more likely to pursue

high mate value men and seek **long-term commitment** (Reeve et al., 2017). **<— ⍰⍰♂ Lucio's note**: same here, confirms the trend I was expecting

Mate value also influences sexual behavior:

- **High mate value men** report more sexual partners, earlier sexual debut, and greater success in short-term mating (Landolt et al., 1995; Clark, 2006; Perusse, 1993).
- **High-status or wealthy men** tend to marry younger, more attractive women—a pattern seen both historically and today (Betzig, 1992; Conroy-Beam & Buss, 2019).
- **Low-status men**, by contrast, struggle more in both long- and short-term mating markets and often need to lower their standards.

Additionally, **mate value affects mate retention**:

- High mate value men use more **benefit-providing** strategies (e.g., affection, gifts) and fewer **cost-inflicting** ones (e.g., jealousy, control) to retain partners (Miner et al., 2009).

Dark Triad, Psychopathy, & Coercion

Life history (LH) theory helps explain the dark side of sexual behavior.

Individuals with a fast LH strategy—linked to traits like psychopathy and the Dark Triad—tend to pursue exploitative and coercive short-term sexual strategies.
Indeed, research has suggested that **coercive sexuality is a fundamental component of psychopathy** (e.g., Harris, Rice, Hilton, Lalumière, & Quinsey, 2007).
In fact, the best predictor of sexual coercion was predicted by this higher-order Dark Triad factor.

Sociosexuality Components

Sociosexuality was originally viewed as a single dimension (casual vs. committed), but newer research divides it into two separate orientations: short-term and long-term.

These two orientations are somewhat independent but have also been combined into a single higher-order factor to predict behaviors like partner violence and aggression.

Slow LH strategists (those who invest more in long-term planning and relationships) are generally less oriented toward short-term mating and more toward long-term mating. However, newer data suggest that slow LH individuals may integrate both short- and long-term mating strategies more flexibly.

This means that for slow LH individuals, these strategies are less mutually exclusive, allowing for greater adaptability in their mating behavior.

Chapter 18: Experimental Methods in Sexual Psychology

Fitzgerald and Thompson close Volume 1 with a practical guide to experimental design in sexual psychology.

Interesting findings:

- Anxiously attached individuals perceived ambiguous partner behavior to indicate infidelity
- Avoidant individuals perceived these ambiguous behaviors as less likely to indicate infidelity

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Culture of Honors Develop to Control Women's Sexuality

Atari, citing Shackelford (2005), writes:

> behaviors defined as indicators of a culture of honor, such as male aggression to punish sexual transgressions, might be the output of psychological mechanisms that evolved in response to the adaptive problem of mate retention

Supporting this idea, Atari et al. (2020) found that in Iran – a classic "culture of honor" – values around honor strongly correlate with both protective and punitive mate retention behaviors. These values emphasize men's duty to guard female kin and punish women's sexual transgressions, sometimes even by targeting the women themselves.

⍰⍰♂ **Lucio's note:** I considered cultures of honors in this light even before I got deeper into evolutionary psychology: sexual control, and status-promotion.
But the sexual part is likely stronger than the respect/status part.

Similar evidence comes from more female repressive customs like forcing women to use a veil.
Writes Butovskaya:

> The study by Pazhoohi and Kingstone in twenty-five countries demonstrates that veiling promotes sexual fidelity in women (Pazhoohi & Kingstone, 2020).
> **Veiling is a male mateguarding strategy used to secure male reproductive success**.
> Men support veiling more than women, and this male mate-guarding strategy was more evident in harsher environments, with higher mortality rates, where paternal care may be more important for infant survival.

However, veiling is not always and necessarily imposed.
Continues Butovskaya:

> (…) although Islamic men are more supportive of veiling than are women, in general both sexes are more likely to support the veiling tradition when their reproductive interests are more male-centric (i.e., sons are more desirable) (Blake et al., 2018).

Short-Term & Uncommitted Mating Is Inherently More Conflictual

Candolin only indirectly suggests so when she writes that monogamy best merges the interests of both sexes:

> Interlocus sexual conflict could be resolved if the evolutionary fitness interests of the two sexes become aligned. This requires monogamy, with the two partners entirely dependent on each other. However, strict monogamy is uncommon and perfect alignment of interests is thus unlikely to be achieved in most mating systems.

However, it seems a logical next step to me that uncommitted and short-term sex has a larger scope for conflicting interests and, potentially, for manipulation and deception.

Dads vs. Cads (relationship types vs players)

Evolutionary game theory models, inspired by Hawk–Dove dynamics, describe two male mating strategies: “Dads,” who provide parental care, and “Cads,” who do not (Maynard Smith, 1982; Alger et al., 2020).

These strategies coexist in dynamic equilibrium influenced by ecological conditions that favor or disfavor paternal provisioning.

Empirical support for these categories comes from social perceptions, where “Dads” and “Cads” correspond to “Proper” and “Dark” heroes in British Romantic literature, with women preferring “Proper” heroes for long-term and “Dark” heroes for short-term relationships (Kruger, Fisher, & Jobling, 2003).

The models assume that tendencies toward these phenotypes are genetically determined, though this is a theoretical assumption, not an empirical finding.

Research shows men generally score higher on the Sociosexual Orientation Inventory (SOI) than women, reflecting greater average openness to casual sex, though there is substantial variation within each sex (Clark, 2006; Schmitt, 2005).
Both genetic and environmental factors influence sociosexuality. A twin study found sociosexuality to be moderately heritable (about 49%) with a significant role for unique environmental influences (Bailey et al., 2000).

Additionally, unrestricted sociosexuality correlates genetically with sexual coercion (Westerlund et al., 2010). Dark Triad personality traits (narcissism, psychopathy, Machiavellianism), linked to short-term, exploitative mating strategies, also show genetic and environmental influences (Jonason et al., 2009; Schermer & Jones, 2020).

⍰⍰♂ Lucio’s note: the ‘cad approach’ may come with a specific set of psychological and behavioral adaptations
Including avoidant attachment style, Cooldige effect and higher dominance motivation.

Sociosexual Orientation: One Can Be High In Both Casual Sex and Relationship Motivations

In chapter 10 Figueredo and Peñaherrera-Aguirre explain the evolution of sociosexual orientation measurements.

The Sociosexual Orientation Inventory (SOI) originally measured openness to casual sex as a single trait (Gangestad & Simpson, 1990), but later research split it into two dimensions: short-term mating (STM) and long-term mating (LTM) orientations (Jackson & Kirkpatrick, 2007).

Though these two tend to correlate negatively (around r = –0.30), studies show they have distinct patterns of association with other traits—supporting their partial independence (Simpson et al., 2004).

Some researchers recombine STM and LTM into a single factor when predicting broad outcomes like partner violence (Figueredo et al., 2018), while others keep them separate to explore more specific traits like emotional intelligence or executive function (Figueredo et al., 2012).

Father Absence Promotes Fast Life Strategies (Casual Sex)

It's been proposed that girls raised without their biological father tend to mature sexually earlier, start having sex sooner, have more partners, and get pregnant at a younger age than those with present fathers (Anderson, 2015; Ellis et al., 2003; Quinlan, 2003; Salmon, Townsend, & Hehman, 2016).

A 2014 meta-analysis confirmed that father absence is linked to earlier puberty (Webster, Graber, Gesselman, Crosier, & Schember, 2014).

More recent research suggests that it's not just presence or absence, but also the *quality* and *amount* of paternal investment matters in shaping girls' sexual development and behavior (DelPriore, Schlomer, & Ellis, 2017; Ellis et al., 2012).

And a role for behavioral genetics has also been proposed (Mustanski, Viken, Kaprio, Pulkkinen, & Rose, 2004; Schlomer & Cho, 2017), with mathematical models suggesting genetic confounding (Barbaro, Boutwell, Barnes, & Shackelford, 2017).

However, ultimately, father presence or absence does seem to make a big difference:

> However, in an empirical test of the genetic confounding hypothesis (i.e., gene–environment correlations cause spurious relationships between father absence and females' age at menarche and first birth), Gaydosh, Belsky, Domingue, Boardman, and Harris (2017) used molecular-genetic data and found that father absence and polygenic scores independently predicted reproductive timing. This suggests that (at least for females) **father absence, as an index of stressful childhood environments, explains unique variance in sexual behaviors beyond genetic inheritance**.

There Is A Link Between IPV & Cuckoldry

This may be an uncomfortable finding and obviously it doesn't justify violence in any way, and we must be careful not 'victim blame' with it.

But cuckoldry, whether real or imagined, seems to be an important element of intimate partner violence and forced copulation:

> Men who report sexually coercing their regular partner also report greater suspicion of her extra-pair copulation (EPC), and women who report a greater likelihood of pursuing EPCs also report that their regular partner is more sexually coercive (Arnocky, Sunderani, Gomes, & Vaillancourt, 2015; Goetz & Shackelford, 2006, 2009).
> Among men convicted of physically assaulting their regular partner, those who performed forced intimate partner copulation (IPCs) – relative to those who did not perform forced IPCs – experienced greater cuckoldry risk events prior to the assault (Camilleri & Quinsey, 2009). Men at greater objective sperm competition risk are more likely to perform forced IPCs, but only those men who perceive a greater likelihood of their partner's EPC (McKibbin, Starratt, Shackelford, & Goetz, 2011; reviewed in Goetz, Shackelford, & Camilleri, 2008).

QUOTES

On survival meaning nothing from an evolutionary point of view if without reproduction:

> if an animal lives but does not reproduce, it may as well not have bothered, at least from an evolutionary standpoint

On humans losing to tardigrates unless we're careful:

> the human brain has enabled one species of apes to conquer the Earth and possibly also other parts of the solar system or the universe. However, the same brain has allowed the ape to construct hydrogen bombs that could destroy a large part of the Earth's biosphere, including its own species. Due to SBS, the winners of the evolutionary battle could be resilient, undemanding organisms without such "progressive" brains (e.g., tardigrades), and such organisms might prevail on the Earth and most planets in the universe.

On pop psychology books:

> One of the most popular "pop" psychology books of all time, *Men Are from Mars, Women Are from Venus* (Gray, 1992), focused on differences between men (…)
> Looking at selected pop psychology books and ancient civilizations is not the best way to understand the differences and similarities between men and women – instead, we need to turn to scientific evidence

REVIEW

The Cambridge Handbook of Evolutionary Perspectives on Sexual Psychology serves as a solid and research-driven foundation for the follow-up volumes.
It offers a valuable introduction to the evolutionary study of sexual behavior and conflict.

While a few areas could benefit from refinement—such as clearer acknowledgment of ongoing debates (e.g., sperm competition, ovulatory shifts), and some closer alignment between cited studies and the interpretations—these are minor in the context of the book's overall quality.
From an editing perspective and ease of learning, some chapters may be streamlined by reducing overlap across topics or condensing them into a single chapter (eg.: sperm competition, dark triad/life history strategies).

That said, this is an authoritative textbook tackling a complex subject, and it succeeds in laying the groundwork for the adaptations explored in volumes 2 and 3.
I came away with new insights and I could improve several articles on our site as a result—that's always the biggest compliment I can pay to any resource.
I'm grateful to the editors and contributors ⍰⍰, and I look forward to delving into volumes 2 and volume 3.

The Science of Masculinity: Traits, Roles, and Strategy

Lucio Buffalmano · 14 September 2025 · Archived copy · Original

Masculinity can be confusing for men because the discussion is often biased, opinion-based, or unscientific.

At The Power Moves, we prioritize science, experience, and what's proven to work.

This masculinity guide helps you become a powerful, effective, and masculine man by synthesizing evidence from psychological research, sociology, and human behavior to provide a no-nonsense, proven approach—without platitudes or wishful thinking.

What Is Masculinity

Definition:

Masculinity represents a set of physical and psychological traits, behaviors, and achievements typically associated with dominant adult males.

Note:

- 'Achievements' is important because, unlike femininity, **masculine respect must be earned** (Vandello, 2008)
- 'Dominant' because many masculine traits align more with high-value, successful men, rather than 'men' in general.

Common Masculine Traits

Across many cultures and studies, common masculine traits include:

- **Mental strength**
  - Confidence and self-esteem
  - Courage and risk-taking (when appropriate)
  - Stoicism, emotional self-control and stability
  - Independece and self-reliance
- **Physical formidability**, including size
  - Strength and muscular build
  - Athleticism
  - Body cues: V-hape, prominent jawline, masculine nonverbals, etc.
- **Social power and influence**
  - Interpersonal dominance and assertiveness
  - Leadership
  - Status
    - Honor, upholding individual, familial, and group honor
- **Ambition**
  - Decisiveness & action bias

Many of these traits are not arbitrary, and correlate with testosterone and/or with evolved strategies (Myers and Bjorklund, 2020).

Lower scores on these traits signal lower masculinity.
Higher scores signal higher masculinity.

Core Masculine Roles

These roles, common among different cultures, also carry expctations of behavior:

- **Breadwinner**, or higher household income
- **Contributor** to society
- **Household leader**
- **Impregnator** (Gilmore, 1990)
- **Protector** of females or society (warrior archetype)

Culture plays a larger role in men's *roles*, rather than *traits*, but biology also matters.

The 'breadwinner' may be more contested.
Even if the hunter-gatherer hypothesis is correct, hunting equals not 'breadwinner' since some evidence suggests women's gathering can bring more food and calories.

The evolutionary and biological basis for the "protector" role is stronger, supported by physical dimorphism and male–male competition.
And the biological case for 'impregnator' is unquestionable.

The masculine archetype of warrior/protector, also highlighted by Gillette and Moore, is a cross-cultural role that emphasizes protection and strength.

Masculinity in Context: A Comparison

Masculinity often gets defined in contrast to femininity.

Here are research-based contrasts (with lots of overlap in reality):

Trait / Domain	Men	Women	Magnitude / Notes
Mental	Higher spatial (rotation/navigation), STEM propensity. Same general reasoning	Higher verbal (fluency, reading, writing) and superstition propensity (woo-woo)	verbal: small; spatial: moderate
Aggression	More physical & verbal aggression, especially in competitions	More relational & covert aggression (e.g., exclusion, gossip, & in relationships)	Moderate
Risk-Taking	Higher, especially under social pressure or masculinity threat	Lower; more cautious and risk-averse	Moderate to large in physical domains
Emotional Expression	More anger expressions; less expressiveness in public; similar in private	Higher emotional responsiveness, expressiveness (esp. for sadness/vulnerability)	Small to moderate, varies by emotion & context
Help-Seeking	Less likely to seek help; greater self-reliance	More likely to seek help, esp. for emotional or health	Substantial real-world implications
Communication Style	Report-focused, task-oriented, higher power language	Rapport-focused, cooperative, lower-power language	Context-dependent
Nonverbal Behavior	Less smiles & gazes; more dominant nonverbals	More smiles, gazes, touches in social contexts;	Small to moderate; varies with context
Socialization & Skills	Activity-based; instrumental support; lower self-disclosure & social skills	Emotion-based & intimate; co-rumination; higher emotional reading	Moderate
Empathy & Helping	More physical help in public or risky situations	More nurturing & empathetic in private	Moderate; varies by situation
Confidence & Self-esteem	Higher confidence; attributes success to ability	Lower & fluctuating; attributes success to effort & luck	Small to moderate
Leadership	More task-oriented or autocratic leadership. Competence assumed.	More democratic or transformational leadership. Competence must be proven	Large perception gap, equal results
Social Dominance	Higher interpersonal dominance and social-dominance orientation	Lower interpersonal dominance & SDO	Moderate to significant

Table compiled by Lucio Buffalmano, synthesizing empirically supported findings from the Sage Handbook of Gender and Psychology & Helgeson's Psychology of Gender, and various meta-analyses

Culture, Biology, and Masculinity

Biology influences culture and, in the long run, culture also shapes biology (Henrich, 2015).

Hence, rather than clashing, **biology and culture often move together**. Studies also show strong cross-cultural agreements regarding beliefs about manhood.

However, culture also plays a decisive role.
Some standards of masculinity shift across time and place (for example, *The Cambridge Handbook* notes changing views around oral sex, with older-school men seeing it as unmanly).

In many cases, cultural expectations may outweigh biological markers, since masculinity is judged socially rather than in the laboratory.

For example, there is no clear evidence that men are less emotional. In some studies, men have *stronger* physiological responses to emotion-inducing events.

However, people associate emotions with femininity and stoicism with masculinity.

Masculine Cultural Stereotypes

Men are different in important ways.

Gender differences also add up over time and aggregate at the group level to produce significant differences for both individuals and societies.

However, **pop psychology often overestimates gender differences**, contributing to perceptions of exaggerated differences.
It's not uncommon for people to associate these polar opposites to masculinity and femininity:

Masculine Traits	Feminine Traits
Assertive	Agreeable
Dominant	Nurturing
Stoic	Expressive
Independent	Interdependent
Competitive	Cooperative
Relaxed	Neurotic

Partly true—but without context, it's pop-psych, male wishful thinking, and disempowering clichés

In reality, the overlap is greater than many claim (Stewart-Williams, 2020), and many gender differences typically follow the pattern shown in this chart:

However, as we shall see, even mistaken cliches matter in defining masculinity.

⍰⍰**Takeaway**: To assess individuals, look more at *individuals*, rather than gender.

Masculine Stereotypes Set Masculine Standards

> Masculinity is what people believe masculinity is

Gender stereotypes are prescriptive, not just describing typical behavior, but suggesting how individuals *should* behave (Prentice & Carranza, 2004).

Meaning, **it doesn't matter whether a stereotype is biologically grounded, fair, or harmful—if X is expected of men, not doing X is deemed unmasculine**
And failure to perform may cost men status, mental health, and even their relationships.

This is why an early article on this website cautioned men around displaying vulnerability.

However, following stereotyping blinding won't serve a man's interests.
Some are bogus, some are manipulative, and some are obviously harmful.
For example, I've encountered older masculine stereotypes that 'mannish men smell (because they don't care about hygiene)'.
While it may be true that men, on average, are less invested in grooming than women, poor hygiene consistently lowers both social status and intrasexual attractiveness.

Lucio's Tip: **Choose *your own* standards**

Lucio:
Why would you let *random others* set *your* standard?

First, most claims about 'what men are' are baseless power plays to impose personal standards.
Second, generalizations refer to the *average* of men. If you're reading TPM, you want more than average.

I've seen enough cool guys lose self-esteem based on inherited standards.

Throw out others' definitions of 'what a man is'.
And focus on whatever moves you towards your goals.

This is what I've done for myself, and it has served me incredibly well.

It's mentally empowering. And paradoxically, *this* is actual masculinity: less other-reliance, more independence. ⍰

⍰⍰**Takeaway**: Both biological markers and culturally-shaped behavioral expectations define masculinity

Why Masculinity Is Important

Men who are more masculine than the average tend to gain in:

- **Status & respect**: High-masculinity men are perceived as more dominant and competent. They tend to gain status and respect. And the more masculine the context, the more masculinity matters
- **Attraction**: Masculine men are more attractive, especially to high mate value women (Figueredo and Salmon, 2022)
- **Competitive achievements**: Thanks to masculine traits like ambition, risk-taking, and assertiveness (Puts, 2010).
- **Leadership**: Masculine behavior correlates with being seen as a natural leader (Van Vugt & Spisak, 2008).

Conversely, low masculinity *costs* in all those areas.
And 'gender non-conformity' incurs extra social and health costs.

Masculinity & Power

> Masculinity gets ahead, femininity gets along
>
> *– A generalization, with a backdrop of truth*

Already from childhood, girls play more relationship-oriented games, and boys more dominance-related games (Pellegrini, 2013).

Men seek more agentic power, whereas women prefer social connections (Hays, 2013; Yang & Girgus, 2019). Women also associate stronger emotions with their intimate relationships and are more anxiously attached.

⍰♂**Lucio's take: your value trumps gender for relationship dynamics**
Studies found *men* often value relationships more—likely because mate value trumps all. Lower-value men cling; high-value women choose. So forget 'men are…' and focus on *your* power.

Men Have Higher & Resilient Self-Esteem

Across several studies, men's self-esteem is more constant and independent.

from Roberts and Nolen-Hoeksema's study, adapted by Helgeson

Lucio's Note: Prioritize self-esteem
It underpins masculinity, mental health, and social power. If needed, check our confidence course.

Agentic Masculinity Improves Health & Self-Esteem

Power and acceptance relate to the 'agency' and 'communion' model (David Bakan, 1966):

Concept	Definition	Examples	Key Phrases
Agency	**Self-focus**: independence, assertiveness, control, achievement.	Ambition, leadership, self-reliance, competence.	*"I act" / "I achieve."*
Communion	**Others-focus**: warmth, cooperation, connection, nurturance.	Empathy, kindness, emotional support, belonging.	*"I belong" / "I care."*

Alignment with these modalities supports mental health.
Men's self-esteem seems based on power, differentiation, effectiveness, and independent action. Women's self-esteem is based on communion (Miller, 1991; Brizendine, 2006).

Asian men: prioritize power & masculinity
East and South-East Asian men are seen as less masculine. Plus, collectivist cultures are seen as low agency. This combo may explain why Asian men in the West have the fewest sexual partners.

High Power Emotions

Agentic emotions are associated with masculinity, and communal ones with femininity (Fischer and Evers, 2013):

Agentic (high power)	Communnal (subordination)
Anger	Sadness
Contempt	Guilt

Agentic (high power)	Commununal (subordination)
Disgust	Shame
Pride	Happiness

⍰⍰ **Takeaway**: focus less on 'being happy', and more on being *proud* of who you become ⍰

⍰♂Lucio's Approach: **Go for power, and masculinity will follow**

Lucio:
Despite never building my identity around 'masculinity', two meaningful events made me reflect.

One day, my father proudly said of me, 'He's a real man'. And an ex-girlfriend in love said that 'I behaved like a (real) man'.

I suspect traditional ex and 'old school' father linked 'high power' to 'masculinity'.
But I found a 'power-focus' approach far more effective for achieving goals.

Hyper, Positive, & Toxic Masculinity

Hypermasculinity has negative associations because the Hypermasculinity Inventory measures *toxic* traits.

We take a different approach and define it neutrally to distinguish it from *toxic* masculinity:

- **Hypermasculinity:** extreme masculine traits (neutral)
- **Toxic masculinity:** extreme *antisocial* masculine traits (value-taking)
- **Positive masculinity**: extreme *prosocial* masculine traits (value-adding)
- **Naive masculinity**: milder, culturally acceptable, but biased masculinity

Masculine	Hypermasculine
Mascular definition	Bodybuilder

Masculine	Hypermasculine
Protector	Fighter
Honor (upholding reputation)	Honor-based aggression
High-ranking	Top ranking
Driven	Hypercompetitive

Positive vs. Toxic Masculinity

These dichotomies are simplistic, but can help understand the concepts:

Toxic Hypermasculinity	Positive Hypermasculinity
Gangster	Cop
Barbarian / Warlord	Special op / General
Genghis Khan / Mongols	Marcus Aurelius / Roman Empire
Joker / Villain	Batman / Hero
Deadbeat dad	Top 1% provider

They're both masculine, but one adds value, the other takes value

Note that women can also display behaviors labeled as 'toxic masculinity'. They're not *exclusive* to men—they are simply *more common* in men.

The Dark Appeal of Toxic Masculinity

The unmitigated dominance of toxic masculinity can be perversely attractive.

Part of it relates to sexuality.
For example, a popular study with 'Proper' and 'Dark' heroes in romantic literature showed that women preferred 'Proper' heroes for long-term but 'Dark' heroes for short-term flings.

The hero in Bonnie Tyler's song is a hypermasculine cowboy. And he's not carrying roses

Not all women prefer 'dark heroes'—it may be correlated with sociosexuality (ie, preference for short-term mating). But dominant and masculine men tend to out-compete men who are too low in dominance and masculinity.

⍰⍰♂ Lucio's experience: Genghis Khan had 3 balls?
In primary school, a (female) teacher said, awestruck, that 'Genghis Khan was rumored to have had 3 balls'. I wasn't impressed: 'What's so remarkable about being a freak', I asked. I remained unimpressed by Mr. Khan's balls count, but I learned about hypermasculinity's appeal.

Men follow similar patterns.
In the 2020s, young men flocked to a high in psychopathy influencer.
It may be a historical aberration—a swing back against a wave of anti-masculinity. But the appeal of darker figures seems timeless.

Men have long been fascinated by drug lords, fictional or not, powerful despots, and gangsters. And few mind that male role models like The Godfather or Gotti 'made their bones' at the end of a barrel.

⍰ Covert Toxicity: Masculine Shaming Power Move to Support War

Toxic masculinity may be nuanced and covert.
Take this *alleged* quote from a US general as an example:

The quote's interpersonal dominance, sexual confidence, and 'warrior ethos' can also be seen as disrespectful mate poaching, narcissistic self-aggrandizement, and possible war (crime) apologia.

This approach is effective because young men loathe being seen as effeminate. Evolution underpins it: invading soldiers may out-reproduce low-status, cuckolded pacifists.

Unfortunately, it brings along ingroup-outgroup dynamics that include racism and tribalism ('Male warrior hypothesis').

🤔Lucio's Opinion: **Humanity needs *enlightened* (hyper)masculinity**

Lucio:

Cooperation is crucial to long-term human survival and thriving, solving global issues and maximizing our potential.

Conversely, war has always been progress and civilization's #1 enemy.
And it may be the #1 risk for humanity's future.

Naive Masculinity Is Weak

Naive masculinity is 'safe' but biased, and doesn't serve men's best interests.

Naive	Truth
Masculinity is to provide	Higher-testosterone men are more likely *players* than providers (Archer, 2005)
Men should be 'tender defenders'	No evidence that non-tender men are any less masculine
'Man up and commit'	Men face real risks and challenges in modern dating dynamics
Masculinity is to build	True, and toxic masculinity can also destroy
Downplays or undermines womanizers	The inseminator is a masculine archetype. 'Lover' is an effective sexual strategy

This sanitized version of masculinity may sound 'nice'—but it's a lie.
Worse, watered-down masculinity is ineffective and unappealing, and only pushes more men toward *toxic* extremes.

Solution: ***Honorable*** **masculinity is your life call**

Lucio:
I believe men's ultimate call is to advance humanity and civilization.

Ambitious men desire a strong impact.
That impact can be positive, building businesses, empires, and advancing humanity.

Or it can be destructive.

You must accept that reality.

And *choose* to be a 'builder'.

The answer is not 'less masculinity'.
The answer is *channeling* more masculinity well .

Read more:

- **Naive self-help** doesn't help men advance

Calibrating Masculinity for Success

Now let's get to practical strategies to make the most out of masculinity:

1. Embrace Your Masculinity

Ambition, independence, confidence and positive dominance are great things.

They make your life better, and if you pursue them with win-win, they make the *world* better.

Masculine ambition advances men, and humanity.

PRO Tip: Embrace your unfavorable masculinity, too.
The 'masculinity' that's often swept aside. Baldness is masculine, for example. And autism has been theorized as 'extreme male brain'.

2. Choose Resilient Self-Identities

Building your self-esteem around masculinity has some upsides if you 'meet the standards'.

But it has bigger downsides because masculinity is earned, but also *easily lost* (Vanedello and Bosson, 2013).

For example, men with more traditional masculinity beliefs suffer more anxiety and depression for as little as a job loss (Bosson et al., 2013). That's not masculine power, that's masculine *fragility*.

Solution: choose antifragile self-identities.
Be the relentless man, the strategist who finds ways. Or be like water, adapt, and win

3. Reach A 'Masculine Optimum Balance'

Masculinity follows the law of balance: benefits reach a peak, then decline, and may turn negative.

For example, extreme risk-taking becomes recklessness and shortens lives.
Write Helgeson and Fritz:

> unmitigated agency has been associated with reckless driving, substance use, binge eating, psychological distress, and overall lower levels of well-being (Danoff-Burg et al , 2006; Ghaed & Gallo, 2006; Yu & Xie, 2008).
> (…)
> unmitigated communion is associated with poor health

Also women's attraction decreases at extreme levels of masculinity (e.g., hirsutism, beards, muscularity, facial masculinity).

Most men must focus on *increasing* masculinity
While overdoing it is a risk, most men are far from that 'threshold'.

♂Lucio's Take: **Acquire empowered 'balanced' open-mindedness**

Lucio:
Men tend to be less progressive than women.

But reactionary masculinity is partially fear-driven.
Fear of losing social power, and fear of cuckoldry from 'sexually liberated' women.

Fearful reactionism is driven by neediness.

Peak power is always having others *want* to follow, without even *needing* them to follow.
Make women *want* to offer support and loyalty to a masculine protector (see here).

Calibrate Masculinity

The name of the advanced game is calibration.

Calibration is its own skill and requires power awareness and strategic thinking.
But just as examples:

- More masculinity with dominant men
- More communion bonding with a girl

⍰⍰♂ Lucio's experience: calibrating masculinity and bonding was the secret
In good part, women attached to me because I mixed power with effective empathic bonding.

FAQ About Masculinity

What is masculine

Masculine is anything commonly associated to men, both biologically and socially. Biologically, men on average have greater physical strength, higher testosterone, and more risk-taking tendencies. Culturally, men may be expected to provide and protect. What counts as "masculine" can shift across societies, but it always reflects a mix of male biology and social values.

What's toxic masculinity

The term 'toxic masculinity' is often misunderstood—it doesn't mean masculinity itself is toxic.
Toxic masculinity is a subset and distorted version of masculinity. It arises when otherwise neutral or even positive male traits—like strength, leadership, or ambition—are taken to extremes or expressed without regard for others. In those cases, they can cause harm to both individuals and society. Examples include gratuitous aggression, dominance pursued without moral qualms, or bullying.

What's the difference between masculinity and toxic masculinity

Masculinity refers to traits that help men gain respect, achieve goals, and navigate social hierarchies. Toxic masculinity is when those traits go to extremes and become antisocial—assertiveness turns to aggression, protectiveness to control. The Power Moves focuses on developing masculine traits effectively, avoiding the pitfalls of both naivete and harmful expressions.

Is masculinity natural or learned?

Both. Biology provides predispositions—testosterone, physical dimorphism, sexual interests—while culture channels them, and role models provide guidance. Effective masculinity comes from both innate tendencies and deliberate practice.
The Power Moves teaches men how to develop these traits practically, and to achieve relevant life goals.

SUMMARY

About the Authors:
Different authors, and the main editors are **Lance Workman**, **Will Reader**, and **Jerome H. Barkow**.
Workman and Reader also edited *Evolutionary Psychology: An Intro*.

Chapter 4: Eusociality in Humans

Laura Betzig opens by tracing the evolution of fully cooperative societies ("eusociality") in humans, contrasting our species with the eusocial structures of some insects.
She argues that human kinship systems and cooperative breeding foster levels of altruism and division of labor unseen elsewhere, yet still follow principles of inclusive fitness.

- **Allomothering & cooperative childcare**: human infants receive care from multiple relatives (grandmothers, aunts) boosting offspring survival.
- **Division of labor & reproductive skew**: though humans lack the morphological caste system of insects, social structures help regulate who reproduces vs. who helps.

Chapter 5: The Nature and Psychological Foundation of Social Universals

Bernard Chapais argues that many cultural universals (e.g. taboos, marriage rules) derive from evolved psychological adaptations for kin recognition, alliance formation, and status acquisition.

He outlines how a small set of cognitive mechanisms gives rise to the vast interlinked web of human social values and norms.

Category	Examples
Individual social acts	Insulting, tickling, healing the sick, gossiping, gift-giving, mourning, courting, greeting, threatening, joking, monitoring/imitating high-status individuals, provisioning children, stealing
Social interactions	Misinforming/misleading others, toilet training, rape, weaning, food sharing, teaching, taking revenge, incest avoidance, mating, male/female/sibling conflicts, mediation in conflicts, dominance interactions, coalitions, social play
Dyadic relationships	Friendships, pair-bonds, liaisons, mother–offspring bonds, father–offspring bonds, grandparent–grandchild bonds, lifetime bonds between cross-sex siblings, kin bonds, affinal bonds (e.g., brothers-in-law), task-specific partnerships, leader–follower relationships
Social differentiation criteria	Gender, age, kinship distinctions (paternal/maternal, lineal/collateral), generation (ascending/descending), affinal links, physical formidability, skills (physical, intellectual), temperament, beauty, health, in-group vs. out-group
Adaptive processes regulating social relationships	Reciprocity, negative reciprocity, mutual cooperation, kin altruism, nepotism, resource/status/sexual competition, male bias in violence, female mate choice, female bias in childcare
Moral dimensions of adaptive processes (derived)	Fairness (equity), generosity, judging others, disapproval of stinginess, resentment of exploitation, loyalty
Consistent social arrangements (derived)	Multimale–multifemale groups, kin groups, division of labor by age/sex, age grades, biparental families, households, status orders, prestige, lineages, clans, intergroup alliances, federated structures, leadership/government
Categories of social activities (derived)	Games, sports, feasts, ceremonies, cooperative labor, trade, decision-making, capital punishment, intergroup conflicts, religious rituals, rites of passage, visits, storytelling, dance, music, singing
Principles characterizing social life (derived)	Male political control, hospitality, collective identity, in-group favoritism (ethnocentrism), ostracism, parental mate influence, exogamy, property, territoriality, inequality, murder proscription, kinship, group coordination, social inheritance
Abstract social notions (derived)	Law, proscriptions, prescriptions, membership rules, kin/age-based statutes, rights, etiquette, obligations, sanctions, humor

A classification of a large sample of social universals found in Pinker's (2002) alphabetical list of absolute

universals drawn from Brown (1991). Primary social universals are likely to have psychological underpinnings. Derived social universals result from combinations of primary social universals.

- **Status-attainment module**: humans possess innate sensitivities to rank and prestige, which drive political alliances and social stratification.
- **Kin detection & incest avoidance**: cues like coresidence and maternal perinatal association inform inbreeding avoidance.
- **Coalition psychology**: mechanisms for recognizing and reciprocating support within groups underpin norms of obligation and trust.

Status-seeking

Humans are hard-wired to pay attention to status, and the author lists four motives related to status:

1. opportunistically **acquiring** and improving one's competence (in one or more domains of activity);
2. **monitoring** one's and others' relative position in the competence order;
3. seeking to **outperform or outrank** others whenever this is possible and advantageous – which depends on the context (e.g., Anderson et al., 2012) – and to maintain one's position in the face of challenges;
4. **signaling** one's position in the status hierarchy in order to reap the benefits associated with it

Chapter 6: The Study of Culture and Evolution across Disciplines

Alex Mesoudi surveys how cultural evolution has been approached in anthropology, psychology, archaeology, and biology.
He advocates for moving past the evolution/culture dichotomy, and for integrative models that extend the scientific approach to culture (something that sociocultural anthropology isn't doing, but that cultural evolutionary scientists are).

⍰⍰♂ Lucio's note: This was a good and well-balanced chapter showing how culture and evolution aren't two extremes of a continuum, but two mutually-evolving and codependent forces (just added a note to Rogers' paradox, see analyis below).

The 'Drift' Between Evolution & Cultural Evolution Is Thinning, But Differences Persist

The author argues that despite there still being some lingering drift between evolutionary psychologists and cultural constructionists, the field has been moving in the right direction of acknowledging the importance of both evolution/biology, and culture:

> This focus on universals was an explicit reaction against what Tooby and Cosmides (1992) called the "Standard Social Science Model," which they characterized as a denial of human nature and an extreme cultural determinism where evolution played no role in shaping human behavior.
>
> While this was a laudable aim, some have argued that evolutionary psychologists swung too far the other way. As Laland and Brown (2011) point out, in Buss et al.'s (1990) cross-cultural study of mating preferences, much

> more variation (around 14 percent) in responses was explained by the cultural background of the participants than was explained by sex (only around 2 percent).
> Yet the study is typically cited as evidence for the universality of human mating strategies.
>
> The situation has improved since these early studies, however, with evolutionary psychologists now formulating specific hypotheses about particular patterns of cultural variation and testing them in targeted cross-cultural comparisons (Apicella & Barrett, 2016).

And, most importantly, that cultural variations do not disprove evolution, but confirm it:

> In sum, an early focus within evolutionary psychology on human universals (e.g., Brown, 1991) has given way to an appreciation that cultural variation (Definition 3) is not only perfectly consistent with an evolved human psychology (Barrett, 2015), but also that cultural variation can be utilized to test evolutionary predictions (Apicella & Barrett, 2016)

However, while there are plenty of areas of disagreement, there still remain some differences to exactly how much culture matters, and which force is the most 'potent' in shaping human psychology, behavior, and society:

> In sum, while there are large areas of agreement, evolutionary scholars disagree over how much explanatory power to assign to transmitted culture.
>
> Evolutionary psychologists and human behavioral ecologists typically treat transmitted culture as a proximate mechanism that helps to explain how we arrive at genetically adaptive behavior. Much cultural evolution work is consistent with this, as in the case of genetically evolved content biases.
>
> But many cultural evolutionists argue that transmitted culture also often changes the rules of the human evolutionary game, creating new equilibria (e.g., large-scale cooperation), spreading maladaptive behavior (e.g., copycat suicide, small family sizes), and replacing genetic evolution as a source of adaptation (e.g., resulting in complex technology and institutions or grammatical structure).

In simpler terms, this means that evolutionary psychologists and behavioral ecologists view culture not as an independent force, but as a tool that helps people behave in ways that are aligned with their evolved genetic interests (ie.: use culture to enhance genetic fitness with better survival and reproduction).

The author seems to agree with evolutionary psychologists, and content biases, which are built-in tendencies, shaped by evolution, to focus on certain cultural content we're most likely to learn and retain, proves that **genetic evolution still ultimately drives behavior**, and culture just works within that framework — as a **channel for expressing evolved adaptations**.

In contrast, cultural evolutionists (like Boyd, Richerson, Henrich, etc.) argue that **culture can become its own evolutionary force**, sometimes even **overriding or changing genetic incentives**.

My note: both make great points, they're not antithetical, but cultural evolutionists fielded stronger arguments
The spread of maladaptive behaviors (like copycat suicides or choosing to have fewer children), the importance of culture to survival and reproduction in harsh climates and environments, and culture's increasing role in human evolution are too compelling to downplay.

Marriage Norms Adapt to Environments

> Human behavioral ecologists assume that human behavior is flexible enough to generate adaptive responses to

> diverse environmental conditions, in contrast to the sociobiological focus on behavioral universals or fixed genetically evolved predispositions.
>
> Consequently, human behavioral ecologists showed how marriage practices may vary in a biologically adaptive manner, with polyandry emerging in harsh environments where more than one man is needed to raise offspring (Crook & Crook, 1988; Smith, 1998) and polygyny emerging when men can monopolize resources and accumulate wealth, particularly via pastoralism (Borgerhoff Mulder, 1990)

Important Concepts

- **Dual-inheritance frameworks**: gene–culture coevolution models showing feedbacks between genetic propensities and cultural practices.
- **Transmission biases**: prestige, conformity, and content biases shape which cultural variants spread.
- **Methodological advances**: network-based diffusion analysis (NBDA) and experimental microcultures as tools to quantify cultural-evolutionary dynamics.

Chapter 7: Are Evolutionary Psychology and the Neuroscience of Motivation Compatible?

Frederick Toates explores how basic human drives like hunger and sex work.
He combines insights from evolutionary psychology with brain research, showing that many of our motivations are shaped by evolved systems in the brain—like the dopamine system—that push us to seek rewards and meet survival and reproduction needs.

Some of these systems, however, evolved for different environments and can turn maladaptive, including our preference for sugary or fatty foods, and our brain receptors that didn't evolve in a world where getting addicted to drugs was a possibility.

Interesting Notes

- **Pregnancy sickness may be an adaptation**: *Rather than being an example of pathology, pregnancy sickness fits the criteria of being an adaptation (…) It protects the baby from toxins at a time of maximum vulnerability of the developing nervous system (i.e., usually starting at 2–4 weeks of pregnancy and ending at 14 weeks) (Profet, 1992).*
- **Testosterone ≠ more aggression**: *in the popular imagination more T = more aggression. However, the evidence suggests a more nuanced view (Archer, 2006; Dreher et al., 2016).*
  (…) in keeping with principles of evolutionary function, the secretion of testosterone usually reflects the cost–benefit calculation of aggression in the animal's present context (Archer, 2006). (…) Testosterone increases aggression tendencies in men who are dominant and/or low in self-control (Carré et al., 2017).
  (…) In men, boosting levels of testosterone increases the punishment given to wrongdoers, but also increases the reward given to a deserving other (Dreher et al., 2016). The authors interpret both of these actions as assertions of status.
- **There may be a correlation between testosterone and short-term mating strategy**: Archer (2006) predicts that testosterone is positively linked to short-term mating and negatively linked to marital and parental investment. Supporting evidence suggests testosterone is associated with a more extraverted, uninhibited, and dominant personality (Archer, 2006, p. 337), aligning with a short-term mating strategy focused on mating over parenting
- **Empathy's strength is partially associated with in-group belonging** (Hein et al., 2016).

Chapter 8: Are We Designed to Be Happy? The Neuroscience of Making Sense of Pleasure

Stark, Berridge, and Kringelbach explain that the brain has separate systems for "liking" and "wanting." Evolution shaped these systems to help us seek rewards that boost survival and reproduction.

- "Liking" involves small brain areas (hedonic hotspots) that produce pleasure, using opioid and endocannabinoid chemicals.
- "Wanting" is driven by dopamine, which tracks reward cues—not pleasure itself—explaining why we can strongly crave things without enjoying them (as in addiction).

This split helps us stay motivated without becoming overwhelmed by constant pleasure.

Chapter 9: Environmental Pressures on Transgenerational Epigenetic Inheritance

Adhya et al. look at how stress during pregnancy or early life can cause changes in how genes are expressed—without changing the DNA sequence itself.
These are called 'epigenetic changes,' and when such changes can be passed on to future generations, it's called 'transgenerational epigenetic inheritance'.

They focus especially on links to autism-related traits.

- **Timing matters (critical windows)**: Stress in early stages of pregnancy (like the first trimester) affects gene expression patterns in developing brain cells.
- **Lab models**: Stem-cell–derived brain cells show abnormal gene activity in genes linked to autism.
- **Air pollution is harmful**: Maternal exposure to air pollution during pregnancy is also highly associated with autism, and one study showed pregnant mothers living near freeways were more likely to have children with autism (Volk et al., 2011).

I also noticed that the concept of autism as a 'extreme male brain' seems to get with these findings:

> Steroids are important factors in brain development, and higher levels of circulating sex steroids in the male fetus are positively associated with autism (Baron-Cohen et al., 2011, 2015). Mothers with polycystic ovary syndrome, characterized by hyperandrogenism and elevated levels of androgens during pregnancy, are also at greater risk of having children with autism (Kosidou et al., 2016; Pohl et al., 2014)

Chapter 10: The Problem of Altruism and Future Directions

Colquhoun, Workman, and Fowler revisit classic theories about why people help others—like helping family (kin selection) or expecting favors in return (reciprocal altruism).
They argue that in real life, cooperation often happens in larger social networks, not just one-on-one relationships.

- People tend to form **clusters of cooperators**, which helps keep altruism going even without direct payback
- **Altruism for reputation may be a strategy** to attract strong, reliable allies.
  Indeed:
  - **Altruism increases when behavior is made public** from altruism in economic games like public goods or dictator games (Andreoni & Petrie, 2004; Filiz-Ozbay & Ozbay, 2014; Rege & Telle, 2004), to greater engagement in volunteering (Carpenter & Myers, 2010; Linardi & McConnell, 2011), or buying "green" products rather than cheaper alternatives (Griskevicius, Tybur, & Van den Bergh, 2010)
- **We help the highest values people when risk is high**: In life-or-death scenarios, participants would help young, healthy, and/or wealthy individuals as opposed to very young or old, unhealthy, and/or poor individuals.

They also found more help was given to premenopausal as opposed to postmenopausal women.
  - But we help the neediest when risk is low: But in the lower cost situation of everyday favors, the authors found a curvilinear effect for age, with the very young or old receiving more help, and the reverse or diminished effects for health, wealth, and many other factors (Burnstein, Crandall, Kitayama, 1994)
  - It's not always 'kin above all': While there was still found a preference to help close kin, the results demonstrate that it is not sufficient simply to state that kin selection should lead to favoring close relatives; rather, it should lead to the selection of the optimal indirect fitness gain
    Similar results are reported by Essock-Vitale and McGuire (1985)

- **Sexual selection may play a role, and men may help others to signal mate value**: *researchers have proposed that males are more likely to produce costly signals through altruistic behavior, either by aiding females or by aiding males to signal that they are of higher quality. In this way, both intra (within sexes) and inter (between sexes) components of sexual selection may be operating.*
  Some evidence supports this theory:
  - And prosociality may support sexual outcomes: *Following up on the themes explored by Barclay, Arnocky et al. (2016) found that "altruists" self-reported more sexual partners than "non-altruists." This was particularly the case for males. In a follow-up study, men who were more willing to donate money to a good cause reported a larger number of lifetime romantic partners (Arnocky et al., 2016). Both of these findings support the notion that altruism increases (male) mating success in humans.*
    In addition to recent empirical studies, circumstantial evidence for this position arises from social anthropologists' studies of hunter–gatherer peoples. It is well established that, in forager societies, men who hunt and share meat enjoy greater reproductive success (Hawkes, 1991; Hill & Hurtado, 1996).

- **Selfish genes don't negate altruism because in repeated interactions like relationships it's best to cooperate**: *In the iterated prisoner's dilemma, we have a microcosm of real-life dilemmas that regularly occur in everyday life – from whether we should offer people a lift in our car, to tipping a waiter (or not), to deciding whether or not to remain faithful to our romantic partner. Do we cooperate or do we defect? In most cases, it will be to our advantage in the long run to cooperate – so long as this is reciprocated, that is.*
- **Emotional closeness may be the cue to kin altruism**: empirical studies demonstrate that kin selection theory stands up to scrutiny, but supporting proximate mechanisms are not as well developed. Emotional closeness may be a proximate cue for kinship, as found it mediates the effect of relatedness and altruistic willingness to help for both low- and high-cost altruistic acts.
  - Nonkin altruism may hijack kinship cues (like emotional closeness): It's likely that the kin selection heuristic rule of "help those you are emotionally close to" could be selected for, and altruism towards emotionally close nonkin may be hijacking a once-adaptive heuristic.

Also, I found this interesting as a possible friction between individual empowerment and human progress:

- **Cooperation is good for everyone, but limits individuals' freedom**: *According to new group selectionists, while cooperation is advantageous to the group of cooperators as a whole, it may also curb some individual freedoms*

New Group Selection Theories

There are three main overlapping forms of new group selection:

- Multilevel selection (MLS)
- Dual inheritance theory (DIT; or gene–culture coevolution)
- Cultural group selection (CGS)

Let's quickly review them in relation to cooperation:

1. Multilevel Selection (MLS)

Wilson & Sober (1994); Wilson, 2007; Wilson & Wilson, 2007
This theory argues that natural selection operates not only at the individual level but also at the group level. Groups with more cooperation can outperform less cooperative ones, passing on more genes.

Humans, being highly social, may have evolved group-level traits like altruism.

E.O. Wilson later supported this, arguing that in some species (like social insects), group benefits outweigh kin benefits (Nowak, Tarnita, & Wilson, 2010). However, many scientists remain skeptical, defending Hamilton's rule (Abbot et al., 2011; Dawkins, 2016).

2. Dual Inheritance Theory (DIT)

Feldman & Cavalli-Sforza, 1976; Henrich & McElreath, 2007; Richerson & Boyd, 2005
DIT proposes that humans evolve through both genetic and cultural transmission. Cultural practices shape the environment in which genes evolve.

For example, imitating a successful farmer may pass on both useful and useless traits (Henrich & McElreath, 2007).
Altruism may evolve not because it's immediately adaptive, but because group norms favor it—especially when people reward cooperation and punish norm-breakers (a concept called strong reciprocity).

> They suggest that our current propensity for altruistic behavior is due to our evolved tendency to gravitate toward group norms.
> One of these group norms has been labeled "strong reciprocity."
> Strong reciprocity is based on Trivers' notion of reciprocal altruism, but is more generalized and culture specific. Strong reciprocity refers to a combination of: 1. Tendencies to reward others for cooperation 2. Norm-abiding behavior 3. Altruistic punishment (i.e., the propensity to impose sanctions on others who violate norms).
> (…)
> those cultural groups that exhibited strong reciprocity in the past are considered to have outcompeted those cultural groups that did not exhibit strong reciprocity.
> This then results in genes that underlie prosocial behavior being selected for, leading ultimately to a form of universal pro-social behavior.

3. Cultural Group Selection (CGS)

Boyd & Richerson, 1982, 1985; Richerson et al., 2016
CGS argues that **culture itself**—not genes—can drive group-level evolution.

Groups that share norms and cooperate may outcompete others, especially in conflict or war.

Behaviors like building defenses or punishing cheaters help such groups survive and grow (Laland & Brown, 2011).
CGS emphasizes **conformity, fast cultural transmission**, and **clear group boundaries**. But while it can promote **within-group altruism**, it can also lead to **between-group hostility** (Bowles, 2009).

Boyd and Richerson (2005) argue that cultural group selection (CGS) can promote pro-social behavior, based on studies in New Guinea.
But the authors correctly note that cultural group selection fosters altruism within groups while encouraging selfishness or hostility between them.
Bowles (2009), analyzing ancient death data, found that between-group competition significantly raised mortality.
So the key question becomes: **altruism toward whom?**
For example, suicide bombers may be seen as altruistic by their own group—but not by outsiders.

I'm glad the author pointed that out since I believe that tribalism stands in the way of both self-development and human development.
Also see:

- **Empowered individualism**

Lucio's note: cultural evolution is less convincing in explaining the origins of altruism
I so far found the evidence for cultural evolution strong and fascinating, but somewhat less convincing when it comes to explaining cooperation.
At the time of writing, I believe it may have had an impact, but more of a reinforcing one, rather than being a creationist force.

Humans: Not Selfless Altruists, But Still Good Cooperators

> As such, the goal of the theories discussed in this chapter is to demonstrate that true altruism, in an evolutionary sense, does not exist. From a gene-centered viewpoint, a gene mutation that encourages true altruistic behaviors will not be selected for. So while it may seem that natural selection and evolutionary explanations for apparent acts of altruism contradict Augustine's and Aquinas' views that humans are innately good, remember that the following evidence demonstrates that, while not altruistic from the genes' eye view, many species – humans included – have evolved to engage in pro-social and cooperative behaviors.

Chapter 11: Can Evolutionary Processes Explain the Origins of Morality?

Dennis Krebs investigates whether moral emotions (guilt, indignation) and judgments arise from adaptive mechanisms (e.g. policing, sanctioning) that enhanced group cohesion.
He critiques "moral-sense" theories of innate morality for underestimating the importance of culture.

- **Commitment devices**: moral norms as credible signals of cooperative intent.
- **Third-party punishment**: neural and game-theoretic data show a readiness to incur costs to defend group rules and cooperation.
- **Cultural amplification**: moral foundations vary by ecology, but rest on shared psychological foundations (Haidt's Harm/Care, Fairness/Reciprocity).

The 6 Forms of Cross-Cultural Morality

Researchers have found that people from all cultures consider at least six forms of conduct moral (Krebs, 2011):

1. Altruism
2. Group solidarity
3. Respect for rules and authority
4. Fairness
5. Self-control
6. Cleanliness and purity

Cultures vary in which moral norms they prioritize and how they express them. Western societies value care and justice, Orthodox Jewish and Hindu cultures emphasize purity and authority, and Japanese culture highlights group loyalty (Pinker, 2008).

Altruism May Have Evolved Because We Can't Recognize Kin

> Strictly speaking, kin-selected altruistic dispositions should be triggered by kin.

> Fortunately for the evolution of altruism, however, members of most species, including our own, are not very good at determining the extent to which they are related to others, let alone the probability that potential recipients possess copies of their altruism genes.
>
> Like other animals, we infer the degree of genetic relatedness by attending to three main correlates of – or cues to – kinship: similarity (e.g., in appearance and smell), familiarity, and proximity.
> Because nonrelatives may look like relatives, be familiar to donors, and live in close proximity to them, nonrelatives may trigger kin-selected altruistic dispositions.

Group Selection For Morality & Tribal Instincts

Some forms of altruism—such as self-sacrifice for unrelated group members—aren't fully explained by kin or reciprocal altruism alone.

Most evolutionary biologists accept that under certain conditions, group selection can support the evolution of altruistic traits when groups with more cooperators outperform more selfish groups (Sober & Wilson, 1998).

This dynamic becomes especially powerful in humans through **cultural group selection**: cooperative norms, behaviors, and institutions spread because **groups that cooperate more tend to outcompete those that don't**, not just in warfare, but also economically and socially (Henrich, 2016; Richerson & Boyd, 2005).

These **"tribal instincts"** are thought to rest on evolved capacities like emotional bonding, norm enforcement, and loyalty, which are then **shaped and reinforced by cultural institutions**. This helps explain strong **in-group favoritism**, including moral concern primarily directed toward group members (Tajfel & Turner, 1985; Greene, 2013).

Together, this body of research suggests that large-scale cooperation in human societies likely emerged not just from individual-level strategies, but also from **selection pressures acting on culturally organized groups**.

Mental Mechanisms Supporting Kin-Selected Altruism

Research shows that kin-selected a suite of neurochemical and emotional systems support altruism.
Hormones such as oxytocin, vasopressin, prolactin, and endogenous opioids help regulate altruistic behavior toward kin or those perceived as kin (Brown & Brown, 2006).

Two key emotions—**empathy and sympathy**—are central to this process (Batson, 1991).
According to de Waal (2008), these emotions are triggered by cues like similarity, familiarity, social closeness, and shared experiences.

Empathy tends to be activated toward cooperative or close others, while it is suppressed—or even replaced with Schadenfreude—toward strangers or perceived defectors.
Scan shows that empathy activates toward cooperative confederates but reward centers in the brain activate when seeing pain in defectors, at least in men (de Waal, 2008).

Although empathy can sometimes motivate helping to reduce personal distress or avoid disapproval, Batson's research (1991) supports the idea that empathy and sympathy can produce genuinely altruistic motivation—helping others as an end in itself, not for selfish gain.
This kind of motivation is typically judged as more moral.

Respect for Authority Is Evolved

Respecting authority helps maintain group cohesion, especially in large or structured societies. It supports order by encouraging individuals to follow rules and defer to those who enforce them — such as parents, teachers, and legal authorities.

This tendency serves adaptive functions. Deference helps individuals avoid punishment, access leadership and protection, and ensures smoother group coordination — especially in competitive environments.

In humans, this predisposition appears early. Developmental research shows that young children tend to equate morality with obeying rules and authority figures (Kohlberg, 1984). While later development brings more independent moral reasoning, many still view following legitimate authority as a moral obligation.

Neurobiologically, different pathways may drive respect for authority.
One is fear-based — linked to the threat of punishment. The other stems from admiration or awe, directed at high-status individuals.
Hormones like testosterone and serotonin modulate these tendencies (Cummins, 2005).

As people mature, they gain the cognitive ability to assess authority more critically. This includes distinguishing between legitimate and illegitimate power, questioning unfair rules, and deciding when defiance may be justified — a level of flexibility less common in nonhuman primates.

Origins of Fairness, Justice, & Dislike of Cheats

Trivers (1971) used game theory to show how *reciprocal altruism*—helping others with the expectation of return—can evolve because it pays off biologically.

Strategies like *Tit for Tat* outperform selfish ones in repeated exchanges, making fairness not just moral, but adaptive.

Among humans reciprocal altruism is powered by evolved emotions like gratitude, guilt, indignation, and forgiveness. These “moral emotions” promote cooperation, punish cheaters, and help restore valuable relationships:

- **Gratitude** → Encourages helping those who helped us; reinforces beneficial cooperation.
- **Indebtedness** → Triggers discomfort when you’ve received help you haven’t yet repaid; pushes to restore balance and avoid being a “free rider
- **Guilt**→ Discourages selfish or harmful behavior by triggering discomfort after cheating or harming others.
- **Indignation (or moral anger)** → Motivates punishment or distancing from cheaters; protects the system from exploitation.
- **Forgiveness** → Allows reconciliation and restoration of cooperation after a breach, when it’s still beneficial long-term.

> the biological function of conscience and guilt is to induce members of groups to regret behaving in ways that undermine the cooperative social orders of their groups, to motivate them to right the wrongs they have committed, and to induce them to reform.

These emotions can be so strong that they even invert people’s self-serving biases.
Indeed, Janicki (2004) found that people tend to feel worse when they fail to repay their friends than they do when their friends fail to repay them. The long-term fitness benefits of upholding friendships outweigh the short-term benefits of exploiting one’s friends.

While fairness appears in other species (e.g., capuchins rejecting unfair rewards), humans stand out for their ability to manage complex fairness systems.
Fair behavior works best in small groups, where reputations and repeated interactions keep cheaters in check.

The Original Selfish Gene Approach Was Wrong

> As brilliant and renowned as Richard Dawkins is, he reached the wrong conclusion about the evolution of morality, primarily because he conflated genetic selfishness, which pertains to the selection of genes, with

> biological and psychological forms of selfishness (a mistake that Dawkins corrected in revisions of his books).
>
> In a nutshell, behaving in biologically and psychologically altruistic and moral ways can increase fitness, and behaving in biologically and psychologically selfish and immoral ways can diminish fitness (Krebs, 2011).

Chapter 12: The Evolution and Function of Third-Party Moral Judgment

Reader and Hughes focus specifically on third-party moral judgment, which is:

> Third-party moral judgment is the positive or (probably more usually) negative judgment of a behavior or trait in others that has no material effect on the person judging.

They integrate moral judgment with evolutionary theory, claiming that condemning norm violators serves to maintain group-wide cohesion and cooperation by broadcasting sanctions and enabling coalitional sorting.

Lucio's note: did third-party judgment evolve for individual benefit, or group benefit?
The authors claim that it likely evolved as a result of intergroup conflict, something I can partially agree on, but of which I'm not fully convinced.
I believe that the selfish gene point of view also provides a good ultimate explanation via virtue signaling and power signaling (eg.: i'f I can negatively judge others, it means I'm higher status/power').

- **Audience effects**: individuals amplify moral outrage when observed, signaling loyalty.
- **Proportionality norms**: calibrated punishments reflect perceived fitness costs of violations.
- **Cognitive underpinnings**: fast, intuitive judgments (System 1) followed by deliberative justifications (System 2).

Chapter 13: Evolution of the Human Family

Palmer and Coe argue that the human family isn't a 'core social unit' but a **mechanism** to transmit traditional behaviors to maximize fitness, eventually enabling the formation of clans.

- **Grandmother hypothesis**: post-reproductive women increase inclusive fitness by provisioning grandchildren.
- **Stepfamilies & paternity certainty**: trade-offs between male investment and cuckoldry risk shape mating systems and grandparent provisioning, with grandparents from the mother side investing more than from the father side

Chapter 14: The Parasite-Stress Theory of Cultural Values and Sociality

Thornhill and Fincher propose that pathogen prevalence selects for collectivist norms, stronger in-group ties, and purity taboos, as behavioral "immunizations." They integrate cross-cultural data on parasite load and individualism–collectivism.

- **Immune-behavioral links**: the 'behavioral immune system' supports the biological immune system with behavior like distancing oneself from sick people and toxic compounds. It's driven by disgust sensitivity, which is upregulated in high-pathogen ecologies.
- **Fear of infections drives xenophobia and ethnocentrism**: Faulkner et al. (2004) and Navarrete and Fessler (2006) provided evidence that the degree of xenophobia and ethnocentrism correspond to chronic individual differences in worry about contracting or catching infectious disease.
  Those who perceive high infectious disease risk are more xenophobic and ethnocentric
- **Higher parasites lead to good looks becoming more important**: Gangestad and Buss (1993) and Gangestad et al. (2006) empirically reported a positive correlation across countries between human parasite stress and the importance people place on physical attractiveness (good looks) in mate choice.

It was hypothesized that physical attractiveness is a certification of genetic resistance to parasites

- **Social distancing norms** (tight/loose): tight-loose theory says some cultures have strict norms (tight) and others are more permissive (loose). Tight cultures often emerge in places with high threats—like parasite stress—because strict rules help prevent disease spread and protect the group

Parasites Shape Collectivism and Conservatism

The parasite-stress theory of sociality proposes that **high levels of infectious disease promote collectivism and conservatism** over individualism (especially non-zoonotic infectious diseases transmissible between humans).

Collectivism–individualism is a cultural dimension that closely mirrors the political spectrum of conservatism–liberalism.
Regions with high pathogen stress tend to favor collectivist and conservative values like ethnocentrism, conformity, and xenophobia, which serve as behavioral defenses against disease.

In contrast, individualist and liberal values—such as autonomy, openness, and diversity—thrive in low-pathogen environments, where the risk of infection is lower and the costs of openness are reduced. Thus, disease prevalence helps shape both cultural and political orientations.

In short, high pathogen stress pushes cultures toward collectivism and political conservatism by activating a behavioral immune system aimed at minimizing disease risk. This leads to increased in-group conformity, xenophobia, religiosity, and resistance to social change, forming the cultural and political basis of conservative and authoritarian societies.

Lucio's Note: This was an incredible, novel insight ⁉️
What we may call a 'aha moment', or even a mindblown insight. It adds up and passes the 'logic test', but it's so groundbreaking for now that I need to further reflect on it (and I await further future data).
It may be an idea to test and see if more conservative individuals are less healthy, or more health-conscious

Key Findings:

- **Collectivism increases with pathogen stress**: Cross-national and within-country studies (e.g., across U.S. states and indigenous societies) consistently show that regions with higher pathogen stress display higher collectivism and lower individualism. This includes tighter family ties, traditionalism, and less tolerance for outsiders.
- **Non-zoonotic diseases matter most**: Diseases that spread human-to-human (as opposed to those contracted from animals) are particularly predictive of collectivist cultures. These findings hold after controlling for wealth, population, and geography.
- **Political conservatism and authoritarianism increase with pathogens**: Collectivism correlates with right-wing and conservative political ideologies, including authoritarian governance, gender inequality, sexual restrictiveness (especially for women), and limited property rights. This implies that high pathogen stress fosters politically conservative, hierarchical, and closed societies.
- **Religiosity as behavioral immunity**: Religiosity supports in-group cohesion and moral conformity, making it another collectivist value linked to parasite stress. Highly religious regions tend to have higher disease risk and more collectivist norms.
- **Conformity and prejudice rise with perceived infection risk**: Both experimental and survey-based studies show that people exposed to disease cues become more conformist, more prejudiced toward non-conformists and out-groups, and more favorable to traditional values. These are immediate, psychological shifts triggered by infection salience.
- **Disgust sensitivity links to collectivism and conservatism**: People with higher disgust sensitivity—often correlated with disease concerns—are more likely to be collectivist, religious, and prejudiced against sexual and

ethnic minorities. This supports the idea that **disgust acts as a behavioral immune trigger favoring conservative values**.

- **Linguistic and cultural fragmentation rise with pathogens**: Pathogen stress promotes the rise of new, smaller cultures and languages—a process termed the "parasite-driven wedge." It suggests that avoidance behaviors (e.g., ethnocentrism and limited dispersal) segment cultures even without geographic barriers.

Chapter 15: The Evolution of Pride and Shame

Beall and Tracy argue that pride and shame are universal self-conscious emotions that regulate status within hierarchies: pride signals success to others, shame promotes appeasement when status is threatened.

> In evolutionary accounts, emotions are fitness maximizing affective mechanisms that galvanize coordinated suites of physiological and psychological responses to recurrent events of evolutionary significance (Beall & Tracy, 2017; Cosmides & Tooby, 2000; Nesse & Ellsworth, 2009)

- **Pride and shame are cross-cultural prototypical expressions**: consistent facial and body language cues for pride and shame
- **Pride is associated with high status** (Tracy, 2016)**, shame with low stauts**. Pride inclucdes dominant and confident body language, shame with closed off and low power body language
- **Two forms of pride** conceptualized and experienced as distinct and independent and are associated with highly divergent personality profiles (Tracy & Robins, 2007a, 2014; Tracy et al., 2009)
  - hubristic, marked by arrogance and conceit, more antisocial, associated with disagreeableness, aggression, and lack of conscientiousness, and narcissism
  - authentic, fueled by feelings of accomplishment, confidence, and success
- **They both serve an adaptive function**: pride motivates dominance behavior, shame deflects aggression
  - Shame displays appease and decreases punishment: researchers found that a hypothetical convicted drug dealer was judged as less guilty and given a weaker penalty when displaying shame and embarrassment compared to contempt or a neutral expression

- **There are benefits to reading body language well**: Shame displays signal group commitment, helping observers choose trustworthy partners, avoid unnecessary conflict, and understand social hierarchies—key for cooperation and resource-saving
  - It's especially important for men: in certain contemporary cultures, men must constantly track their own status relative to those around them, whereas for women this is less essential (Tracy et al., 2013)

⍰⍰♂ **Lucio's Note / suggestion: may want to revise the attractiveness of shame/pride**
The chapter says that '*shame expressions are one of the most sexually attractive emotion expressions shown by both men and women (Tracy & Beall, 2011; but see Beall & Tracy, 2014)*', which seemed strange.
Little later it says that '*men who displayed pride were found to be highly attractive to women compared to men who gave neutral, shame, or happy displays (male happy displays, in fact, were particularly unattractive)*'.

Chapter 17: Runaway Processes in Modern Human Culture

Miklósi and Konok apply Zahavi's handicap and runaway sexual selection models to contemporary media, showing how exaggeration of signals (e.g. social-media personas) fuels escalating patterns of self-presentation.

- **Costly signaling in digital realms**: curated online identities used as hard-to-fake reputational markers.
- **Cascade effects**: viral replication amplifies extreme traits through social copying.
- **Psychological drivers**: reward circuits respond to likes/shares, reinforcing signal inflation.

- **Cooperation and cheat punishment may be runaway selection**: *Nakamaru and Dieckmann (2009) demonstrated mathematically that cooperation and punishment of defectors in human groups underwent runaway selection, with evolution toward enhanced cooperation and ever stricter punishment norms mutually reinforcing each other*

⍰⍰♂ Lucio's Notes On Runaway Selection & Handicap Principle

I had to do some extra research to clarify for myself how runaway selection isn't withheld by the women who don't like the runaway trait, and how it fits with the handicap principle.

Here's what I cam up with:

How Runaway Selection Starts & Works

Three phases:

1. **Accidental preferences** (sexual selection): A female shows a preference for a male trait (accidentally)
2. **Runaway** (sexual selection): the bearers of the trait increase their ratio in the population.
   - ⍰⍰ Trait competition may limit runaway: sexual selection simultaneously acts on multiple traits that could mutually inhibit the "runaway" of the others. For example, if females like long tails and dancing, then a too long tail hampering dance acts against longer tails
3. **Natural selection**: the trait that emerges as a result of sexual selection may be subject to factors of natural selection.
   At this point, if the trait is negative, natural selection will 'cap' how far the trait can grow

At the beginning, **random variation or drift** introduces a small number of females who prefer longer tails. These females:

- Choose slightly longer-tailed males → produce sons with slightly longer tails **and** daughters who prefer them.

Even if the advantage is **tiny at first**, that **correlation between trait and preference** builds momentum.
Once a small preference becomes common enough, then:

1. Long-tailed males get more mates,
2. The feedback loop kicks in (runaway), and
3. Short-tail males (and their daughters' preferences) get outcompeted <— ⍰⍰♂ Lucio's note: This is not fully clear to me yet and I suggest the authors to dig deeper into it. Why would the short tail males get out-competed as long as females who don't acquire the taste for longer tails can still pick them to reproduce with? It seems to me there is a missing piece here: a **crowding out** whereby shorter tales men must compete on other traits, while still never winning the long-tail lovers (a **handicap by omission**, you may call it)

The text explains that the preference is expressed only in females and the sexually dimorphic trait is expressed only in males.
So only males pay the price of the costly growing ornament.

Zahavi Handicap Principle

Zahavi's handicap principle says costly traits (like long tails) signal male quality because only the healthiest can afford them.

Studies support this: females prefer such traits, which often reflect good genes or strong immunity. These traits act as honest, hard-to-fake signals of genetic fitness.

Getty (2006) refined this view: rather than just being costly, these traits are **strategic investments** by high-quality

males who benefit more from increased mating opportunities.

Fisher Runaway vs. Zahavi Handicap: They're Both Right

Both are **partially right**, and modern evolutionary biology sees them as **complementary**, not mutually exclusive:

- **Fisher** explains how female preferences and traits can co-evolve and become exaggerated—even if they start arbitrarily.
- **Zahavi** explains **why** a preference might evolve *in the first place*—because it's tied to reliable indicators of health or fitness.

In reality, many traits likely involve **both mechanisms**:

- A preference may **start** because the trait signals health (Zahavi),
- Then it becomes exaggerated through **runaway selection** (Fisher).

Chapter 18: Ontogeny of Tactical Deception

LaFreniere and Smith review how children develop deceptive tactics, going from simple feigning to complex deception, against a backdrop of evolving mind-reading and inhibitory control capacities.

They refer to the theory of Machiavellian intelligence, and claim that deception is a useful skill to succeed in life.

- **Stages of deception**: spotting opportunities, inhibiting truth, constructing plausible falsehoods.
- **Theory of mind** refers to knowing what others think and want, and it correlates with false-belief understanding and lie sophistication.
- **Cost–benefit trade-offs**: social learning conditions which deceptions pay off at different ages.

Chapter 20: The Adaptive Problem of Exploiting Resources

Wilke used experiments to show that people make smart choices in problem-solving tasks—similar to foraging—by weighing the cost of searching against the rewards they get.

- **Fishing vs. word-puzzle analogies**: similarity in participants' switching behavior across domains
- **Cognitive heuristics**: "good-enough" stopping rules rather than perfect optimization.

Chapter 21: Evolutionary Developmental Psychology

Myers and Bjorklund explain how evolution shapes different behaviors at different ages—like infant attachment or teen risk-taking—through the interaction of genes, environment, and culture.

- **Sensitive periods**: windows for imprinting and social learning.
- **Life-history calibration**: environmental harshness accelerates developmental milestones, shifts towards more risk-taking behavior and prioritize quantity of offspring rather than quality
  Children who are exposed to extrinsic morbidity–mortality cues, such as exposure to violence or harsh childrearing practices, shift their resource allocation toward earlier pubertal maturation and sexual debut, engage in more aggressive and risky behavior, become pregnant earlier, form unstable pair bonds, and provide less parental investment per offspring than children growing up in less harsh and more predictable environments (e.g., Ellis, 2004; Ellis et al., 2009; Nettle, 2010; Nettle & Cockerill, 2010; Placek & Quinlan, 2012; Wilson & Daly, 1997)
- **Adaptive plasticity**: variation in trait expression shaped by early cues.
- **Boys vs Girls** show differences from childhood
  - Boys problem solve, girls befriend: Boys are more inclined to use tools for problem-solving, whereas girls are more likely to be oriented toward personal relationships (Gredlein & Bjorklund, 2005).

- Boys play dominance-related games: *Girls' fantasy play tends to be oriented more toward relationships, such as playing house. Boys' fantasy play, on the other hand, tends to be more oriented toward dominance themes, such as playing cowboys and Indians or being "superhero crime fighters," dependent on current cultural themes (Pellegrini, 2013)*

> Men's relationships are more based on dominance and status, whereas women's relationships are more interpersonal and intimate (Bjorklund & Ellis, 2014).

Chapter 22: The Ontogeny and Evolution of Cooperation

Grüneisen and Wyman chart how cooperative behaviors emerge in toddlers—sharing, helping, group cohesion—and link these to ancestral needs for collective action, supported by oxytocin and endorphin systems.

- **Early helping**: infants as young as 14 months assist adults without reward.
- **Punishment & partner choice**: toddlers show aversion to unfair peers.

Cooperation is The Secret of Our Success

> We propose that a defining human characteristic, which in its scope and flexibility is unparalleled in the animal kingdom, is the ability to coordinate actions with others – even with total strangers – in the pursuit of shared goals

Chapter 23: Genomic Imprinting and Psychological Mechanisms

Brown explains how parent-of-origin effects on gene expression (e.g. IGF2, PEG3) shape early brain development and influence behaviors like attachment and resource solicitation, with implications for disorders.

- **Conflict theory**: paternal genes drive behavior that maximizes infant's resources while maternal genes 'defend' the mother, balancing growth vs. maternal investment.

Also see:

- **Sexual conflict theory explained**

Chapter 24: Evolutionary Explanations for Bullying Behavior

Smith reviews bullying as an adaptive strategy for social rank acquisition, outlining its costs and benefits in ancestral groups and modern contexts (Table 24.1).

- **Frequency-dependence**: bullying pays off only when rare.
- **Sex differences**: males favor physical intimidation, females relational aggression.
- **Intervention implications**: reframing anti-bullying efforts with status-alternative strategies (e.g. reputation enhancement).

Definition of Bullying

Bullying is generally defined as a subset of aggressive behavior – so, behavior with an intent to harm another person. But to be called bullying, most researchers agree that two criteria must be satisfied:

- repetition
- imbalance of power

Bullying Roles

Bullying involves different roles:

- **Ringleader bullies**: Initiate and organize the bullying *(Salmivalli et al., 1996)*
- **Followers**: Join in after the ringleader starts the bullying *(Salmivalli et al., 1996)*
- **Reinforcers**: Do not directly bully but laugh or encourage the bullying behavior *(Salmivalli et al., 1996)*
- **Victims**: The targets of bullying *(Smith, 2014)*
- **Bully–victims (AKA 'provocative victims')** : Children nominated as both bullies and victims. Often referred to as "provocative victims" because their behavior may provoke others, leading to retaliatory bullying *(Smith, 2014)*
- **Pure bullies / Pure victims**: Identified separately to avoid overlap with the bully–victim category, especially in research on outcomes and correlates *(Smith, 2014)*

Gender Differences in Bullying

Boys's stategy revolves more around physical power while women more around reputation

The physicality/reputation split is explained based on what's most effective for each gender:

> Physical strength is more important in boys' peer groups and reputation is more important in girls' peer groups, so this gender difference has been explained as each gender choosing the most effective method of displaying power and/or damaging a victim (Archer, 2009; Guerra et al., 2011).

Type of Bullying	Boys	Girls	Notes/Explanation
Physical bullying	More involved	Less involved	Physical strength more important in boys' peer groups
Verbal bullying	Similar involvement	Similar involvement	Little gender difference
Social exclusion, rumors, cyberbullying	Less consistent evidence; generally less involved	Tend to prefer these relational forms	Reputation more important in girls' peer groups

Adaptive vs. Maladaptive Bullying

Volk et al. argued that bullying is an adaptation based on its heritable basis and the advantages it provided for survival and reproduction (gaining dominance and social status, and hence access to resources).

The authors ultimately state that it may be too early to judge whether bullying is a specific evolutionary adaptation, also because many bullies operate in a novel environment of 'evolutionarily unnatural' classrooms.

Conceivably, it is a by-product of aggression, and pursuing dominance by displaying power against weaker peers may bring payoffs, including gaining or protecting resources and status (Archer, 1988).

While sometimes seen as a sign of poor social skills in children (Crick & Dodge, 1994, 1996), that's often wrong and **some aggressive kids are socially skilled and popular**, especially if they use aggression strategically and combine it with prosocial behavior (Hawley, 2003; Bjorklund & Hawley, 2014).
Kaukiainen et al. (1999) also demonstrated that social intelligence correlated positively with relational aggression in particular.

Bullying is a more extreme form of aggression, and although typically labeled harmful or antisocial, bullying can bring real benefits to those who use it effectively:

- **Strategic controllers** (not emotionally reactive) were the most successful. They mix aggression with prosocial

approaches, and tend to:
  - Score high in **theory of mind** (Sutton et al., 1999b).
  - **Are strategically smart** (Sutton et al., 1999b).
    they argued that ringleader bullies in particular might deploy skills such as knowing how to choose vulnerable victims, how to choose the right social context to initiate bullying, how best to put down the victim in a way that demonstrated their own power, and how to avoid detection by adults.
  - Be **popular**, **influential**, and **resourceful**

Bullying is usually **facultative**—children do it when the **benefits outweigh the risks**. Some researchers suggest victims adapt to avoid further harm, but this idea is controversial.

Outcomes depend on the type of bully:

- **Pure bullies**:
  - Often **popular, athletic, attractive**
  - **Powerful but not necessarily well-liked** (especially ringleaders) are seen as powerful and popular in terms of *perceived popularity*, though not necessarily *well-liked* (Peeters et al., 2010; Veenstra et al., 2005).
  - Show **few consistent psychological downsides**
- **Bully–victims** (both bully and get bullied):
  - More likely to experience **negative outcomes** like depression and loneliness

Because bullying can work as a dominance strategy, interventions need to go beyond teaching social skills. A better approach is to redirect status-seeking into prosocial behavior.

Bullies Enjoy Better Dating Outcomes

Research shows that bullies generally start dating earlier, have more dating partners, and engage in more sexual activity.

Physical bullies, especially boys, are particularly more likely to have more dating and sexual partners. However, the quality of their relationships tends to be poorer, with more aggression and less intimacy (Connolly et al., 2000; Espelage & Holt, 2007; Volk et al., 2015; Dane et al., 2017).

Relational bullying alone does not strongly predict dating success, but relational bully–victims (those who both bully and are victimized) may have more dating partners, especially girls (Dane et al., 2017).

Overall, bullies date quantitatively more, there is no information about partners' mate value, and these relationships often involve more conflict and less emotional closeness.

Health Outcomes Are Generally Poorer for Bullies, But Worse for Victims

Most research suggests that *pure bullies*—those who bully others but are not themselves victims—tend to have **poorer mental and physical health** than uninvolved peers, though findings are mixed and depend heavily on the methods used.

Some early studies argued that bullies enjoy **better or equal mental health** (e.g., Juvonen et al., 2003; Volk et al., 2012), but these conclusions were based on limited evidence. When studies clearly distinguish pure bullies from bully–victims, most show bullies scoring **worse on depression, anxiety, psychosomatic complaints, and suicidal ideation**, although:

- Some studies report no significant differences or slightly better scores for bullies (e.g., Juvonen et al., 2003; Koh & Wong, 2017).
- In several studies, **bullies score better than victims or bully–victims**, but still worse than noninvolved

children.

- **Self-reports** are the most common method used, and these often show worse outcomes for bullies.
- **Peer nominations**, used less often, show smaller or non-significant differences, suggesting self-report data may overstate the negative effects.
- **Self-esteem findings vary**: bullies may rate themselves low in *academic self-worth* (due to disapproval from school), but normal or high in areas like *athletics* or *peer relations* (O'Moore, 2000; Salmivalli et al., 1999).

Overall, while the picture isn't entirely uniform, the bulk of evidence—especially from self-report studies—suggests that being a bully is linked to **greater internalizing problems and poorer well-being**, though not as severely as being a victim.

This applies to self-reported bullies; more evidence is needed for peer-nominated bullies

Outcomes of Bullying Summary

1. Pure bullies are seen as powerful, not necessarily well-liked, but are seen as exercising resource control
2. Pure bullies enjoy better dating, but with more toxic relationships
3. Ringleaders bullies in particular have good theory of mind abilities (the stereotype of the bully as socially incompetent seems radically incorrect)

Genetics and Heritability of Bullying

Twin studies show that both bullying and being victimized are influenced by genetics.

For victimization, genetic influence increases with age, reaching up to 66% by age 10. For bullying others, about 60–70% of the variation is explained by genetic factors.

Genetic traits may make someone more likely to be bullied if they are introverted, emotionally sensitive, or have poor social or emotional regulation.
On the other side, children may be more likely to bully if they are impulsive, thrill-seeking, emotionally cold, or interpret others' actions as hostile.

"Bully-victims" often show signs of emotional dysregulation, which may also be genetically influenced.

Several heritable personality traits are linked to bullying:

- Low agreeableness and low conscientiousness (Big Five)
- Low honesty–humility and emotionality (HEXACO)
- Traits from the dark triad:
  - Machiavellianism: manipulative, distrusting
  - Narcissism: arrogant, entitled
  - Psychopathy: impulsive, thrill-seeking, uncaring
- Callous–unemotional traits, especially lack of caring

So bullying isn't just learned—it often reflects inborn tendencies shaped by personality and emotional style, which can either predispose kids to dominate others or make them more vulnerable to being targeted.

How to Stop Bullying

Bullying should not be viewed simply as pathological behavior since many bullies are socially skilled and gain real status and resources from it.

Because bullying can provide benefits and low costs in certain contexts, interventions need to address this balance. Successful reduction of bullying must consider the bully, the victim, and the social environment.

For bullies:

- Recognize that popular bullies may not respond well to standard anti-bullying programs.
- Provide alternative, pro-social, status-enhancing roles such as organizing activities, leading sports events, or peer tutoring to replace bullying as a way to gain respect (the "meaningful roles" approach).

For victims:

- Teach friendship skills and coping strategies through assertiveness training.
- Use buddying schemes to provide social support.
- Encourage high-status peer defenders to intervene on behalf of victims.

For the peer group and school context:

- Improve the overall peer group climate to reduce the perceived popularity of bullies.
- Apply clear sanctions and enforce effective school policies against bullying.
- Consider the bully's social competence and motivation for status, rather than just labeling bullying as "wrong," to avoid counterproductive effects.

Chapter 25: Birth Order and Evolutionary Psychology

Sulloway presents evidence that firstborns tend toward conformity and authority-orientation, laterborns toward rebellion and risk-taking, framing this as parent–offspring conflict over niche differentiation.

- **Resource dilution & niche partitioning**: siblings diversify strategies to reduce competition.
- **Personality correlations**: meta-analysis shows consistent but small effects across cultures.
- **Historical shifts**: family-size decline may amplify birth-order effects.
- **Later-borns are more likely to be homosexual**: Among males (but not females), higher birth rank is correlated with an increasing likelihood of homosexual orientation (Blanchard, 1997, 2004)
  Explanation: About 15% of mothers develop antibodies to male-specific antigens, which can interfere with the masculinization of later male fetuses. As a result, the likelihood of homosexuality increases by roughly 33% for each older brother.
- **IQ scores increase slightly among lastborns** growing up in large families

Birth Order Affects Investment & Emotional Bond

Since the last child can't be replaced, we could expect mothers to invest more in lastborns.
And indeed older mothers report that they feel more emotionally attached to their lastborn children (Suitor & Pillemer, 2007)

> Trivers (1972) has defined parental investment as any investment in time, energy, or resources that benefits one offspring at a cost to another offspring. Among humans, biases in parental investment are well documented and have often been based on differences in birth order, gender, and offspring quality (Daly & Wilson, 1988; Hrdy & Judge, 1993)

Chapter 26: Survival, Selection, and Sex Differences in Fear

Campbell integrates meta-analytic data on dot-probe tasks and fear conditioning to argue that women's greater fear sensitivity evolved as protection for offspring.

Summarized in one great quote:

> The benefits for women lie in lower mortality and greater longevity, which enhance mothering and enable grandmothering. Among women, living slow and dying late has been a winning strategy.

- **Preparedness theory**: faster conditioning to ancestral threats (snakes), stronger in females.
- **Hormonal modulation**: estrogen amplifies amygdala reactivity.
- **Clinical relevance**: sex differences in anxiety disorders reflect these evolved mechanisms.

Remember: the overlap is still larger than the difference

> It bears repeating that any sex difference is a matter of degree, not kind.
> For example, even with a large effect size of d = 1.00 (as found by Campbell et al., 2016), 62 percent of the male and female fear distributions overlap. Men and women are, after all, morphs of the same species, and selection pressures "nudge" rather than "shove."

But she reminds us that the differences become more noticeable and impactful at the extreme ends of the distribution.

Increasing Male Aggression Is Capped By Risks, and May Increase Monogamy

Traditional sex-role theory claims male aggression evolved to attract mates and beat rivals—but this view is problematic, claims Campbell.

Higher aggression means higher risk.
When competition gets intense or unwinnable, increasing aggression increases the payoffs of monogamy.
Males benefit more from sticking with one mate and helping raise kids (Gangestad & Simpson, 2000).

Aggression is not on a runaway trajectory, but on a tradeoff.
Data show aggression rises as more males compete, but drops once it gets too extreme—replaced by courtship and mate guarding (Weir et al., 2011).

A model also shows monogamy can evolve if women prefer resource-giving men. Low-status males adopt this to reproduce, and since they're the majority, the strategy spreads (Gavrilets, 2012).

Chapter 27: The Enigmatic Urge: How Sexual Desire Works

Toates dissects desire into drive (homeostatic), incentive (external cues), and cognitive (expectations) components, showing how each relates to certain reward circuitry and how they relate to evolved mating strategies.

- **Dual-control model**: balance of excitatory vs. inhibitory inputs varies by sex and context.
- **Sociosexuality**: individual differences in desire linked to mating market variables.

And I found interesting from a relationship power dynamics point of view:

- **Women seek confirmation in relationships**: *After time in an established relationship, women tend to place more weight upon associations with their regular partner, such as to receive confirmation of their desirability (Basson et al., 2003).*

Sexual Desire And Dominance

There is a link between dominance and sexuality.

Sexual violence is mostly male behavior and often driven by a mix of sexual desire and dominance—not just one or the other.

Desire is usually present, but the role of aggression varies: from calculated use of force to outright violent acts. Testosterone fuels both sexual and dominance motives.

Some men find women more attractive when primed with dominance cues, suggesting a link between power and sexual desire.

Rape victim age data clusters around 15, suggesting physical features and perceived vulnerability at that age may trigger these drives.

To explore this topic also see our article:

- **The role of dominance in dating**, courtship, and sexual success

---

Lucio's suggestion: Revist the claim on bigger penis = bigger pleasure
The author states that '*the male penis is much larger than the female clitoris as a source of self-generated pleasure, deliberately induced or accidentally*'.
I'm not sure I understood the 'accidental' bit, and I don't think that women necessarily derive less pleasure from masturbation.

Chapter 28: Are Humans Peacocks or Robins?

Stewart-Williams evaluates whether human traits (e.g. ornamental displays, courtship rituals) align better with Darwin's runaway signal theory (peacock) or Zahavi's handicap model (robin), concluding both processes operate in mating domains.

- **Mate choice experiments**: women prefer indicators of genetic quality under high-risk contexts, ornamental cues under low-risk.
- **Signal costs**: costly self-disclosure and creative displays function as honesty assurances.
- **Low-investing sex develops ornamentation, high-investing one lives longer** because they avoid risk and take care for children
- **Cultural variation**: relative importance shifts across ecologies.

The Difference Between Sexes Isn't Smaller Than Some Evolutionary Psychologists Claim

While Stewart-Williams acknowledges that some differences between men and women are real, he shows they are often exaggerated.

He demonstrates that men and women's mating psychology tends to overlap more than it diverges, and that **large, attention-grabbing claims often rest on modest differences in averages**—differences that shrink further when placed in a broader biological and statistical context.

Let's review the domains:

Reproductive Variability

- **Common assumption**: Men can have many more children than women (e.g., Ismail the Bloodthirsty with 888 offspring), suggesting stronger male desire for multiple partners.
- **Reality**: Such reproductive extremes are historical anomalies, not typical.
  In small-scale societies, which better reflect most of human history, the difference in reproductive variability is usually small—and sometimes even favors women.
- **Implication**: Modest sex differences in reproductive outcomes mean we should expect only modest differences in sexual psychology.

Polygynous Desires & Short-Term Interest

- **Claim**: Men are more interested in casual sex and short-term mating.
- **Reality**: True across all cultures studied, but the effect size (d = 0.74) is still modest when compared to more intuitive sex differences like height (d = 1.63).
- **Implication**: The differences are real but relatively modest. This is expected on the assumption that our primary reproductive pattern was pair-bonding and biparental care.

Mate Preferences: Physical Attractiveness

- **Claim**: Men care far more about physical attractiveness than women.
- **Reality**: Men rate it slightly higher on average, but both sexes value it. In Buss's influential study, men ranked it only 10th, women 13th. The difference from a meta-analysis was moderate (d = 0.54), implying around 80 percent overlap between the male and female distributions.
  This makes evolutionary sense: women as the choosier sex are *expected* to care for looks
- **Implication**: Attractiveness matters to both sexes, and the average difference is meaningful but far from stark.

> Similarly, Kanazawa (2003) observed that, "In every society, men prefer young and attractive women for mates, and women prefer wealthy and powerful men" (p. 292).
> Such descriptions suggest substantial, dichotomous differences. The evidence for these differences, however, invariably consists of relatively modest differences in the central tendencies of highly variable and overlapping distributions. There is thus a mismatch between the data and the verbal descriptions of the data: we are comparing apples but concluding oranges.

Mate Preferences: Wealth and Status

- **Claim**: Women are hypergamous and strongly prioritize wealth/status in a mate.
- **Reality**: Women rank wealth slightly higher than men, but often below other traits like love, character, and intelligence. In many real-world cases, women prioritize attractiveness over wealth.
- **Implication**: While the sex difference is consistent, it's moderate in size (d = 0.69), with a lot of overlap. Many women don't strongly prioritize wealth or status.

Jealousy

- **Claim**: Men are more distressed by sexual infidelity, women by emotional infidelity.
- **Reality**: In the classic Buss' study, only 60% of men chose sexual infidelity as more upsetting, and in some cultures (like Germany or Japan), a majority of men picked emotional infidelity instead.
  We cannot conclude that men are more concerned about sexual infidelity when only a little more than half of men do and in some samples, more men are upset by emotional infidelity.
- **Implication**: *The difference is not accurately described by statements such as "men find sexual infidelity more upsetting, women emotional infidelity." A more accurate description would be that "a larger proportion of men than women find sexual infidelity more upsetting, whereas a larger proportion of women are more upset by emotional infidelity."*
  Buss' 'forced choice option' also exaggerated the differences, while the reality is that most men and women are upset by both

The 'menopause for women', 'retained virility for men' is an exaggeration

> Although men do not experience the complete cessation of fertility in middle age that women do, their fertility declines more precipitously than was once believed.

> To begin with, men's testosterone levels tend to nosedive with age (Harman et al., 2001), which may lead to a reduction in courtship effort and intrasexual competition. In addition, the quality and quantity of men's sperm declines throughout adulthood (Kong et al., 2012).
>
> The implication is this: the sex difference in age-related fertility is smaller than previously thought, which provides a theoretical rationale for thinking that the sex difference in the importance of physical attractiveness will be smaller than previously thought.

Lucio's Take: **Let's all be more careful in not over-stating the differences**

Lucio:
I loved this chapter, and I had noticed a similar trend to overstate the differences, including among some scholars.

Just as an example, the *"men seek looks, women resources"* not only didn't seem to square too well with the data, but also not with my personal experience of successful dating with limited resources.

I believe that stressing the differences may have been a knee-jerk reaction to decades of the "standard social science model" and of downplaying genetic differences.

However, it's now time to start being more balanced.
Balance is also important given the general public's (and pop authors') tendency to over-focus on the differences while forgetting the overlap.

Chapter 29: Human Mate Selection: A Multidimensional Approach

Conroy-Beam and Buss integrate mate-value indices, preference hierarchies, and mating market constraints to model real-world pairings.

- **Euclidean metric**: potential mates evaluated across multiple preference dimensions (Table 29.1 below)
- **Preferences reflect choice**: *People's actual long-term mates tend to fall close to their ideal preferences through the multidimensional preference space, exactly as they would if mate preferences were integrated according to a*

Euclidean algorithm (Conroy-Beam & Buss, 2016b)

- **Preferences reflect choice when people can afford to select**: *people who are themselves higher in mate value according to Euclidean calculations – that is, who are closer to the opposite sex's aggregate preference point in the preference space – tend to be mated to partners closer to their own mate preferences*
- **Market dynamics**: sex ratio skews and operational sex ratio modulate selectivity, as do other sexual market variables and localized dynamics
- **Preference fulfillment**: trade-offs between ideal standards and available options.

Table 24.1 A toy model of mate selection using a Euclidean algorithm to integrate five preferences.

	Trait 1	Trait 2	Trait 3	Trait 4	Trait 5	Mate value
Emma's preference	5	5	5	5	5	
Alfred	1	1	1	1	1	0
Charles	1	1	1	1	5	1.07
George	5	5	5	5	1	4
Bill	5	5	5	5	5	8

Note: Euclidean distances were transformed by multiplying each distance by −1 and adding the maximum possible distance value (8).

The Three Key Constraints in Realistic Human Mating Markets

While people have ideal mate preferences, real-life mating markets are complex, and several constraints significantly weaken the link between those preferences and actual partner choices. Agent-based models show that **three main dynamics** explain why preference fulfillment is often limited:

1. Availability

- **Constraint**: People can only choose partners from those who are locally available.
- **Impact**: Even if someone has strong preferences, they may not encounter partners who match them well.
- **Finding**: This was the **most impactful constraint** in reducing both preference fulfillment and predictive power.

2. Competitiveness

- **Constraint**: People compete for the same desirable mates, and each person can only form a limited number of relationships (especially in monogamous settings).
- **Impact**: Even if a preference-fulfilling partner is available, a rival might pair with them first.
- **Note**: Competitiveness alone had no strong effect, but it **amplified** the impact of other constraints.

3. *Mutual* Mate Choice

- **Constraint**: Attraction must be **mutual**—it's not enough to prefer someone; they have to prefer you back.
- **Impact**: Ideal partners may not reciprocate interest, forcing people to settle for less ideal matches.
- **Interaction**: This constraint becomes harsher in competitive markets.

Overall Findings

In fully constrained markets, predictive power of mate preferences dropped to r = 0.24, close to real-world findings like Campbell et al.'s r = 0.14.

These constraints **don't mean mate preferences are unimportant**, but rather that their influence is embedded in complex, dynamic systems.

Chapter 31: Integrating Feminist Perspectives

Fisher, Garcia, and Burch argue that evolutionary psychology must incorporate perspectives on gender inequality, intersectionality, and power dynamics, proposing revisions to standard mate- preference models to account for patriarchal cultural overlays.

> There is an enduring uneasy relationship between evolutionists and feminists when it comes to the study of human behavior. In general, feminists tend to view work incorporating an evolutionary perspective as being somewhat anti-feminist, unnecessarily reductionist, or at least neglecting to be inclusionary of sociocultural and gendered factors

However, things are changing for the positive say the authors, and there are now even 'feminist evolutionists'.

Lucio's Take: **I couldn't agree more**. **Some feminist scholars are spot on power dynamics**

Lucio:
The easiest way to spot a scholar biased by gender is a woman who rejects evolutionary psychology's universal tendencies, or a man who rejects feminist contributions to social and interpersonal power dynamics (social dominance theory also backs up some feminist theories).

From my perspective, evolutionary psychology is the foundation of all psychology-related disciplines—and feminists are spot on when they highlight the drive of some men to control and disempower women (which makes perfect sense to anyone who understands evolution and power dynamics).

Evolutionary Psychology's Reliance On Self-Reports Is Problematic

Eagly and Wood (2013), among others, note that evolutionary psychology's reliance on self-reports raises concerns.

While such studies often find sex differences (e.g., men reporting a stronger preference for casual sex or more sexual partners), these results may partly reflect social desirability and adherence to gender role norms, rather than innate differences.

For example, Alexander and Fisher (2003) used a bogus pipeline method (a fake lie detector) and found that men reported more sexual experiences only when they believed their answers would be seen by others.
When they thought lying could be detected, the sex differences nearly vanished.

Similarly, Eastwick et al. (2011) argue that implicit measures tend to reveal smaller sex differences than explicit self-reports.

These findings suggest that some evolutionary psychology claims may overstate innate sex differences, and that more reliable methods are needed—especially in light of broader replicability concerns in psychology (Camerer et al., 2018).

🤔 **Lucio's note: I agree, it's something to keep in mind**
I also suspect, for example, that people, and potentially women in particular, may rate the importance of looks lower than what they truly are.

The Main Issue Is Social Constructionism: Here's Why It Shouldn't Be

Feminist scholars often emphasize social constructionism, while criticizing evolutionary psychology for being biologically deterministic.

Social constructionism is the idea that much of what we consider to be "reality" — including concepts like gender, morality, or even intelligence — is not purely objective or natural, but shaped by social interactions, cultural norms, and shared beliefs.

However, the authors argue that social construction is itself enabled by evolved traits—humans are a culture-bearing species, and our capacity for social learning is biologically rooted.
Rather than opposing each other, social and biological explanations can be integrated.

Yet both fields have historically missed this opportunity to cooperate and build upon each other.

Chapter 32: Psychopathology from an Evolutionary Perspective

William J. Ray surveys theories of depression (analytical rumination, social competition), anxiety (smoke-detector principle), and more, emphasizing that many pathologies may be misfirings of once-adaptive defense mechanisms.

- **Autism may be an extreme case of understanding and developing systems**: Coupled with the inability to empathize in autism is the superior ability to systemize. Systemizing is the ability to analyze objects or events in terms of their structures and future behaviors. These deficits and abilities make up the empathizing–systemizing theory of autism (Baron-Cohen & Belmonte, 2005)

Histrionics and Psychopathy Are An Adaptive Cheater Strategy

From an evolutionary perspective, **psychopathy** may be understood not simply as a disorder, but as a possible **adaptive strategy**—specifically, a "cheater" strategy in reproductive and social life.

Psychopaths, characterized by manipulativeness, lack of empathy, dishonesty, and disregard for social rules, may exploit others for short-term gains without remorse.

According to Harpending and Sobus (1987), both **male psychopaths** and **female histrionics** can be seen as different forms of sexual cheater strategies:

- **Male psychopaths** deceive women about commitment to gain sexual access while avoiding investment in offspring.
- **Female histrionics** exaggerate emotional neediness and helplessness to attract male attention and secure resources, potentially even at the cost of their offspring's well-being.

This view frames certain personality disorders not merely as dysfunctions, but as **extreme or context-dependent evolutionary strategies** shaped by environmental pressures and individual reproductive incentives.

⍰⍰♂ Lucio's note: psychopathy may be seen as an extreme end of a short-term and uncommitted sexual strategy (player strategy)
And unfortunately, the sexual deception strategy goes beyond 'deceiving about commitment'. This is an exposé article on a psychopath openly discussing his cheater strategy:

- Psychopaths' cheater strategy in dating: a shocking revelation from an actual psychopath

> Psychopaths' Sexual Strategy: Marauders of Sex

Chapter 34: The Evolution of Prosocial Behavior: From Caring to Compassion

Gilbert outlines the phylogeny of care-giving systems.

The Benefits of Caring

Compassion training has been shown to positively affect physiology (e.g. nervous system, immune function, neuroplasticity) and mental health (reducing depression/anxiety) (Kirby et al., 2017b; Goleman & Davidson, 2017). Various training models now exist, including those based on Mahayana Buddhism and modern psychotherapy (Gilbert, 2010).

However, modern societies often promote competitive self-interest and narcissism, especially in schools and businesses, which can suppress compassionate instincts.

The evolutionary lens shows that while self-interest and tribalism are natural, so are empathy and cooperation. The challenge is to create individual and cultural environments that activate and reinforce pro-social motives over competitive or exploitative ones (Gilbert & Mascaro, 2017).

A Case For Working Toward A More Compassionate Society

One is mental health:

> There are concerns as to whether we should allow our schools to drift further and further into narcissistic, competitive self-interest, with consequences for vulnerability to mental health and reducing community values, or whether schools should be the grounding for the teaching of ethical and compassionate values and behavior (Weissbourd & Jones, 2014)

And the other is the future of humanity:

> This is important because we cannot simply rely on the emergence of contexts to create the kinds of justice, fairness, ecological sensitivity and compassion we may wish to see. Indeed, self-interest and tribalism can equally recruit new brain competencies, and they have done so for thousands of years, with some very horrific consequences. We may be vehicles for our genes and for different algorithms and strategies that are "battling" for the control of the minds

Wealth May Decrease Compassion & Cooperation

In environments where resources are scarce—such as in small-scale, low-resource hunter–gatherer societies—people tend to adopt strategies centered on caring and sharing.
In these settings, survival depends on mutual reliance and cooperation, so compassion and generosity are adaptive.

Reputation for helping matters, and group interdependence fosters empathy and support.

In contrast, in wealthy, high-resource societies, the strategy shifts toward controlling and holding.
As people can store resources, grow wealth, and live in larger, more anonymous groups, the adaptive approach becomes one of accumulation, protection, and self-interest.
Compassion becomes less central, and individuals are more likely to prioritize themselves or their close kin.

Research supports this shift:

- **Lower socioeconomic classes are more charitable**, often more trusting, and helpful than those from higher classes—despite having less to give.
- **Entitlement grows with wealth**: as wealth and power increase, individuals tend to show reduced empathy, greater entitlement, and less sensitivity to others' suffering.

This evolution poses a challenge: compassion evolved to function in small, kin-based groups, but modern societies are large, unequal, and often driven by competitive, individualistic, or nationalistic agendas.

Prosocial Adaptation Can Be Co-Opted For Selfish Purposes

> As evolution modifies physiological systems that facilitate different competencies, these competencies can begin to be utilized for a range of different purposes.
>
> For example, it is well known that human empathy can be used to be caring or for Machiavellian self-advancement or to cause harm (Gilbert et al., 2017b; Zaki, 2014).
> Similarly, caring behavior can be used for a whole variety of purposes, one being to advance one's reputation (Catarino et al., 2014; Goetz et al., 2010).

We Need Science to Develop A Better Future For Humanity

> It is very easy to inspire humans to violence and the enjoyment of narcissistic self-interest with a toning down of empathic concern for the misfortune of others.
> (…)
> Although many might like to see humanity as a compassionate species – and we can be – we can also be one of the nastiest, most brutal, and most exploitative species to have ever walked this planet.
> (…)
> Our challenges are to try to create a more compassionate mind in a more compassionate and pro-social world.

⍰♂Lucio's Take: **I agree, and humanity's future may be at stake**

Lucio:
I consider ingroup/outgroup tribalism—and humans' tendency to band together to attack others—one of the major risks to humanity's future.

If we are to survive and thrive, and hopefully expand into the universe, some form of "cooperation and compassion engineering" may be necessary.

Chapter 36: A Bridge Too Far? Evolutionary Psychology and Social Problems

Buunk assesses evolutionary psychology-based interventions for social issues (e.g. aggression, obesity), warning against genetic determinism and urging policies that modify environments to align proximate incentives with adaptive goals.

Evolutionary Psychology More Useful In Telling Us What Not to Do, Than What to Do

For example, it's useless to tell or expect men to commit more if women far outnumber men, or if men have been raised in difficult environment and already adopted a fast life strategy.

Similarly, policies to bring more women to the to of organizations may fail or be misguided because, given women's different psychological makeup from men, it is unrealistic to assume that complete equality in the workplace is a reachable goal.

⍰⍰♂ **Lucio's note: potentially too critical and potentially underestimating the impact of Evolutionary Psychology**
I was surprised to find this chapter rather critical of evolutionary psychology's contribution to solving modern problems.
Every field may need internal criticism to avoid touting its horns and some of Buunk's points are valid. I agreed for example that some criticism of cognitive or social psychology may be taken too far.
However, I remain more optimistic about the value evolutionary psychology can bring to the table.

Chapter 37: The Evolution of Personality

Furnham and Kanazawa review Big Five traits as fitness-relevant dimensions balancing costs & benefits across environments, proposing that personality diversity is maintained by fluctuating selection (ie.: selection pressure change over time and contexts) and pleiotropy (ie.: one mutation affects many traits, so even sub-optimal traits may stick around even if they're not always helpful).

Factor	Adjectives	Q-sort Items	Positive Benefits	Negative Costs
Extraversion	Active, Assertive, Energetic, Enthusiastic, Outgoing, Talkative	Talkative, Skilled in play/humor, Rapid personal tempo, Facially/gesturally expressive, Behave assertively, Gregarious	Big social networks, Relationship and mating success, Explorer of opportunities, Happiness	Accidents and risk-taking, Impulsivity and poor decision-making, Relationship instability
Neuroticism	Anxious, Self-pitying, Tense, Touchy, Unstable, Worrying	Thin-skinned, Brittle ego defenses, Self-defeating, Basically anxious, Concerned with adequacy, Fluctuating moods, Hypervigilance, Achievement striving, Emotional sensitivity, Competitiveness	Hypervigilance Achievement striving Emotional sensitivity Competitiveness	Poor mental health, Stress sensitivity, Poor physical health
Openness	Artistic, Curious, Imaginative, Insightful, Original, Wide interests	Wide range of interests, Introspective, Unusual thought processes, Values intellectual matters, Judges in unconventional terms, Aesthetically reactive	Social attractiveness, Creativity, Flexibility, Change oriented	Mental illness, Social exclusion, Bizarre belief systems and lifestyles
Agreeableness	Appreciative, Forgiving, Generous, Kind, Sympathetic, Trusting	Not critical/skeptical, Behaves in a giving way, Sympathetic/considerate, Arouses liking, Warm/compassionate, Basically trustful, Psychological mindedness	Social networks, Strong relationships, Valued group member	Vulnerable to exploitation, Failure to maximize personal advantages, Too conflict-avoidant, Low assertiveness
Conscientiousness	Efficient, Organized, Planning ability, Reliable, Responsible, Thorough	Dependable/responsible, Productive, Able to delay gratification, Not self-indulgent, Behaves ethically, High aspirational level, Long-term planning	Longer life expectancy, Good citizenship, Dependable and dutiful team member	Obsessionality and perfectionism, Rigidity with poor flexibility, Slow to respond

All credits to Adrian Furnham and Satoshi Kanazawa

- **50-0-50 rule of personality**: for many personality traits roughly 50 percent of the variance in individual differences in personality is heritable (determined by genes), roughly 0 percent is attributable to the shared environment, and roughly 50 percent is due to the nonshared environment, including peer socialization (Harris, 1995, 1998).

⍰⍰♂ Lucio's note: I still don't see how this squares with other evidence, and may be potentially misleading
The 50-0-50 rule doesn't reconcile perfectly with what I've learned and observed so far.
For example, Life History Theory says the early environment cues people into fast or slow strategies, often through perceived harshness or unpredictability (see next chapter and not for more ⍰⍰). That's often a shared environment heavily shaped by parents, including the simple presence or absence of a father.

I suspect the misunderstanding may be related to what counts as 'trait', and many authors may refer to the Big 5. But a fast life history approach more closely resembles that of individuals high in psychopathic traits, so I struggle to see how that's not a highly significant impact on personality.

Intelligence Predicts The Acquisition of Novel Preferences

> The idea is that intelligence is essential to comprehending and responding to complex and evolutionarily novel situations, but not necessarily to evolutionarily familiar situations. Thus, it is possible to explain a whole range of individual differences from television watching to political attitudes in terms of the intelligence of individuals. More intelligent individuals are more likely to acquire and espouse evolutionarily novel preferences and values such as political liberalism, atheism, and nocturnal lifestyles

There is no 'best' personality, only contextually better

> The fluctuating selection model highlights the fact that few personality traits have unqualified and universal reproductive benefits under all circumstances;
> instead, their **benefits depends on contexts and circumstances**. Every personality trait has trade-offs in terms of costs and benefits. Different geographical locations and different historical times may select for different personality types.

And this is why social calibration is crucial.

⍰⍰♂ Lucio's suggestion: expand this great chapter!
This chapter was great, and with even bigger potential for more. It mentions the limitations of random mutation and natural selection in driving evolution toward a single optimum, due to factors such as shifting environments, niche specialization, pleiotropy, and the fact that most traits are not simply present or absent, but continuously distributed—potentially with adaptive advantages near the middle and maladaptive effects at the extremes—making them difficult to eliminate entirely
These are concepts I've been grappling with for some time and I'd love for the authors to explain them even more deeply.

Chapter 38: Applying Evolutionary Principles to Criminality

Taylor and Workman apply life-history theory to antisocial behavior, showing that "fast-life" strategies (early reproduction, high risk) correlate with Cluster B personality disorders and propensity for crime.

- **Secure attachment is rare for psychopathic offenders** (Frodi et al., 2001), and such offenders were far more likely to have been physically abused as children

⍰⍰♂ Lucio's note: sometimes a good family can't put a bad seed on a good path
The authors compare psychopathic researcher James Fallon's good upbringings and a psychopathic killer who had a bad childhood, suggesting that the contingent shift theory (ie.: adjusting to a different environment) explains the diverging paths. However, I'd note that we can't be sure that was the case, and the main difference may still be genetic, with Fallon having stronger impulse control, or stronger long-term thinking propensities. Or, simply, Fallon may score lower in psychopathic traits (eg.: psychopathy factor 1).
Finally, as per note above, this seems to defy the 50-0-50 'rule' that discounts the early shared environment.

Chapter 39: Substitute Parenting

Daly and Perry analyze stepfamily fertility and child-investment patterns, revealing higher mortality rates in stepchildren (the "Cinderella effect") and proposing evolutionary explanations for kin-selective caregiving.

Existing (dependent) children may decrease a mate's value:

> From a suitor's perspective, the prospect of becoming a stepparent to a predecessor's child is treated as a cost, not a benefit, in remarriage negotiations, and stepchildren are sources of marital instability, conflict, and violence (Becker, Landes, & Michael, 1977; Campbell et al., 2003; Daly & Wilson, 1996; Daly, Singh, & Wilson, 1993; White & Booth, 1985;)

The authors also state that 'stepparental investment has to be understood as a form of mating effort, not parental effort (Rohwer, Herron, & Daly, 1999)'.

Chapter 40: Historians and the Evolutionary Approach

Hanlon critiques historical narratives for ignoring biological factors, illustrating how warfare, state formation, and economic cycles are shaped by evolved incentives and collective action dilemmas.

- **Mothers don't automatically accept newborns**: n*or do they treat all of their children equally. It is lactation, with its attendant nurturing and cooing, that establishes the bond between mother and infant, who quickly responds (Hrdy, 1999).*
- **Abortion and infanticide have been common in history**: *Abortion and infanticide appear to be part of the universal repertoire of human behavior and are much more widespread than we thought. The mothers appear everywhere to be the authors of them, and midwives are active or complicit in the phenomena with various degrees of concealment.*
  - Christianity decreased infanticide: *The long-standing opposition of Christianity to infanticide is held to represent the dominance of culture over nature*
- **The certitude of punishment, not the severity, reduces crime**: teaching that the short-term advantages aren't worth it is key to deter people from pursuing a life of crime
- **Crime statistics are only as good as the bureaucracy that produced them**, and many crime go unreported, unregistered, or unprosecuted.
  The authors also imply that Pinker's work in *The Better Angels of Our Nature* was questionable
- **Battles are a game of posturing until one faction quits**: *The actual battle among men at close quarters is a process of posturing until one side turns and runs. "It is in the subsequent pursuit of a broken or defeated enemy that the vast majority of the killing happens. Dogs understand this too, and you will be pursued if you run from them" (Grossman, 2004).*
- **The desire for dominance drives status acquisition**: *All primate communities form status hierarchies, and individuals with a strong desire for dominance generally rise to the top.*

Chapter 41: The Psychology of Extraterrestrials: The New Frontier?

Barkow speculates on universal cognitive architectures and adaptive behaviors of hypothetical alien intelligences, using human evolutionary constraints to predict likely forms of extraterrestrial sociality and technology.

- **We don't know what they compete on, but if they reproduce sexually, they're competitive**: *Because we are a cultural species, the criteria in terms of which we compete and then allocate prestige – relative standing – can vary enormously (Barkow, 1975, 1980b, 1989, 2014a). What is universal is not the specific kind of competition, but competition itself, competition in terms of a standard of excellence*

Chapter 45: Evolution and the Media

In this finale, Workman et al. note that modern media exploit ancient biases (supernormal stimuli, gossip networks) to hijack attention and drive status hierarchies. They argue for "media hygiene" practices grounded in evolutionary

insight.

- **Law of least effort got us hooked**: people do what's easiest, and modern media makes it easy for most people to get entertained, without having to move or do much at all

> The principle of least effort has implications for all forms of media: why people may (…) pass up a chance to meet a woman in order to surf porn, pass up a chance to meet a man to read a romance novel
> (…) And he can do this while indulging the "rest when you don't need to move" impulse in a padded lounge chair and consuming supernormal stimuli for hunger or enjoying endogenous feel-good chemicals.

And just wait for AI and sex robots, I'd add…

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Tribal Altruists Are Humanity's Enemies

From Colquhoun et al.:

> Based on observations of pro-social behavior of various groups in New Guinea, Boyd and Richerson (2005) claim that CGS can work.
>
> There is, however, a downside to this, since **CGS can lead to altruism within the group, but simultaneously promote selfishness between groups.**
> In fact, Bowles (2009) looked at archaeological data on causes of death during the late Pleistocene and the early Holocene and concluded that between-group competition led to a large increase in mortality rates.
>
> **In a sense, the claim that cultural group selection can lead to altruism in humans really raises the question: Altruism toward whom?**
>
> From this perspective, **suicide bombers may be thought of as altruists to the cause of their group by other group members, but to non-group members they are anything but.**

Communism Is Failure to Understand Human Nature

> one might argue – with reason – that communist regimes were based on the assumption that the human mind was completely malleable and that society could strongly influence, if not completely change human nature. Indeed, many social scientists have been guilty of actively supporting this notion and the dictatorial regimes based on it.

And, I'd add, the failure of communism and its chronic underperformance in output, quality of life, and progress, is also the natural consequence of not maximizing the human drive to status and wealth accumulation in the same way that (regulated!) capitalism does.

Society Replaced Alpha Males With Institutions

Taylor and Workman, citing Dennis Krebs, say:

> Showing deference ensured survival, whereas defiance may have resulted in injury or death if the challenger was overwhelmed by the alpha male.
> Today, the concept of the alpha male has largely been replaced by societal infrastructure and, in particular, by the laws of the land. This means that whereas we once paid deference to the alpha male, we now do so to organizations such as the police force

However, I wouldn't say that the 'alpha male' has been suppressed, but more like it's been *supplemented*.
Social hierarchies haven't gone anywhere and are still part of our social architecture and internalized psychology.

Lower mate value men may drive monogamy

Quoting Campbell:

> Although the selective forces that led to widespread human pair-bonding are debated, Gavrilets (2012) found support for a plausible model that showed that, if females were willing to forego extra-pair matings and preferred males who provided resources, **male provisioning would increase driven chiefly by low-ranking males who would otherwise fail to reproduce at all**. Because these males outnumbered elite males, selection would have acted more strongly on them and their strategy, causing it to spread through the male population

This recalls the mantra of 'alpha fux, beta bucks'.

But the same author then notes:

Monogamy may make for better societies

> Humans' basically **monogamous mating system**, through its effects on individual behavior, **brings with it societal rewards in terms of reduced crime rates** and stronger within-group alliances.
>
> For women, it reduces gender inequality and domestic conflict while increasing child survival (Henrich, Boyd, & Richerson, 2012).
>
> Monogamy also means that mate selection becomes a two-way street: when men constrain their (potentially) high reproductive output to that of a single woman, they become much choosier

I agree with this, and even made it a step on our 'how to build an empire' article, since it stabilizes society.
But, importantly, I believe it may also make for a better quality of life for many, and children may benefit from monogamy and a present father.

Some aggressive men may find aggression exciting

Quoting from Toates' chapter:

> For those males who have a desire to dominate, the subliminal presentation of dominance-related words tends to increase the attractiveness rating of the female being viewed (Bargh et al., 1995).

Lying is part of being human

Quotes from the chapter on deception:

> lying is just a solution to the ecological circumstances of being human. We have to forge alliances with others, conceal important personal information, and manage multiple – often mutually antagonistic – relationships, none of which would be possible if we were obligate truth-tellers

Lying is so commonplace that it may be the default, and it's functional:

> We used to consider truth-telling to be the default position and deception to be deviant, but evolutionary research is increasingly demonstrating that deception is not only ubiquitous, but functional.

However, not all lies are mean and self-serving:

> The lies need not be directly malign, and unlike psychopaths and other pathological liars, they are motivated to grease the wheels, pour oil on troubled water, and generally manage social situations, albeit often for the ultimate benefit of the deceiver.

The best liars may believe in their lies

> It should be noted that it has been suggested that human cheats could employ complex methods of hiding their intentions, such as Trivers' (2011) theory of selfdeception, in which humans are not consciously aware that they will cheat, allowing them to hide dishonest cues

QUOTES

On how researchers still can end up on opposite side of the spectrum when it comes to the role of culture:

> Evolutionary scholars often appear to disagree strikingly about the value of "culture" in explaining human behavior.
> John Tooby (…_ responded to the Edge.org question "What scientific idea is ready for retirement?" with the answer "Learning and culture" (Tooby, 2014).
> At around the same time, Joseph Henrich published '*The Secret of Our Success: How Culture Is Driving Human Evolution*'.
> How can two highly reputable scholars, both committed to understanding human behavior within an evolutionary framework, come to such apparently opposing conclusions? Should the concept of "culture" be retired, or should it be heralded as the secret to humanity's evolutionary success?

My note:
I disagree with Tooby here, unfortunately, he spoke like a biology/evolutionary determinist

---

On the misplaced criticism against simple models being 'too simplistic':

> Simple models do not imply that the modeler thinks that the real world really is simple.
> (…) simple models are the best way of understanding a complex reality (Servedio et al., 2014; Smaldino, 2016).

On the relative importance between mothers and fathers:

> through our evolutionary past from an infant's viewpoint, mothers have always been essential while fathers have been an optional extra (Campbell, 2013) (p. 73)

On the cost and inheritability of honor:

> He who was ready to sacrifice his life, as many a savage has been, rather than betray his comrades, would often leave no offspring to inherit his noble nature (Darwin, 1871)

On sexual selection supporting human cooperation:

> The reason we're nice is that, throughout the course of our evolution, kind, loyal, and generous people attracted more romantic interest than their cruel, traitorous, or selfish peers, and therefore did better in the reproductive sweepstakes. (2018, p. 200)

On our natural morality:

> Mental mechanisms that disposed early humans to behave in moral ways were selected and shaped as humans evolved. Modern humans are naturally disposed to uphold culturally universal and culturally relative moral norms. **We are moral by nature**.

On women's 'slow life' winning strategy:

> The benefits for women lie in lower mortality and greater longevity, which enhance mothering and enable grandmothering. Among women, living slow and dying late has been a winning strategy.

Lucio's Analysis

Roger's Paradox Could Be Expanded: Cultural Learning Deserves Better Defense

Mesoudi introduces the Rogers' paradox, showing that undirected social learning can evolve without improving average fitness, due to frequency dependence.

However, as Mesoudi and others have clarified, this result applies only to **non-selective copying**. Human learners typically use **strategic, selective learning**—copying successful individuals or deferring to social learning when individual learning is costly—which can and does enhance fitness.

More importantly, **cumulative culture** allows humans to build on prior knowledge across generations, achieving innovations no individual could invent alone. This cumulative aspect—not modeled in Rogers' original framework—is central to culture's adaptive power.

Finally, human learners are not passive. They can **selectively learn, evaluating and refining** what they copy with some reverse engineering, filtering out outdated or maladaptive behaviors. These richer learning dynamics resolve the paradox and reaffirm the role of culture in human success.

More Structured Presentation of Main vs Speculative Theories

To improve clarity on complex topics, I believe it's best to first present the main, most well-supported drivers—those with the strongest empirical backing and largest effect sizes—before introducing additional or more speculative contributors.

Otherwise, readers can get lost in a dense web of interwoven theories, all technically valid, but lacking a coherent narrative or hierarchy of importance.

I recommend authors adopt a top-down structure from most important to least.
Start with the key explanatory drivers, then layer in secondary mechanisms and less supported hypotheses.

For example:

⍰ Ranking the drivers of altruism, morality, & cooperation

For example, despite several chapters dedicated on the topic, I wasn't able to gain the level of clarity I wanted.

What I wanted was a ranked explanation:

- What are the largest, most widely accepted evolutionary drivers of altruism and cooperation?
- And what are the possible, but less substantiated or narrower-scope, contributors?

This is what I would have liked to see:

Theory	Impact	Explanation
Kin selection (inclusive fitness)	Very high	Altruism toward genetic relatives evolves when helping kin (rB > C) still propagates shared genes.
Direct reciprocity	Very high	In repeated interactions, helping others pays off because they'll return the favor later.
Misdirected kin selection	Speculatively high	Cooperative behavior triggered by evolved kin-detection mechanisms (e.g., familiarity, similarity, proximity, emotional closeness), evolved in small kin-based tribes but triggers even without genetic relatedness
Indirect reciprocity (reputation)	High	Acts of helping build a good reputation, which attracts aid from third parties.
Network (spatial) reciprocity	High	Emergent property. Cooperators cluster together in networks or colonies and collectively outcompete isolated defectors.
Multi-level (group) selection	Moderate	Groups of cooperators outperform groups of defectors, so cooperative traits spread with the winning groups/coalitions.
Enforcement (punishment)	Moderate	Emergent cultural byproduct. Punishing or excluding defectors imposes costs on cheats, stabilizing cooperative behavior.
Parochial/Ingroup altruism	Moderate/low	Preferential help for in-group members, often paired with hostility toward outsiders.
Green-beard effects	Low	Rare "tagged" genes recognize and favor copies of themselves, leading to targeted cooperation.
Partner choice	Low	Cooperative partners are favored over selfish ones. 'Cooperative' signaling is a consequence. Its strong effect on long-term dating is offset by short-term mating and forced copulation

“Evolutionary Drivers of Altruism, Morality, and Cooperation: A Ranked Framework”
(by Lucio Buffalmano)

REVIEW

The Cambridge Handbook of Evolutionary Perspectives on Human Behavior is an authoritative, comprehensive, and wide-ranging source of insights into human psychology and behavior.

I’ve reviewed and studied many evolutionary psychology textbooks, and yet the best ones still manage to deliver new and fresh insights.

This *Cambridge Handbook* ranks among the very best.
It helped me improve several articles, and I learned a ton in the process.

From chapters on cooperation and altruism to bullying, parasite-stress theory, and beyond—there’s so much value here that it’s hard to even pick a favorite.

So instead, I’ll just express my gratitude to every contributing author:
Thank you for the excellent work you do ⍰⍰

Check the **best evolutionary psychology books** or **get this book on Amazon**.

How to Be More Masculine: The 10-Step Guide for Men

Lucio Buffalmano · 21 September 2025 · Archived copy · Original

What does it mean to be a man in today's world?

Search "how to be more masculine" and you'll find everything from gym-bro clichés to feel-good advice that doesn't deliver.

Masculinity isn't about PEDs or being 'nice'. It's about strength, status, dominance, and mental power.

At The Power Moves we've helped thousands of men rediscover their masculine edge and achieve their goals.

This guide cuts through the noise with proven, practical steps to build real masculinity—backed by psychology, biology, and real-world power dynamics.

Contents

  - Your Next Masculine Move

1. Unleash Your Inner Warrior

Ambition, Aggression, and Will to Power are the masculine trinity.

Call them the ‘warrior spirit’.

They can power heroes and build civilizations.
Or they can *destroy* civilization.

Unleash your inner warrior, yoke it with win-win, and you’re the ultimate masculine hero.

♂Lucio’s Experience: **Run to win the race of life**

Lucio:
My first 10k race highlighted the warrior spirit vs. ‘most men’.

I couldn’t believe people stopped for water. *Stopping* for water? In a *race*??

When the road bent, some runners ahead of us smiled and waved.
My prosocial half loved the festivity. But my inner warrior saw taunts to be avenged with my performance.

Left with no overtaking space in the last stretch, I horned in between two guys, their elbows hitting my arms. They looked incredulous. My prosocial shell apologized—it was a bold move. But my inner warrior gritted '***Get the f*ck out of my way***'.

At the end, it seemed like I was the only one spent. Was I the exception for having given his all?

Deep down, I couldn't help but think, 'No wonder I achieve my goals, while most people dream'.

2. Pursue Ambitious Goals

Effective men pursue and achieve ambitious goals.

Ambition without goals and hard work is called *entitlement*.
Don't be that guy. **Masculine self-respect is earned, not claimed.** Earned with the hard work that moves you forward.

Stay stedfast to those goals

Emotional steadfastness underpins behavioral steadfastness.
Stay resilient from criticism and bounce back from losses: both are more strongly associated with masculinity (Brizendine, 2006; Gard et al., 2007; Johnson & Helgeson, 2002).

Non-masculine	High-power Masculinity
Fluctuating self-esteem, based on external events	**Constant self-esteem**, high in victory or defeat
Undisciplined, start and stop	**Stick to plan**, day in/day out
Fickle, constantly changing one's mind	**Decisive**, changing one's mind only with evidence

Think of masculinity like a river: despite the bends and rocks, it never stops moving towards the sea.

3. Develop High Self-Esteem

Believing in yourself is a top priority.
A weak mind is like a weak foundation. **No amount of muscle or money can fix a self-doubting mind.**

The true foundation of confdience is self-esteem, also shown to be more resilient in men (Helgeson, 2020 for an overview).

Here's a good primer on higher self-esteem:

> **Lucio**: Start from the basics of self-love and self-respect, then work your way up

5. Be More Dominant

Dominance, status, and power are the base currencies of masculinity.

Masculinity is not just about how you look; In large part, masculinity is about *behavioral* masculinity.
Behavioral masculinity boosts relationship satisfaction and loyalty. Write French in the *Cambridge Handbook of Female Adaptations*:

> women whose partners are more (versus less) symmetrical or behaviorally masculine report increased attraction to and satisfaction with their partners near peak fertility (Gangestad, Thornhill, & Garver-Apgar, 2005; Meltzer, 2017)

Some tips:

- **Speak with confidence**, see here
  - Lower your pitch within your natural range
  - Speak clearly, don't mumble
  - Never rush, or you sound nervous
- **Behave more dominant**, see here and dating dominance

The off-the-charts masculine/feminine polarity is instructive (not necessarily advising you do the same)

5.2. Adopt Masculine Body Language

Masculine body language is *confident* body language.

- **Take up space**, arms on armrests, feet apart
- **Comfortable posture**
- **Open up**: straight spine, shoulders back

P.S.:
Avoid ‘power posing’. It’s pop-psychology, and screams of unmasculine overcompensation

Check out:

- ✅ Masculine body language
- ❌ Feminine body language to avoid

Display Strength and Stoicism

Lean towards *under*-reacting.
Lower reactiveness, including in facial expressions, are associated with masculinity.

Most of all, banish drama and hysterics.

Unmasculine	Masculine
Ouch	⍰
Oh my Goood! ⍰	WTF is that!
HELP!! Can anyone please help! I lost my dog, HELP! <– Emotional and dramatic	*Have you seen a black pitbull roaming around* <– Factual and collected

6. Develop A Masculine Body

Physical formidability is masculine.

- **Lift Weights** and train. It helps with *looking* masculine, and boosts testosterone
- **Healthy diet**: Rich in protein and vegetables. Avoid deep-fried, and ‘junk food’
- **Rest and recover**: Sleep deprivation impacts testosterone and mental sharpness. 4am alarms don’t boost masculinity
- **Stay lean**: Lower body fat is associated with higher testosterone and masculinity

Balance: health and fitness, no obsession
Healthy mind in a healthy body. Body dysmorphia is the opposite of healthy masculinity. And obsessing over carbs, sugar, or a drink isn't top masculinity either.

⍰ Example: Quit Diet Fads & Optimization Porn

The masculine man mindset around fads and 'over-optimization':

> **Alex**: *This has to sink in (…) I get the same questions (…) what's the new marketing trick what's the new hack. (…)* **It's like the gal who's like 'hey is it keto is it intermittent fasting'.** *It's how you sound like*

Top 1% masculine men look down on 'biohacking' fads—they focus on timeless, high ROI fundamentals.

Dress Masculine

- **Masculine accessories**, like a metal watch or a leather strap for younger men. Less is more
- **Boots are masculine**, and so are leather and dress shoes. Avoid overdoing trainers
- **Beard is masculine**. Stubble for younger men, beard up until middle age. Then shave more often

⍰⍰ **Tip**: develop a small wardrobe of sharp basics that suit your body type. Shopaholism is not masculine

8. Be A Leader

Leaders are high power and intrinsically top status.
And leadership is associated with masculinity.

True leadership goes beyond a title; it's about embodying the key **mindsets of a masculine leader**, such as ownership of your deliverables, of your life, and looking out for the people around.

⍰♂Lucio's Take: **The Sigma male way to leadership**

Lucio:
I'm not interested in leading others.
It requires commitment and often comes with status games and politics.

But I am even less interested in *being* led. I'm fiercely protective of my freedom.

Instead, I think of myself as **leading my own life.**
And I lead my life the way *I* want.

9. Be Sexually Confident

Sexual confidence is masculine.
And despite the changing times, expectations of men being initiators and leaders persist.

If you're single, take action on your desires and respectfully but confidently approach the girl you like.
Lovers are a masculine archetype (Gilmore, 1990). And the proof is in the pu…dding: women's choice. Women prefer high-value men for uncommitted dating.

9.2. Retain Power to Be Masculine In Relationships

To remain masculine in relationships:

- **Ensure she wants *you***, not just your provisioning
- **Keep high-priority goals** outside the relationship
  - You chase goals > she chases quality time. That's the masculine/feminine dynamic
- **Prioritize respect**, if you lose respect, you lose masculinity and attraction

Example of the type of disrespect you may have to check:

Also read:

- How women control relationships, and how to maintain your masculine edge
- How to maintain masculine power in relationships

10. Stay Honorable: The 'Masculine Code'

An 'unwritten male code' combines power and honor.
And it glues masculinity, respect, and status (prestige-type of status).

Lack of social and mental power lead to dishonorable sneakiness

The 'unwritten male code' includes:

- **Assertive direct talk** over passive aggression
  - Man-to-man conflict resolution over sneaky tactics
- **Hierarchy-skills**

  - Respecting higher-ups
  - Stronger boundaries from below (lower status)
  - Not bothering higher-ups for small stuff
- **Team spirit**, playing to win for the team, channeling anger into fuel for performance
- **Self-reliance**, attempting to solve one's problems before crying for help

Avoid B*tch Moves

The 'b*tch' is the worst spot in the masculine quadrant of honor and power:

Nobody teaches this unspoken code. Some power-aware men naturally understand it. But some men are struggle to gain other men's respect because they're oblivious to it.

Some examples of masculine faux pas:

Code	Unmasculine	Masculine
Man-to-man	*"I'd like a supervisor"* <— Skips assertiveness, seeks fake corporate kid-glove	Demand proper service first. Only *after* you escalate
Self-reliance	*"Hey boss-of-my-boss, I want to complain about my boss"* <— Adult equivalent of calling daddy.	Find own solutions
Competitive	*"Ooow! You went in too hard* <— Expects nice playing, instead of playing to win	Play tougher next time
Directness	*"Dear, let's go. We'll leave a bad review"* <— Indirect aggression as revenge	Calls waiter to complain

Since this is crucial for men, we dig deeper in PU.

The man's code of honor starts from childhood.
Here's a good example:

> **Lucio**: We were having a 1:1, man to man disagreement. Suddenly he turns around and seeks support from another guy.
> Even as a kid I felt it broke the 'man code of honor'. Immediate respect loss

TPM Special Tips

Logic Over Woo-Woo

Men tend to believe less in 'supernatural forces'.

Here's how you can use that polarity to spike attraction:

> **Girlfriend**: You don't believe in horoscopes at all?
> **Lucio**: No. As if I'd let horoscopes tell me what's in store for me. I make my reality <— Immediate attraction spike

🧔♂Lucio's Take: **Woo-woo is the fastest way to lose my respect**

> **Lucio**: Masculine men run the world because they focus on active action, rather than 'passive attraction'

Be Strategic

Just like strategies beat dominance, strategic masculinity always beats rigid masculinity.

Own Your Shortcomings: Penis & Masculinity

Physical size, including penis size, can influence perceptions of masculinity.

In dating, men make it a bigger deal than women. Men are less satisfied with their penis size than their women are (55% vs. 85%).
And studies shows it impacts men's self-esteem.

Some men may feel powerless over less malleable traits like height or penis size.
But there is much you can do.

🧔♂Lucio's Take: **Locker room confidence as a 'grower'**

Lucio:
As a ‘grower’, I wasn’t always comfortable in locker rooms and showers.

That changed with mindsets, results, and expanding self-esteem.

More details here.

Quit watching masculinity videos

Learn if you must learn.
But don’t stay stuck in learning *forever*.

It’s demeaning to be an adult, eternally schooled on how to be a man

⁉️ **Solution**: Rediscover your nature, then do ‘masculine’ in your own way and move on.

FAQs

What causes low masculinity

Common causes include: low testosterone or health issues; overprotective parenting or overly shielded childhood; cultural discouragement of assertiveness; absence of male role models or mentorship; fear of conflict or rejection; low ambition and underdeveloped confidence. Most of these can be addressed through training, experience, and lifestyle changes, helping men regain status and agency.
The Power Moves we provide frameworks for **building status, confidence, and real-world masculine effectiveness**.

Can I become more masculine?

Yes, anyone can become more masculine by building mental resilience, physical strength, confidence, and other traits associated with masculinity.

Start by lifting weights to boost testosterone and increase muscle mass, practice assertiveness in daily interactions, and own your space. Masculinity is a skill set you can develop.

How to be more masculine in a relationship

To be more masculine in a relationship, lead with confidence by making decisions, setting boundaries, and protecting your partner without being controlling.
Communicate directly and honestly, expect and demand the same back, and handle conflicts calmly, but resolutely. Finally, build emotional independence to avoid neediness, and maintain your own pursuits to keep the relationship balanced and remain attractive.

How to be more masculine in bed

Being more masculine in bed means taking charge with confident, dominant energy—initiate boldly, guide the pace, and focus on her pleasure while owning yours. Build physical stamina with cardio, and practice lasting longer. Embrace raw passion, avoid overthinking, and lead the experience.

Your Next Masculine Move

This masculine guide gives you a solid overview.
But real masculinity isn't learned from articles — it's lived. **Power University** is the definitive program for men ready to master the art of power, masculinity, and leadership.

Exec Summary

- **Gender stereotypes create or reinforce the reality of gender differences**. Stereotypes aren't just descriptive, but prescriptive, applying social pressure on men and women to conform and be 'good men/women'
- **People exaggerate and over-generalize gender differences**, but gender differences are small
  - Even small effects can be significant when applied to whole population, when consistent (and, we add, when they shift the full 'bell curve')
- **Must must 'prove' their masculine worth**, while women don't need to prove femininity

FULL SUMMARY

About the Authors:
Various authors by chapter. The main editors are:
Michelle K. Ryan is a Professor of Social and Organisational Psychology at the University of Exeter and the University of Groningen. She co-developed the concept of the *glass cliff*: women promoted in leadership roles during crises and declines, setting them up for failure. Her research spans gender, leadership, and workplace diversity.
Nyla R. Branscombe is a Professor of Psychology at the University of Kansas. She is a leading scholar in social psychology, with a focus on intergroup relations, social identity, prejudice, and discrimination. Her work often explores how group memberships shape attitudes and behaviors, including issues around gender and inequality.

Trait	Men	Women	Magnitude
Emotion Expression	More likely to express anger; suppress vulnerability	More emotionally expressive overall	Small to moderate, context-dependent
Risk-taking	Higher, especially when masculinity is threatened	More cautious overall, favoring stability and safety	Moderate to large, especially in physical domains
Social Dominance	More encouraged to assert dominance	Discouraged from dominance, faces social penalties	Moderate, shaped by cultural norms
Communication Style	More direct and authoritative	More tentative and cooperative to avoid backlash	Small to moderate, highly context-sensitive
Motivation Focus	Status and achievement-driven	Relational and communal goals	Moderate, varies with context
Perception of Competence	Often praised for basic caregiving or support roles	Held to higher standards; competence often questioned	Large in perception, not in actual performance
Aging Experience	More concern about loss of status or utility	More affected by appearance-related ageism	Moderate, varies by culture and role expectations
Personality Traits	More assertive, less agreeable on average	More agreeable, especially in nurturing roles	Small on average; heavily role- and culture-dependent
Verbal Ability	Slightly lower performance in verbal tasks (e.g., reading, writing).	Slightly higher performance in verbal tasks (e.g., reading, writing).	Small ($d \approx 0.1$–0.2)

Trait	Men	Women	Magnitude
Spatial Ability	Higher performance in spatial tasks (e.g., mental rotation).	Lower performance in spatial tasks (e.g., mental rotation).	Moderate, dependingon task (d ≈ 0.5–0.7)
Aggression	Higher physical and verbal aggression, especially in competitive contexts.	Lower physical aggression; more relational aggression (e.g., social exclusion).	Moderate (d ≈ 0.4–0.6)
Empathy & helping	Men are more helpful in risky situations and in the presence of others	More nurturing and caring in private	
Social Expectations	Avoid femininity, avoid powerless emotions (e.g., sadness, fear, shame)	Avoid masculinity, show positive emotions (e.g.: smile, love, enthusiasm, warmth)	

Small Effects Are Still Significant If Consistent

> small effect sizes are not necessarily unimportant in daily life. Small effects can have substantial impact when they consistently describe female and male behavior across time and situations.
> As explained by Abelson (1985, p. 133), 'small variance contributions of independent variables in single-shot studies grossly understate the variance contribution in the long run'
> (…)
> In addition, when experiments are designed to have particularly weak manipulations or difficult-to-influence dependent variables, even small effects can be impressive and important (Prentice & Miller, 1992).
> These considerations raise serious concerns about routinely interpreting effect sizes in terms of Cohen's (1988) guidelines of 0.20 for small, 0.50 for medium, and 0.80 for large.

And:

> if studies' measures are not 'single-shot' but aggregated across multiple observations of behaviors, effect magnitudes are larger and sometimes dramatically larger (Eagly, 2009).

The authors mention the democratic VS autocratic leadership style for men and women as an example of a 'small' difference, but that was larger when based on measures that aggregated behaviors across more observations.

I'd also add that the 'small' difference is much larger at the extreme, so that despite the small different, almost all autocrats are men.

Researchers Favor Their Own Sex in Research

> (…) tendencies that are sometimes observed in meta-analyses for the sex of studies' authors to predict studies' outcomes, generally in the direction that authors of each sex obtain or publish more findings that favor their own gender and thereby shore up their gender identities (e.g., Anderson & Leaper, 1998; Eagly & Carli, 1981; Wood, 1987).

The Science and Politics of Comparing Women and Men

Eagly challenges the notion of simplistic sex comparisons, noting that such comparisons often reinforce stereotypes rather than clarify differences. She advises to focus on understanding context-dependent behavior.

In the next chapter Fine debunks pseudoscientific claims of hardwired sex differences found in brain imaging studies, and the limitations of neuroscans.

Any region can be recruited for most functions, so jumping to conclusions about the meaning of an area 'lighting up' is fraught with potentials for errors.
She emphasizes the role of context, expectations, and socialization in shaping brain activity.

- **Avoid simplistic male-female comparisons.**
- **Understand when differences matter in real-world settings.**
- **Consider how social roles influence behavior** rather than assuming innate sex differences.

An Evolutionary Understanding of Sex Differences

Jennifer Byrd-Craven and David C. Geary apply an evolutionary lens to sex differences, arguing that male and female behaviors evolved to maximize reproductive success.

They highlight men's tendency toward competitive and risk-taking behaviors and women's focus on nurturing and relationship-building, rooted in differential parental investment, but urge caution against overgeneralizing evolutionary explanations.

- Humans have more intrasexual reproductive strategies variation than other species.
- Men in successful coalitions have more reproductive opportunities and success than men in less successful coalitions
  - High status men in successful coalitions being the most reproductively successful (Zerjal et al., 2003).
- Sex differences start at around 3 years
- Bullying among boys of this age often increases at the beginning of the school year and decreases later in the year, likely a result of the establishment of a dominance hierarchy (Pellegrini & Bartini, 2001).
- Physical bullying in adolescent boys is associated with social dominance, as defined by peers and teachers, and with a higher frequency of dating and higher rated attractiveness by girls (Bukowski, Sippola, & Newcomb, 2000).
  They're not liked, but have 'social presence' (Berger, 2007).
- Both socially dominant men and women use a mix coercion and prosocial strategies to achieve dominance, depending on the context and the relationship (Hauntil hewley et al., 2007); the sex difference is in the frequency and pattern of physical aggression and social manipulation.
- **Girls are more sensitive to relational aggression**, and twice as likely to suffer from depression or anxiety than boys. The author suggests that's the reason why women use relational aggression: to disempower competitors

Precarious Manhood

The authors explore how manhood is often seen as earned and easily lost, leading men to engage in riskier behaviors to affirm masculinity.

Bosson, Vandello, and Caswell introduce the concept of "precarious manhood," positing that masculinity is a socially conferred status that men must continually prove through action.
Unlike womanhood, which is seen as biologically assured, manhood is vulnerable to threats like job loss or perceived weakness, leading to compensatory behaviors like aggression. This chapter offers practical strategies for addressing toxic masculinity in clinical and organizational settings.

In *Manhood in The Making* author Gilmore lists three recurring themes of masculinity across cultures:

- Impregnator
- Protector
- Provider

There have been many categories and traits that various authors listed and that makes a man a man, but what's striking is that, the authors suggest, there is cross-cultural consensus in beliefs about manhood:

> Cross-cultural consensus in beliefs about manhood is consistent with research by Williams and Best (1990), who conducted a 27-nation study of gender stereotypes.
> Respondents (approximately 100 university students in each country) read a list of 300 adjectives and rated whether each was more descriptive of men or women, or not differentially associated with either.
> High degrees of consensus were reached both within and across cultures, with people from every nation rating men as more adventurous, dominant, and independent than women.
> In short, the results suggest that despite cultural differences in specific norms and customs regarding manhood, there is substantial agreement across cultures regarding stereotypes of men.

- **Masculinity is seen as a status to prove**, unlike femininity.
  Some researchers stated that's remained the same despite cultural changes in 'what it means to be a man'
- **Men may overcompensate** when masculinity is threatened.
  - This dynamic contributes to aggression, competitiveness, and emotional suppression.
- **Perceived 'manhood' impacts men's health**: men who believed job loss made others question their manhood and lose status suffered anxiety and depression

Gender-Based Standards of Competence

This chapter discusses how competence judgments are filtered through gendered expectations in work and parenting contexts.

- Men and women are held to different standards for the same roles.
- Success is often seen as more surprising for women.
- Women in leadership face a "double bind": competent but disliked.
- Fathers are often overpraised for caregiving; mothers are scrutinized.

Minimum requirements VS confirmatory requirements

Minimum standards are **low-bar expectations** based on **group stereotypes** (women need less competence to be considered 'good enough' because expectations are lower).

Confirmatory standards are the higher bar of proof needed to confirm that someone has a quality (women need more evidence to prove competence, men more to prove warmth).

- In hiring, **women often meet minimum standards more easily** (e.g., get shortlisted), but:
  - They must **exceed higher confirmatory standards** to be hired.
  - **Men**, by contrast, are often hired with the same evidence that just got them shortlisted — for them, "suspicion equals confirmation."
- In firing decisions, **women are judged more harshly**:
  - **Fewer mistakes are tolerated** before concluding they're incompetent.
  - Men can make more errors before others conclude they are truly incompetent.
- These **shifting standards** show that:
  - **Women have to work harder to prove competence**.
  - **Men are given more benefit of the doubt** — both in being hired and retained.

This means that Lower expectations (minimum) help stereotyped groups initially but higher requirements

(confirmatory) hurt them at critical decision points like hiring or firing.

Gender and Personality

The authors emphasize that personality differences often reflect gendered social roles more than inherent traits.

Luisa Batalha and Katherine J. Reynolds challenge traditional views of personality as fixed, emphasizing social identity's role in shaping gendered traits. They argue that women's and men's personalities shift in response to group norms and social change, with women adopting more agentic traits in egalitarian contexts. This chapter provides actionable insights for fostering personality flexibility in educational and organizational settings.

- **Women are moderately more neurotic and agreeable** from crosscultural findings measuring Big Five personality. The differences in openness, extraversion, and conscientiousness were small.
  But it varied greatly across cultures, with a larger difference in the West (Costa, Terraciano, & McCrae, 2001)
- **Women's assertiveness has increased over time** and varies depending on role, suggesting that human traits aren't stable across time but varies with culture and role (Twenge, 2001)
- Differences in traits like agreeableness or assertiveness are context-dependent.
- Gender identity and social expectations shape behavior.
- **Men embrace sexism because it benefits them**

Long quote:

> the association of beliefs in gender hierarchy (sexism) with beliefs in innate gender differences (essentialism), is dependent on whether essentialism promotes or challenges the status quo (Morton, Postmes, Haslam, & Hornsey, 2009).
> When men consider increasing gender equality (social change) their sexism scores go hand in hand with essentialism scores.
> On the other hand, when they (…) think about areas in which they are disadvantaged in relation to women (reversed status quo), this relationship disappears or reverses.
> Clearly, when the status quo is threatened the more powerful group (men) adopt beliefs concerning natural disadvantage and innate differences, which provide justification for gender inequality.

The Social Basis of Emotion in Men and Women

⍰⍰♂ My note: the title of this chapter may suggest something about the preference of culture over biology.

Agneta Fischer and Catharine Evers explore gendered emotional expression, debunking myths like women's greater emotionality.

They find that women cry more and smile more, while men express anger more readily, but they lean more towards a social norms explanation, rather than biology (note: I don't necessarily fully agree it's *only* social norms).

- Women are more emotionally expressive
- Gendered emotions showing differences are:
- Women cry more, and a greater variety of situations or interactions. But as adults, not as children. This suggests that socialization, social roles, and social costs for men's crying play a role <— ⍰⍰♂ **Lucio's note**: not necessarily, biology changes wit hage, so it may reflect biological development
- Men may express anger more due to permissive norms.
- Emotional intelligence is influenced by gender roles.

The authors argue on this emotional categorization:

Agentic (high power)	Commununal (affiliation/subordination)
Anger	sadness
contempt	guilt
disgust	shame
pride	happiness

Anger, pride, and contempt

This text examines gender differences in emotions typically associated with male roles—especially anger, pride, and contempt.

- **Pride and contempt**, often linked to dominance and superiority, show **no consistent gender differences** according to existing studies.
- **Anger** is stereotypically male, but research finds **no evidence that men feel anger more intensely or more often** than women. Differences emerge only when the anger-triggering event aligns with gendered concerns (e.g., appearance for women, intelligence for men).
- The main gender difference lies in **how anger is expressed**, not experienced:
  - **Men** are more likely to use **physical and verbal aggression**.
  - **Women** tend to show **indirect or relational aggression** (e.g., ignoring, gossiping), due to higher concern about social harmony, fear of retaliation, and traditional subordinate roles.
- **Social context and gender roles** influence these patterns:
  - In **egalitarian relationships**, women express anger more directly.
  - In **traditional contexts**, they regulate it more, fearing social consequences.
- **Women often view anger as a loss of control**, while **men see it as a tool**, which further drives women's tendency to regulate it.

Overall, gender differences in anger expression depend on context, social roles, and perceived consequences than on actual emotional experience.

Different Expectations for Men and Women

Emotion norms have changed over time, and modern media shows both men and women expressing vulnerability (Labott et al., 1991).

However, **implicit norms still guide how men and women "should" express emotion** (Timmers et al., 2003):

- **Norm 1: Women must show positive emotions**
  - Women are expected to smile, express love, enthusiasm, and warmth—linked to their perceived communal, caregiving role (Graham et al., 1981; Stoppard & Gunn Gruchy, 1993).
  - Women face greater social sanctions for failing to appear positive (e.g., seen as cold or "bitchy").
  - In the workplace, female managers suppress negative and display positive emotions; male managers tend to do the opposite (Simpson & Stroh, 2004).
- **Norm 2: Men must avoid powerless emotions**
  - Men are expected to express dominant, powerful emotions (e.g., anger), which signal competence and status (Brescoll & Uhlman, 2008).
  - Powerless emotions (e.g., sadness, fear, shame) are seen as inappropriate for men but expected in women (Timmers et al., 2003).
  - A man showing sadness may be judged as weak, while a woman showing anger may be penalized as

unfeminine or aggressive.

Gendered Communication and Social Influence

Linda L. Carli investigates how gender shapes communication and influence, finding that women use more communal language (e.g., affiliative speech) and men more agentic (e.g., assertive speech).
These differences affect perceptions of influence, with women often facing backlash for assertive behavior.

- Women persuade better with a mix of power and warmth: combining communal with agentic behavior increases favorable reactions than merely agentic (Heilman & Okimoto, 2007).
  Women influenced men mixing nonverbal warmth (e.g., by smiling and nodding) with competence than competence alone (Carli et al., 1995).
- Influence is more challenging for women as because of the 'lower competence and authority' stereotype
- Women use more tentative language to avoid backlash.
- Men are perceived as more authoritative by default.

The Social Psychology of Gender across Cultures

Serge Guimond, Armand Chatard, and Fabio Lorenzi-Cioldi examine how culture shapes gender stereotypes and differences.
They find that egalitarian cultures reduce gender gaps in traits like assertiveness, while hierarchical cultures amplify them.

Men tend to dominate in high-status roles across cultures, but social comparison processes can mitigate stereotypes.

The various traits attributed to men and women are structured along two main dimensions: an individualistic dimension, typical of men, usually called agency, with traits such as dominant, assertive and boastful, and a more social or collectivistic dimension, typical of women, usually called communion, with traits such as affectionate, gentle and sensitive (Wood & Eagly, 2010; see also Carli, Chapter 13 this volume).

- Gender inequality correlates with rigid gender norms.
- Westerners, men, and people in general were attributed agency, Asians were attributed communion.
  My note: this may partially explain Asian men's challenges in dating, not being seen as masculine
- **Leaders are typically endowed with masculine, agentic characteristics**. The 'think manager—think male' phenomenon (Schein, 1996), making it difficult for women to combine leadership with femininity (see Eagly & Karau, 2002; Heilman, Wallen, Fuchs, & Tamkins, 2004).
- **Gender differentiation is greater in individualistic (and more egalitarian) nations** than in collectivistic (and less egalitarian) nations.
  - Egalitarian difference increase is known as 'gender equality paradox'
  - Some studies show that in egalitarian societies gender differences may decrease, for example in women placing less value on men's status and earning <— My note: this may be a confounding factor. Egalitarian societies tend to be richer, and women can 'afford' to care less about resources because resources are more abundant and more equally distributed

For a quick overview of the current literature between these two opposing theories:

Domain	Social Role Theory	Gender Equality Paradox
Mate preferences	✅ Supported (in *some* domains!)	❌ Less relevant
Personality traits	❌ Less supported	✅ Supported
Vocational interests	❌ Less supported	✅ Supported

Domain	Social Role Theory	Gender Equality Paradox
Behavioral roles (e.g., chores, parenting)	✅ Supported	❌ Less relevant

Stereotypes of gender differences create realities

A wide range of studies—from Rosenthal and Jacobson's (1968) pioneering research on self-fulfilling prophecies in classrooms, to Snyder's (1984) laboratory experiments, and the broader literature on stereotype threat (e.g., Steele & Ambady, 2006; see Betz, Ramsey, & Sekaquaptewa, Chapter 26)—support the idea that **stereotypes can shape reality by influencing behavior and memory in line with those stereotypes**.

The findings underscore the prescriptive nature of gender stereotypes—not just describing typical behavior, but suggesting how individuals should behave (Prentice & Carranza, 2004).

Consequently, gender differences in behavior may result from conformity to social expectations rather than innate differences, highlighting the critical role of social influence processes (Haslam et al., 1996; Haslam, Oakes, Reynolds, & Turner, 1999). This strengthens the case for using social psychological approaches to understand gendered behavior patterns.

My note: but 'stereotypes' aren't necessarily 'plucked from thin air' and instead can *start* from biological differences

Gender Differences in Motivation

This was one of my favorite chapter, and in one quote:

> Men and women differ more in motivations tha in capabilities

Roy F. Baumeister argues that men's and women's differing motivations—men's drive for status and women's for relationships—shape social structures and inequalities.

Baumesteir also goes into dating market dynamics applying the social exchange paradigm.
He states that men's higher sex drive empowers women (principle of least interest, Waller, 1937).
I agree with Roy, but also add that it's not only about wanting sex more, but also about differential reproductive maxima, and risks and benefits. No risk for men in adding one sex partner, only benefit, and much bigger risks for women.

Finally, I'd also argue that while Roy's analysis is true for most and women, it also depends on mate value, and the power dynamics invert at the top.
And high-value men have more options and power than high-value women.

However, could only partially agree with this:

The notion that men conspire together against women is typical of a victim fantasy (see Baumeister, 1997) but has very little evidence to support it. Hence, let me offer an alternative hypothesis (from Baumeister, 2010).

I agree there is no 'conspiracy'… But not a conscious one.
Otherwise, there is an emergent property of individual men who'd rather have lower-power women for their mating success.

See:

- Male sexuality is more natural, female sexuality more cultural (higher plasticity)
  - Men have higher rates than women of almost all sexual paraphilias — but these do not seem to reflect plasticity per se.
- Men are more driven by status, women by relational goals.

- Monogamy is good for men, not women
- These patterns influence workplace dynamics and courtship.

Men believe in evolutionary psychology and women in cultural learning because it reflects their reality

This struck me as incredibly insightful by Baumeister, something I had never thought about but that immediately clicked after hearing it:

> My own reading of the literature uncovered one factor that almost certainly contributed to the disagreements about what mixture of nature and culture shapes the human sex drive: The answer differs by gender. In brief, male sexuality is more natural, female sexuality more cultural. This can also be phrased in terms of differing degrees of erotic plasticity, which is defined as the degree to which sexual motivation is shaped by social, cultural, and situational factors: Women have higher erotic plasticity than men (Baumeister, 2000).

And later:

> The difference in erotic plasticity may help explain some of the acrimony in the overarching debate between social constructionists and evolutionary psychologists about sexual motivation, because there really are different answers.
> Males may be intuitively more comfortable with theories that emphasize the innate and inflexible nature of sexual desire, whereas females may be more drawn to theories that depict sexuality as fluid and changing in response to circumstances.

Sexism in Contemporary Societies

Manuela Barreto and Naomi Ellemers analyze modern sexism, distinguishing between overt, hostile sexism and subtle, benevolent sexism.
Women are more likely to detect sexism but face social costs for confronting it, while men may overlook subtle forms.

Some takeaways:

- **You can use prejudice to maintain high self-esteem**: *in individual performance contexts (…) members of socially stigmatized groups can protect their self-esteem by attributing a negative outcome to prejudice or discrimination of the evaluator instead of their personal inadequacy (Major, Kaiser, & McCoy, 2003).* However, this only works if prejudice is perceived as rare (Schmitt & Branscombe, 2002a) and it's harmful for individuals for whom this is a pervasive or recurring event (Schmitt, Branscombe, Kobrynowicz, & Owen, 2002).
  - Women with high self-esteem didn't need to 'blame shift'
- **Benevolent sexism can be more 'effective' in keeping women lower down** compared to no sexism or to overt sexism, including in giving up leadership more easily
  - Benevolent sexism decreases pushbacks: *blatant discrimination leads to intentions to protest, subtle discrimination does not (Ellemers & Barreto, 2009). This is partly because blatant discrimination is perceived as discriminatory and elicits anger in its targets (Barreto & Ellemers, 2005a, 2005b), an emotion that is an important precursor to collective action (Van Zomeren, Postmes, & Spears, 2008). The negative emotions more typically elicited by subtle prejudice, such as anxiety or sadness, are directed at the self, and are less likely to lead to protest responses. (…) Thus, another way in which subtle prejudice is self-fulfilling is that it impairs group identification and collective protest, and fails to fuel attempts at social change.*
- **Women who encounter sexism can increase their 'woman identification'**, which can have positive mental

health effects: *Identifying with a socially devalued group has important psychological benefits, such as increases in self-esteem (Schmitt et al., 2002). One reason why group identification has this effect is that it draws individuals to the group, exposing them to its positive definition of the group, its social support, and its resources. In this sense, group identification itself constitutes a resource to which group members can turn to resist the negative effects of prejudice or discrimination (Leach, Rodriguez-Mosquera, Vliek, & Hirt, 2010).*

- **Successful women may become women's worst enemies (queen bees)**: *Yet, women who succeed in entering high-status positions often decrease the extent to which they identify with their gender group, and derogate ingroup members who have not fared as well (Ellemers et al., 2004). These so-called 'queen bees' distance themselves from other women as a way to escape sexist treatment at work (Derks, Van Laar, Ellemers, & De Groot, 2011).*

Benevolent sexism is well-meaning but harmful

> Benevolent sexism can be manifested in several ways, such as by introducing restrictions on women's activities in order to protect them (Moya, Glick, Expdsito, de Lemus, & Hart, 2007) or by paternalistic forms of help (Becker, Glick, Ilic, & Bohner, 2011). Such behaviors are enveloped in a positive layer of protection and flattery, but they also subtly convey the belief in women's inferior abilities to defend themselves, help themselves, or deserve rewards. The positive tone of benevolent sexism is thus only superficial.

Read more here for how these dynamics work and how you can handle them:

- **Benevolent racism**: dynamics and solutions

> Benevolent Racism: The Hidden Power Play Behind White Sympathy

Sexual Harassment: Motivations and Consequences

Anne Maass, Mara Cadinu, and Silvia Galdi investigate sexual harassment, highlighting its prevalence and impact on women, who are primary targets due to power dynamics and objectification.
Men's motivations often stem from dominance or sexual interest, while women face career and psychological consequences. The chapter offers practical strategies for prevention and intervention in workplaces and institutions.

The 3 Main Motivators Driving Sexual Harassment

There have been three main drivers hypothesizes to drive sexual harassment:

Sexual Motivation:
Some perpetrators harass in pursuit of **sexual arousal or satisfaction**, especially in cases like sexual blackmail. However, this motivation doesn't fully explain other types like gender harassment, which often targets less traditionally feminine women.
(Source: Maass & Cadinu, 2006; Berdahl, 2007a, 2007b)

Power Motivation:
Harassment can serve as a **tool to assert dominance**, especially in societies with entrenched gender power imbalances. For some men, **sex and power are cognitively linked**, making power-driven harassment more likely, particularly toward vulnerable victims.
(Source: Bargh et al., 1995; Maass et al., 2003)

Gender Identity Protection:
Harassment may function as a **defensive reaction** when a man's masculine identity feels threatened. It often targets women who challenge traditional gender roles (e.g., feminists), serving to reaffirm the perpetrator's in-group male identity, especially when reinforced by peers.

(Source: Maass & Cadinu, 2006; Maass et al., 2003; Hunt & Gonsalkorale, 2011; Siebler et al., 2008)

Traits of Men Likely to Sexually Harass

Men high in Likelihood of Sexual Harassment Scale (LSH) include:

- high levels of hostile sexism
- rape myth acceptance
- authoritarianism
- endorsement of traditional gender roles
- masculine ideology
- low levels of agreeableness, openness to experience, and empathy (see O'Leary-Kelly, Bowes-Sperry, Arens Bates, & Lean, 2009; Pina, Gannon, & Saunders, 2009 for reviews).
- High Social Dominance Orientation (SDO)

Reducing Gender-Based Violence

In samples varying from college-aged men to juvenile offenders to adult male sexual offenders, men who gain gratification from controlling or dominating women or who are distrustful of women, often display the following pathological personality traits:

- callousness
- disinhibition
- narcissism
- antisocial personality disorder colored by impulsivity
- Social dominance orientation

Another path to sexual aggression, which can interact with pathological traits, arises from a personal history that includes (Malamuth, 2003):

- lack of emotional bonding with sexual partners
- familial conflict or abuse
- adolescent delinquency

Psychological Perspectives on Gender in Negotiation

Hannah Riley Bowles examines gender differences in negotiation, finding that women face stereotype threat and social backlash for assertive bargaining, unlike men. Contextual factors, like ambiguity, exacerbate these gaps, but training can mitigate effects.

- Men offer smaller concessions and worst first offer to female (and black) buyers
- Peace offers from women may be more persuasive: *Maoz (2009) hypothesized that negotiators would be more receptive to peace proposals that came from female than male opponents because stereotypes suggest women are more willing to compromise than men are. As hypothesized, negotiators rated identical proposals more favorably when they came from female than male opponents.*
- **Too much warmth harms you in negotiations**: *The findings of multiple studies suggested that feminine warmth is more of a liability than flirtatious charm because warmth signals a lack of competitiveness and concern for self. There were no comparable effects for men.*
- Women perform better in negotiations advocating for others (Bowles et al., 2005)

MORE WISDOM

People over-estimate the links between behavior and power

> A meta-analytic review of the literature testing the association of nonverbal behaviors with verticality, a construct encompassing power, status, and dominance effects, revealed that people perceive stronger links between verticality and communication than actually exist (Hall et al., 2005).
> Specifically, people perceive possessing high power to be associated with an erect posture and open body position; rapid speech and lower vocal pitch; increased gazing, nodding, interrupting, gesturing, speech loudness, and touching of others; and decreased speech hesitations, smiling, brow raising, self-touch, and interpersonal distance.
> However, only three of these behaviors actually correlate with verticality: High-power individuals speak more loudly and have more open bodies and smaller interpersonal distances

But I think these signals can ALL indeed be power-cues, it just depends on the context.
Interrupting for example can be a cue of dominance indeed, especially *successful* interruptions.

Experimental work shows the tendency for over-generalization

Reflecting the particular tendency to essentialize gender, experimental work has shown that people readily generalize information about a single individual to their gender category as a whole (Prentice and Miller, 2006).

Essentialist thinking is an inevitable feature of certain individuals (e.g., those high in need for cognitive closure) and certain groups (i.e., higher status ones) and, the authors argue, it's an hallmark of male sexism.

Collectivist cultures may be seen as more feminine

> A series of studies by Lorenzi-Cioldi (2002) highlights the resulting greater ambivalence of perceptions concerning lower-status groups. Male and female Swiss participants judged the extent to which various attributes apply to people in general, to men and women, to Westerners and Asians, and to themselves. Two attributes represented the Western culture ('independent' and 'individualistic'), and two other attributes represented the Asian culture ('collectivistic' and 'follower'). The findings showed that, overall, Westerners, men, and people in general were attributed agency, whereas Asians were attributed communion.

Large cities are for attractive women

> A regions-of-significance analysis indicates some evidence of a 'liberation' pattern, but only among a very select group of women at the extremely high end of the attractiveness distribution (i.e., who reported low WHR).
> These women experienced higher quality friend relations and more life satisfaction if they inhabited the high mobility ecology of urban settings rather than the relatively restrictive ecology of rural settings.
> However, among the much larger group of women in the middle-to-low range of the attractiveness distribution (1.e., who reported high WHR), the regions of significance analysis indicated a 'risk' pattern, such that women experienced lower quality friend relations and worse life satisfaction in urban settings than in rural settings (Plaut et al., 2009).

Women had peak emotions in intimate relationships, men in groups

> When people were instructed to recall a single event from their lives marked by strong positive or negative emotion, women talked about intimate relationship events, whereas men were more likely to mention events

> involving groups or organizations.

Solitary events were a minority for both.

Feminist self-identity is healthy

> Perhaps because of the greater sense of control and efficacy such a decision reflects, a stronger feminist identity is also related to better health and well-being (Yakushko, 2007; Zucker & Bay-Cheng, 2010).

Monogamy benefits men as a whole, not women

Baumeister says:

> Although laypersons have often expressed surprise at hearing that women outnumber men two to one among humankind's ancestors, thinking it would be closer to equality, experts have tended to be surprised for the opposite reason — they thought the imbalance would be even larger than it is (again, as is often found in other species).
> What has reduced the gap has been the spread of monogamy through the civilized world during the last couple of centuries.
> This is often depicted as a benefit to women, but it is difficult to see how enforced monogamy actually benefits women. It reduces their options. Indeed, even a woman who wants monogamy would be better off in a polygamous society, because there will be an oversupply of single men. Almost certainly, monogamy was institutionalized in order to ensure that almost every man could have a mate.

I agree at a population level.
But monogamy doesn't serve *high* value men well.

QUOTES

> Crying has generally been considered as the ultimate sign of helplessness, because it signals the inability to act in order to cope with a situation (Frijda, 1986).

On one often underestimated reason for men and women's different outcomes:

> Men and women differ more in motivations tha in capabilities

CONS

- **Socialization and nurture bias**

Several chapters and authors felt like over-leaning towards socialization, social roles, and culture, rather than genes and biology.

The cautioning -or complaints- against generalizations, genes, and biology sometimes felt overdone, without equally appreciating their impact and importance.

REVIEW

The Sage Handbook of Gender and Psychology offers a broad overview of gender differences and commonalities.

It seems to me it over-represents the constructionists' and feminist-leaning takes, but I could still learn a lot from it.

The Sage Handbook book also made me realize how benevolent sexism is the specular concept of benevolent racism. It was an old dynamic we described on this website, but only thanks to this book was I able ot give it the appropriate name, and provide it with academic references.

7 Best Books on Masculinity (Ranked & Critically Reviewed)

Lucio Buffalmano · 28 September 2025 · Archived copy · Original

Masculinity is a core aspect of men's identity and a core trait to succeed in the world as a man.

The best books on masculinity draw from psychology, history, and social perceptions to offer insights on becoming a well-rounded, empowered man.

At *The Power Moves*, we've studied masculinity— analyzing the psychology, the archetypes, and the practical applications to integrate it into our power-centric approach to men's development.

This guide reviews the best books on masculinity we've learned from, highlights their pros and cons, and shows how to apply (and adapt) their ideas in real life. (Note: we *only* list books we personally reviewed).

And now let's deep dive into each of these books on masculinity.

Contents

6. The Mask of Masculinity

Howes offers an analysis of the societal “masks” men wear to conform to traditional masculinity and feel powerful, and he suggests that dropping them leads to greater freedom and fulfillment.

❓ Pros

- **Solid, accessible psychological insights** into male behavior, presented clearly for broad understanding
- **Enhances self-understanding and growth**, especially helpful for men building greater awareness

- **Includes real-world illustrations**, making concepts highly applicable in everyday situations

⍰Cons

- **Missing the strategic payoffs of masks**. If masks evolved and many men use them, it's because they provided some payoffs.
- **Dropping the masks may come at a cost** in certain contexts, but the book doesn't go into these nuances
- **Offered alternatives aren't necessarily 'masculine'**, and in some cases 'dropping' the masks completely may cost in masculinity or motivation
- **Missing guidance on change**, on how to go from 'masks up' to 'masks down' (while still being motivated and achieving masculine objectives)

Our review

Excellent for identifying restrictive patterns in male experiences, useful for both self-awareness and self-development.

But we also find it flirts with naive self-help. **It offers a nice-sounding and sanitized critique of masculinity** that your gender studies professor would approve of, but that may not help you advance in life.

We don't fully agree that men would necessarily gain by 'dropping masks' *completely* or, based on Howes' guests, 'becoming vulnerable'.

Our strategic and goal-oriented approach proposes instead a more tailored approach: dropping or donning masks selectively and based on context and goals.

⍰⍰ **Takeaway**: Recognize and drop harmful masks to achieve emotional freedom, but balance vulnerability with strength.

Learn more:

- The Mask of Masculinity summary

---

5. The SAGE Handbook of Gender and Psychology

The SAGE Handbook is a multi-author synthesis of the research literature in the field of gender psychology, helping men learn 'masculinity' in comparison with 'femininity'.

⍰ Pros

- **Scientific**, written by scholars and researchers based on the full research literature
- **Go to the core of masculinity**, based on biology and research results
- **Helpful gender comparison** of masculinity and femininity

⍰Cons

- **Dense**, it's not written to be easy to read, or entertaining. There is a reason handbooks don't sell despite being the most scientific
- **Limited practicality** since there is no advice on what to do or how to be more of a man
- **Cautious wording**, you'll rarely hear a good researcher provide conclusive remarks

Our review

The Sage Handbook, *The Psychology of Gender*, and similar quality handbooks offer the 'closest truth' about masculinity, but provide more limited practical takeaways.

They helped us write high-authority, scientific articles and lessons on masculinity, but still require good critical thinking and strong 'real world experience' to turn the scientific insights into coherent strategies and approaches to improve life results.

So while we always prefer a good handbook for our goals, we may not recommend the same for most readers looking for practical advice.

⍰⍰ **Takeaway**: Masculinity must be earned and is easily lost, with heavy prices. Build your self-esteem around less fragile beliefs than just 'being masculine'

Learn more:

- The Sage Handbook of Gender and Psychology Review

4. The Way of Men

Donovan offers an exploration of masculinity through a tribal lens and through his interpretation of evolution, emphasizing core masculine virtues and the role of male groups in defining manhood.

⍰ Pros

- **Valuable insights into social aspects of masculinity**, including male-only socialization, 'brotherhoods', and how men evaluate each other
- **Emphasizes important masculine traits** like resilience, bravery, and integrity among peers. Many modern men need this reminder
- **Captivating read** of riveting, atavistic masculinity.

⍰ Cons

- **Over-idealizes group-based lifestyles**, succumbing to nostalgia for simpler, supposedly superior eras. In that sense, it's a naive take
- **Restrictive definition of manhood**, based on four male virtues only, based on the author's opinion
- **Glorifies conflict and hierarchies**, with cooperation based on aggression towards the outgroup rather than, say, human development
- **Encourages group dependency** over individual expression, which is limiting for men who prefer to live their own way
- **Disempowering for individual men,** pushing conformity to society and authorial standards instead of

individual empowerment and freedom

Our review

A captivating read that gets many aspects of male psychology right, but without including their downsides, and while missing other crucial aspects of masculinity.

For example, one could argue that achieving goals is as masculine as physical strength.
Or that one displays more courage by leaving the tribe's support and protection and carving his own path.

The book is **great to reconnect with our caveman ancestors**, and that may help modern men who have grown overly shielded.
But it's also its limitation.

The Way of Men* is masculinity looking *backward, at how we *were*.
We may have huddled around bonfires for a tiny portion of our past, but **copying how we were won't help modern men win in today's world**. It may not even help them be more *masculine* for that matter, since masculinity also evolves.
And it certainly won't help civilization move from tribal cavemen to Cosmos explorers.

We must respect our forefathers: they took us here after all.
But the best way to respect our forefathers is not by copying them, but *outdoing* them.

Finally, I disagree with this standard of masculinity at a personal level.
Top 'sigma males' leave restrictive tribes, set off on their hero's journeys to conquer the world, and become men by carving their own path. This approach displays *more* strength, resilience, and self-reliance.

⁉ **Takeaway**: Cultivate strength, courage, mastery, and honor, but define manhood on your own terms, and in a way that allows you to win in *today's* world.

Learn more:

- The Way of Men summary
- *Tribe*: similar to The Way of Men for embracing tribal societies and lifestyle, but more extreme.

3. King, Warrior, Magician, Lover

An exploration of four masculine archetypes drawn from myths, religion, and history. Moore and Gillette help men achieve balanced manhood by highlighting the 'toxic' and healthy expressions of each archetype.

⍰ Pros

- **Effective blend of myths, psychology, and spiritual elements** to guide men toward their best masculine selves
- **Details positive/negative traits for each archetype**, some of which felt like prefectly hitting the mark
- **Promotes an 'effective balance' approach**, and that 'optimum balance' is crucial for effective self-development

⍰ Cons

- **Limited scientific backing**, and in some parts it shows
  - Freudian influences at times, and evolutionary psychology backing would have helped
- **Magician archetype is less convincing** in both masculinity and in relation to 'modern magicians'
- **Not a practical manual**, but it's not necessarily a 'con', it's simply a different type of book
- **Lover archetypes falls short**, it's more politically correct but less realistic than Gilmore's 'inseminator' archetype, and lacks deeper evolutionary insights

Our review

King, Warrior, Magician, Lover is a gem serving as a valuable tool for both men's self-awareness and personal growth.

The description of **the lover archetype is more lacking and 'politically correct'**. A deeper understanding of the lover type must include lover psychology and evolutionary pay-offs of high-value men who can date freely (lover types).

The **warrior and king archetypes are what truly shine in this book**, including their child versions of 'hero' and

‘divine child’.
I learned a lot from the progression of ‘divine child’ onward, also at a personal level.

⁉ **Takeaway**: Lean towards your masculine archetype, add some warrior type, and stay away from toxic masculinity shadows

Learn more:

- King, Warrior, Magician, Lover summary

---

2. Scipio Africanus

A biography of the Roman general Scipio Africanus, highlighting his strategic brilliance, leadership, and honorable character as models of masculinity.

⁉ Pros

- **Masculine effectiveness** beyond historical role model, teaching valuable lessons in planning, guidance, and personal character building
- **Showcases exceptional leadership** with top-tier power intelligence to master soldiers and politics, grand strategy to win wars, and moral integrity to gain everyone’s respect
- **Role model of masculinity**

⁉ Cons

- **Less reliable** given the limited sources for ancient figures. But it’s not an issue for me: the best role model is an ideal, rather than an accurate depiction
- **Requires an extra real-life role model** for men to learn about positively dominant behavior or masculine body

language

- **Some author fandom** can feel too much. For example, he could have shortened the argument that Scipio is greater than Napoleon and Alexander the Great

Our review

This is the 'special TPM treat', a book you will hardly find in most others 'masculine books' lists.

And I almost had some qualms sharing it, since it feels personal. Scipio is as close as it gets to my role model of an ideal man. So to speak, **Scipio is my 'hero figure' to aspire towards**.
He is one of the 'past greats' I look at, and that in my life philosophy we should all strive to match up. That's how we pass the best baton to the future generations of men (and then it's on them to carry it forward).

Scipio embodies masculine traits I admire, all at incredibly high levels.
They are:

- **Effectiveness**. Undefeated, took on Hannibal, and won a Western civilization-defining war
- **Unstoppable drive**. Denied an army by the senate, he *built his own* (these feats are inimitable in modern age)
- **Virtue**, gaining 'near the top status', but without being an autocrat, over-narcissist type (eg.: Julius Caesar)
- **Honor**: Never too 'nice', he prioritized victory. But with an honorable approach to enemies
- **Long-term thinking** that builds enduring civilization, promoting peace deals and win-win commerce
- **Force for good**, playing the political game, but without letting games or power overwhelm or corrupt him.
- **Enlightened man**: while a staunch and proud Roman, he had a grander vision for civilization, uplifting and moving humanity forward

That makes a perfect role model of masculinity we can all aspire toward.

⍰⍰ **Takeaway**: True masculinity combines competence, honor, and strategic magnanimity to develop win-win and achieve lasting success.

Learn more:

- Scipio Africanus summary

1. Power University

Note:

We are the creators of Power University, so this entry comes from an insider's perspective. We aim to keep the description objective by focusing on the curriculum structure and the documented results achieved by alumni.

A multimedia course on power dynamics, strategy, and self-development tailored for men seeking success in status, relationships, and life.

⍰ Pros

- **Masculinity for success**, not as a goal in itself
- **Designed for ambitious men**, offering hands-on tips and tactics to achieve status, influence, and romantic opportunities

⍰ Cons

- **Not exclusively tailored for 'becoming more masculine'**, though recent updates include a lesson specifically on masculinity
- **Higher time investment** compared to books
- **Higher monetary investment** compared to the books on this list. As a premium course, the difference is large

Our review

While Power University's focus isn't masculinity as a goal, **masculinity becomes the natural consequence of Power University's skills** and mindsets.

Power University makes men *effective*, helping them achieve life-relevant goals like status, respect, career promotions, and women's attraction.

When you're a man who carries himself with confidence, behaves high power and achieves goals and status, 'masculinity scores' naturally go up.

Furthermore, the 9.1. upgrade added a dedicated lesson to becoming a more masculine man.

⍰⍰ **Takeaway**: Focus on power dynamics and goal achievement to become a winning man and masculinity becomes the natural consequence.

Learn more:

- Power University overview

Book	Theme	Key Concepts
King, Warrior, Magician, Lover	Mature masculine energies and archetypes	King (order, integrity), Warrior (clarity, destructive for good), Magician (knower, transformation), Lover (sensual, compassionate); shadows and boyhood forms
The Way of Men	Core values of masculinity in tribal contexts	Strength, Courage, Mastery, Honor; need for male gangs; masculinity vs. modern PC society
Scipio Africanus	Leadership, strategy, and honorable masculinity	Win honorably, reputation for magnanimity, treat foes well, confidence, strategic chivalry
The Mask of Masculinity	Societal pressures and false masks of manhood	Nine masks (Stoic, Athlete, Material, etc.); dropping masks for emotional freedom and growth
Power University	Practical power dynamics for men's success	Strategies for status, power, dating; winning mindset with real-world applications

Bonus: Books on Masculine Relationships

Books focusing on how to be more masculine in relationships include:

- ***The Way of the Superior Man***: while a popular book on male energy, the suggestion of 'accepting women's drama' and 'fixing it with more love' may *lose* attraction and power, instead of increasing them
- ***Practical Female Psychology***: several unique and insightful takes, but also less convincing personal speculations. Some advice, like leaning into her drama and her change of minds relinquish frame, and are *low* masculinity
- ***The Rational Male*** (Rollo Tomassi): Red pill insights on intergender dynamics. Good primer for beginners, but more advanced practitioners may want more (readers beware: the framing reflects the author's worldview, which can at times feel one-sided)
- ***The Tactical Guide to Women***: a great book written by a male clinical psychologist sensitive to men's issues and rights. Several of Shawn Smith's approaches also align with our TPM approaches

FAQ

What are the best books on masculinity?

The best books on masculinity include King, Warrior, Magician, Lover for archetypes; The Way of Men for core virtues; Scipio Africanus for historical leadership; The Mask of Masculinity for societal pressures; and Power University for practical strategies.

What order should I read books on masculinity?

Start with classical archetypes (King, Warrior), then raw masculinity core virtues (Way of Men), historical examples (Scipio), modern pressures (Mask), and practical application (Power University).

What's the top book on masculinity?

King, Warrior, Magician, Lover is often hailed as a classic for its deep dive into balanced masculine energies.

The Cambridge Handbook on Sexual Psychology: Male Sexual Adaptations: Summary & Review

Lucio Buffalmano · 1 October 2025 · Archived copy · Original

The Cambridge Handbook of Evolutionary Perspectives on Sexual Psychology Volume 2: Male Sexual Adaptations (2022) is the second entry in a four-part academic series on sexual psychology. This volume offers an in-depth overview of male sexual strategies and adaptations through the lens of evolutionary psychology, exploring both well-established findings and emerging theories.

Contents

- FULL SUMMARY
  - Chapter 1: Men's Sexual Preferences
  - Chapter 2: Men's Extra-Pair Sexual Interest
  - Chapter 3: Male Sexual Attraction Tactics
  - Chapter 4: Men's Intrasexual Competition
  - Chapter 5: Competitiveness and Fatherhood as Overarching Domains of Female Choice
  - Chapter 6: Sexual Coercion and Rape
  - Chapter 7: Mate Poaching by Men
  - Chapter 8: Sexual Fantasy
  - Chapter 9: Ejaculation Latency
  - Chapter 10: Copulatory Thrusting in Males
  - Chapter 11: Men's Provisioning of Oral Sex
  - Chapter 12: Inducing Female Orgasm
  - Chapter 13: Copulatory Urgency
  - Chapter 14: Postejaculatory Adaptations to Self-Semen Displacement

  - Chapter 15: Male Mate Retention
  - Chapter 16: Shifts in Partner Attractiveness: Evolutionary and Social Factors
  - Chapter 17: Emotional Commitment in Men
  - Chapter 18: Sexual Jealousy in Males
  - Chapter 19: Men's Attachment-Related Needs in the Sexual Arena
  - Chapter 20: Paternal Care
  - Chapter 21: Paternal Filicide
- ⍰⍰♂ SHARPEST INSIGHTS
  - Lower mate value men should leverage money
  - Lower-value men are more likely to be abusive
  - Lower status men are better daddies (not because they're 'nice')
- QUOTES
- ⍰⍰♂ Lucio's Analysis
  - Still unconvinced by semen displacement theory (Chapter 14)
  - The 'Sperm piggybacking hypothesis' is too speculative (chapter 14)
  - Suggestion: change the frame of 'solving problems'
- REVIEW

FULL SUMMARY

About the Author:
Various experts for each chatper, while the volume is edited by Todd K. Shackelford, a leading evolutionary psychologist and active handbook editor.

Chapter 1: Men's Sexual Preferences

Authors: Daniel J. Miller and Ryan C. Anderson

Despite considerable overlap between men and women, there are also important differences.

Physical attractiveness dominates men's mate selection criteria, and higher interest for casual sex and sexual variety aligns with men's lower minimum parental investment compared to women.

Female Youth and Fertility

By responding to indicators of youth, men indirectly increase the likelihood of selecting mates who are biologically more fertile.

These cues can be physical, such as facial features and body characteristics, or behavioral, reflecting energy and vitality:

- Small nose and feet (Barber, 1995)
- Hairless skin (Barber, 1995)
- Full lips
- Lustrous hair
- Good muscle tone
- Physical enthusiasm high activity levle, and spiritely gait (Buss & Barnes, 1986)

Will You Have Sex With a Stranger? Experiments

Across varying experimental designs, men show a higher willingness than women to accept casual sex offers.

The difference can be explained by men's stronger evolved mating strategies for short-term, but women's lower acceptance rates are also partly explained by perceived danger, moral considerations, and the need to know the partner better.

Main studies

- **Clark & Hatfield (1989)** a Florida university campus proposed 3 options: date, go to the apartment, have sex.
  Findings:
  - Date: ~50% of men and women agreed.
  - Apartment: 6% of women, ~67% of men agreed.
  - Sex: 0% of women, ~75% of men agreed.
- **Hald & Høgh-Olesen (2010)**: Replication in sexually liberal Denmark.
  Findings:
  - Date: 30% of men, 20% of women.
  - Apartment: 22% of men, 8% of women.
  - Sex: 38% of men, 2% of women.
  - Among singles: 59% of men, 0% of women agreed to sex.
  - Women's consent more linked to requester attractiveness; men's consent largely unaffected.
- **Guéguen (2011)** Field study in France with confederates of average and high attractiveness.
  - Average attractiveness: 60% of men, 0% of women agreed to sex.
  - High attractiveness: 83% of men, 3% of women agreed.
- **Schützwohl et al. (2009)** Hypothetical scenario study in Italy, US, and Germany.
  Findings:
  - Sex: 45.8% men, 4.2% women.
  - Men more likely to accept from moderately or very attractive women.
  - Women's acceptance strongly tied to requester attractiveness.
  - Cultural variation for men: Italy (61%) > US (43%) > Germany (29%).
- **Shackelford et al. (2004)** Hypothetical one-night stand scenarios with partner relationship status varied.
  - Men less likely to pursue if partner is in a relationship, but still more willing than women in all cases.
  - Suggests evolved preference to avoid sperm competition.
- **Tappé et al. (2013)** Pencil-and-paper replication in Hawaii using photos of attractive individuals.
  Findings:
  - Men consistently more willing to accept sex request.
  - Women cited "don't know person/need to know better" most often, followed by "immoral," then "danger."
  - Danger cited by 17 women vs. 5 men.

Key concepts:

- **Error management theory**: Male psychology evolved to minimize the costliest reproductive errors—missing a mating opportunity or raising another man's offspring.
- **Sexual overperception bias**: A tendency for men to overestimate women's sexual interest as a byproduct of error management.
- **Priority of physical attributes**: Men gravitate toward cues tied to estrogen levels and reproductive potential

(Singh, 1993; Jasieńska et al., 2004) like WHR around 0.70, full lips, and symmetrical breasts

- **Casual Sex Preference**: Men's permissiveness toward casual sex outpaces women's, with meta-analyses showing a moderate gender gap (d = 0.45) (Petersen & Hyde, 2010).
- **Higher desire for many partners**: Across cultures, men desire and report more sexual partners than women. The authors explain how the gap originates, including possible biases of over-reporting for men and under-reporting for women
- **Transactional Sex**: Men are far more likely to pay for sex (16.7% in Australia vs. 0.3% for women) (Richters et al., 2014).

Interesting Notes

- **Men like partners who often change appearances** (Hughes, Aung, Harrison, LaFayette, and Gallup, 2021), probably because of men's preference for novel partners
- **Men's MILF porn explained with men relaxing standards for short term**. ⍰⍰♂ **Lucio's note**: not a valid explanation, since one should always prioritize the most valuable/fertile partner, even in short term. Instead, I believe that the MILF is attractive for proven fertility, less likely to require extra investment, and for unrelated potentially maladaptive pursuit of better sex through disinhibition/experience and male drive to experiment

Chapter 2: Men's Extra-Pair Sexual Interest

Authors: Adam C. Davis, Steven Arnocky, Megan Mackinnon, and Larissa McKelvie

Davis and colleagues argue that extra-pair sexual interest stems from a drive to boost reproductive output by siring more offspring with minimal investment, though it's a balancing act of opportunities and risks (e.g.: partner abandonment, retaliation, social costs).

Many factors influence the likelihood, intention, and behavior of extra-pair mating, including personality, culture, mate value, dissatisfaction in current relationship, availability of mates, etc.

Key Concepts:

- **Reproductive Gains**: Extra-pair mating can increase offspring without the burdens of provisioning (Buss & Schmitt, 1993).
- **Risk Trade-offs**: Costs include partner loss or violence, balancing the potential genetic payoff (Kaighobadi et al., 2009).
- **Influencing Factors**: Sociosexuality, self-assessed mate value, and low relationship satisfaction predict extra-pair pursuits (Schmitt, 2003).

Interesting Notes:

- **Extra-pair mating is a cross-culturally and historically ubiquitous phenomenon** (Betzig, 1989; Fisher, 1992; Huber, Linhartova, & Cope, 2004; Marlowe, 2000; Nowak et al., 2014; Scelza et al., 2020; Schmitt, 2004)
- **Men more likely to adhere to a mixed dual mating strategy of commitment + cheating** (Buss & Schmitt, 2019; Nowak et al., 2014): men were more likely to conceal their relationship status from a hypothetical extrapair sexual mate, whereas women were more likely to reveal it (Hughes and Harrison, 2019)
- **Men cheat more out of opportunity** (32.1%), women because they were unhappy (53%) and made to feel attractive by the extra-pair partner (41%) (Brand et al., 2007)
- **The most consistent predictor of infidelity is past infidelity**: Feldman and Cauffman (1999) found that 80 percent of college-age men that cheated once went on to do so again. Knopp et al. (2017) found that 45 percent of those who had previously engaged in sexual infidelity would do so in the next relationship
- **More unrestricted men are more likely to cheat**, and low agreeableness and conscientiousness and high

extroversion predicted infidelity

- Mate value and infidelity don't present a clear picture, with mixed results, but…
  - Believing to be higher mate value than one's partner predicted infidelity intentions
  - Attractive partners decreased men's intentions of infidelity, possibly suggesting their fear of jeopardizing the relationship
  - High mate value individuals are more indignant and less insecure in case of partner infidelity
- **More opportunities = more cheating**: Men primed with women's abundance increased their intention to cheat and embraced more unrestricted sociosexuality
- **There is cultural variance** for dispositions towards infidelity. When infidelity is more common, people are less harsh about. But…
  - **Globally women are judged more harshly** for infidelity

Also see:

- Why people cheat

⍰⍰♂ ⍰ Lucio's Suggestions

Great work, just a suggestion: change the description of Tinder, it seems to suggest it's dedicated to extra-pair sex, but it's not

Chapter 3: Male Sexual Attraction Tactics

Authors: Mitch Brown, Kaitlyn Boykin, Kelsey M. Drea, Alicia L. Macchione, Mary M. Medlin, and Donald F. Sacco

> Male signaling, whether perfectly diagnostic of actual mating qualities, evolved to outcompete at least some other men for at least some access to viable women. In this market, men seek to "sell" themselves, and their genes, to women. Women then act as "buyers"

Brown and his team explore men's tactics to captivate potential mates and signal genetic quality, status, or commitment.
Physical feats signal health, resource displays promise provisioning, and interpersonal dominance asserts a competitive edge.

These approaches vary by context, with short-term mating (STM) favoring dominance and long-term mating (LTM) emphasizing reliability, all calibrated to women's mate preferences.

- **Physical Displays**: Grooming and muscularity broadcast vitality and strength (Dixson et al., 2011).
- **Resource Signaling**: Wealth or luxury goods attract mates seeking security (Buss, 1989).
- **Dominance**: Competitive posturing deters rivals and appeals to women valuing protection (Puts, 2010).
- **Humor and Creativity**: Wit and artistry signal cognitive fitness, versatile across mating contexts (Miller, 2000).

Interpersonal Dominance

The authors suggest that trait dominance sees the largest upregulation from long-term to short-term.

And the preference for interpersonally dominant men converges with research showing that dominance is predictive of reproductive success, and particularly in short-term mating contexts.

Narcissists also seem to use dominance effectively, displaying as boldness upon first meeting, signaling agency and increasing attractiveness in short-term mating (Campbell & Foster, 2007; Jonason, Lyons, & Blanchard, 2015).

Narcissistic individuals tend to create a charming and impressive first impression when introducing themselves to strangers (Back, Schmukle, & Egloff, 2010). This social boldness mediates the link between men's narcissism and their mate appeal, with dominant men receiving more contact information from interested women (Dufner, Rauthmann, Czarna, & Denissen, 2013). Such appeal is largely specific to short-term mating and is driven by assertive self-enhancement rather than antagonistic traits like rival derogation (Wurst et al., 2017).

The authors also claim that the social boldness peculiar of extroversion is related to interpersonal dominance and mating success.

If dominant men are more successful, especially in the short term, **more promiscuous women are also more interested in dominant men**, preferring male facial structures suggesting interpersonal dominance (Brown & Sacco, 2017; Lyons & Blanchard, 2016).

Humor

Humor within mating domains shows a degree of sexual dimorphism, suggesting a role in sexual selection (Greengross, 2014).

Research shows humor plays a bigger role for men than women in dating, with **women valuing a man's ability to make them laugh as part of mate choice** (Feingold, 1988; Greengross, Silvia, & Nusbaum, 2020).
Funny men tend to have more short-term mating success (Greengross & Miller, 2011), and the pattern is clear: **men produce humor, women evaluate it** (Wilbur & Campbell, 2011).

The type of humor matters:

- **Benevolent humor is attractive in both short- and long-term contexts**
- **Biting is more for short-term**: sophomoric humor lowers trust (Bressler, Martin, & Balshine, 2006), but women are also more tolerant of aggressive humor in short-term scenarios, likely trading off some risk for signs of dominance and "good genes" (DiDonato, Bedminster, & Machel, 2013).

Men aware of this often lean into dominance-signaling humor in short-term contexts (DiDonato & Jakubiak, 2016). **Sexually explicit jokes appeal more to women with permissive sexual attitudes**, helping align with like-minded partners, but they're disliked by women seeking monogamy and are seen as a turn-off for long-term relationships (Medlin, Brown, & Sacco, 2018).

Interesting Notes:

- **Short-term mating is easier for high mate value men**: *"The potential costs of short-term mating for women would only be worth incurring if a selected short-term partner were especially high in putative good genes traits"*
- **Women outweigh attractiveness for short-term**: *"Indicating their minimal threshold of attractiveness for a one-night stand, women's criterion is substantially higher than for LTM (Kenrick, Groth, Trost, & Sadalla, 1993)"*
  - But downregulate it for long term: *"When selecting mates for LTM, however, women downregulate this interest in attractiveness, particularly for traits related to masculinization, because of its correlation with infidelity (Booth & Dabbs, 1993)"*
- **Risk-taking is attractive for short-term, not long term** (Sylwester & Pawłowski, 2011)
  - **Young men are more prone to physical risk-taking** in the presence of attractive women (Ronay & von Hippel, 2010)
- **Creativity is attractive**: Women at peak fertility report greater interest in creative intelligence. Men primed with both STM and LTM displayed considerably greater creativity (Griskevicius, Cialdini, & Kenrick, 2006)
  - **Creativity may be linked with short-term mating strategies**: because of creativity's association with subclinical levels of schizotypal traits that are associated with a disinterest in long-term pair-bonds (Nettle & Clegg, 2006). Highly creative men report greater STM success (Beaussart, Kaufman, & Kaufman, 2012),

and it's not the same for female artists, suggesting that creativity may be sexually selected to facilitate men's reproductive goals (Clegg, Nettle, & Miell, 2011).
This also explains why the artist has long been a recognized seducer archetype in pop culture

- **Altruistic men are highly attractive as potential long-term mates**, altruism suggests greater interest in monogamy and willingness to invest in a family (Barclay, 2010; Brown, Keefer, Sacco, & Brown, in press; Farrelly, 2013).
  Altruistic men also report more sexual partner (Arnocky, Piché, Albert, Ouellette, & Barclay, 2016)
- **Beards signal positive dominance for long-term**: a full beard augments perceptions of a man's ability as a father (Dixson & Brooks, 2013) and his desirability in LTM (Dixson, Sulikowski, Gouda-Vossos, Rantala, & Brooks, 2016). The inferred dominance in bearded men could suggest capable protection of offspring (Dixson et al., 2017). Though typically not desirable in LTM, beard may be specific to the paternalism and part of the colloquial "DILFs" (i.e., "Dads I'd like to fuck," Oswald et al., 2020).

Chapter 4: Men's Intrasexual Competition

Author: Karlijn Massar

Karlijn Massar dissects the competitive arena of male-male rivalry for mating opportunities.

This chapter frames **competition as an evolutionary imperative**, intensified by skewed sex ratios and modern platforms like social media.

Competition among men ranges from physical showdowns to strategic put-downs, each method designed to elevate one's own appeal while diminishing rivals'.
The stakes rise in male-heavy environments, as male-biased sex ratios heighten rivalry intensity (Schacht et al., 2014).

Combative Tactics

Throughout history and across cultures, men competed aggressively with other men to gain status, resources, and access to mates.

This form of competition—**intrasexual aggression**—is rooted in evolutionary pressures.
Men are generally larger, stronger, and more prone to physical aggression than women (Puts, 2010; Archer, 2004), and archaeological records show male-on-male violence has been common (Walker, 2001).

Even in childhood, boys use rough play to assert dominance and gain peer respect (Pellegrini, 1995).
Popular pupils manipulate and use aggressive behavior publicly to assert their superiority over others (Farmer & Cadwallader, 2000)

Aggression solves several male adaptive problems:

- Defend themselves
- Climb social hierarchies
- Keep mates
- Weaken rivals (Buss & Duntley, 2006)

Male aggression is sensitive to context—**men become more physically aggressive when status is threatened or when other men are watching** (Griskevicius et al., 2009; Vandello et al., 2008).

This pattern continues into adolescence and adulthood. Young, unmarried men—especially those with little status—are more likely to engage in risky violence, a phenomenon called **"young male syndrome"** (Wilson & Daly, 1985).
In some premodern societies, killing rivals even increases men's status and reproductive success (Chagnon, 1988).

Modern parallels include gangs, where the most violent men gain respect and more sexual partners (Palmer & Tilly, 1995; Voisin et al., 2004). Even indirect aggression in teen boys (e.g., social manipulation) predicts greater dating success (Arnocky & Vaillancourt, 2012).

Sport As Ritualized Combat

Many cultures developed **ritualized forms** of male competition, such as stick fighting, wrestling, or team sports.

These allow men to compete safely while showcasing strength and skill (Llaurens et al., 2009; Deaner & Smith, 2012).

Modern sports, especially those requiring explosive power (like football or boxing), likely evolved from training for hunting and warfare (Lombardo, 2012). Athletes gain status, resources, and often more sexual partners (Faurie et al., 2004).
Women even find aggressive male athletes more attractive (Brewer & Howarth, 2012).

Men also compete as spectators—they follow sports more closely, care more about outcomes, and use these events to assess others' strength, loyalty, or potential as allies (Lombardo, 2012; Winegard & Deaner, 2010). Sport fandom may be a modern expression of an evolved male psychology shaped by coalitional conflict.

Areas of Competition

- **Formidability**: men's fighting ability and resource holding potential are referred to as formidability.
  It's relevant interpersonally, but particularly relevant in the context of between- and within-group male contests (e.g., McDonald, Navarrete, & Van Vugt, 2012; Van Vugt, Cremer, & Janssen, 2007). Research established that ancestral men engaged in coalitional aggression with other groups of men.
  ⍰⍰♂ For a related suite of psychological adaptations and how they impact society, also see 'social dominance theory'
- **Social status is a central domain of male competition** with one another. Social status refers to one's position within the relevant social hierarchy. Intrasexual competition among men includes achieving a higher standing and status than rivals
  - Positional bias: outperforming rivals shaped human psychology for 'positional bias', with satisfaction contingent to the position of rivals, regardless of achievement in absolute sense (see also Schmitt & Buss, 1996).
    Envy is emotionally linked to higher standing rivals (Hill & Buss, 2006), and brain imaging studies corroborate: downward comparisons activate reward-related areas, whereas upward comparisons activate brain areas that are associated with social pain and envy (e.g., Swencionis & Fiske, 2014; Yaple & Yu, 2020)
- **Conspicuous consumption is for short-term**: the purchase and flaunting of expensive goods, services, or leisure activities, is linked to short-term mating.
  For example, men who pursue a mating strategy focused on short-term mating opportunities – that is, a low investment strategy – are particularly likely to conspicuously consume. For men with a high-investment strategy, the salience of mating opportunities did not increase their conspicuous consumption.
- **Generosity is a mating signal**: studies suggest that men engage in (public) displays of generosity to impress possible mates and compete with other men.
- **Indirect Competition**: Rival derogation and status displays subtly shift mate perceptions (Buss & Dedden, 1990)

Interesting Notes

- **Higher polygyny = more male competition**: *across species, higher degrees of polygyny are associated with more male–male competition and increased male risk-taking (e.g., Plavcan, 2000; Plavcan, Van Schaik, & Kappeler, 1995), sexual dimorphism (e.g., Clutton-Brock, 1985), and increased male mortality rates (e.g.,*

Promislow, Montgomerie, & Martin, 1992).

- **Testosterone is a 'social hormone'**: testosterone is considered to be a "social hormone" (Eisenegger, Haushofer, & Fehr, 2011) and it is implicated in a range of male behaviors: aggression, dominance, competition, courtship and sexual behavior, and partnerships and paternal care (for a recent review see Gray, Straftis, Bird, McHale, & Zilioli, 2019).
  - Testosterone levels are influenced by paternal involvement in child rearing

Chapter 5: Competitiveness and Fatherhood as Overarching Domains of Female Choice

Author: Gregory Gorelik

Gregory Gorelik says we can't be sure whether traits and behaviors were selected by intrasexual competition or mate choice.

But he claims that competition was the main driver of human sexual selection, citing several findings in support, including interpersonal dominance outweighing attractiveness (Hill et al., 2013).

🤔Lucio's Take: **I'm not fully convinced this holds true in modernity**

Lucio:
Although the author addresses the claim that in modern contexts intrasexual competition may matter less, in my opinion he didn't address some important changes that favor women's selection: women's empowerment, more strangers-to-strangers meetings, online dating, and cold approach.

Such as, smart men may approach women invidivually, and as strangers, outside of social hierarchies. In these contexts, mate choice matters more.
Especially as women's empowerment and safer societies also make them less needy of dominant men's protection.

For example, I was fortunate to have dated attractive women while I was still a nobody at work or in society—but my status wasn't salient when I met them.

That wouldn't have worked back in the days, but it did today.

In brief, I agree that competitiveness, competition, and success and life success matter a lot.
But one, it's not easy to disentangle it from female choice. And two, the competition isn't necessarily against nearby men, or based on aggression and intimidation.

Men's Dual Mating Strategies Mirrors Women's: Madonna/Whore Complex

It only occurred to me, thanks to the author, that both men and women have specular 'dual strategies'.

Women have 'dominant for short term', and 'kind provider' for long-term, while men have 'easy for short-term', and 'pious for long-term'.

He writes:

> Although many questions in this area of investigation are not yet settled, and despite its share of methodological hurdles, the picture that is emerging is that women employ a dual mating strategy marked by a preference for (a) dominant and physically attractive men on the one hand and (b) committed providers and carers who are invested in them and their offspring on the other

And later:

> Men may likewise employ a dual mating strategy, perhaps regulated by changes in testosterone, by shifting between competition for access to mating opportunities and direct paternal care within the context of a pair-bond.

I believe this dovetails perfectly with what at the maladaptive extremes becomes the Madonna-whore complex.
But it's more adaptive when it's more of an idealized, even simplistic *dichotomy* of 'marry and commit to the pious woman, and seek sex on the side with unrestricted ones'.

Read more in:

- **Lovers vs providers**

Chapter 6: Sexual Coercion and Rape

Authors: Andrew M. Holub and Gavin Vance

Holub and Vance tackle the grim topic of sexual coercion and rape.

The adaptation hypothesis suggests rape evolved as a bypass to female choice in mate-scarce contexts, potentially boosting reproductive success for some men. The byproduct view counters that it stems from broader traits like aggression or sexual desire, not a specific strategy.

Ethical note is important: explaining origins isn't endorsing, and insights here aim to inform prevention, not excuse perpetration.

- **Adaptation Hypothesis** vs **Byproduct Hypothesis**: Rape can be a selected strategy for mating access (Thornhill & Palmer, 2000) or a side effect of aggression and variety-seeking (Symons, 1979).
  Genetic technology can help us answer this question in the future
- **Ethical Stance**: Evolutionary analysis targets understanding, not justification (Holub & Vance, 2022).
- **Rapists are neurologically insensitive to consent**: *Rapists were more indifferent (in terms of erectile response) to sexual stimuli in which the woman expressed active consent or nonconsent, compared to nonrapists (Harris et al., 2010). Rapist don't differ from controls consensual stimuli arousal, but show greater sexual arousal to rape than*

do nonoffenders (Barbaree, Marshall, & Lanthier, 1979; Howes, 1998; Seto & Barbaree, 1993). Diminished inhibition of sexual arousal may be a key difference between rapists and nonrapists (Howes, 1998). Rapists also may be neurologically distinguishable by white matter abnormalities in certain areas of the brain

- **Sexual coercion may be at least partially heritable**
  - Past rape is one of strongest predictors of future rape
- **Anti-cuckoldry tool**: *men pursuing a long-term sexual strategy are hypothesized to employ a range of behaviors to manage their risk of cuckoldry. Accordingly, several studies have observed that men's use of sexual coercion is positively associated with their use of other mate retention behaviors.*
  Coercion is also correlated with perception of partner infidelity

Chapter 7: Mate Poaching by Men

Authors: T. Joel Wade and Maryanne L. Fisher

Wade and Fisher unravel mate poaching—men luring women from existing relationships—as a calculated evolutionary play.

Poaching leverages superior traits—resources, charm, or looks—to outshine a woman's current partner, exploiting relationship cracks.
Success depends on many variables, including the poacher's allure and the target's dissatisfaction.

- **Success Factors**: High mate value and partner discontent boost outcomes (Davies et al., 2007).
- **Risks vs. Rewards**: Gains in mate quality offset potential backlash (Wade & Fisher, 2022).
- **Poachers and poachees are less agreeable** (i.e., less empathetic, gentle, and generous), less conscientious (i.e., less self-discipline, vigilance, carefulness, and empathy), and higher in dark triad traits, especially psychopathy
- **Poached relationships have lower satisfaction**, including sexual satisfaction, lower commitment, and lower trust

Chapter 8: Sexual Fantasy

Authors: Mariana A. Saramago and Ricardo Ventura Baúto

Men fantasize more often and explicitly than women, emphasizing variety and visual cues over emotional depth—hallmarks of male psychology.

Lehmiller's (2018) survey of 4,175 adults found that the most common fantasies related to intimate/ romantic themes and, in order, were: "multipartner sex"; "power, control, and rough sex"; "novelty, adventure and variety"; "taboo and forbidden sex"; "swinging, partner sharing, and polyamory"; "intimacy, romance, and passion"; and, lastly, fantasies about "homoeroticism and gender-bending."

Gender Differences

Men and women are **more similar than different** in their fantasies, interests, and experiences, and these differences have **decreased over time**.

However, some patterns persist:

- **Men** tend to have **greater diversity** in fantasies and are more aroused by external stimuli, multiple partners, and sexual novelty.
- **Women** more often prioritize **mate quality** and long-term benefits, reflecting evolutionary strategies.

Evolutionary theories suggest that these differences arise from sexually dimorphic brain and mind mechanisms, with men generally more inclined toward short-term mating and women toward long-term provisioning and

protection.

Specific male-leaning fantasy trends include:

- Voyeurism and frotteurism
- Dominance and power-themed fantasies
- Multipartner scenarios (threesomes, orgies, sex with strangers, polyamory)

These patterns align with evolutionary explanations that men's sexual psychology evolved to maximize reproductive opportunities, while women's evolved to prioritize high-quality, resource-capable partners.

Most common 'deviant' fantasies

Paraphilic interests—like voyeurism, exhibitionism, or sadomasochism—are often labeled "deviant," but research shows they are **relatively common** in the general population.

For example, Joyal & Carpentier (2017) found that 45.6% of participants reported paraphilic desires, and 33.9% had acted on them at least once. Paraphilic fantasies also significantly predict actual behavior (Williams et al., 2009).
In order:

- **Voyeurism:** 34.9–83%
- **Frotteurism:** 13.4–72%
- **Sadism:** 21.8–62%
- **Fetishism:** 30–44.5%
- **Exhibitionism:** 30.6–39%
- **Masochism:** 15.8–23.8%
- **Transvestism:** 10%
- **Pedophilia:** 4.1–13%

- **Emotionally charged events can impact the development of sexual interests**, *Lehmiller (2018) further noted that those who reported fetish fantasies explained that the association between the object and the pleasure was learned when they had a very intense orgasm with the object present and from then on found this fetish to be arousing* ⁉️ **Lucio's note:** but I have to wonder if the fetish was already present and was the source of the 'intense orgasm'. Also, as a man, most orgasms feel pretty much the same, so I must wonder

Personality differences

Personality correlates with sexual fantasies, with psychopathy as the strongest predictor of deviant fantasies. Importantly, **criminal offenders had much higher rates of deviant fantasies** (12–56.5% vs. 9.1% in controls).

Paraphilic fantasies are also higher among sexual offenders compared other types of crimes (Curnoe & Langevin, 2002; Langevin et al., 1998).

- **Neuroticism:**
  - Higher overall fantasy frequency (egosyntonic and egodystonic)
  - Submission fantasies
  - Frotteurism and bondage fantasies
- **Openness to experience:**
  - Higher overall fantasy frequency
  - Frotteurism and pedophilia fantasies

- **Extraversion:**
  - Transvestism fantasies
- **Narcissism:**
  - Sadism fantasies
  - More intimate fantasies
- **Psychopathy:**
  - Bondage and sadism fantasies
  - Strongest predictor of exploratory, impersonal, and sadomasochistic fantasies
  - Interpersonal facet → voyeuristic and exhibitionist interests
  - Affective facet → pedophilic interests
- **Self-destructive / high affective personality types:**
  - Report more sexual fantasies than self-actualizing / low affective types
- **Obsessiveness:**
  - Positively predicts overall fantasy frequency

⍰⍰♂ **Lucio's suggestion:** would have been great to get the strength of correlation for these studies

Chapter 9: Ejaculation Latency

Authors: Rosa Angélica Lucio, Alonso Fernández-Guasti, and Maria Reyna Fuentes-Morales

Lucio and her team dissect ejaculation latency, particularly the widespread premature ejaculation, as an evolutionary puzzle tied to reproductive efficiency.

They argue that rapid ejaculation may have been favored in high-competition settings.
Short latency could optimize quick insemination amid rival males or fleeting opportunities, enhancing sperm competition odds.

⍰⍰♂ **Lucio's note: while it's an interesting interpretation and may ultimately be valid, I'm skeptical.** While it may in some cases be adaptive, it's also maladaptive for seduction and partner retention, which have historically been more important for men's reproduction.

Chapter 10: Copulatory Thrusting in Males

Authors: Anders Ågmo and Gabriela Morali

Thrusting enhances fertilization with better sperm positioning and may dislodge competitors' sperm.

⍰⍰♂ **Lucio's note**: While all explanations are plausible and possible, I remain skeptical about the degree to which trust directly contributed to reproductive success. I recommend caution in assigning definitive evolutionary causes.

Chapter 11: Men's Provisioning of Oral Sex

Author: Gavin Vance

Gavin Vance examines why men perform oral sex on women, first wondering if it's a byproduct or an adaptation.

Beyond pleasure, it signals commitment, boosts partner satisfactio,n and retains mates, and possibly detects rival sperm.

Cultural norms shape its practice though, as it seems more frequent among caucasians and Westerners.

Chapter 12: Inducing Female Orgasm

Author: Tara DeLecce

Tara DeLecce investigates men's pursuit of female orgasm, linking it to evolutionary goals like paternity assurance and mate retention.
Men's efforts aren't necessarily altruistic—they're strategic, enhancing bonds and reproductive odds. It's a deep dive into how male behavior adapts to female physiology.

Variability in women's responses means that it acts as an indicator of mate quality.
It seems to me that these mate qualities can also be divided into short-term/attractive and long-term/investing.
Indeed says the author:

> It could be that male performance of foreplay is another form of investment that signals willingness to invest in a woman, which is important for long-term relationships, and this supports the pair-bond hypothesis for female orgasm.

Short-term / sexy sons orgasms	Long-term / supportive orgasms
Physical prowess	Foreplay
Attractiveness	Attentiveness
Masculinity	Emotional satisfaction
	Oral sex

Men's effort for female orgasm, categorized by short and long term by Lucio Buffalmano

Takeaways

- **Paternity Boost**: Orgasm may favor sperm uptake (Baker & Bellis, 1993).
- **Mate Retention**: Pleasure strengthens pair-bonds (Shackelford et al., 2005).
- **Signaling Skill**: Success reflects mate quality (DeLecce, 2022).
- **Attachment styles moderate men's interest for her orgasms**, with anxious men reporting greater interest than secure men, and avoidant men report less interest
- **Orgasm is unrelated to reproductive success**: *In one study of over 8,000 women, there was no significant correlation between rates of orgasm and number of children conceived (Zietsch & Santtila, 2013)*

Chapter 13: Copulatory Urgency

Authors: Arial Bloshinsky and Valerie G. Starratt

Bloshinsky and Starratt define copulatory urgency as an intense motivation to pursue sex with a sense of immediacy, insistence, and persistence.

Urgency increases with fertile females or rival threats, pushing men to act fast and secure copulation. It's a flexible trait, varying by personality and context, but can lead to impulsivity—like pornography binges—when unchecked.

- **Triggers**: Fertile cues or competition spark urgency (Goetz et al., 2005).
- **Adaptive Value**: Quick mating maximizes fitness in uncertain contexts (Buss & Schmitt, 1993).
- **Variability**: Hormones and traits shape intensity (Bloshinsky & Starratt, 2022).

Chapter 14: Postejaculatory Adaptations to Self-Semen Displacement

Authors: Gordon G. Gallup, Jr., and Steven M. Platek

Gallup and Platek explore postejaculatory behaviors—like continued thrusting—as evolved tactics to ensure paternity.

Postejaculatory thrusting may scoop out competitors' sperm, a mechanism tied to penis morphology and timing precision. Psychological drivers like jealousy fuel these actions, integrating with mate guarding to protect genetic investment.

- **Semen Displacement**: Thrusting removes rival sperm (Gallup et al., 2003).
- **Timing**: Men suspecting infidelity seek sex ASAP, while women who believe the extra-pair partner is of higher value should actively avoid sex with their partner
- **Psychology**: Competition cues trigger adaptive responses (Shackelford et al., 2002).
- **Male jealousy accounts for most violence** (e.g., spouse and child abuse), more than social class, poverty, alcohol, or drug addiction combined (Burch and Gallup 2019).

Female Hypergamy & Bruce Effect

The Bruce effect—a phenomenon where a recently impregnated female mouse spontaneously aborts after exposure to a new higher quality male, is an adaptation of female hypergamy—the drive to seek and potentially switch to higher-quality mates.

The authors suggest that certain non-phase menstruation (bleeding outside the expected menstrual window) at the start of a new sexual relationship might be a human analog to the Bruce effect.
This bleeding could either:

- signal the termination of a prior pregnancy from a lower-quality mate, or
- serve as a signal to new partners that the woman is not currently pregnant—possibly reducing the chance of male cuckoldry.

From the male perspective, the chapter suggests that men might have evolved to detect unusual menstruation timing in their partners. If detected, this could lead to increased mate guarding behaviors and more vigorous sexual activity, aimed at reducing the risk of losing paternity to another man.

🤔Lucio's Take: **Bruce effect needs a stronger frame of *speculative* theorizing**

Lucio:
I was surprised to see the Bruce effect presented as applying to humans.

As expected, the theory is highly speculative, based on limited empirical evidence and with a likely small real-world effect even if it turns out to be true.

Prefacing it with *"There is reason to believe…"* overstates the case and, in my view, may undermine the authority of the chapter.
A stronger disclaimer of speculation would be more appropriate.

⍰⍰♂ Lucio's note: male paternity 'detection system' is inaccurately biased for safety

The authors write:

> for men with low paternal confidence the incidence of nonpaternity was 30 out of 100 (…) an astonishing 15 times higher than those with high paternal assurance.
> (…)
> while attributions of nonpaternity are far from being failsafe, these data suggest there are some evolved/hardwired and surprisingly accurate paternity assessment mechanisms

Being wrong 70% of the time doesn't seem 'surprisingly accurate' to me.
Instead, it seems a case of perception bias erring on the side of safety.

Chapter 15: Male Mate Retention

Authors: Bruna S. Nascimento, Katia C. Vione, and Renan P. Monteiro

Nascimento and colleagues first explain the many benefits for men in commitment, and then outline how men guard mates to thwart infidelity and secure paternity.
These strategies, flexible to context, balance benefits like pair-bond stability against costs like effort, resource depletion, or partner alienation when they are value-taking.

Mate retention spans direct guarding—like jealousy-fueled monitoring—to indirect boosts like enhancing appeal or providing gifts. High mate value or infidelity risks dial up intensity, while harsh tactics risk backfiring.

- **Investing men obtain higher quality mates** because women value investment in long-term relationships, which are typically more advantageous for women in comparison to short-term relationships (Buss & Schmitt, 1993)
- **Cuckolding undermines social social and interpersonal respect**, on top of jeopardizing paternity
- **Direct Guarding**: Vigilance and control deter rivals (Buss, 1988).
- **It's a strategic dance of controlling**, while still retaining a mate.
- **Indirect Guarding**: Gifts and charm reinforce bonds (Shackelford et al., 2005).
- **Anxiously attached men work harder to retain their mates** (Barbaro et al. 2019)
- **Costly Tactics**: Threats can destabilize relationships (Nascimento et al., 2022).
  - Men use more submission tactics than women (Buss & Shackelford, 1997; Kardum, Knežević, & Gračanin, 2006), in what I suspect are cases of emotional manipulation like guilt tripping

Chapter 16: Shifts in Partner Attractiveness: Evolutionary and Social Factors

Authors: Rebecca L. Burch, Maryanne L. Fisher, James B. Moran, Catherine A. Salmon, T. Joel Wade, and David R. Widman

Burch and her team analyze why partner attractiveness waxes and wanes, blending evolutionary cues like fertility with social dynamics like familiarity.
Evolutionary factors tie attractiveness to reproductive status: fertile phases heighten appeal, menopause dims it.

Interesting Notes

- **The importance of physical attractiveness decreases with growing familiarity** (Hunt, Eastwick, & Finkel, 2015)
- **Female youth is most appealing for long-term mating** (Buss, 1999)
- **Men find 'nipple erections' sexy** (Burch and Widman, 2021)
- **Inducing jealousy may increase attraction**: but it's not been empirically verified yet

Chapter 17: Emotional Commitment in Men

Author: Elizabeth G. Pillsworth

Elizabeth Pillsworth analyzes emotional commitment as an evolved male trait fostering pair-bonds and paternal care, critical for human offspring survival. It's not just sentiment—it's strategy, cementing relationships and boosting fitness.

Commitment increases resources and protection for vulnerable young, a hallmark of human biparenting. Attachment styles and satisfaction modulate the strength of pair bonding.

Interesting Notes

- **Reproductive success is the goal, not relationship strength**: commitment or relationship stability aren't the purpose or desired outcome, and there is no 'ideal' approach to a relationship. Each attachment style, commitment level, and relationship orientation represents a strategy that promotes the greatest reproductive success in a particular context
- **Men's infidelity is less predictive of relationship dissolution than is women's infidelity** (Betzig, 1989), suggesting that sexual infidelity and relationship commitment are not mutually exclusive, particularly among

men

Chapter 18: Sexual Jealousy in Males

Author: Tsukasa Kato

Tsukasa Kato argues that sexual jealousy is a tailored male adaptation to guard against cuckoldry, distinct from emotional jealousy.

He delves deep into intercultural studies and finds that the Buss' original findings that men are more concerned about sexual infidelity and women more by emotional infidelity is more nuanced.
He summarizes the findings in this way:

> Following Sagarin's criterion, the studies using a forced-choice measure found that the (evolutionary jealousy mechanism) EJM hypothesis was corroborated overall.
> As claimed by Buss, the sex difference in jealousy was robust and replicable (…) although the effect size was small.
>
> However, the studies using continuous measures presented mixed results.
> In contrast, when following Harris' criterion, the EJM hypothesis was not holistically corroborated by either forced-choice or continuous measures.
> (…)
> Following Sagarin's criterion, the studies using a forced-choice measure found that the EJM hypothesis was corroborated overall.
> As claimed by Buss, the sex difference in jealousy was robust and replicable, excluding a few samples, such as homosexuals, although the effect size was small.
> However, the studies using continuous measures presented mixed results. In contrast, when following Harris' criterion, the EJM hypothesis was not holistically corroborated by either forced-choice or continuous measures.
> (…)

He also adds though that we cannot deny the viability of the EJM based on low effect sizes, but that sociocultural factors and relationship type matter.

Chapter 19: Men's Attachment-Related Needs in the Sexual Arena

Author: Moran Mizrahi

Moran Mizrahi uses attachment theory to decode how men's emotional styles shape their sexual lives.

Secure men thrive in committed relationships, anxious ones chase reassurance through frequency, and avoidant ones favor detachment. These patterns, forged in childhood, steer mating strategies—long-term for some, short-term for others—revealing how attachment links to mating strategies and relationship dynamics.

Chapter 20: Paternal Care

Author: Ryan Schacht

Ryan Schacht traces paternal care's evolutionary arc, explaining why men invest in offspring and how this varies globally.
Paternal care is a fitness booster, enhancing child survival, yet flexible to ecology and culture.

Paternal care—rare among mammals—is particularly useful in humans because of children's prolonged dependency.

Interesting Notes

- **Poverty, low paternity certainty, and polygyny lead to absent fathers**: *Among Afro-Caribbean households in St. Kitts, offspring investment often comes from extended female kinship networks because men are typically peripheral to family structure due to limited male economic opportunities and lower paternity certainty (reviewed in Gray & Brown, 2015). When men can find new wives, they also look outside the household to invest their resources in new women* <— ⍰⍰♂ Bright observation, I had never thought that to increase paternal care one should also ensure a minimum income, paternal certainty, and encourage monogamy

⍰⍰♂ **Lucio's note: paternal investment is expected IF it increases fitness**
The author states that paternal investment is expected to evolve if it aids in offspring survival or quality once pair-bonding evolves and paternity certainty is high (Clutton-Brock, 1991; Dunbar, 1976; Perrone & Zaret, 1979; Thornhill, 1976; Westneat & Sherman, 1993). While these elements are indeed crucial milestones, the ultimate driver of evolutionary outcomes remains **inclusive fitness**. There may be a species where women are more than enough to ensure offspring well being, and hence men still have no benefit in investing.

Chapter 21: Paternal Filicide

Author: Vibeke Ottesen

Vibeke Ottesen confronts the dark paradox of paternal filicide—fathers killing their own—framing it as an extreme response to reproductive conflict and perceived threats like doubted paternity or resource drain.

Filicide emerges when investment in a child clashes with a father's reproductive interests, a calculus from ancestral scarcity.
Mental health crises or step-parenthood amplify risks.

- **Reproductive Conflict**: Killing reflects investment trade-offs (Daly & Wilson, 1988).
- **Risk Factors**: Psychopathology and step-parenting heighten likelihood (Ottesen, 2016).
- **Cultural Mitigation**: Legal and social shifts curb incidence (Durrant, 1999).

How Northern Europe Tackled The 'Stepfather Issue'

The Nordic countries reduced stepparental violence by structurally removing the reproductive conflicts that typically arise in stepfather–child relationships.

Indeed, say the authors, the mere lack of genetic relatedness is not determined to motivate men to perform lethal behaviors toward children.
It's the extra costs of the stepchildren that fuel harm-inflicting strategies.

Key strategies include:

- **Shared custody and legal child support** obligations ensure that biological fathers retain primary parental duties after separation, relieving stepfathers of those burdens.
- This **removal of stepfathers' investment pressure** minimizes the evolutionary incentives for harmful behavior by stepfathers.
- **Strict laws banning physical punishment** of children, combined with cultural norms against violence, further reduce the behavioral outlets for such conflicts.

As a result, while stepfathers remain overrepresented among rare filicide cases, the overall rates of child abuse and filicide are very low.
Most remaining cases of paternal filicide in these countries are now linked to severe psychopathology, not reproductive conflict.

⍰⍰♂ SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Lower mate value men should leverage money

Contrary to misguided advice in some male development circles, lower value men should leverage resources to maximize their mating strategies and attract higher quality partners.
From chapter 3:

> This desirability of **provisioning becomes an especially important attraction strategy for unattractive men** because of the reprioritization of resource access over attractiveness in selecting mates, with men demonstrating greater beneficence toward women as a compensatory strategy for their own lack of attractiveness (Buss & Greiling, 1999; Takahashi, Yamagishi, Tanida, Kiyonari, & Kanazawa, 2006).

This also recalls, and confirms, a popular maxim on 'alphas vs betas' mating strategies.

Lower-value men are more likely to be abusive

Quoting Nascimento from chapter 15:

> Men with higher mate value are more likely to be able to provide the partner with benefits such as good genes, resources, and protection as opposed to men with lower mate value (Miner, Starratt, & Shackelford, 2009).
>
> Men with lower mate value are more likely to perform higher risk, cost-inflicting mate retention, because, unlike men with higher mate value, they may lack the resources to perform benefit-provisioning strategies. Indeed, Miner et al. (2009) suggested that men's mate value is a better predictor of men's mate retention than their partner's mate value

And:

> Mate retention strategies may be grounded in feelings of insecurity and, as such, activated by cues of real or perceived infidelity (Campbell & Ellis, 2015). As the risk of infidelity increases, men also experience more jealousy and allocate more effort to mate retention.

Of course, the answer for committed men is not to pretend all is OK when they doubt their spouses' infidelity or when someone is hitting on them.
The answer is to be smart and strategic about it so to not appear low value.

Lower status men are better daddies (not because they're 'nice')

Quoting Schacht:

> However, how much each individual father invests is flexible and depends on his social status with the group. Poorer, lower status Aka fathers spend more time with their children and provide more childcare than do wealthier, higher status fathers (Hewlett, 1988)

I suspect this is not because they're 'nicer', but a combination of having fewer extra-pair mating options, fewer

chances of siring other offpsring (and hence focus on the ones home), less fulfilling lives outside of home, and becaue they're expected to contribute more with the unwritten deal 'provisioning in exchange for intimacy'.

Indeed, little later writes the author:

> Additionally, where men can marry polygynously (i.e., have more than one wife), excess resources are often targeted toward attempts to gain additional wives rather than additional investments in improving offspring quality (Hedges, Mulder, James, & Lawson, 2016).

QUOTES

The bottom line logic of evolution:

> Reproductive success is the ultimate currency in the economy of natural selection" (Frank Marlowe, 2004)

On cold evolutionary investment logic:

> paternal investment in a genetically unrelated child is more or less a waste, in strict evolutionary terms. Even worse than a waste, investing paternal care in a stepchild would be aiding the transmission of another man's genes (i.e., an evolutionary competitor) to the next generation

⍰⍰♂ Lucio's Analysis

Still unconvinced by semen displacement theory (Chapter 14)

In previous volumes and handbooks I raised my concerns around the semen displacement hypothesis.

I'm glad Gallup and Platek address some of them, and I will respond to their points:

> Another common objection to the semen displacement hypothesis concerns the incidence of female infidelity. How often does the frequency of double mating produce instances in which viable sperm from two or more males coexist in a woman's vagina?
> (…)
> While it is true that sperm can live in a woman's reproductive tract for several days, a generous estimate of the amount of time that would be available to displace viable rival male semen from a female's vagina would be plus or minus twelve hours (Gallup, Finn, & Sammis, 2009)

The authors then note that several women have had sex with different partners within 24 hours.

However, this still does not fully account for biology.
The first hours after insemination are when sperm competition is most intense, and each passing hour reduces the likelihood of effective displacement.
Back-to-back encounters, which would be the most effective, are also likely the rarest.

Most importantly, **sexual activity in the cited studies does not equal reproduction**.
The study surveyed American college students—an environment dominated by hookup culture—where nearly none of these encounters were aimed at conception.

This context is therefore a poor proxy for ancestral conditions.

Overall, these factors suggest that the evolutionary relevance of semen displacement remains, in my opinion, more marginal than semen competition theories may lead to believe.

The ‘Sperm piggybacking hypothesis’ is too speculative (chapter 14)

Even as an hypothesis, leaving this section as it is risks undermining the book’s authority.
Here’s one passage:

> Put another way, if your partner is not circumcised you may be at risk of having sex with the men who had sex with your partner’s previous partner. <— ???
> This idea inspired a novel by Robin Baker (2013) who is one of the prime movers behind the concept of sperm competition.
> As implied by the title of his book, the sperm of one man may “hitchhike” under the foreskin of another man and lead to fertilization by proxy (see Figure 14.11)

It ‘might’, of course, but how likely and impactful is this be on an handbook of *adaptations*?

Even if it’s ‘proven’ to have happened a number of times, which over millions of years it probably did, what impact would it have on evolution?

I don’t see how this could be an adaptation.
And even to be a process with any evolutionary effect, you’d have to believe it was common for men to impregnate women with another man’s sperm lodged under their foreskin.

For many reasons, including basic biological constraints on sperm survival, I find that extremely unlikely. And no evidence or logic was provided to suggest otherwise.

At the mention of Baker’s novel though I had my own hypothesis: some of the most out there speculations on sperm competition may be driven less by logic and more by paraphilic fascination.

Suggestion: remove the novel’s book cover, add a clear claim of speculation, or reduce/remove the sub-chapter entirely. May note that modern sperm competition includes sperm banks and donations.

Suggestion: change the frame of ‘solving problems’

Referring to strategies and adaptations as solutions to “ancestral problems” is standard in the literature.

However, the phrase is not always logically precise.
You only *solve* a problem when you’re facing a specific, well-defined challenge.

But evolutionary changes often arise not from solving discrete problems, but from seizing *novel opportunities*.

Take for example this quote:

> “Physical aggression solves several adaptive problems.”

Besides sounding morally off with the ‘solving problem’ frame, it would be more correct to say that physical aggression created *opportunities* for those who could use it with lower costs relative to the benefits.

But I’m aware of being on the anal retentive side on this :).

REVIEW

The Cambridge Handbook on Sexual Psychology Volume 2: Male Sexual Adaptations is a comprehensive, high-quality resource for understanding evolutionary logic in mating, particularly when it comes to male sexual psychology and adaptations.

If I were to offer some suggestions, it’s that a few chapters lean a bit too heavily on more speculative theories. Flagging those more clearly—or trimming them—would help.

Also, while some comparisons with female adaptations are useful, I'd encourage the editors to focus more tightly (if not entirely) on male-specific dynamics. That would make the four-volume series even tighter and on-topic, also helping with future information retrieval (e.g.: do I need to revisit a male adaptation? I'm sure it's going to be on volume 2, and not anywhere else).

On the plus side? Pretty much everything else.
I especially appreciated the editors' decision to avoid over-focusing on individual studies. That approach gives us readers the broad literature overview we're really after—and the one that's most useful. (That said, it might help to briefly note the statistical power of key studies and, more importantly, the overall strength of empirical support for the different theories).

Overall, this book gave me several new insights and directly helped me improve multiple articles on this website—which is the highest compliment I can give any handbook.

Big thanks to the editors and all contributors. I'm grateful for the work you've done and look forward to what's next.

The Power Moves Reviews: The Good, The Bad, The Shocking

Lucio Buffalmano · 5 October 2025 · Archived copy · Original

The Power Moves (TPM) is a leading resource on power dynamics, self-empowerment, and social strategies.

Founded by Lucio Buffalmano, author and expert on power dynamics and social strategies, it offers evidence-based articles, critical reviews, and training programs like *Power University*.

But what do real readers say about The Power Moves?
This article analyzes hundreds of verified The Power Moves reviews left by our readers. The data was collected between December 2023 and September 2025 with the Hotjar feedback system, anonymized, and analyzed to provide an unfiltered look at what readers say about The Power Moves.

Contents

- Overall TPM Rating: 4.2/5 Stars
  - Dataset at a Glance
  - Top Rated & Bottom Rated Pages
  - Trend: Improving Over Time
- Qualitative Analysis
  - Positive TPM Reviews
  - Critical TPM Reviews
  - ⍰ Critical Reviews: Power Dynamics Analysis
- Surveys
  - Would you recommend TPM?
  - What's Stopping You From Joining Power University?
- Conclusion

Overall TPM Rating: 4.2/5 Stars

Based on 452 anonymized responses collected via Hotjar from December 2023 to September 2025, *The Power Moves* earns an average rating of **4.2 out of 5 stars**. This score reflects strong satisfaction among readers, with 68% awarding 4 or 5 stars.

- **5 Stars: 58% (262 reviews)** – Praised for insightful, practical content.
- **4 Stars: 10% (45 reviews)** – Solid value with minor suggestions for enhancements.
- **3 Stars: 12% (54 reviews)** – Neutral.
- **2 Stars: 8% (36 reviews)** – Criticisms around content presentation or technical issues.
- **1 Star: 12% (55 reviews)** – Objections often related to strong reactions to content or site features.

Readers who also added written feedback generally found TPM to be a unique and valuable resource for self-development.

48	The Power Moves offers the best information regarding psychology, self-improvement and life effectiveness that I've encountered in the internet to date. When I found it I thought it was too good to be true. Now, after +5 months with PM and +1 year learning power dynamics I think it's too good, and it's true
47	I love it
45	Awesome
43	Awesome
41	The power moves is mind blowing. I haven't stopped reading it for 2 days straight
39	Great format
37	Pop up bullshit
36	Hello, I didn't know your name, sorry! I love your content a lot. I have a question, what do you think about Ayn Rand? In her books she seems to promote the ideal man as a type of narcissistic, high

Dataset at a Glance

- **Total responses**: 452
- **Date range**: 2023-12-03 → 2025-09-08
- **Ratings distribution**:
  - 5 stars: 262 (58%)
  - 4 stars: 45 (10%)
  - 3 stars: 54 (12%)
  - 2 stars: 36 (8%)
  - 1 star: 55 (12%)

- **Neutral** (3): 54 (12%)

- **Negative** (1–2): 91 (20%)
- **Top countries represented**: United States (124), India (38), Germany (27), United Kingdom (22), Canada (18), Philippines (16), Nigeria (14)

Top Rated & Bottom Rated Pages

We've analyzed the pages with the highest and lowest average ratings in our dataset. This feedback is helpful for highlighting what our audience values most and where we can improve.

Top rated:

1. **Page:** https://thepowermoves.com/local-sexual-marketplaces/
   - **Rating**: 5/5
   - **Number of Responses**: 4
   - **Breakdown**: All 4 reviews at 5 stars
2. **Page:** https://thepowermoves.com/dictionary-of-power/
   - **Rating**: 5/5
   - **Number of Responses**: 2
   - **Breakdown**: Both reviews at 5 stars
3. **Page:** https://thepowermoves.com/forum/
   - **Rating**: 4.8/5
   - **Number of Responses**: 6
   - **Breakdown**: 5 reviews at 5 stars, 1 at 4 stars
4. **Page:** https://thepowermoves.com/three-pillars-of-knowledge/
   - **Rating**: **4.6/5**
   - **Number of Responses**: 5
   - **Breakdown**: 4 reviews at 5 stars, 1 at 4 stars

Bottom rated:

1. **Page:** https://thepowermoves.com/sexual-market-value/
   - **Rating**: 2/5
   - **Number of Responses**: 2
   - **Breakdown**: 1 review at 3 stars, 1 at 1 star
2. **Page:** https://thepowermoves.com/manipulation/
   - **Rating**: **2.3/5**
   - **Number of Responses**: 3
   - **Breakdown**: 1 review at 4 stars, 1 at 2 stars, 1 at 1 star

Our Analysis & Action: We were surprised to see the **Dictionary of Power** among our top-rated pages, as it has primarily been an unorganized repository.
But readers highly valued this resource. While we always intended to improve it, these reviews provided the evidence needed to prioritize turning it into a more structured and comprehensive resource.

Trend: Improving Over Time

Last 30 days aggregate rating in September 2025

Reviews reveal a strong upward trend: from an average of 3.8/5 in late 2023 to 4.5/5 by mid-2025.
The early dip was primarily caused by technical friction (especially intrusive pop-ups). Once corrected, and as the content library expanded, satisfaction steadily increased.

Period	Average Rating	Common Themes
Dec 2023 – Jun 2024	3.8/5	Technical issues, content suggestions
Jul 2024 – Dec 2024	4.1/5	Balanced feedback, praise for insights
Jan 2025 – Sep 2025	4.5/5	High acclaim for uniqueness, fewer complaints

Qualitative Analysis

Several members left written notes about their experience with The Power Moves.

Readers overwhelmingly rate *The Power Moves* positively. Common themes include:

- **Actionability:** Readers consistently praised the concrete, usable tactics.
- **Uniqueness:** Many highlighted that TPM covers subjects rarely addressed elsewhere, such as manipulation dynamics and advanced social strategies.
- **Depth:** Several emphasized the deep research-backed analyses.

Positive TPM Reviews

Most high-rated reviews celebrate TPM's depth, practicality, and unique approach to self-development. Here are some representative examples:

> The power moves is mindblowing, I haven't stopped reading it for 2 days straight – 5 stars, US, Sep 2025

> Ive been browsing your blog for the past 2 years and it's absolute gold mine. Thank you for keeping all this content for free. – 5 stars, India, Feb 2024

> The Power Moves offers the best information regarding psychology, self improvement and life effectiveness that I've encountered in the interned to date. When I found it I thought it was too good to be true, now, after +5 months with PU and +1 year learning power dynamics I think it's too good, and it's true. – 5 stars, Spain, Dec 2024

Critical TPM Reviews

Lower ratings often pointed to technical issues (most of which have since been resolved), requests for more features, or differing views on content. These were valuable for shaping improvements.

Some examples:

> “Pop-up in mobile ist glitched” – 1 star, Bosnia and Herzegovina, Jul 2025

> “Make clips work without having to sign in” – 3 stars, Australia, Feb 2025

> “The Adulteress section needs revising. It’s incredibly sexist to use the term UNDERSTANDABLE here…” – 3 stars, United States, May 2025

Among the negative content reviews, most related to sensitive topics such as gender dynamics, mate choice, and relationships.
These disagreements are expected in discussions about complex human behavior, but they provide useful signals for balancing tone in future updates.

⍰ Critical Reviews: Power Dynamics Analysis

Most angry reviews are legit and valuable. They pushed us to improve TPM, and for that, we’re grateful.

That said, TPM is a site about human nature and power dynamics. **Anger and strong emotions aren’t just feedback — they’re also social signals**.

Let’s start with a “dubious” one:

What's stopping you from joining PU?	Country
From reading your page and even email popup it’s clear you’re a bunch of toxic as fuck people who teach harmful shit to insecure guys. Pathetic.	Finland

> **Him**: From reading your page and even email popup it’s clear you’re a bunch of toxic as f*ck people who teach harmful shit to insecure guys. Pathetic

Contextual analysis: the referenced popup appeared after at least 15 minutes of session time — indicating this reader had substantial engagement before reacting.

Sometimes people are drawn to certain type of content to consume privately, while also criticizing in public.
In power dynamics, this can stem from:

- **Envy**: wanting to learn from the material, but resenting the author’s position of authority
- **Status competitions**, not wanting empowering information to be widely available to others
- **Tricking others** into skipping effective content

But it’s also possible that some readers may honestly feel that way. Without knowing someone in person, it’s impossible to tell for sure.

⍰ Raging Review Case Study

This feedback was on a password-protected post that the user couldn't access:

> **User**: I used your content too a joy and now you can go eff yoursef (expletive)

This shows a taker mindset: consuming freely, but reacting with rage when access is restricted. This entitled approach to social exchanges expects unlimited benefits without reciprocity.

(For context: the protected post was titled "5 Machiavellian Techniques to Sell a House Fast (Unethical!)" — content deliberately not public.)

⍰ Manipulative 'Reviews' Dynamics

Several of the harshest negative reviews clustered around posts on mate selection and red flags (e.g., "Signs of Quality Women").
Several relied on shaming language rather than engaging with the substance. In power dynamics, **this is a suppression tactic** to:

- **Suppress knowledge** that could shift leverage in the dating market.
- **Discourage mate-quality assessment** to maintain the chooser's power, rather than also competing in being chosen

In both cases, it's about **empowering oneself at others' expense**.

Please note: this isn't about men vs. women or anyone being "better."
Some critical responses came from readers who identified as female because many of these posts are addressed primarily to men.

But similar dynamics are at play with men towards women and among different groups (e.g., 'have vs. have-nots').

In all cases, it's about social power moves: controlling the public narrative to gain or retain more power.
At TPM, our belief is that more empowerment for all leads to a better world.

Surveys

Separate feedback forms collected specific insights about The Power Moves.

Here's a summary of the main findings.

Would you recommend TPM?

We asked readers (N = 126) whether they recommended TPM in the past six months, and invited open-ended comments.
Responses fell into the following range:

- **30% said "yes"**
- **About half were considering**, including first-time users
- **The remainder provided a negative response**

A few selected quotes:

> Yes I always recommend you.

> I hooked the website a few time on Reddit

> One I don't know how I can contact you Lucio to say thank you (…) This is the site that changes your life is my recommendation to friends I have talked about

And some readers chose a more humorous approach to voice their criticism, for example, one said "*recommend to stay away*," and another, "*Take a look at this (sic) mysogynistic drivel*".

🙇♂️Lucio's personal note: **Thank you so much to anyone who mentioned us!** 🙏🙏

Lucio:
I give The Power Moves my full and best effort, but it's challenging for us to reach the people who may need us the most. So any mention or share is incredibly valuable for TPM.

And since I've dedicated my life to this, it truly means a lot to me.
For that, I want to extend a heartfelt thank you 🙏🙏

Follow up 1: What did you say?

The second survey question asked respondents what they shared in their recommendations. Here are some representative answers:

> better than anything I have read on how to handle the dark triad types.

> “Trust me, read it”

> I have highly recommended this sight to my close family as a novel new place that breaks down social interactions in a way I have never seen before, and that I can finally understand.

> When they noticed some of the changes i have had, I told them about The Power Moves and how it has helped me to become higher value.

> Yes I always do with the prime: best resource on social skills / power dynamics

A minority of negative responses, sometimes employed a humorous or sarcastic tone:

> This site is extremely sexist, please avoid it

> Yes, I told them to bust the pimp spank (Ed.: referring to an edgy ‘technique’ in the article)

Overall, readers overwhelmingly spoke positively.

Follow-up 2: What Makes Us Unique

Looking to find out what TPM readers would list as our USP, we lastly asked, ‘What do you think sets us apart from the competitors?’.

The answer largely pointed to the quality of the content.

17	You actually know what you're talking about.	
15	The quality of your articles.	
12	[redacted]	
6	No room for dogmatism here, which is good. Everything is critically analyzed and then incorporated.	
13	Lucio's background/credentials. The forums, sheer volume of reviews, leading to recommendations and discovering new content we never would otherwise	
5	Honesty, Accurate Information, Best resource.	
3	High quality	
7	Great information and easy to understand.	
10	Dont know	
20	Backed by research and you can tell that you know what you are talking about	

Some selected replies:

> Backed by research and you can tell that you know what you are talking about.

> Lucio's background/credentials. The forums, sheer volume of reviews, leading to recommendations and discovering new content we never would otherwise

> The quality of your articles

> The systematic way in which you present the knowledge, as well as the regular reference to scientific literature

> No room for dogmatism here, which is good. Everything is critically analyzed and then incorporated.

A psychoanalytic-inclined reader replied: 'Asking questions that are just thinly disguised attempts to obtain narcissistic validation'.

Overall, readers recognized and appreciated TPM's three-pillars method, ensuring quality by only writing we can combine science, experience, and critical thinking.

What's Stopping You From Joining Power University?

A second survey was more commercially focused and revealed a consistent theme: **price** was the most common hurdle to joining Power University.

[illegible]	[illegible]
25	[illegible]
20	[illegible]
15	[illegible]
[illegible]	[illegible]
36	[illegible]
13	[illegible]
18	[illegible]
17	[illegible]
12	[illegible]
20	[illegible]
5	[illegible]

Several responses highlighted ways to improve product descriptions, while a few flagged onboarding issues we're addressing step by step. Our priority has long been content quality, sometimes at the expense of smoother onboarding.

Some interesting responses include:

> im a pathetic broke fuck

> Is your curriculum open to heterosexual women?

> I need to research this program first and see reviews from external sources.

> Where do you use these knowledges, if you have online business, and you do not have nothing to do with people. Basically you want to stay away from people?

Our replies to similar queries:

'Broke loser': Most TPM readers are smart, ambitious, and strategic. Those qualities last a lifetime. With the right mindset and tools, 'broke' is temporary.

'Is it for women?': While many principles apply universally, since upgrade 9.0 we've focused Power University primarily on men.

'Using PU to avoid socialization': Just like learning to drive doesn't force you to own or drive a car, learning how to navigate people doesn't force you to socialize. The skills empower you to engage more effectively—goal-based, faster, and limited to exactly what you need, if that's your choice.

Conclusion

Across 452 reviews collected over almost two years, reviews of *The Power Moves* are positive.

Readers find it helpful and unique, and providing real-life benefits.

The trend also shows clear improvement over time as we fixed technical concerns and content expanded.

Not every review was glowing—nor should it be, for a site that tackles complex and sometimes controversial topics. We believe that having zero strong criticism would be a sign of being too bland and shying away from reality. A reality that, although beautiful, also includes competition, diverging interests, and, at times, can also be darker than we wish it.

But the balance of evidence shows that most readers consider TPM to be unique, practical, and transformative in the field of self-development.

Transparency note: All reviews quoted here were collected via Hotjar, anonymized, and unedited except for typos or clarity. A downloadable file of the full dataset is available for verification upon request.

Methodology note: We analyzed N = 452 anonymized Hotjar responses collected 2023-12-03 → 2025-09-08. Quantitative metrics (average rating, distribution, trends) were calculated programmatically and cross-checked manually to reduce bias. All quoted material is verbatim except in some cases fixing typos; responses were anonymized prior to analysis and sensitive information in the pictures has been removed.

The Cambridge Handbook on Sexual Psychology: Female Sexual Adaptations – Summary & Review

Lucio Buffalmano · 8 October 2025 · Archived copy · Original

The Cambridge Handbook of Evolutionary Perspectives on Sexual Psychology Vol. 3 (2022) is the third entry in a four-part academic series on sexual psychology. This volume offers an in-depth overview of female sexual strategies and adaptations through the lens of evolutionary psychology, exploring both well-established findings and emerging theories.

Contents

- FULL SUMMARY
  - Chapter 1 — Women's Preferences: Precopulatory Adaptations
  - Chapter 2 — Female Sexual Attraction Tactics
  - Chapter 3 — Extra-Pair Sexual Interest
  - Chapter 4 — Female Intrasexual Competition
  - Chapter 5 — Female Intersexual Selection
  - Chapter 6 — Evolution of Precopulatory Defense from Rape and Coercion in Women
  - Chapter 7 — Mate Poaching
  - Chapter 8 — Sexual Fantasies
  - Chapter 9 — Copulatory Thrusting
  - Chapter 10 — Female Provision of Oral Sex
  - Chapter 11 — The Adaptive Value of Women's Orgasm
  - Chapter 12 — Copulatory Urgency: An Evolutionary Perspective of Women's Sexual Desire
  - Chapter 13 — Mate Retention
  - Chapter 14 — Shifts in Partner Attractiveness

- Chapter 15 — Emotional Commitment
- Chapter 16 — Female Sexual Jealousy
- Chapter 17 — On Attachment and Evolution
- Chapter 18 — Maternal Filicide

- SHARPEST INSIGHTS
  - Makeup Sex: A Tactic to Keep Partners In Toxic Relationships
  - Self-Made Men Are Higher Value
  - Extra-pair Sex Is Evolved And Adaptive
  - Relationships: A Contract of Sexual Exclusivity For Provision?
  - Women's Dream Is Turning A Player Into A Husband

  - Avoid Inflating the Case for Nonpaternity
  - Suggestion: cut history of attachment & myths of oral sex
  - Suggestion: focus on women only
- REVIEW

FULL SUMMARY

About the Author:
Various experts for each chapter, while the volume is edited by Todd K. Shackelford, a leading evolutionary psychologist and active handbook editor.

Chapter 1 — Women's Preferences: Precopulatory Adaptations

Authors: Donald F. Sacco, Mitchell Brown, Kaitlyn Boykin, Alicia L. Macchione, Kelsey M. Drea, Mary M. Medlin

This chapter explains the evolved decision rules women use before sex to choose mates who maximize offspring survival and future reproductive success. It shows what those decision rules are — the kinds of cues they use, why some cues matter more in short-term versus long-term contexts, how fertility and ecology shift preferences, and how personality and life history calibrate choice.

- **Women trade off** heritable-quality cues (good genes) against indicators of investment and fidelity; cues are integrated across face, body, voice and odor and are flexibly weighted by fertility, pathogen risk, resource scarcity and individual sociosexuality.
- **Good-genes vs. investment trade-off:** Masculinity, symmetry and muscularity index possible genetic/immune benefits but often correlate with lower paternal investment or higher short-term mating orientation.
- **Signals of mate quality:** Facial masculinity, symmetry, limbal rings, white sclera with eye/skin contrast, and other cues signal health and reproductive value.
- **Short-term vs long-term cues:** STM emphasizes physical cues (masculinity, muscularity, symmetry); LTM emphasizes resources, prosociality, self-control and fidelity.
- **Cycle & context effects:** Fertility and local ecology (pathogen load, resources) shift cue weighting.
- **Individual differences:** Sociosexuality, personality, and pathogen avoidance motives modulate cue emphasis.

Interesting Notes

- **Expensive purchases signal short-term interests** (*e.g., purchasing a Rolex) are frequently perceived by women as a man interested in STM, with men motivated by LTM avoiding such behavior (Sundie et al., 2011).*
- **Daddy-types playing with children are attractive**: *Recent work has found that men who play and interact well with children are found to be particularly attractive (Bleske-Rechek, Remiker, Swanson, & Zeug, 2006; Oswald et al., in press).*
- **High status women are less hypergamous**: *Women belonging to a high socioeconomic status are more likely to seek mates with indicators of heritable fitness, whereas lower-status women frequently prefer resource potential and willingness to invest resources in offspring (Fan, Dai, Liu, & Wu, 2005; Fleck & Simpson, 2017; Stone, Shackelford, & Buss, 2008; Swami & Tovée, 2005).*
- **Unrestricted women prioritize looks**: Sociosexually unrestricted women prioritize physical attractiveness given its emphasis in STM (Li & Kenrick, 2006) and facial structures suggesting interpersonal dominance, namely, extraversion and narcissism (Brown & Sacco, 2017; Marcinkowska, Helle, & Lyons, 2015) whereas…
  - Restricted women have stronger preference for benevolent behavior (Simpson & Gangestad, 1991)
- **Unrestricted women like dirty jokes**: *Women with unrestricted sociosexual attitudes are attracted to men who utilize dirty jokes, although such mating displays are considered particularly aversive in LTM contexts (Medlin, Brown, & Sacco, 2018).*
- **Women who feel more vulnerable to infections prefer symmetrical faces** that signal good genes (Young, Sacco, & Hugenberg, 2011), a preference specific to opposite-sex faces, suggesting a mating basis (Ainsworth & Maner, 2019). They like less faces signaling extraversion (Brown & Sacco, 2016), which may be adaptive since extraverted men are more likely to contract diseases and pursue promiscuous strategies that increase infection risk (Nettle, 2005).

Chapter 2 — Female Sexual Attraction Tactics

Authors: Trond Viggo Grøntvedt, Mons Bendixen, Leif Edward Ottesen Kennair

This chapter describes the behavioral toolkit women use to attract mates: visual dress and grooming, body language, gait, vocal modulation, proxemics, flirtation scripts, and digital-profile curation. It explains how tactics differ for short- vs long-term goals.

- **Women's signals balance conspicuousness with reputation:** Attraction tactics are multimodal, calibrated to goals and context, and constrained by reputational costs.
- **Strategic deployment:** Short-term contexts favor sexual displays; long-term favors trust and commitment displays.
- **Hormonal effects:** Evidence suggests cycle-linked shifts in tactic use, though findings are mixed.

Interesting Notes

- **Men prefer hairless bodies** because they signal youth, fertility, or health
- **Shaved women report being more sexually active** (referring pubic hair)
- **Tattooed women are more sexually active** and more open to short-term sexual relationships (Davis & Arnocky, 2020). The common factor underlying both tattooing and sexual activity may be sociosexuality.
- **Dating app users are more sexually unrestricted**: current dating app users are less sociosexually restricted than former users, who again are less restricted than non-users (Botnen, Bendixen, Grøntvedt, & Kennair, 2018).
  But women also use it for long-term relationships and for entertainment and to pass time

Chapter 3 — Extra-Pair Sexual Interest

Authors: Marissa A. Harrison

This chapter reframes extra-pair interest as an evolved conditional strategy: not mere moral failing but a motivation that can yield genetic benefits, insurance against partner infertility, or an exit strategy when long-term provisioning declines.

People seem to be more interested in female cheating, than male.
Says the author:

> it appears that there are far more evolutionary psychological research endeavors geared at documenting women's extra-pair interest and behavior than men's extra-pair interest and behavior. Is it because women hold the keys to the kingdom with internal fertilization?

- **Extra-pair sex is evolved and adaptive:** Since our brains process information in a manner to facilitate adaptive behavior (Cosmides & Tooby, 1987), it seems that selection favored at least some degree of extra-pair sex (Andrews et al., 2008)
- **It's a risk-benefit calculation**: Extra-pair interest is hormonally and contextually modulated and represents a risk–benefit calculation.
- **Triggers:** Fertility cycles, relationship dissatisfaction, partner qualities, and local mating markets.
- **Constraints:** Male mate guarding, reputational sanctions, and provisioning loss limit payoff.

Interesting Notes

- **Love shields against cheating**: the most powerful predictor of deciding against cheating was love for and loyalty to the current partner.
  And loving one's partner and satisfaction with the relationship inoculates against infidelity (Shackelford, Besser, & Goetz, 2008). Apostolou and Panayiotou (2019) surveyed men and women in their early thirties
- **Women may partner with a lower-value mate and cheat with a higher value one**: *The dual-mating theory, AKA "good genes ovulatory shift hypothesis," states that women secure a long-term partner with inferior genes who provides, but engage in EPCs to reproduce with men with high-quality genes (Jünger et al., 2018; Pillsworth & Haselton, 2006a, 2006b).* This is called 'alpha fucks, beta bucks' in the manosphere, and there is some supporting but also mixed evidence for a more nuanced and couple-dependent picture. Also see our article for the full dynamics
- **Cheating is heritable, and more in men**: *by studying twin pairs, they documented an arguably high heritability in extra-pair behavior, with 63 percent of the variation for men and 40 percent for women in extra-pair mating propensity attributable to genetic differences* (Zietsch et al. 2015)
- **The most important factor in forgiving infidelity is children** (Apostolou and Demosthenous, 2020), and more children related to increased forgiveness.
  Dependence and increased age also raised the odds of forgiveness

⍰⍰♂Lucio's suggestion: the table of 'proximate factors creating risk for infidelity' is great, add a row for 'effect size'

Chapter 4 — Female Intrasexual Competition

Authors: Maryanne L. Fisher

This chapter analyzes how women compete with each other for mates and resources. It dissects typical forms (indirect aggression, reputation management, appearance enhancement), triggers, and adaptive trade-offs.

- **Indirect aggression:** Female competition is usually indirect and social, targeting investment rather than physical dominance.
- **Men's parental investment is a commodity women compete for:** women compete with each other for access to men who are able and willing to invest.
- **Forms:** Indirect aggression, derogation, exclusion, self-enhancement, and coalition-building.
- **Triggers:** High-value mates, rival fertility, status asymmetries, or scarcity of men/resources
- **Costs:** Reputation risks and cultural modulation of acceptable tactics.

Sexual Economics Theory

Sexual economics theory conceptualizes heterosexual sexual relationships as a market, where women are "sellers" of sexual access and men are "buyers" competing for it (Baumeister et al., 2017).

The theory assumes men desire sex more, giving women greater negotiating power. Women may exchange exclusive sexual access for material resources, while men compete to display those resources.

Women compete by signaling sexual loyalty, attractiveness, and willingness, and may view sexually promiscuous women as a threat because sex is a scarce resource that gives them leverage (Baumeister & Twenge, 2002; Baumeister et al., 2017).

To maintain this sexual economy, women may use indirect aggression, such as gossip or ostracism, to suppress rivals.

If indirect aggression is linked to mating, it should emerge at puberty, and evidence supports this. Adolescent girls who date earlier show higher levels of same-sex indirect aggression, while victims of such aggression date later and receive fewer flirtations (Gallup, O'Brien, & Wilson, 2011).
Adolescents of both sexes also score higher than adults on measures of intrasexual competitiveness (Buunk & Fisher, 2012; Polo et al., 2018; Fernández et al., 2014), suggesting that adolescence marks a peak in competitive behaviors for reproductive success.

In adulthood, strategies stabilize and become fewer but more refined (Ellis et al., 2012).

Gossip to damage and control rivals

Baumeister and Twenge (2002) suggest that women use acerbic gossip to enforce norms around sexual promiscuity, preventing rivals from "dropping the price" of sexual access.

Women compete strategically for desirable mates, balancing the risk of gossip against the benefits of granting sexual access selectively. They may also derogate rivals' promiscuity or use other information to improve their own mating success (Baumeister et al., 2017).

Indirect aggression works

Indirect aggression is a successful female adaptation that provides high benefits at low cost, by reducing rivals' ability or desire to compete for mates (Vaillancourt, 2013).

Attractive women can influence men's evaluations of other women, lowering rivals' mate value (Fisher & Cox, 2009).
Same-sex victimization can also cause negative outcomes—such as poor health, low self-esteem, or suicide attempts—which females may experience more than males (Vaillancourt, 2013).

Coalitions of Friends for Self-Defense

Women rely on friends to help protect their reputations, forming a buffer against malicious gossip (Reynolds, 2018; 2021).

However, if a friend is also a mating rival, support may depend on closeness, since close friendships can shield against social exclusion and harassment, and same-sex peers can act as alloparents or co-aggressors to defend one's children (Hrdy, 1999; Krems, Williams, et al., 2021).

The benefits of alliances often outweigh the risks of sharing personal information, so women form same-sex networks to gain status and dominance, increasing access to social and reproductive advantages (Liesen, 2013).

In this video we highlight though that women grow closer when men are perceived as more of a common threat, a phenomenon we dubbed the sisterhood.

Short vs. Long-Term Tactics

Tactics	Short-Term Tactics	Long-Term Tactics
Women	Emphasized sexuality and physical attractiveness. Derogate competitors as frigid	Self-promoted faithfulness and sexual restrictiveness. Derogate competitors for promiscuity
Men	Emphasized immediately available resources.	Promoted future resource availability.

P.S.:
⍰⍰♂ Loved this chapter

Chapter 5 — Female Intersexual Selection

Authors: Steven Arnocky, Adam C. Davis, Michael Suszter

This chapter reframes female choice as a driver of male trait evolution: preferences create selection pressure on male ornaments, displays, and behaviors.

Interesting Notes

- **Women engage in more mate retention tactics when with higher value men**: *women who are mated to men who are higher in status striving and income, as putative indices of their mate value, have been found to engage in more mate retention effort* (Buss & Shackelford, 1997).
- **Economic inequality increases women's expenditure for beauty** (Blake et al., 2018) and income inequality increased women's intentions to wear more sexualized clothing for a hypothetical night out (Blake and Brooks, 2019).
  This mirrors the "lipstick effect" – the finding that in times of economic uncertainty and hardship, women shift spending to appearance enhancement products (Hill, Rodeheffer, Griskevicius, Durante, & White, 2012)

Health & Genetic Quality Matter More In Unhealthy Places

Research indicates that in regions with higher pathogen threats, both men and women place greater importance on partner attractiveness as a cue for good genes and disease resistance (Gangestad & Buss, 1993; Arnocky et al., 2014).

Individuals higher in pathogen disgust rate unattractive targets as even less attractive.

Less healthy individuals are at a mating disadvantage and tend to be more vigilant against reproductive threats, exerting greater effort to retain desired partners.
For example, young adults with poorer health perceived their partners as more likely to cheat and engaged in more cost-inflicting mate retention behaviors (Arnocky, Pearson, & Vaillancourt, 2015; Davis, Belanger, Mattsson, & Arnocky, 2019).

Are Lower Value Women More Promiscuous? Maybe, More Research Needed

Buss and Shackelford (2008) argue that high mate-value women can secure all desired male traits from a single partner, while lower mate-value women may pursue pluralistic mating—gaining resources from one man and good genes from another.

Less attractive women are more likely to commit infidelity (McNulty, Meltzer, Makhanova, & Maner, 2018) and are viewed as less desirable long-term mates (Campbell et al., 2009), leading them to adopt a more unrestricted sociosexual strategy.

Conversely, some research shows a small positive link between women's attractiveness and unrestricted sociosexuality (Fisher, Hahn, DeBruine, & Jones, 2016; Arnocky et al., 2021), suggesting that high mate-value women may also pursue pluralistic strategies when confident in attracting future mates.

Chapter 6 — Evolution of Precopulatory Defense from Rape and Coercion in Women

Authors: Domenic Roberto, Rachel James, Melissa McDonald

This chapter examines evolved female defenses against sexual coercion — a 'threat management system' for rape avoidance that includes perceptual threat detection, avoidance, protective partners, and coalition-building.

> Given the importance of reproductive choice in women's mating strategy, rape presents a serious threat to women's fitness.
> Female rape victims are prevented from expressing their desired mate preferences, controlling the preferred timing of pregnancy, and may be subjected to conceiving with a mate of low genetic quality and/or who provides no protection or resources to the mother or offspring (Thornhill & Palmer, 2000)

- **Threat management system** includes:
  - Greater care when fertile: less likely to engage in risky sexual behaviors that may put them at greater risk of rape during their ovulatory window (Bröder and Hohmann, 2003)
  - Greater risk is matched with greater care, suggesting an evolved 'risk tracking'
  - Alliances for protection, with other women and men. Women prefer men who are physically strong as friends, which may serve as protection and/or as future mating options (Weatherhead & Robertson, 1979)
  - Information gathering for avoidance and defense, which the author link to women's greater intereset for true crime

⍰⍰♂ **Lucio's suggestion**: I'd suggest more caveats of speculation around some hypotheses like rape fantasies as rehearsal for self-defense. They didn't feel the most compelling explanation to me.

- **Rape is unfortunately cross-cultural and widespread**: *Minturn et al. (1969) examined 135 small-scale societies and found rape to be reported in 90 percent of those for which sufficient data were available for examination. Indeed, the hypothesis of a society without rape has been refuted (Rozée, 1993) even among allegedly "rape-free" societies (Palmer, 1989)*
- **Some men switch to aggression after rejection**: After repeated failed attempts at mating, some males shift strategies and become more aggressive, such that escalating the force of a coercive strategy may lead to rape (Gorelik et al., 2012)
- **Opportunistic rape is unfortunately a possible sexual strategy**: interviews with serial rapists suggest they select victims based on the probability that they will be successful and will not be caught (Beauregard, 2007). Women who are intoxicated for example are at greater risk of rape and coercion (Abbey, Zawacki, Buck, Clinton, & McAuslan, 2004)
  - Men can detect 'exploitability cues' from pictures, and rate these pictures more sexually attractive.

Categories of exploitability includes ‘susceptibility to manipulation’, ‘primiscuity’ and ‘risk-taking behaviors’

⍰⍰♂ Manipulation Is Related to Rape. But Seduction? Probably Not

The author proposes an interesting take:

> Related to rape are manipulative tactics that facilitate sexual coercion.
> Coercion tactics include behaviors categorized as sexual seduction, verbal or nonverbal pressure, and deception (Goetz, Easton, Lewis, & Buss, 2012).

I agree that some of these behaviors can range on a spectrum and pure manipulation is on the ‘coercive’ and ‘value-taking’ end of the spectrum.

However, I’d be careful listing ‘seduction’ there, and I offer a different take. **Good seduction is a display of advanced skills and mental abilities that signal genetic quality.**
It’s not any different than a woman mating with a good-looking man for pathogen resistance or a dominant man for genes that help climb social hierarchies.

Seduction falls squarely into the sexy son theory.

Chapter 7 — Mate Poaching

Authors: Jasna Hudek-Knezević, Igor Kardum, Nermina Mehić

This chapter analyzes mate poaching as a conditional tactic: pursuing already-partnered individuals can secure vetted, high-quality mates but carries retaliation and reputational risks.

- **Mate poaching is universal**, present in all cultures
- **Why adaptive:** Partnered targets are pre-vetted
- **Constraints:** Social sanctions and retaliation risks

Interesting Notes

- **Friendships can be a first step of mate poaching:** Friendship between men and women sometimes increases the likelihood of mate poaching. Friendship is often a first stage in a longterm romantic relationship and single men and women prefer friends for a long-term romantic relationship over those already taken (Bleske-Rechek & Buss, 2001)
  ⍰⍰♂ **Lucio’s note**: this confirms that the male ‘fear’ of being a friend only applies to lower mate value men who are less likely to be a mating option and, hence, more likely to be used

Women’s Poaching Increases with Gender Equality, Decreases With Patriarchy

Social Structural Theory argues that sex differences in mating behaviors stem from patriarchal gender ideologies and social role expectations (Wood & Eagly, 2002; Eagly & Wood, 2005).

Cross-cultural research shows that sex differences in short-term mate poaching are larger in traditional societies but smaller in more gender-egalitarian societies, largely due to increased female poaching behavior (Schmitt et al., 2004).

Women are more likely to engage in short-term poaching when they have greater access to resources, political power, or when they outnumber men, and women’s long-term poaching is also positively linked to gender equality (Schmitt et al., 2004).

⍰⍰♂**Lucio’s suggestion**: tighten the chapter around the core topic of mate poaching. Social structure theory was the cherry

Chapter 8 — Sexual Fantasies

Authors: Rui Miguel Costa

- **More frequent and diverse fantasies correlate with higher desire**
- **Fantasizing about someone else during sex is common**: popular fantasies during foreplay and/or intercourse included not only sex with the partner (100 percent of women and 84 percent of men), but also sex with someone other than the partner (80 percent of women and 92 percent of men).
  Oral sex on the partner and reliving a previous sexual experience were also common fantasies during foreplay and/or intercourse in the male and female control groups (Nutter & Condron, 1983, 1985).
- **Women fantasize more about current partners, men about new partners**: Evolutionary theory predicts that compared to men, women are less likely to fantasize about multiple partners, group sex, or sex with complete strangers, but more likely to fantasize about their current partner. Several studies have confirmed these predictions.
  One study found the current partner was involved in 64 percent of women's fantasies, but in only 46 percent of men's fantasies (Hicks & Leitenberg, 2001)
- **Rape fantasies are not uncommon in men and fantasies of forcing others are not uncommon in women**. While men have more rape fantasies and women more fantasies to be raped, the other way around is also not uncommon <— ⍰⍰♂ This was the first time I learned about this. Very surprising at first, logical with hindsight
- **Functions:** Rehearsal, compensation, and exploration of taboos.
- **Clinical relevance:** Fantasy informs assessment but does not predict behavior directly.

Rape Fantasies: Prevalence, Correlates, and Explanations

Rape fantasies are surprisingly common.

Studies since the 1970s estimate that **30–60% of women** report such fantasies, with 10–20% describing them as frequent or preferred (Critelli & Bivona, 2008; Joyal et al., 2015).
Men also report them, though fantasies of forcing others are more common among men, while fantasies of being forced are more common among women (Joyal et al., 2015).

Rape fantasies are not directly linked to actual victimization, but **are linked to childhood sexual abuse**, which is consistently associated with higher frequency and diversity of sexual fantasies, including coercive ones (Briere et al., 1994; Wilson & Wilson, 2008).
Not all women find the fantasies purely erotic. Emotional responses vary: some women experience them as erotic, others as aversive, and many as a mix (Bivona & Critelli, 2009).

Several explanations have been proposed:

- **Self-blame avoidance –** fantasies permit sexual expression without guilt.
- **Desirability theory –** women imagine being irresistibly attractive.
- **Openness to experience –** linked with greater fantasy variety and sensation seeking.
- **Sympathetic arousal –** controlled fear enhances sexual excitement.
- **Sociological accounts –** fantasies reflect cultural gender norms or eroticized stereotypes (Brownmiller, 1975).
- **Adversarial transformation –** fantasies symbolize the conquest of a cruel man into a loving partner.
- **Power dynamics –** some women's fantasies correlate with desire for control over resources (Hawley & Hensley, 2009).
- **Childhood sexual abuse and dissociation –** abuse may heighten fantasy proneness, leading to coercive themes.

Overall, no single theory explains rape fantasies; they likely emerge from **multiple pathways**.

Freud's idea of fantasy resolving contradictory desires (1915) may help integrate these findings: in fantasies, conflicting states—desire and resistance, fear and arousal, dominance and submission—can coexist safely, enhancing sexual arousal.

Chapter 9 — Copulatory Thrusting

Authors: Olivia Le Moëne

This chapter analyzes the biomechanics and communicative functions of thrusting: how tempo, depth and angle affect stimulation, sperm transport, arousal, and signaling.

Chapter 10 — Female Provision of Oral Sex

Authors: James B. Moran, Catherine A. Salmon, Rebecca L. Burch

This chapter treats female-provided oral sex as behavior with proximate motives (pleasure, reciprocity) and adaptive functions (pair-bond maintenance, signaling, reciprocity).

- **Main takeaways:** Oral sex operates as mating effort, retention strategy, and pleasure behavior; prevalence varies by culture.
- **Hypotheses:** Signaling commitment, reciprocity, and partner satisfaction.
- **Variation:** Cross-cultural and relationship-phase differences.
- **Some view male provisioning of oral sex as unmasculine**: For much of recorded history, performing oral sex on a woman was taboo and viewed as not 'manly'

The authors mention The Sopranos as an example:

> **Mobsters**: Make fun of Uncle Junior for giving oral sex, a 'non-masculine' behavior

We Can Explain Behaviors With Pleasure, Not Just Evolution

Agmo and Ellingson (2003) argue that **people aren't thinking about evolutionary survival when having sex.**

Sexual behavior is about the positive affect it produces—people have sex because it is pleasurable.

While behaviors like oral sex may still serve evolutionary functions, this perspective highlights the need to study all sexual behaviors, including non-reproductive ones.

⍰⍰♂ **Lucio's note:** I couldn't agree more.
We sometimes get caught up in explaining every behavior strictly through the lens of survival or reproductive maximization, when in fact some may simply be byproducts of other adaptations that produce pleasure.

Chapter 11 — The Adaptive Value of Women's Orgasm

Authors: Lisa L. M. Welling, Virginia E. Mitchell, Jenna Lunge, Alex C. Orille

This chapter evaluates competing explanations for the female orgasm. It could be a 'happy by-product' of common fetal development with males, for which orgasm serves a reproductive purpose.
Or it could serve adaptive roles such as cryptic female choice, sperm retention, pair-bond reinforcement, and a screening tool for bonding only with quality and/or good long-term partner choices (mate choice of female orgasm hypothesis).

The authors seem to favor the adaptive role of female orgasm:

> The evidence that female orgasm may be adaptive, be it through increased pair-bonding, increased likelihood

> of conception, encouraging sex with high-quality partners, or by reinforcing sexual behaviors in general, is too plentiful to be dismissed.

But much research remains to be conducted.
The authors also raise important issues that must be addressed before linking female orgasm to 'sexy partners for sexy sons':

> (…) results from studies investigating female orgasm as a sire choice mechanism may have alternative explanations. More dominant and masculine men have more sexual experience (e.g., Keller, Elliott, & Gunberg, 1982; Perusse, 1993; Puts, Gaulin, & Verdolini, 2006)
> (…)
> Given that women find masculine men more sexually attractive (Little, Jones, Penton-Voak, Burt, & Perrett, 2002), the earlier timing of female orgasm with partners whom they consider attractive may not be related to increasing sperm retention (and increased probability that that individual will sire offspring), but rather associated with sexual excitability and arousal.

- **Main takeaways:** Orgasm may serve bonding and cryptic-choice roles but evidence is mixed.
- **Mechanistic proposals:** Bonding via oxytocin, sperm transport, mate assessment.
- **Evidence:** Orgasm frequency correlates with closeness and technique but causal mechanisms remain unclear.

Interesting Notes

- **Few women reach orgasm through coitus**: the estimates vary widely, from 6 percent (Wallen, 2006) or closer to 100 percent (Marshall, 1971), but the majority of research finds incident rates closer to 50 percent (e.g., Dawood, Kirk, Bailey, Andrews, & Martin, 2005)
  - Rates go up if there is concurrent clitoral stimulation: Eschler (2004) reported that only 33.3 percent of women experienced orgasm with no clitoral stimulation, and 77.4 percent of women reported experiencing orgasm with clitoral stimulation <— ⍰⍰♂ Could be a good tip for men to encourage women to touch themselves
  - Orgasms are more likely and intense if the man is attractive: Women report more intense orgasms (Gallup, Ampel, Wedberg, & Pogosjan, 2014) and are more likely to experience orgasm when they are more physically attracted to their sexual partner (Puts, Welling, et al., 2012; Shackelford et al., 2000) and if their partner is very masculine (Puts, Welling, et al., 2012).
  - There is wide cultural variation: *For example, rates of anorgasmia are higher among East Asian women compared to women from Western countries (Moreira et al., 2005), and field research on the Polynesian island of Mangaia, a culture that places a high emphasis on female sexual pleasure, reports that all women achieve coital orgasm (Marshall, 1971).*
  - Most women achieve orgasm via masturbation: women most often achieve orgasm through masturbation, clitoral stimulation, oral sex, or a combination of these practices (e.g., Baker & Bellis, 1993; Richters, de Visser, Rissel, & Smith, 2006).
- **Unrestricted women experience more orgasms in casual encounters**: *Women with more restricted sociosexual orientations experienced more orgasms in committed relationships, but women with less restricted sociosexual orientations experienced similar orgasm frequency in casual sexual encounters as they did in long-term committed relationships* (Wongsomboon et al., 2020)
- **Orgasm is a desired outcome for most women**. *One study found that only 6 percent of women rate having an orgasm during sexual intercourse as either somewhat or very unimportant, whereas 75.8 percent rate it as somewhat or very important (Eschler, 2004). Likewise, roughly 32 percent of women report they would be somewhat or very likely to enjoy sexual intercourse without an orgasm, compared to roughly 54 percent who would*

be somewhat or very unlikely to enjoy sex without an orgasm

- **Testosterone heightens orgasms**: *women with higher testosterone report more positive orgasm experiences (van Anders & Dunn, 2009), and a single dose administration of exogenous testosterone increases female genital responsiveness, genital arousal, and subjective reports of "sexual lust" and "genital sensations" (Tuiten, Van Honk, Koppeschaar, Bernaards, Thijssen, & Verbaten, 2000)*
- **Many women and few men fake orgasm**: *more than half of women admit to having previously faked an orgasm (e.g., Ellsworth & Bailey, 2013; Muehlenhard & Shippee, 2010; Roberts, Kippax, Waldby, & Crawford, 1995; Wiederman, 1997) compared to only 25 percent of men (most of whom faked orgasm because of intoxication or because they had already orgasmed that day; Muehlenhard & Shippee, 2010).*
  - Women who fake orgasms are more likely to engage in mate retention behaviors, suggesting faking orgasms is a tool to maintain the relationship
- **Orgasm is more complex for women than for men**, and women seem to be able to experience orgasm through non-genital stimulation

Chapter 12 — Copulatory Urgency: An Evolutionary Perspective of Women's Sexual Desire

Authors: Courtney L. Crosby

Crosby outlines the evolutionary purposes of desire, ranging from reproduction to mate attraction and retention, and maximizing offspring survival by tracking the presence/absence of children (and their age).

It's possible for example, that women may have lower sexual desire with young children to avoid being spread too thin with sexual effort or a new child.

- **Relationship length decreases desire**, and it's one of the strongest predictors of declines in sexual desire (Durr, 2009a; Laan & Both, 2008; Moor et al., 2021; Murray & Millhausen, 2012)
- **Bait and switch hypothesis with sex**: Women's higher levels of sexual desire at the beginning of relationships may represent efforts to bait – or secure – a high-quality mate.
- **The presence of children lowers sexual desire**: consistent with evolutionary metatheory, women who have children report lower levels of sexual desire than women without children (e.g., Dewitte & Mayer, 2018). Although there are no studies investigating if this effect is strongest when children are young, frequency of intercourse is lower with young children
- **Mate retention hypothesis**: when women face a mate retention problem, they may experience increases in sexual desire; engaging in sex in response to potential threats may facilitate partner retention
- **Sexual motivation-disgust hypothesis**: Sexual disgust is hypothesized to repel from costly mates or sexual situations (Tybur et al., 2009). Researchers hypothesize a continuum of sexual motivation, with sexual desire – or lust – being the opposite of sexual disgust (Lieberman & Patrick, 2018)

Chapter 13 — Mate Retention

Authors: Jitka Lindová

Mate retention has been defined by Buss (1988) as behavior aimed at preventing a partner's infidelity or desertion. This chapter catalogs mate-retention tactics from benefit-provisioning to high-cost surveillance and coercion. Choice depends on mate-value asymmetry and perceived infidelity risk.

- **Women are well-equipped to identify a decrease of male commitment**. On the emotional level, women are more anxiously attached than men (del Giudice, 2011). On the cognitive level, women are better at identifying emotions and responding with appropriate emotions (Thompson & Voyer, 2014)
- **Main takeaways:** Tactics are adaptive and scale with threat level.

- **Taxonomy:** Low-cost (gifts, affection) to high-cost (monitoring, aggression).
- **Predictors:** Infidelity risk, mate value, and stressors increase costly tactics.

Interesting Notes

- **Polygyny reduces the costs of mate sharing for women because she won't lose his investment:** *Research shows that, especially in the case of first wives, being part of a polygynous marriage is connected with reproductive success. For the subsequent wives, on the other hand, marrying an already partnered man can represent an optimal solution in a situation when there is a lack of alternative men able and willing to provide for her and any offspring she might produce (Gibson & Mace, 2007)*
- **Coalitional mate retention recruits an ally**, typically a friend (Pham, Barbaro, & Shackelford, 2015b). Think of it as the 'sisterhood' (real-life example of sisterhood in action here)
- **Sex differences in mate retention:** men more than women submitted to their partners, debased themselves, and were violent toward their rivals (the latter tactic was used more often by men in Arabic countries as well). Women, on the other hand, punished a mate's infidelity threat more than men did (Atari et al., 2017b; Buss & Shackelford, 1997; de Miguel & Buss, 2011; Kardum et al., 2006)
- **Women derogate other women for using makeup and revealing clothes because they're threats**: *women derogate other women for using makeup, perceive them as dishonest, promiscuous, and more inclined to mate poach, feel more jealousy toward them and do not want to associate with them (Batres et al., 2018; DelPriore, Bradshaw, & Hill, 2018; Mileva, Jones, Russell, & Little, 2016). Women are also intolerant of other women who wear revealing clothing (e.g., Arnocky et al., 2019; Borau & Bonnefon, 2019; Reynolds, Baumeister, & Maner, 2018; Vaillancourt & Sharma, 2011)*

The 19 Tactics of Mate Retention

The Mate Retention Inventory (Buss, Shackelford, & McKibbin, 2008) sorts nineteen tactics into five components and two higher-order domains:

1. Intersexual manipulations, i.e., behaviors directed at one's romantic partner:
   - 1.1. direct guarding (vigilance, concealment of mate, and monopolization of mate's time)
   - 1.2. negative inducements (threatening infidelity, punishing mate's threat of infidelity, emotional manipulation, commitment manipulation, and derogation of competitors)
   - 1.3. positive inducements (resource display, sexual inducements, enhancement of physical appearance, emphasis on love and caring, and submission and debasement),
2. Intrasexual manipulations, i.e., behaviors directed at same-sex rivals:
   - 2.1. public signals of possession (verbal signals of possession, physical signals of possession and possessive ornamentation)
   - 2.2. negative inducements (derogation of competitors, intrasexual threats, and violence)

A major difference is between cost-inflicting and often associated with lower mate value women and dark triads, and benefits-providing, more associated with higher mate value women.
But the link between mate value and benefit-provisioning behaviors seems stronger in men; in women, their mate retention behaviors reflect their partner's mate value more than their own (Salkicevic et al., 2014)

Chapter 14 — Shifts in Partner Attractiveness

Authors: Juliana E. French, Sierra D. Peters, Olivia W. Breedin, Emma E. Altgelt, Andrea L. Meltzer

This chapter explains how and why partner attractiveness is re-evaluated over time, depending on needs, contexts, and dyadic changes in values.

Important drivers of change include fertility, pregnancy, parenting, aging, and hormonal contraception.

The importance women ascribe to each component of partner attractiveness, according to their functions, across the life-course of their relationship. Critical gaps in our current theoretical and empirical understanding are highlighted with dashed lines. French et al., 2022

- **Main takeaways:** Attractiveness is multidimensional and dynamically reweighted across life stages.
- **Drivers:** Fertility, contraceptive use, pregnancy, parenting, and aging transitions.
- **Research gaps:** More longitudinal research is needed.

Interesting Notes

- **Hormonal contraceptives decrease attraction for masculinity**: *women who use (versus do not use) hormonal contraceptives report lower attraction to masculine men (Little, Burriss, Petrie, Jones, & Roberts, 2013; for a review, see Alvergne & Lummaa, 2010; but also see Marcinkowska, Hahn, Little, DeBruine, & Jones, 2019) and symmetrical men (Gangestad & Thornhill, 1998; Thornhill & Gangestad, 1999)*
- **Altruism trumps attractiveness for long-term**: Women demonstrate a preference for an unattractive partner high in altruism – an indicator of good character and parenting ability (Farrelly, 2013) – over an attractive partner low in altruism, but only in the context of a long-term relationship (Farrelly, Clemson, & Guthrie, 2016)

Masculinity and Indicators of Good Genes Increase Women's Faithfulness

> Women's long-term relationship outcomes (e.g., relationship satisfaction, extra-pair attention, dissolution) seem to depend on the extent to which their long-term partners possess traits signaling physical health, genetic quality, and genetic dissimilarity.
> For example, women whose partners are more (versus less) symmetrical or behaviorally masculine report increased attraction to and satisfaction with their partners near peak fertility (Gangestad, Thornhill, & Garver-Apgar, 2005; Meltzer, 2017). In a similar vein, women whose partners lack such good gene indicators report greater interest in extra-pair partners near peak fertility (e.g., Gangestad et al., 2005; Gangestad, Thornhill, & Garver-Apgar, 2010; Pillsworth & Haselton, 2006)

Chapter 15 — Emotional Commitment

Authors: Marissa A. Harrison

This chapter treats emotional commitment as an evolved mechanism that stabilizes biparental investment through

credible costly signals of future orientation.

- **Commitment provided evolutionary benefits**, or it wouldn't have evolved. Evolutionary psychologists seek to answer what those benefits are
  - Better survival of offspring
  - Cooperation / division of labor
- **Signals:** Sacrifices, public promises, and future planning.
- **Systems:** Attachment, reputation, and future orientation underpin commitment.

⍰⍰♂ Lucio's question: baby cuteness, and the chicken-and-egg issue
The author states that 'baby cuteness' is an evolutionary mechanism to elicit parental emotional commitment. Cuteness is not an inherent trait—it only exists in the eyes of the beholder. So I wonder: did babies evolve traits that signal cuteness, or did parents evolve to perceive babies as cute? Probably co-evolution since both gained from it

Interesting Notes

- **Women seek pair-bonding more than men do**, and it appears to be intercultural (Buss, 1989; 2003)
- **Attractive women want a loving partner**: Women's own level of physical attraction can influence commitment. Attractive women have higher demand for a loving partner, an indication of an emotionally committed partner, and other traits most conducive to their reproductive success (i.e., good genes, investment and parenting potential). Buss and Shackelford (2008) called this mate value calibration adaptation (p. 141)
- **Love is a means to emotional commitment**, cementing the pair bond

What is a commitment?

Its first statement is already a reminder of evolution's amoral calculativeness:

> According to game theory, a commitment is a strategy to change or influence others' approaches (Schelling, 1960)

Commitment involves forsaking alternatives in exchange for reciprocity and assurance of others' behavior, thereby reducing free riding and fostering trust (Del Corral, 2015; Kurzban, McCabe, Smith, & Wilson, 2001).

Strong commitments signal reliability and clarify from whom one can expect benefits (Smith, Pedersen, Forster, McCullough, & Lieberman, 2017).

Why commitment? Because cooperation is good for long-term

> "Two parties who can count on reciprocity exchanges that transcend opportunities for short-term gain by cheating or defection will have an advantage over individuals who cannot establish this type of relationship" (Neese, 1990)

Humans gain many advantages by sacrificing short-term for long-term via pair-bonds, not the least of which is biparental care of offspring (Fisher, 1992).

Chapter 16 — Female Sexual Jealousy

Authors: Jaroslava Varella Valentova, Marco A. Correa Varella, Andrea Lorena da Costa Stravogiannis, Ana Maria Fernandez, Tamsin Saxton

This chapter analyzes sexual jealousy as an evolved system to prevent infidelity and resource diversion. It details affective, cognitive, and behavioral components.

- **Main takeaways:** Jealousy motivates detection and retention responses; shaped by individual and cultural factors.
- **Variation:** Attachment styles, ecology, and cultural scripts shape expression.

Interesting Notes

- **Jealousy matches the threat**: the bigger the threat, the more we can expect jealousy. Especially when a rival exceeds the qualities of the person
- **Higher jealousy when the partner is higher value**: *Individuals with a partner of higher mate value than themselves are susceptible to insecurity and hypervigilance, which increases jealousy and mate guarding (Redlick, 2016)*
- Some studies show women are more jealous than men, Although men report higher sexual than
- emotional jealousy, women show higher emotional, overall, reactive, and virtual jealousy than men (Buunk & Fernandez, 2020; Southard & Abel, 2010; Valentova et al., 2020). It might apply to populations where children depend on biparental care, and women depend economically more on men (cf. Schmitt, 2005)
- Higher neuroticism, social anxiety, & lower self-estee = higher jealousy (Buunk, 1997; Khanchandani & Durham, 2009)
- **Jealousy is considered proof of love** in many cultures (Sheets, Fredendall, & Claypool, 1997)
- **Father absence increases anxious and preventive jealousy** compared with women who grew up with their father (van Brummen-Girigori, Buunk, Dijkstra, & Girigori, 2016)
- ⍰ **Excessive jealousy can be a red flag**: *jealousy in women can thus be a manifestation of proper self-value and self-esteem, which can be influenced by many factors, such as previous relationship experience but also stress that each society gives to pair-bond, procreation, and intrasexual competition (Bhugra, 1993; Hupka, 1981).*

Chapter 17 — On Attachment and Evolution

Authors: William L. Dunlop, Majse Lind

This chapter retells attachment theory through evolution: infant proximity systems evolved for caregiver investment and were repurposed to sustain adult pair bonds.

- **Main takeaways:** Attachment styles are developmental calibrations linked to mating strategies and life history strategies (Del Giudice, 2009, 2011).
- **Developmental logic:** Harsh childhoods bias toward insecure attachment and faster life histories.
- **Avoidance is considered a "male-biased" strategy** as it is associated with reduced parental investment
- **Anxiety is hypothesized to be adaptive for women** under conditions of moderate environmental stress, whereas highly stressful and dangerous conditions would prompt avoidance and reduced parental investment in both sexes"

⍰⍰♂ **Lucio's suggestion**: Consider cutting the history and explanation of attachment theory. I felt it could have been briefer on a book focused on female sexual adaptations.

Chapter 18 — Maternal Filicide

Authors: Vibeke Ottesen

This chapter treats maternal filicide as a rare, tragic, but potentially adaptive calculation.

> the evolutionary consequence of the fact that ancestral women would have to make exceedingly high investments to successfully rear the children in their care is that women inevitably evolved to be discriminative with regard to regulating whether and how much investment is made in any given child.

> From an evolutionary perspective, to study maternal filicide is to study discriminative maternal investment in its most extreme form

- **Main takeaways:** Filicide arises under extreme stress, deprivation, or illness and requires prevention efforts.
- **Preventing unplanned and unwanted pregnancies reduces filicides** by reducing the number of women who may experience reproductive conflicts with their neonates

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Makeup Sex: A Tactic to Keep Partners In Toxic Relationships

From Crosby, chapter 12:

> **when women face a mate retention problem, they may experience increases in sexual desire; engaging in sex in response to potential threats may facilitate partner retention.**

The author is clear that it's only speculation for now, but with some initial preliminary support:

> Though there is no research directly examining this hypothesis, there is preliminary evidence that provides insight into this as a possibility.

They list as supporting evidence:

> For example, relationship duration is associated with higher levels of sexual satisfaction such that the longer a couple is together, the more sexually satisfied they are (Heiman, Long, Smith, Fisher, Sand, & Rosen, 2011).
> This effect exists despite reported declines in sexual desire over the course of a relationship, suggesting that when couples do engage in sex, they are more satisfied.
> In turn, higher levels of sexual satisfaction are related to greater commitment (e.g., Sprecher, 2002).

It seems to me that even stronger evidence comes from real-world observation.

The most 'troublesome' partners, both women and men, seem to follow a cycle of fight/love.
And women may resort more than men to makeup sex for the differential value that sex and bonding have for each sex.

I've noticed this pattern from anxiously attached women (see 'anxious-avoidant trap' for the dynamics),
and borderline personality disorder, for example.
And both types make for poor quality and emotionally draining relationships.

This may go together with female emotional and behavioral control tactics that women may have evolved to control relationships and secure provisioning (linked is our take on it).

Self-Made Men Are Higher Value

> However, the desirability of this wealth is largely rooted in men's capability of earning money themselves instead of through inheritance or illicit means, with women finding men's industriousness a priority in their

> criteria to select a long-term mate (Buss, 1989; Jonason, Li, & Madson, 2012).

Extra-pair Sex Is Evolved And Adaptive

From chapter 3 by Marissa A. Harrison:

> Since our brains process information in a manner to facilitate adaptive behavior (Cosmides & Tooby, 1987), it seems that selection favored at least some degree of extra-pair sex (Andrews et al., 2008)

Relationships: A Contract of Sexual Exclusivity For Provision?

From chapter 13 by Lindová:

> granting sexual exclusivity to a man can be exchanged for other valuable resources, such as food or protection (Ellis, 1998; Lovejoy, 2009) provided to a woman, her offspring, and/or her family, while demanding sexual exclusivity from a man would decrease the risk that he will divert investment from her in the future

I believe that this is indeed a tacit but foundational barter in monogamous and committed relationships.

Women's Dream Is Turning A Player Into A Husband

From Harrison in chapter 15:

> Further, as shown by Cox and Fisher (2009) and Fisher and Cox (2010), women worldwide read billions of books, i.e., romance novels, where the predominant story is one of transforming a "cad" into a "dad." These stories follow particular patterns of female–male romantic commitment and of becoming a mother to the offspring of a wealthy male progenitor.

QUOTES

On the inherent challenges of human mating systems, and the challenges of monogamy:

> In an ideal world, women would prefer a marriage partner who has it all – that is, a partner who is (a) physically attractive, (b) committed to the relationship, and (c) willing and able to invest resources. However, such men (…) are likely few and far between and thus most women are unable to attract and – more importantly – retain such a long-term partner

⍰⍰♂ Lucio's Analysis

Avoid Inflating the Case for Nonpaternity

In chapter 3 the author takes the *highest* Western reported rate of extra-pair paternity (about 6% in low-income urban families: Larmuseau et al., 2019), scales it up to Belgium's population, arriving at half a million misattributed children.

Then the final number is compared to whole countries.

This feels a dramatization and I think the whole point of a good analysis is to focus on the *percentage* rather than inflating smaller rates into impressive raw numbers.

It also feels dramatizing when it says (and similarly restated in chapter 15):

> ‘Even today’s most sophisticated DNA tests are not guaranteed to provide accurate results, as laboratories can make mistakes and parties involved can lie about genetic samples.

Sure, nothing is *guaranteed*, but… how often do labs make mistakes?
And when they do, it’s rarely a false positive — most mistakes are false negatives that get corrected with a second test when the alarm bells go off.

And let’s be real: if paternity is in doubt, he won’t send the wife to confirm he’s the dad :)

Suggestion: cut history of attachment & myths of oral sex

They’re tangential to female adaptations.
The ‘myths of oral sex’ doesn’t seem befitting to a handbook—the note that it doesn’t imply loss of vaginal vrginity adds no scholarly value for an academic readership. I suggest cutting the whole section

Suggestion: focus on women only

Just like we said for Volume 2 on male adaptations, this Volume 3 is supposed to be about *female* adaptations.

I felt there is too much talk about ‘people’, ‘partners’, ‘fathers’, male mate guarding, and ‘men’. This should be about *girlfriends*, *mothers*, and *women*.

Remove ungendered and men’s point of view: focus on women.

REVIEW

The Cambridge Handbook of Evolutionary Perspectives on Sexual Psychology – Female Adaptations caps the Cambridge series on evolutionary sexual psychology (general overview is vol. 1, and male adaptations is vol. 2)

There is a fourth volume on animals and open questions, but I’ll hold off on that since we focus more on humans here.

Overall, it’s a great text, just like the previous two volumes. I still recommend sticking closely to the main topic of female adaptations: cut all discussions about men and move them to the second volume (and vice versa). Doing so would make an already excellent series even stronger and more coherent.

But overall, thumbs up.
I learned something new once again and could also improve a few articles. Thankful to the authors and look forward to reading more from them again.

Get this book on Amazon or check the **best evolutionary psychology books**.

The Handbook of Narcissism and Narcissistic Personality Disorder: Summary & Review

Lucio Buffalmano · 12 October 2025 · Archived copy · Original

The Handbook of Narcissism and Narcissistic Personality Disorder: Theoretical Approaches, Empirical Findings, and Treatments (2011) is a comprehensive academic reference edited by Campbell and Miller. It reviews theoretical models, empirical findings, and treatment approaches to narcissism, making it one of the most cited and authoritative works on the subject.

Contents

- FULL SUMMARY
  - Chapter 1, 2, 3: History, DSM, Psychiatric Classifications
  - Chapter 4: Narcissistic Grandiosity and Narcissistic Vulnerability
  - Chapter 5: Psychoanalytic Theories on Narcissism and Narcissistic Personality
  - Chapter 6: Narcissism from the Perspective of the Dynamic Self-Regulatory Processing Model
  - Chapter 7: Trait Personality Models of NPD, Grandiose Narcissism, and Vulnerable Narcissism
  - Chapter 8: Narcissism, the Agency Model, and Approach-Avoidance Motivation
  - Chapter 9: Behind the Mask
  - Chapters 10, 11, 12, 13: Assessments and Measurement of NPD
  - Chapter 14, 15: Sociodemographic Correlates of NPD
  - Chapter 16: Parenting as a Cause of Narcissism
  - Chapter 18: Narcissism and Culture
  - Chapter 19: The Evolution of Narcissism and Short-Term Mating
  - Chapter 20: Correlates of Narcissism and Psychopathy
  - Chapter 23: “I Love Me Some Me” (Narcissism & Self-Esteem)

- Chapter 24: Psychopathy and Narcissism
- Chapter 25, 26: Self-Perceptions & Self-Other Discrepancies
- Chapter 27: Narcissistic Self-Enhancement
- Chapter 29: The Emotional Dynamics of Narcissism
- Chapter 30: Narcissism and Romantic Relationships
- Chapter 32: Narcissism and Social Networks
- Chapter 34: Narcissism and Brand Name Consumerism
- Chapter 35: Leadership
- Chapter 36: Celebrity and Narcissism
- Chapter 37: Narcissism and Spirituality
- Chapter 39: Attachment Theory and Narcissistic Personality Disorder

FULL SUMMARY

About the Author:
The handbook is an edited volume, with individual chapters contributed by various leading scholars and experts in narcissism and personality disorders.
The two editors are:

W. Keith Campbell, Ph.D. – Professor of Psychology at the University of Georgia, widely recognized for his research on narcissism, personality, and cultural change. Author of *The Narcissism Epidemic* and other influential works.

Joshua D. Miller, Ph.D. – Professor of Psychology at the University of Georgia, specializing in personality assessment, narcissism, and clinical psychology. Known for his empirical research on personality disorders and their measurement.

⍰⍰♂ Note: we moved and nested some chapters to improve reading experience and flow.

Chapter 1, 2, 3: History, DSM, Psychiatric Classifications

Authors: Kenneth N. Levy, William D. Ellison, Joseph S. Reynoso

The concept of narcissism evolved from ancient myth to a recognized psychiatric diagnosis.
Across the 20th century, narcissism shifted from myth and metaphor to clinical construct, with contributions from psychoanalysis, social psychology, and psychiatry.

- **Mythic origins:** The story of Narcissus introduced themes of self-love, fragility, and despair, which later

influenced psychoanalytic views (Hamilton, 1942; Ovid, 8 C.E.).

- **Psychoanalytic development:** Freud conceptualized narcissism as both normal (developmental) and pathological (defensive withdrawal, inflated self). Rank, Horney, Winnicott, and Kernberg elaborated on its defensive and relational functions.
- **From personality style to disorder:** Clinicians such as Wälder, Reich, and Kernberg described narcissism as a personality type marked by grandiosity, lack of empathy, and aggression. Kohut reframed it as a developmental failure of healthy self-integration.
- **Cultural expansion:** From Lasch's "culture of narcissism" to Twenge & Campbell's "narcissism epidemic," the construct has been used to describe both individuals and society (Lasch, 1979; Twenge & Campbell, 2009).

Chapter 2: Narcissism in the DSM

Authors: Elizabeth K. Reynolds, Carl W. Lejuez

Narcissistic Personality Disorder (NPD) became an official diagnosis in DSM-III (1980).
Its evolution across DSM editions reflects ongoing negotiations between clinical theory and empirical research. Earlier versions emphasized observable grandiosity, while later revisions streamlined criteria but downplayed vulnerability and dynamic shifts. DSM-5 proposed a hybrid dimensional model, integrating personality functioning and traits, to capture narcissism more flexibly.

- **DSM-III (1980):** First official inclusion of NPD, influenced by Kernberg, Kohut, Millon, and empirical trait research.
- **DSM-III-R and DSM-IV:** Narrowed to overt grandiosity, reducing recognition of vulnerable forms.
- **DSM-5 proposals:** Move toward dimensional assessment, aiming to capture narcissistic functioning beyond rigid categories.
  Current conceptions of DSM-5 do not include NPD among the five major personality disorder types.

Chapter 3: Narcissism in Official Psychiatric Classification Systems

Authors: Susan South, Nicholas Eaton, Robert Krueger

This chapter situates NPD in the broader landscape of psychiatric classification. While DSM traditionally emphasized categorical diagnosis, narcissism is increasingly viewed as dimensional — existing along a spectrum of severity.
The challenge is to integrate clinical richness (grandiosity, vulnerability, oscillations) into empirically valid diagnostic systems.

- **Dimensional approach:** Narcissism may be better understood as variation across traits rather than a binary disorder.
- **Future direction:** Hybrid models combining categorical clarity with dimensional nuance.

Chapter 4: Narcissistic Grandiosity and Narcissistic Vulnerability

Authors: Aaron L. Pincus, Michael J. Roche

Narcissism is not a single phenomenon but a dual expression: grandiosity and vulnerability. Grandiosity involves arrogance, dominance, and entitlement, while vulnerability manifests as hypersensitivity, insecurity, and withdrawal.
Both forms share self-absorption and fragile self-esteem regulation, but they differ in outward style. Research supports treating them as distinct yet related dimensions of dysfunction.

- **There is no gold standard definition**: *there is no gold standard as to the meaning of narcissism and thus whether it is clinically described or empirically measured*

  - Diverse conceptualizations include Nature (normal, pathological), Phenotypic Description (grandiosity, vulnerability), Expressive Modality (overt, covert), and Structure (category, dimension, prototype).
- **Phenotypic description:**
  - Grandiose narcissists appear confident and demanding;
  - Vulnerable narcissists appear defensive, anxious, and sensitive to criticism.
- **DSM limits:** Diagnostic manuals have traditionally emphasized grandiosity, underrepresenting vulnerability.
- **Oscillations between grandiose and vulnerable**: *Although the clinical literature often employs typological distinctions, many contemporary clinical experts on narcissism now recognize that grandiose self-states oscillate with vulnerable self-states and affective dysregulation within the same person.*
  - Classifications are of relative levels: *narcissistic patients are best differentiated from each other based on relative levels of grandiosity and vulnerability rather than categorical classifications (Pincus & Lukowitsky, 2010).*
- **Clinical recommendation:** Understanding both forms is crucial for treatment, as patients often shift between grandiosity and vulnerability.

I found the authors' definitions to be good:

> We propose that narcissism be defined as one's capacity to maintain a relatively positive self-image through a variety of self-regulation, affect-regulation, and interpersonal processes, and it underlies individuals' needs for validation and admiration, as well as the motivation to overtly and covertly seek out self-enhancement experiences from the social environment (Pincus et al., 2009).

And about pathological narcissism:

> From our perspective, the fundamental dysfunction associated with pathological narcissism is related to intense needs for validation and admiration that energize the person to seek out self-enhancement experiences. Such needs and motives are normal aspects of personality, but they become pathological when they are extreme and coupled with impaired regulatory capacities.
> (…) in the ability to manage and satisfy needs for validation and admiration, such that self-enhancement becomes an overriding goal (…) sought in maladaptive ways and in inappropriate contexts.

Chapter 5: Psychoanalytic Theories on Narcissism and Narcissistic Personality

Authors: Elsa Ronningstam

Psychoanalytic theories shaped early conceptualizations of narcissism.
Contemporary psychoanalysis frames narcissism as a failure in self-structure and relationships, driven by unresolved trauma, self-esteem dysregulation, and defensive grandiosity.

- **Freud:** Saw narcissism as a universal stage of development, but also pathological when excessive, tied to ego ideals and defense against feelings of insignificance (Freud, 1914/1957).
- **Kernberg:** Conceptualized narcissism as pathological grandiosity rooted in cold, rejecting parenting, leading to compensatory grandiose self-images.
- **Kohut:** Emphasized developmental failure of the "grandiose self" when parental idealization fails, producing dependency on others for self-esteem regulation.
- **Other contributions:** Horney stressed self-inflation without genuine self-love; Winnicott focused on the false self; Reich and others highlighted oscillations between grandiosity and despair.
- **Clinical implication:** Therapy approaches use empathic confrontation, helping patients integrate fragmented

self-states and reduce defensive reliance on grandiosity.

🤔Lucio's Take: **Not a big proponent of non-empirical theories**

Lucio:
Although some psychoanalytic insights into narcissism were sharp — even ahead of their time — the approach as a whole suffers from a lack of rigorous empirical testing.

Without evidence, many ideas remain speculative at best, and some have even been contradicted by later research.

To stay relevant today, psychoanalysis should discard what cannot be tested, update or abandon what evidence disproves, and ground itself in empirically supported theories while framing the rest as hypotheses to be tested.

Chapter 6: Narcissism from the Perspective of the Dynamic Self-Regulatory Processing Model

Authors: Carolyn C. Morf, Eva Schürch, Loredana Torchetti

The dynamic self-regulatory processing model presents a unifying framework for the analysis of the self-regulation processing dynamics that characterize not just narcissism, but diverse personality types.

Narcissists strive to maintain a grandiose self-image by seeking validation, reacting defensively to threats, and amplifying their sense of superiority. Rather than being stable traits, narcissistic behaviors are strategic responses to protect self-esteem in real time.

The authors claim that from the 2001 Psychological Inquiry target article by Morf and Rhodewalt, research on has yielded extensive empirical support for the self-regulatory dynamics proposed by the model.

> A key feature of the narcissistic system seems to be the conjoint striving for grandiosity at overt explicit levels juxtaposed with a much more concealed implicit vulnerability, which leads them to be highly vigilant to opportunities to bolstering the self, but simultaneously also highly sensitive to potential threats.

- **Dynamic cycle:** Narcissists pursue admiration, react with hostility or withdrawal to criticism, and reinforce grandiose self-concepts through feedback loops.
- **Self-regulation strategies:** Attention-seeking, charm, aggression, and withdrawal are used flexibly depending on the context.
- **Heuristic utility:** Explains how narcissism can look adaptive (confidence, leadership) yet lead to dysfunction when validation is lacking.
- **Future directions:** Research should track how narcissists shift between grandiosity and vulnerability across social interactions.

Tactics to maintain high self-regard

The authors list a set of tactics that seem to be a mix of potentially adaptive, and some with larger social costs and potentially toxic to others:

- **Disparaging outperformers**: To diffuse negative social comparison, narcissists openly disparage an outperforming other—even directly to their face (Morf & Rhodewalt, 1993; South, Oltmanns, & Turkheimer, 2003).
- **Hostility and aggression under threat** of negative evaluation or rejection, including toward displaced aggression (Bushman & Baumeister, 1998; Bushman et al., 2009; Penney & Spector, 2002; Reidy, Zeichner, Foster, & Martinez, 2008; Twenge & Campbell, 2003).
- **Unforgiving and vengeful**: Narcissists frequently perceive interpersonal transgressions, and in response, they tend to be unforgiving and vengeful (McCullough, Emmons, Kilpatrick, & Mooney, 2003; Brown, 2004; Exline, Baumeister, Bushman, Campbell, & Finkel, 2004).
- **Low accommodation in conflicts**: In the face of romantic conflicts, narcissists report less accommodative behavior—that is, fewer constructive reactions to potentially negative partner behavior (Campbell & Foster, 2002).
- **Psychological control as parents**: When children fail to meet expectations, narcissistic mothers often react by inducing guilt and exerting psychological control through hostility, intrusiveness, and withdrawal of love (Schürch & Morf, 2010).

⍰⍰♂ Lucio's note: integrating vulnerable and grandiose narcissism may be a weakness
Hansen Brown in *The Handbook of Trait Narcissism* notes that the dynamic self-regulatory processing model conceptualizes narcissism as both grandiose and vulnerable simultaneously rather than as two separate subtypes. I also felt this was a possible weakness

Great First Impressions, Poor Long-Term Relationships

At first encounter, narcissists often make a strikingly positive impression.
They come across as charming, attractive, humorous, and confident, and others see them as agreeable, competent, and leadership material (Paulhus, 1998; Oltmanns, Friedman, Fiedler, & Turkheimer, 2004; Back, Schmukle, & Egloff, 2010; Brunnell et al., 2008; Judge, LePine, & Rich, 2006).

Yet this favorable impression tends not to last.
With more exposure, others begin to view narcissists as arrogant, hostile, and boastful (Paulhus, 1998). Supervisors, unlike co-workers, are quick to note their poor leadership quality and deviant workplace behavior (Judge et al., 2006).
The same pattern emerges in close relationships. Romantic partners often find the start of a relationship with a narcissist more exciting than average, but satisfaction declines as intimacy and emotional bonding fail to develop (Foster, Shrira, & Campbell, 2003, as cited in Campbell et al., 2006). Over time, partners report feeling deceived, manipulated, and undervalued by the narcissist (Campbell, Foster, & Finkel, 2002; Torchetti & Morf, 2010).

However, and some studies do not find negative relationship satisfaction in their partners (Sedikides et al., 2004). The authors suggest it's because narcissists tend to date other narcissists, and because when partners elicited communal thoughts and feelings, narcissists' low commitment was no longer apparent (Finkel, Campbell, Buffardi, Kumashiro, & Rusbult, 2009).

 It's a pattern of **early attraction followed by eventual disappointment**: narcissists shine in first impressions but lose their appeal as deeper flaws surface.

Chapter 7: Trait Personality Models of NPD, Grandiose Narcissism, and Vulnerable Narcissism

Authors: Joshua D. Miller, Jessica Maples

Narcissism can be understood through the lens of trait personality models, especially the Five-Factor Model (FFM). Grandiose narcissism aligns with high extraversion, dominance, and low agreeableness, whereas vulnerable narcissism aligns with high neuroticism, low extraversion, and hypersensitivity.
Viewing NPD dimensionally helps capture individual differences and overlap with broader personality traits.

> Ultimately, Paulhus' (2001) description of grandiose narcissists as "disagreeable extraverts" seems quite accurate.

- **Grandiose narcissism:** Assertive, dominant, extraverted, socially bold, but antagonistic.
- **Vulnerable narcissism:** Withdrawn, insecure, emotionally unstable, hypersensitive to rejection.
- **Trait narcissism's measurements align with grandiose:** *The vast majority of empirical research on trait narcissism has used the NPI, which measures a grandiose variant of narcissism*
- **Trait integration:** Both types share antagonism (low agreeableness), which may be the core feature of narcissism.
- **Trait narcissism vs NPD**: trait narcissism is considered a dimensional personality trait that exists to varying degrees in all individuals

FFM Trait / Facet	Grandiose Narcissism	Vulnerable Narcissism	NPD Expert Ratings

N (Sample Size)	3751 (domains) 3207 (facets)	8100 (domains) 1090 (facets)	1002 (domains) 599 (facets)

Note: FFM and NPD: Domains (weighted average from Samuel & Widiger's, 2008, and Saulsman & Page's, 2004, meta analyses; facet level effect sizes were taken from Samuel & Widiger's, 2008, meta-analysis). FFM facets and Vulnerable Narcissism: Relations come from Miller, Dir, et al. (in press) and Miller, Hoffman et al. (2010). In parentheses, first number represents meta-analytic effect sizes from measures of the FFM (NEO PI- R; NEO-FFI). The second number represents meta-analytic effect sizes from non-FFM measures, primarily the Big Five Inventory (John, 1991).

The Big 5 Underestimate Narcissism's Downsides

NPI measures of grandiose narcissism often appear adaptive because they correlate with high self-esteem, well-being, and low psychological distress (Cain et al., 2008; Trull & McCrae, 2002; Bosson et al., 2008; Sedikides, Rudich, Gregg, Kumashiro, & Rusbult, 2004), but they miss key pathological features.

The Big Five framework emphasizes high Extraversion and low Neuroticism while underestimating low Agreeableness because it doesn't capture deceitfulness, callousness, and immodesty—core interpersonal and externalizing traits of narcissism (Miller, Campbell, et al., 2009).

Same as for psychopathy, the authors also caution to not equate low distress with psychological health, as seen in prototypical psychopathy (Cleckley, 1941; Miller, Lynam, Widiger, & Leukefeld, 2001).

Vulnerable Narcissism Is Closer to Borderline Personality Disorder

Research suggests that **vulnerable narcissism is largely distinct** from grandiose narcissism and NPD.

From a Five-Factor Model perspective, it presents high negative emotionality—depression, anxiety, hypersensitivity, stress, anger, and self-consciousness—and low interpersonal trust rather than grandiosity or dominance.
Vulnerable narcissists often display a **hostile attribution bias**, interpreting others' actions as malevolent, leading to problematic interpersonal behaviors (Miller, Dir, et al., 2010; Dodge, Price, Bachorowski, & Newman, 1990; Miller, Lynam, & Jones, 2008). Etiological factors such as abuse or harsh discipline are linked to these tendencies (Dodge, Pettit, Bates, & Valente, 1995).

Trait profiles of vulnerable narcissism closely resemble **Borderline Personality Disorder** rather than NPD or grandiose narcissism (r = .93; Miller, Dir, et al., 2010) and align more with expert FFM profiles for Borderline PD (r = .71) than for NPD (r = .06).

Chapter 8: Narcissism, the Agency Model, and Approach-Avoidance Motivation

Authors: Joshua D. Foster, James C. Brennan

The agency model highlights how narcissists are driven by approach-oriented motives: pursuing rewards, recognition, and dominance.
Narcissists rarely focus on avoidance (preventing harm) but instead on achieving visibility and success. This bias explains their bold risk-taking in areas like finance, relationships, and leadership, though it also exposes them to failures and social costs.

- **Agency model:** Narcissists orient their lives around personal agency — achievement, control, power, and recognition.
- **Approach-avoidance balance:** Narcissists strongly favor approach motivation, leading to overconfidence and risky decisions.
- **Narcissism may precipitate financial crisis**: anecdotal evidence suggesting that investor narcissism and overconfidence may have fueled some of the risky financial decisions that contributed to the recent collapse of the world economy (Cohan, 2009; Gladwell, 2009).
- **Application:** In financial choices, narcissists pursue high-reward opportunities while neglecting potential losses.
- **Implication:** This approach orientation explains both the charisma and recklessness associated with narcissism.

Chapter 9: Behind the Mask

Authors: Virgil Zeigler-Hill, Christian H. Jordan

This chapter explores the "mask model" of narcissism, which proposes that narcissists' overt confidence conceals fragile self-esteem. The model suggests a discrepancy between explicit (conscious) self-esteem, which is high, and implicit (unconscious) self-esteem, which may be low or unstable. However, empirical evidence is mixed: some studies support the fragile high self-esteem view, others find narcissists report genuinely high implicit self-regard.

- **Mask model:** Overt grandiosity hides insecurity, shame, or low implicit self-esteem.
- **Mixed empirical findings:** Some research supports fragile self-esteem; other studies suggest narcissists' implicit self-esteem can be as high as explicit self-esteem.
- **Fragile high self-esteem:** Narcissists' confidence collapses when challenged, fueling defensiveness or aggression.
- **Conclusion:** The link between narcissism and implicit self-esteem is inconsistent, suggesting subtypes or contextual effects.

Chapters 10, 11, 12, 13: Assessments and Measurement of NPD

Authors: Chris Watson, R. Michael Bagby

Assessing NPD is challenging because narcissism exists on a spectrum from normal to pathological. Traditional categorical diagnosis often misses nuances. Dimensional approaches, structured interviews, and self-report measures improve reliability. Assessment should capture both grandiosity and vulnerability as well as interpersonal dysfunction.

- **Dimensional vs. categorical:** Dimensional assessment better reflects narcissistic traits across severity levels.
- **Structured interviews:** Tools like SCID-II provide standardized NPD diagnoses.
- **Self-report:** Measures such as the Personality Diagnostic Questionnaire highlight narcissistic traits but risk self-presentation bias.
- **Future direction:** Combine self-reports with informant ratings for more accurate assessment.

Chapter 11: The Measurement of Trait Narcissism in Social-Personality Research

Authors: Michael Tamborski, Ryan P. Brown

Trait narcissism is usually measured with self-report scales, the most widely known being the Narcissistic Personality Inventory (NPI). Other measures capture vulnerable narcissism, pathological forms, or domain-specific expressions. Researchers debate whether narcissism is one construct or a family of related but distinct tendencies.

- **NPI:** Captures grandiose traits like exhibitionism, dominance, and entitlement.
- **Pathological Narcissism Inventory (PNI)** captures both grandiosity and vulnerability.
- **Choice of measure influences findings**, since different scales tap different narcissistic expressions.

Chapter 12: Of Tails and their Dogs

Authors: Simine Vazire, Laura Naumann, Joey T. Cheng, Jason P. Martens

This chapter critiques narcissism scales, arguing that measures can shape theories rather than reflect reality — the "tail wagging the dog." Researchers must ensure scales measure narcissism itself rather than assumptions embedded in item wording.

Chapter 13: Addressing Criticisms of the Narcissistic Personality Inventory (NPI)

Authors: Richard W. Robins, Laura Naumann

The NPI is the most used narcissism measure but also the most criticized. Critics argue it conflates healthy self-confidence with pathology. Defenders emphasize its predictive power for real-world outcomes. The chapter concludes that the NPI is valuable but incomplete.

- **Validity questions:** Debate over whether the NPI measures narcissism or simply extraversion + self-esteem.
- **Support:** NPI predicts leadership, risk-taking, and interpersonal dominance, consistent with narcissism theory.
- **Conclusion:** NPI remains useful, but complementary measures are needed to capture vulnerability.

Chapter 14, 15: Sociodemographic Correlates of NPD

Authors: Attila J. Pulay, Risë B. Goldstein, Bridget F. Grant

Large epidemiological surveys reveal that NPD is more prevalent in younger adults, men, and certain sociodemographic groups. Prevalence is lower among older adults, suggesting either remission or cohort differences. Findings highlight the social context of narcissistic expression.

- **Prevalence:** NPD affects roughly 1–6% of the population, depending on definitions.
- **Age:** Higher in younger adults; decreases with age.
- **Gender**: More common in **men** than women.

Chapter 14: Assessment of Youth Narcissism

Authors: Christopher T. Barry, Lisa L. Ansel

Studying narcissism in youth is complex, as traits shift with development. Early self-focus may be normal, but extreme entitlement, lack of empathy, and aggression can signal emerging narcissism. Reliable youth measures are needed to track risks without pathologizing normal development.

- **Risk of over-pathologizing** normal adolescent self-focus.

Chapter 16: Parenting as a Cause of Narcissism

Authors: Robert S. Horton

Parenting practices contribute significantly to narcissism development. Clinical theories propose two routes: overindulgence (teaching a child they are special without limits) and rejection (driving the child to compensate with grandiosity). Empirical research supports both, though effects vary by child temperament.

- **Overindulgence hypothesis:** Excessive praise fosters entitlement and unrealistic self-views.
- **Rejection hypothesis:** Cold or inconsistent parenting leads to defensive grandiosity to protect fragile self-worth.
- **Conclusion:** Both indulgence and neglect can cultivate narcissism, depending on context.

Chapter 17: Examining "Developmental Me"

Authors: Patrick L. Hill, Brent W. Roberts

Narcissism develops across the lifespan, peaking in adolescence and early adulthood when identity and status-seeking are central. It tends to decline with age as individuals invest in long-term roles (career, family).
This trajectory aligns with social investment theory: commitments to stable roles reduce narcissistic traits.

- **Childhood:** Self-focus is common but usually transitory.
- **Adolescence:** Narcissism peaks, especially in status-seeking and self-promotion.
- **Adulthood:** Narcissism declines as individuals invest in social roles and responsibilities.
- **Social investment theory**: roles (family, career) reduces narcissistic self-focus.

Chapter 18: Narcissism and Culture

Authors: Jean M. Twenge

Cultural forces contribute to shaping narcissism in individuals and societies.
Societies that emphasize individualism, materialism, and self-expression tend to foster higher narcissism. Cross-cultural studies show variations, and generational analyses suggest increases in narcissism among younger cohorts in the U.S. and other Western countries.

- **Both genes and culture matter**: Like many personality traits, narcissism appears to have a large genetic component (Vernon, Villani, Vickers, & Harris, 2008).
- **Cultural products:** Media, advertising, and celebrity culture reinforce self-focus.
- **Individualistic vs collectivist cultures:** Individualistic cultures show higher narcissism than collectivist ones.
- **Generational rise:** Evidence suggests narcissism has increased among U.S. college students since the 1980s (Twenge & Campbell, 2009).

Individualistic Cultures Have Upsides

An insightful point from the authors I also agree with:

> Individualistic cultures have enormous upsides, among them less prejudice and greater opportunities for people regardless of their backgrounds. Once a culture becomes so individualistic that it is narcissistic, however, negative outcomes are likely to follow.
> A society of narcissistic individuals might seem sexy and fun in the short term, but in the long term society breaks down

Chapter 19: The Evolution of Narcissism and Short-Term Mating

Authors: Nicholas S. Holtzman, Michael J. Strube

This chapter applies evolutionary psychology: narcissism may be adaptive for short-term mating strategies. Traits like charm, boldness, and exploitation facilitate sexual opportunities but hinder long-term bonds. Narcissism thus persists as a mixed reproductive strategy.

- **Empirical evidence:** Narcissists report more short-term relationships, higher mating success in the short run.
- **Evolutionary logic:** Grandiose self-presentation attracts mates but undermines stability.
- **Prediction:** Narcissism should correlate with sexual opportunism, infidelity, and risk-taking.

Read more:

- Love role in dating
- Short-term mating psychology

Status-Enhancing Strategy

> narcissists tend to engage in numerous competitive behaviors that could potentially be viewed as manifestations of a STM strategy.
> For example, narcissists tend to exhibit status-striving (Wallace & Baumeister, 2002), other-derogation (Morf & Rhodewalt, 1993), and physical aggression (Bushman & Baumeister, 1998a; Donnellan, Trzesniewski, Robins, Moffitt, & Caspi, 2005; Twenge & Campbell, 2003a), all of which could elevate narcissists to a top position in a social hierarchy, potentially increasing STM opportunities.

Evolved Adaptations for Short-Term Mating

The authors mention that narcissist may have evolved adaptations to facilitate successful short-term mating:

Narcissists may have different sperm qualities than non-narcissists, such as qualities that facilitate rapid fertilization following one-time intercourse.
In contrast, non-narcissists may have evolved defensive sperm, more designed to block the successful one-time insemination by male narcissists.

Male narcissists may have larger testicles for higher amounts of sperm production, to facilitate insemination.
This hypothesis can be derived from the primate literature in which it is evident that STM species tend to have larger testicles (Buss, 2007).

Also, male narcissists self-report larger penile size (Moskowitz, Rieger, & Seal, 2009); if true, this structure may help remove competitors' semen and increase insemination likelihood for one's own semen (Schmitt, 2005; Shackelford et al., 2005).

⍰♂Lucio's Take: **Interesting, but still speculative**

Lucio:
I do think narcissists are more short-term oriented and that this may have an evolutionary basis. But physical adaptations remain largely speculative.

Larger studies would be needed, and for now these remain hypotheses.
The penis size link is intriguing, but it's correlational—causality could run the other way (e.g., men with larger penises may develop higher self-esteem, which then registers as narcissism on certain scales).
And as far as I know, there's no solid evidence for "sperm blocking."

Chapter 31: Narcissism and Sexuality

Authors: Laura Widman, James K. McNulty

Narcissism strongly influences sexual attitudes and behaviors. Narcissists are more likely to pursue short-term, exploitative sex, prioritize personal gratification, and engage in risky behavior.

- **Sexual attitudes:** Narcissists endorse permissive and game-playing views of sex.
- **Behaviors:** More infidelity, risky sex, and focus on performance rather than intimacy.
- **Outcome:** Narcissists report more partners but less relational satisfaction.

Chapter 20: Correlates of Narcissism and Psychopathy

Authors: Elizabeth A. Krusemark

Neuroscientific research shows that narcissism involves atypical patterns of brain activity related to reward, emotion, and self-referential processing. Overlaps exist with psychopathy, especially in reward sensitivity and reduced empathy.

- **Neuroscience of narcissism:** Greater activation in reward systems when receiving admiration.
- **Overlap with extraversion:** Similar neural correlates in approach/reward circuits.
- **Psychopathy link:** Shared deficits in empathy and heightened reward drive.

Chapter 21: Comorbidity between Narcissistic Personality Disorder and Axis I Diagnoses

Authors: Sebastian Simonsen, Erik Simonsen

NPD frequently co-occurs with Axis I disorders, complicating diagnosis and treatment. Narcissism can amplify vulnerability to mood, anxiety, substance, and eating disorders. Comorbidity worsens prognosis and requires integrated treatment approaches.

- **Schizophrenia:** Narcissistic traits complicate engagement and compliance.
- **Mood disorders:** Narcissism linked with bipolar swings and depressive episodes when grandiosity collapses.
- **Anxiety/eating/substance use:** Narcissists may use substances or control eating as self-regulation strategies.
- **Conclusion:** Comorbidity highlights the need for comprehensive, multi-diagnostic assessment.

Chapter 22: The Comorbidity of Narcissistic Personality Disorder with Other DSM-IV Personality Disorders

Authors: Thomas A. Widiger

NPD overlaps with other personality disorders, especially histrionic, antisocial, and borderline. This raises the issue of whether NPD is distinct or part of a broader antagonistic spectrum.

- **Histrionic PD:** Shared attention-seeking and superficiality.
- **Antisocial PD:** Shared exploitation and lack of empathy.
- **Borderline PD:** Shared instability and vulnerability, though narcissists externalize blame more.
- **Conclusion:** NPD is best seen as distinct but overlapping within the antagonistic and dramatic cluster.

Chapter 23: “I Love Me Some Me” (Narcissism & Self-Esteem)

Authors: Jennifer K. Bosson, Jonathan R. Weaver

This chapter examines the complex link between narcissism and self-esteem. Narcissists often report high explicit self-esteem but remain dependent on external validation.
Measures of the grandiose dimension tend to correlate positively with self-esteem, and measures of the vulnerable dimension correlate negatively or not at all with self-esteem and positively with shame-proneness.

- **High self-esteem appearance:** Narcissists score high on explicit measures.
- **Instability:** Their self-worth fluctuates strongly with feedback.
- **Conclusion:** Narcissism involves self-esteem that is elevated but fragile.

Chapter 24: Psychopathy and Narcissism

Authors: Donald Lynam

Psychopathy and narcissism overlap conceptually and empirically, especially in traits like callousness, entitlement, and exploitation. However, psychopathy includes broader antisociality and emotional deficits, whereas narcissism centers on self-image.

- **Theoretical overlap:** Both involve antagonism and lack of empathy.
- **Differences:** Psychopathy shows more impulsivity and criminality; narcissism is more image-focused.
- **FFM view:** Both share low agreeableness; psychopathy adds low conscientiousness.

Two Too-Broad Constructs For Any Significant Contributions

Narcissism and psychopathy are not unidimensional constructs but composites of more basic personality traits, which makes direct comparisons misleading.
A single correlation between them is uninformative because the overlap could stem from low agreeableness, high extraversion, low neuroticism, or some mix of these factors.

The problem is compounded by the fact that different measures capture different traits: for example, PPI Factor 1 diverges from traditional psychopathy factors, while NPD and the NPI each capture different sides of narcissism.

As a result, their observed overlap comes from different sources—NPD aligns with psychopathy mainly through low agreeableness, while the NPI's link to PPI Factor 1 comes from low neuroticism and high extraversion.

Given these discrepancies, working at the level of such broad constructs may never yield a deep understanding, making trait-level analyses more promising.

🤔 **Lucio's note**: I agree with the authors, casual comparisons between the two at their broader level reek of pop-psychology over-simplification.

Chapter 25, 26: Self-Perceptions & Self-Other Discrepancies

Authors: Erika N. Carlson, William D. Ellison, Simine Vazire

Narcissists' self-perceptions differ from how others see them.
They see themselves as charming, competent, and assertive. Others often agree at first but later view them as arrogant, selfish, and difficult. Narcissists also misjudge how they are seen, overestimating their positive impression.

- **Self-perception:** Inflated, focused on superiority.
- **Others' perception:** Initially positive, later negative as exploitation emerges.
- **Meta-perception:** Narcissists assume others admire them more than they do.
- **Narcissists know others see them as narcissist**s

Positive Impressions Fade Over Time

Initially seen as likable and competent, they are later perceived as poor performers, less agreeable, less warm, and more arrogant and hostile (Paulhus, 1998).
Research on self-enhancers—closely linked to narcissism—shows the same pattern: after a few months, acquaintances and even friends view them more negatively, describing them as condescending, manipulative, hostile, and prone to overreacting (Kwan et al., 2004; Kwan et al., 2008; Colvin et al., 1995).

Chapter 26: Self-Other Discrepancies

Authors: Thomas F. Oltmanns, Erin M. Lawton

Narcissists' views of themselves differ from peers and clinicians. They underestimate interpersonal impairment and overestimate competence. These discrepancies contribute to conflicts and poor outcomes.

- **Peer vs. self:** Others see narcissists as arrogant and difficult, unlike their own self-view.
- **Self-reported questionnaires raise concern**: The emphasis on self-report questionnaires for the assessment of narcissistic personality disorder (NPD) is surprising because many personality disorders involve distortions of self-perception and an inability to assess accurately one's effect on others (Oltmanns & Turkheimer, 2009).
- **Clinical view:** Interviewers detect dysfunction narcissists deny.
- **Impact:** Discrepancies fuel social impairment.

Chapter 27: Narcissistic Self-Enhancement

Authors: Harry M. Wallace

Self-enhancement is central to narcissism: exaggerating achievements, claiming superiority, and seeking admiration. These strategies can bring short-term gains but often backfire long term.

- **Strategies:** Boasting, credit-taking, self-promotion.
- **Trophy wives and husbands**: Narcissists seek romantic partners who offer self-enhancement value either as sources of fawning admiration, or as human trophies (e.g., by possessing impressive wealth or exceptional physical beauty) (Campbell, 1999; Tanchotsrinon, Maneesri, & Campbell, 2007).
- **Competing explanations:** Self-deception vs. deliberate manipulation.
- **Lower long-term competence paradox:** Self-enhancement helps in the short term but undermines long-term competence when narcissists deflect blame and lose an opportunity for self-improvement
  ⍰⍰♂ **Lucio's note**: Unfortunately this may not always mean lack of results. sometimes 'long term' is nothing but the sum of short-term boosts. If we look at Trump, he managed to reach the top despite unaddressed competence gaps

Narcissists Lack Calibration

Says the author:

Narcissists' self-enhancement prospects are also limited by the inflexibility of their approach toward attaining self-enhancement.
Behavior that elicits admiration in one context could induce the opposite response from observers in different situations, so admiration-seekers would be wise to calibrate their self-presentation to match their environment.
Narcissists apparently lack this wisdom. They employ the same unsubtle, exhibitionistic style of self-promotion regardless of the situation (Campbell et al., 2000; Collins & Stukas, 2008).
In effect, narcissists' primary technique for convincing others of their greatness involves bluntly proclaiming their greatness.

Chapter 28: Narcissistic Ego Deflates, Narcissistic Aggression Inflates

Authors: Brad J. Bushman, Sander Thomaes

Narcissism predicts aggression when ego is threatened. Grandiosity makes narcissists hypersensitive to criticism, fueling rage, hostility, and even violence when self-image collapses.

- **Self-esteem theory:** Low self-esteem does not predict aggression; threatened egotism does (Baumeister, 1997).
- **Findings:** Narcissists react aggressively to insults, rejection, or status loss.

Chapter 29: The Emotional Dynamics of Narcissism

Authors: Jessica L. Tracy, Joey T. Cheng, Jason P. Martens

Tracy and Chen, also authors of *The Psychology of Status*, explain that narcissists depend on pride to sustain self-worth but collapse into shame when criticized. Shame often fuels defensive anger and hostility.

> the narcissistic personality may be a result of the same selection pressures that led to a dominance-based hierarchical system, with narcissists best characterized as individuals whose trait profiles and early-life experiences make them prone to chronic shame and hubristic pride, and to seek dominance as an adaptive solution.

- **Shame:** Central emotion of vulnerability, often masked by grandiosity.

- **Pride:** Authentic pride (achievement-based) vs. hubristic pride (arrogance)

Trait Orientation	Negative Emotion	Positive Emotion
Self-aggrandizing (Narcissistic)	Shame	Hubristic Pride
Self-accepting (Authentic)	Guilt	Authentic Pride

Guilt Motivates Improvement & Apologies, Shame Doesn't

> Studies have found that attributing failure to unstable, specific, controllable aspects of the self promotes the negative self-conscious emotion of guilt, rather than shame (Brown & Weiner, 1984; Covington & Omelich, 1981; Jagacinski & Nicholls, 1984; Niedenthal et al., 1994; Tracy & Robins, 2006).
> Guilt, in turn, promotes a wide range of positive social behaviors, ranging from apology and confession to empathy and altruism (Batson, 1987; Baumeister, Stillwell, & Heatherton, 1994; Tangney & Dearing, 2002). Furthermore, proneness to guilt is positively related to self-esteem, but generally unrelated to narcissism (Gramzow & Tangney, 1992).

⍰⍰♂ Lucio's note: gaslighters cannot own up and apologize
This is something we have noticed in our research and community as well. For example, in gaslighting dynamics and gaslighting signs we explain that some negative personalities may resort to gaslighting because they cannot own up and apologize.

Chapter 30: Narcissism and Romantic Relationships

Authors: Amy B. Brunell, W. Keith Campbell

Narcissism undermines close relationships. While initial charm attracts partners, long-term patterns of exploitation, lack of empathy, and self-focus erode intimacy.

- **Agency model:** Narcissists pursue relationships for status and self-image reinforcement.
- **Contextual reinforcement model:** Partners reinforce narcissists' self-focus by admiring their charm.
- **Chocolate cake model:** Relationships start sweet and appealing but end bitter and destructive. People reported that narcissists used them and played games with them
- **Can narcissists change?** Evidence suggests low motivation to change, but some improvement is possible with awareness and effort.

Participants' Ratings of the Partner During the Relationship, from Brunell, Campbell, Smith, & Krusemark (2004).

Participants' Ratings of Their Negative Feelings at the End of Their Relationships, from Brunell, Campbell, Smith, & Krusemark (2004).

🤔Lucio's Take: **Chart seems to disprove the chocolate cake model?**

Lucio:
While the theory and description seem to add up, the chart presented from the authors' study seemed to contract the model of 'great relationship start', with the non-narcissists slightly eding out the narcissists:

Participants' Ratings of How Satisfied They Were at the Beginning and End of the Relationship

I can think of some plasible explanations of why this is the case, but I wished the authors addressed it.

Narcissists Rarely Change

> Unfortunately, because narcissism is a feature of one's personality, it is extremely hard to change. Furthermore, (grandiose) narcissists feel good about themselves (Bosson et al., 2008), and this reduces

> motivation to change. Why should narcissists want to change when they believe they are better than everyone else is?

Chapter 32: Narcissism and Social Networks

Authors: Allan Clifton

Narcissists use social networks to maximize attention and status. In both sociocentric (group-based) and egocentric (personal) networks, they position themselves to gain visibility and influence.

- **Network position:** Narcissists seek central roles to maximize recognition.
- **Egocentric focus:** Relationships serve self-promotion more than mutual support.

Chapter 33: Narcissism and World Wide Web

Laura Buffardi notes that Narcissists post more attractive pictures, more frequent updates, and boastful content.

Chapter 34: Narcissism and Brand Name Consumerism

Authors: Constantine Sedikides, Sylwia Cisek, Claire M. Hart, Eva Schürch

Narcissists prefer luxury and brand-name goods as a way to signal status and superiority. Materialism and consumption serve self-enhancement but rarely increase long-term happiness.

> Brand names provide the platform through which narcissists shine, announcing their uniqueness, haughtiness, and dominance to the world. Brand names are just aids in the narcissistic pursuit of public affirmation and glory.

- **Brand preference:** Narcissists equate expensive brands with self-worth.
- **Inner fragility:** Consumption compensates for insecurity.
- **Happiness paradox:** Pursuit of brands rarely delivers genuine well-being.

Chapter 35: Leadership

Authors: Robert Hogan, James Fico

Narcissists often rise to leadership due to charisma, confidence, and dominance. However, their leadership is a double-edged sword: can be effective in crises or short-term goals, but harmful in the long run due to exploitation and poor empathy.

From a study of 111 CEO (Chatterjee and Hambrick, 2007):

> narcissists changed strategy more frequently, made more and more expensive acquisitions, and their decisions yielded high variability in performance. Moreover, the relationship was linear, so that the more narcissism, the more extreme the firm's performance.

- **Strengths:** Vision, boldness, persuasiveness.
- **Weaknesses:** Arrogance, insensitivity, exploitation.
- **Implication:** Narcissistic leaders succeed initially but risk organizational collapse.

Also read:

- Dark triads at the top: the myth of emotional intelligence

Interesting Notes

- **Appeal to their self-enhancement needs**: When coaching narcissists, one must appeal only to their self-interest. We find it useful to tell narcissists that certain behaviors will harm their careers, and certain others will enhance them.

Chapter 36: Celebrity and Narcissism

Authors: Brittany Gentile

Celebrity culture both attracts narcissists and fosters narcissism. The entertainment industry rewards self-promotion and attention-seeking, creating a feedback loop between celebrity and narcissistic traits.

Although disadvantageous in the long run, narcissists may do well as celebrities where they have to continually turn on the charm for new audiences. Each new performance offers the opportunity for narcissists to self-enhance, and they will exploit it to the fullest.

- **Appeal:** Fame offers validation and admiration.
- **Success:** Narcissists thrive in entertainment industries that reward visibility.
- **Consequence:** Celebrity life exacerbates narcissism, isolation, and instability.

Interesting Notes

- **Extrinsic vs. Intrinsic motivation inverts for narcissists**: Morf, Weir, and Davidov (2000) framed tasks in terms of either intrinsic or extrinsic goals. Participants high in narcissism enjoyed most the tasks in which ego goals were made salient and were motivated by the chance to be evaluated. In contrast, participants low in narcissism enjoyed the tasks most when completed for their own sake, without evaluation.
- **Poor team players but good stars**: *When narcissists were led to believe that they would receive group recognition for their performance, they outperformed all others in the group. When told that no one would be evaluated or that only the group's performance as a whole would be announced, they performed poorly. This drive to perform in front of an audience makes narcissism a potentially important personality characteristic to have as an entertainer* (Wallace & Baumeister, 2002)

Chapter 37: Narcissism and Spirituality

Authors: Steven J. Sandage, Shane P. Moe

Narcissists may pursue spirituality for self-enhancement rather than humility. Genuine practices of self-compassion and humility counteract narcissistic tendencies.

- **Religion:** Can be co-opted for self-aggrandizement.
- **Self-compassion:** Opposite of narcissism; linked to healthier outcomes.
- **Humility:** Protective against narcissistic entitlement.

Chapter 39: Attachment Theory and Narcissistic Personality Disorder

Authors: Björn Meyer, Paul A. Pilkonis

Narcissism can stem from insecure attachment — either avoidant (detachment, superiority) or anxious (hypersensitivity, vulnerability). Attachment-informed therapies encourage trust, emotional openness, and secure bonds.

- **Subtypes:** Avoidant vs. anxious narcissism.
- **Evidence:** Attachment therapy fosters more stable self-esteem and relationships.

Summary of studies:

Study	Sample	Measures	Main Findings
Brennan and Shaver (1998)	1,407 adolescents and young adults	Attachment: Bartholomew & Horowitz's 7-point scale PDs: Personality Diagnostic Questionnaire – R	Narcissistic PD not clearly associated with any one attachment style; low NPD prevalence (0.9%) may explain.
Dickinson and Pincus (2003)	80 undergraduates (26 grandiose, 26 vulnerable narcissists, 28 controls)	Attachment: Adult Attachment Questionnaire PDs: Narcissistic Personality Inventory	Grandiose narcissists reported secure or dismissive attachment; vulnerable narcissists reported fearful or preoccupied attachment.
Meyer et al. (2001)	149 adult psychiatric inpatients and outpatients	Attachment: Interview-based prototype rating PDs: Clinician consensus ratings from structured interviews	Narcissistic PD inversely correlated with secure attachment. Correlated with ambivalent and detached interpersonal functioning.
Otway and Vignoles (2006)	120 adults from general community	Attachment: ECR Scale (anxiety and avoidance) PDs: Hypersensitive Narcissism Scale & Narcissistic Personality Inventory	Attachment anxiety linked to covert narcissism. Both narcissism types linked to cold parenting and overvaluation. Overvaluation strongly associated with grandiose narcissism.
Popper (2002)	184 male cadet squad commanders (Israel Defense Forces)	Attachment: 15-item custom questionnaire PDs: Narcissistic Personality Inventory	High narcissism scores associated with more avoidant attachment.
Sherry, Lyddon, and Henson (2007)	273 undergraduate students	Attachment: Relationship Scales Questionnaire (RSQ) PDs: Millon Clinical Multiaxial Inventory-III	Weak positive correlation with secure attachment; weak inverse with fearful attachment. Narcissistic, antisocial, and compulsive PDs not well explained by attachment scales.
Smolewska and Dion (2005)	171 female undergraduate students	Attachment: ECR Scale PDs: Hypersensitive Narcissism Scale & Narcissistic Personality Inventory	Vulnerable narcissism strongly correlated with attachment anxiety; weakly with avoidance. Grandiose narcissism unrelated to anxiety or avoidance.

Chapters 38, 40, 41, 42, 43: Therapy for Narcissism

The last chapters review several treatment options for narcissism, including some excellent case studies.

Treating most narcissists remains challenging though:

> even when patients with NPD do commence treatment, they are often armed with enough arrogance and entitlement to blame not only everyone else for their circumstances, but the therapist as well.

> the majority of therapists choose to not work with patients with NPD, and many of those who do will feel relief when the patient ultimately ends the therapy (as is often the case).

Levels of Narcissism

From chapter 38 by Diana Diamond, Frank Yeomans, and Kenneth N. Levy:

Healthy narcissism

Integrated sense of self (accepts strengths and weaknesses).

- Stable self-esteem regulation.
- Ability to maintain values, relationships, ambition, and creativity.
- Can live in harmony with principles and enjoy fulfilling connections.

Neurotic-level narcissism

Grandiose self is present but identity remains relatively integrated.

- Excessive need for admiration, entitlement, envy, and lack of empathy.
- Outwardly adapted and can maintain stable self-esteem, but relationships remain shallow.
- Often seek treatment only after failures or crises expose the fragility of their grandiosity.

Borderline-level narcissism

Typical narcissistic personality disorder features: poor anxiety tolerance, impulsivity, and chronic failures in work and intimacy.

- Severe reliance on grandiose self, splitting of idealized vs. devalued self-aspects, with negatives projected onto others.
- Retreat into omnipotence and denial of dependency.
- Relationships are impoverished, others seen as either idealized or worthless.

Malignant narcissism

Most severe form.

- Ego-syntonic aggression, paranoia, and antisocial traits.
- Grandiose self fused with aggression and punitive internal objects.
- Need to dominate others, sometimes even sabotaging therapy through self-destructive acts.

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Narcissists Lose Out to Machiavellians

From Harry M. Wallace in chapter 27:

> Narcissists report Machiavellian willingness to manipulate others for personal gain (e.g., Paulhus & Williams, 2002), but their perpetual grandstanding regardless of context suggests that they lack the craftiness required to exploit others in ways that maximize self-benefits.
> For example, narcissists would likely have trouble resisting their impulse to claim superiority long enough to make allies and disarm opponents with tactics like ingratiation or feigning incompetence that require displays of modesty.

I agree with this, and I've often seen neediness for admiration and neediness to display superiority as a major weakness in narcissism.

Video example here.

Narcissists Beat 'Too Nice Guys' In Dating

From chapter 30, by Amy B. Brunell, W. Keith Campbell

> To test the Chocolate Cake Model, we asked individuals to reflect on past dating relationships with narcissistic and non-narcissistic partners.
> These individuals reported that they were attracted to narcissists because of the narcissists' charm, popularity, and sexual attractiveness (Brunell, Campbell, Smith, & Krusemark, 2004). By contrast, their attraction to their non-narcissistic partners was far less exciting; the non-narcissistic ex-partner was frequently described as "nice" (e.g., the boy/girl-next-door type).

Narcissists Undermine Their Colleagues

From Harry M. Wallace:

> Teammates of narcissists can expect to eventually be victimized by narcissists' tactic of self-promoting by denigrating and exploiting others (e.g., Campbell, Reeder, Sedikides, & Elliot, 2000; Kernis & Sun, 1994).

The More You Talk, The More Leadership You Gain

From chapter 35 by Robert Hogan, James Fico.
Contrary to popular 'laws', talking more during group formation is associated with leadership emergence:

> A study by Sorrentino and Boutillier (1975) essentially brought leaderless group discussion research to an end, but for an interesting reason.
> Sorrentino and Boutillier reported that ratings of leadership emergence were related to how much a person talked, and not to the content of his or her remarks. Narcissists say that they are usually the first person to speak in a group of strangers; thus, leaderless group discussions are a good way to identify narcissists.

QUOTES

On the inherent neediness of narcissism's 'quicksands':

> It is as if the narcissistic self was being constructed on quicksand, continually needing to be refortified and built higher, but never succeeding because simultaneously it is eroding below.
> These efforts are endless not only because they often misfire, but also because narcissists seem never to be able to persuade themselves of their own grandiosity

A woman to a cat:

> Not on this skirt. It's Armani! —A (narcissistic, presumably) woman brushing a cat from her knee

On negative judgments that narcissists may not care about:

> Affluent individuals are also judged as less considerate (e.g., less kind, likable, or honest; Christopher & Schlenker, 2000), but these are communal attributes that narcissists do not value (Campbell et al., 2002).

⍰⍰♂ Lucio's Analysis

The Narcissism Construct Needs Updating

This book makes a strong case that narcissism is a complex, multifaceted construct.

In fact, the case was eveb *too* convincing—highlighting how problematic it is to lump together grandiosity and vulnerability under the same label. Even if there are overlaps, the differences are substantial enough to produce very different real-world outcomes and research findings.

Unless studies focus strictly on the shared core, combining the two risks muddying results—much like what happened in the past with research on self-esteem.

A cleaner solution may be to treat grandiose and vulnerable narcissism as distinct categories rather than forcing them under a single umbrella.

REVIEW

The Handbook of Narcissism and Narcissistic Personality Disorder is a rigorous scientific compendium and one of the most comprehensive resources on the topic.

It's one of the backbones for many of our articles on narcissism, and we are deeply thankful to the authors and editors for their outstanding contribution to the field.

The Art of Seduction by Robert Greene: Summary & Review

Lucio Buffalmano · 15 October 2025 · Archived copy · Original

***The Art of Seduction** (2001)* by Robert Greene is one of the most influential books on the psychology of attraction and seduction power dynamics. It treats seduction not as romance, but as strategy — a psychological game where emotion, fantasy, and control decide who leads and who follows.
Below is a complete summary and review with The Power Moves insights, examples, and modern applications.

Contents

- The Art of Seduction Summary
- The Nine Seducer Archetypes
  - Anti-Seducers: Traits That Repel

The Art of Seduction Summary

- **"Seduction is a game of psychology, not beauty."** Confidence, attention, and timing outweigh physical looks.
- **Pick targets you can move emotionally,** not just people you like. Seduction is strategic selection.
- **Make them fantasize.** Fantasies beat reality. People fall for what you represent, not who you are.
- **Power is magnetic:** confidence and status attract

The Nine Seducer Archetypes

Greene divides seductive power into nine archetypes. Each represents a timeless way humans attract and influence others:

#1. Siren

Sirens are raw sexual energy.
They use voice, allure, and sensual presence to promise pleasure and danger. They have slow movements, and are sexually self-assured.
Cleopatra and Marilyn Monroe seduced through irresistible femininity.

Power play: Overwhelm senses, promise release.

✕ **Dangers**: Jealousy from same-sex peers and frenemies

- **Case studies**: 3 female seductresses

#2. Rake

Lives for passion, and with his passion **he makes women feel uniquely desired**.
His intense desire flatters and disarms. He symbolizes escape from boredom, he's a guilty pleasure. Pure fun plus risk is perversely attractive.

Modern version: the charming bad boy who acts on impulse yet makes women feel seen.

✕ **Dangers**: Reputation backlash if overplayed.

- Psychology of womanizers

#3. Charmer

> *"Charmers seduce by focusing on others, not themselves."*

He masters social grace and empathy. He listens, mirrors emotions, and makes people feel safe and understood. His warmth builds trust before attraction.

✕ **Dangers**: Seen as fake—switch to firm when needed.

- Learn: How to be charming.

> How to be Charming: The Art of Social Seduction

#4. Charismatic

He radiates confidence and lifts people up with his energy. Charismatics combine faith, mystery, and magnetism; they lead crowds through belief rather than logic.

Examples: Joan of Arc and Rasputin <— ⍰⍰♂ **Lucio's note**: while Joan of Arc was *socially* seductive, I have doubts about her sexual seductivity

✕ Dangers: Volatile—emotions flip fast and charismatic leaders can become scapegoats.

- Learn how to be charismatic.

> How to Be Charismatic: A Practical Guide (W/ Examples)

#5. Ideal Lover

The ideal lover tailors his romance to his victim's fantasies and romances them hard.
Casanova's method was to study what each woman lacked and become it.

Power lesson: project what other wish they had. Beauty, mystery, or adventure people crave but can't find.

✕ **Dangers**: Flaws can shatter the illusion of the ideal lover's dream.

#6. Dandy

He rebels through style and ambiguity, including gender fluidity: he is neither masculine nor feminine. But he embodies both female and male energy.
Dandies embody freedom from convention and the power of individual expression. They are artists, poets, and composers.

✕ **Dangers**: Becoming “too much”, too weird, and being attacked for being different.

#7. Natural

Naturals are spontaneous, joyful, and childlike. They disarm cynicism and rekindle wonder. He spellbinds victims by reminding them of their childhood.

Power lesson: genuine enthusiasm seduces more than technique.

✕ **Dangers**: Pure childishness annoys. Mix it with adult’s wisdom.

#8. Coquette

> *“People only value what they can’t fully possess.”*

Coquette provoke with their sexuality and prod their victims to chase with their withdrawal. Emotionally, they alternate warmth and distance to keep others off-balance.
They are empowered and self-sufficient, making their victim crave their possession.

✕ **Dangers**: Overdoing withdrawal can cause victims to move on. And this game can turn love into hate.

#9. Star

Larger-than-life, surrounded by myth. They glow with mystery and distance; people fall for the fantasy, not the person: they are objects of desire.
In modern culture, celebrities and influencers play this role daily.

✕ **Dangers**: Fade when novelty wears off and a new star becomes ‘hip’.

For the full list and ‘how to’ see here:

- Art of Seduction Seducer Types
- Male seducer types, more scientific and real-world practical

Anti-Seducers: Traits That Repel

Greene also lists the opposite types — the **Anti-Seducers** — whose insecurity, self-centeredness, or moralizing destroys attraction.
These are the anti-seducers:

- **Brute**: No patience, skips seduction.
- **Suffocator**: Clings too soon.
- **Moralizer**: Forces their standards.
- **Tightwad**: Cheapness screams insecurity.
- **Bumbler**: Awkward, spreads discomfort. Fix social awkwardness.
- **Windbag**: Endless talk.
- **Reactor**: Ego-fragile.
- **Vulgarian**: Ignores rules, expects wins.
- **Greedy**: Obvious agenda. Goal diggers exposed.

Pro Tip: Ditch anti-seducer vibes with Power University—become top 1% in life and dating.

The Eighteen Victim Types

Seduction succeeds by filling emotional gaps. People reveal what they lack — admiration, adventure, validation, or freedom — through subtle cues. Greene categorizes common targets such as:

- **The Disappointed Dreamer:** longs for passion and escape from monotony.
- **The Pampered Royal:** expects adoration and fantasy treatment.
- **The New Prude:** fears judgment but secretly craves release.
- **The Rescuer:** wants to save someone from chaos or darkness.
- **The Beauty:** tired of surface praise, yearns to be seen for intellect or depth.
- **The Conqueror:** needs challenge; make them chase you.
- **The Crushed Star:** misses attention once freely given.
- **The Lonely Leader:** powerful but isolated; treat them as equal, not follower.

Power lesson: Never seduce your own type. The more different your strengths and their lacks, the stronger the pull.

The Four Phases of Seduction

Greene structures seduction as a four-stage process — psychological warfare wrapped in pleasure. Each stage deepens emotional dependence until the target willingly surrenders.

1 — Separation: Entering Their World

Targets live consumed by routine. The seducer's first task is to break that rhythm and appear as something new. Approach indirectly, study their weaknesses, and make them feel chosen. "There is nothing more effective than making the victim think they are seducing you."

- Approach sideways — intrigue, don't demand.
- Use mixed signals: warmth one moment, distance the next.
- Appear desired by others; triangles amplify status.
- Subtly remind them of what's missing in their life.

2 — Lead Astray: Creating Pleasure and Confusion

Once attention is won, the goal is emotional intoxication. Use surprise, storytelling, and small vulnerabilities to humanize yourself while maintaining mystery. "Dogs are reliable; a seducer is not."

- Keep them guessing; unpredictability sparks obsession.
- Use poetic, suggestive words instead of direct propositions.
- Pay attention to detail — scent, tone, and setting matter.
- Show selective weakness to lower defenses, never full neediness.
- Blur fantasy and reality so they forget where imagination ends.

3 — The Precipice: Intensify Emotion

Here the seducer deepens attachment through extremes — devotion, guilt, conflict, and transgression. Pleasure without risk bores; tension makes it addictive. Greene notes: "The lower the lows you create, the higher the highs will be."

- Prove yourself through effort or symbolic sacrifice.
- Tap childhood emotions (regression) by nurturing or being nurtured.

- Break taboos — forbidden equals unforgettable.
- Alternate affection and distance to create craving.
- Use spiritual or artistic frames to elevate physical desire.

4 — The Kill: Sealing the Seduction

At the peak of tension, reverse the chase. Withdraw slightly and let them pursue. “When the pursued becomes the pursuer, the seducer holds total power.” Physical connection now feels inevitable rather than forced.

- Back off to let desire build in your absence.
- Use touch, voice, and eye contact as cues for release.
- Be bold when the moment arrives — hesitation kills momentum.
- End cleanly; mystery must remain or attraction fades.

This is how you reverse the chase in advanced mode, *after* you seduced them:

> **Lucio**: She turned to make out with me, and she asked if she could spend the night over

Pro Move: Seductive Environments

Theatrical spaces block reality and allow your targets to let go.
Go for mystical vibes and role-play opportunities.

See how:

- Seductive environments guide.
- Playlist: Romance tunes.

> How to Create a Sensual Atmosphere: Sexy Environment

Lucio Buffalmano’s Review

The Art of Seduction is brilliant for its understanding of emotional power dynamics and social influence, but limited as a modern dating guide.
Greene’s framework shines at explaining emotional control, yet many tactics belong to the bygone era of slow-moving courtly love — not twenty-first-century relationships.

And even if you’re planning on a time machine and turning into a knight in shiny armor, you’d still need the foundations of dating power dynamics.

1. Good psychology, weak practicality. His advice on letters, mystery, and “therapist seduction” works only if you already have status. In today’s fast-paced dating, leadership and initiative outperform prolonged intrigue.
And heterosexual men have less to gain from non-heterosexual seduction.

2. No science or personal experience. And we believe both are important to teach others. For example, Greene claims powerful men secretly want to be dominated. That feels like a Freudian-psychotherapy approach, but modern data-driven sources and research suggest the opposite — high-power men often maintain dominance in sex as in life.

3. Ignores basics: status, dominance, and SMV. None of his archetypes captures the high-value, dominant man who leads naturally. Seduction divorced from sexual market value and man’s confidence becomes hollow and

ineffective. Even Casanova's 'ideal lover' charm was backed up by confidence and dominance (and a narcissistic streak, probably)

4. Less effective in today's age. The book relies on royal courts, poets, and saints — fascinating but detached from real, modern social dynamics. Some emotional truths remain useful, yet the scenarios feel theatrical rather than actionable.

5. No win-win. Greene never addresses responsibility or win-win. His manipulative tone can encourage deceit. Not only it's a possible failure of honor and ethics, but it's also potentially less effective in many contexts.

Despite these flaws, the book's brilliance lies in revealing that attraction is a social exchange of power. As Greene writes, "Every seduction has two elements: yourself and what is seductive about you; and your target, the actions that will penetrate their defenses." Understanding that duality is timeless.

Modern Takeaways & Applications

- **Seducers break the rules and conquer hearts and souls**: learn psychology but add power… And you won't need crazy looks, six figures, or a six-pack
- **Power and confidence** matter more than lines or looks.
- **Balanced polarity** — masculine leadership with emotional warmth outperforms one or the other.
- Real power is when others chase your validation, not your approval.

Final Verdict

Rating: 8.5/10 — A masterclass in dark psychology and timeless social strategy. Great read for students of advanced social arts to develop strategic thinking and power awareness. Use it to deepen your understanding of attraction, **but *not* a as manual for modern-day effective dating**. For that, including for modern seduction, address the basics of high-value men, dating power dynamics and sexual marketplace realities.

Masculine vs. Feminine Energy: The Science of Gender Differences

Lucio Buffalmano · 19 October 2025 · Archived copy · Original

In popular discourse, people often speak of “masculine energy” versus “feminine energy.”

Scientifically, however, there are no mysterious separate energies – **observed gender differences arise from biology (genes and hormones) and cultural factors**.

In this article, we’ll review the overlap and differences between men and women.

There is no masculine or feminine ‘energy’, but masculine and feminine biologies, behaviors, looks, mindsets, and gendered cultural associations (like blue for men and pink for women)

Intro: Gender Differences

Men and women differ on average in many traits, while also sharing much in common.

In practice, **masculinity and femininity lie on continuous spectra** with much overlap.
This comparison table reviews the key average male–female differences:

Trait / Domain	Men	Women	Magnitude / Notes
Mental	Wider IQ/math spread; higher spatial (rotation/navigation), STEM propensity. Same general reasoning	Higher verbal (fluency, reading, writing) & location memory; higher superstition (woo-woo)	verbal: small; spatial: moderate
Physical	Hairier, taller, heavier, stronger (esp. upper body), higher athleticism	Higher flexibility; similar endurance	From moderate to large
Aggression	More physical & verbal aggression, especially in competitions	More relational & covert aggression (e.g., exclusion, gossip, & in relationships)	Moderate
Risk-Taking	Higher, especially under social pressure or masculinity threat	Lower; more cautious and risk-averse	Moderate to large in physical domains
Emotional Expression	More anger expressions; less expressiveness in public; similar in private	Higher emotional responsiveness, expressiveness (esp. for sadness/vulnerability)	Small to moderate, varies by emotion & context
Help-Seeking	Less likely to seek help; greater self-reliance	More likely to seek help, esp. for emotional or health	Substantial real-world implications
Communication Style	Report-focused, task-oriented, higher power language	Rapport-focused, cooperative, lower-power language	Context-dependent
Nonverbal Behavior	Less smiles & gazes; more dominant nonverbals	More smiles, gazes, touches in social contexts;	Small to moderate; varies with context
Socialization & Skills	Activity-based; instrumental support; lower self-disclosure & social skills	Emotion-based & intimate; co-rumination; higher emotional reading	Moderate
Empathy & Helping	More physical help in public or risky situations	More nurturing & empathetic in private	Moderate; varies by situation
Confidence & Self-esteem	Higher confidence; attributes success to ability	Lower & fluctuating; attributes success to effort & luck	Small to moderate
Leadership	More task-oriented or autocratic leadership. Competence assumed.	More democratic or transformational leadership. Competence must be proven	Large perception gap, equal results
Social Dominance	Higher interpersonal dominance and social-dominance orientation	Lower interpersonal dominance & SDO	Moderate to significant
Health	Higher mortality, externalizing (antisocial); more completed suicides	Higher morbidity, depression, anxiety, eating disorders, suicide attempts, emotional volatility	Substantial health implications

Trait / Domain	Men	Women	Magnitude / Notes
Attraction & Relationships	Value physical attractiveness and sexual variety; more independent	Value emotional intimacy and resource stability; more interdependent	Consistent across many cultures

Table compiled by Lucio Buffalmano, synthesizing empirically supported findings from the Sage Handbook of Gender and Psychology & Helgeson's Psychology of Gender, and various meta-analyses

⁉️ **Reminder:** these are averages. They don't always apply to every single man and woman, and masculinity and femininity may also be unconnected to biological gender.

- **Male Physical traits:** Men are on average taller, heavier, with more muscle mass. This reflects innate differences in muscle fiber size and distribution
- **Female Physical Traits**: Women carry more fat relative to weight (important for fertility and energy storage) and have more flexible joints
- **Cognition:** Men tend to do better on spatial-visual tasks, especially 3D mental rotation (Voyer, Voyer & Bryden, 1995), while women have slight advantages in verbal fluency and episodic memory (Lindberg et al., 2010).
  No difference in mathematics (Hyde, Fennema & Lamon, 1990).
- **Personality and behavior:** Men report higher trait assertiveness and risk-taking; women report higher empathy and nurturance.
  Males use physical aggression more often (Archer, 2004) and more often adopt dominant or competitive communication styles in groups
- **Emotional expression:** Men and women experience similar emotions, but express them differently. Men are more likely to outwardly express anger or pride, whereas women more often show sadness, fear, guilt or shame

Self-Esteem In Genders: Resilient vs. Fragile

Meta-analyses find that men score slightly higher on global self-esteem.
Hyde reports a small effect (~d = 0.2), but the small effect may underestimate how self-esteem changes in real-world settings.

Across several studies, men's self-esteem seems more constant and independent when faced with criticism or feedback.
This study for example showd how men and women change their self-evaluation based on feedback:

from Roberts and Nolen-Hoeksema's study, adapted by Helgeson

The Roots of Gender Differences

Despite lacking evidence for 'feminine or masculine energy', there is strong empirical support for the following domains.

1. Biological Factors

Innate biology underlies many average differences, and may set the 'foundations' for everything else.

Sex chromosomes (XX for women, XY for men) trigger developmental differences in the brain and body. And circulating hormones play a major role in gender differences.

It's important to note that biology may also set preferences despite no innate skill differences.
For example, men still prefer STEM-related fields despite the fact that gender differences in math abilities have virtually disappeared.

2. Cultural Norms & Expectations

Cultural norms set the expectations of 'what a man should be' and 'what a woman should be'.
For example, many may consider a passive and submissive man 'less masculine'. And they may consider a more assertive woman 'less of a stereotypical woman'.

Cultural expectations are often also normative. Meaning: they exert social pressures to *conform* to the expectations, with social costs for non-conformers (ie.: status loss for men).
This can lead to a self-fulfilling prophecy of first enforcing and then confirming cliches.

However, biology and evolution still influence culture (and the other way around).
For example, men's preferences for more feminine and submissive women may be rooted in men's evolutionary problem of paternity. A more submissive woman may be perceived to be, and may as well be, less likely to cheat.

3. Socialization

In many cultures, boys and girls are overtly or subtly steered into different roles and activities.

Again, socialization and biology may go hand-in-hand.
Pellegrini notes that many boys naturally choose more dominance-oriented plays, while women naturally choose more relationship-based games (Pellegrini, 2013).
But socialization still matters and may also reinforce these tendencies.

4. Social Roles & Self-Identities

Historically and in many cultures, men had traditional roles of protectors and providers, while women were expected to be kind daughters and nurturing mothers.

Roles are also influenced by biology and evolutionary drives.
For example, men's higher risk-taking and spatial abilities better aligns with hunting, which more modern societies may have inherited as working providers.

These roles may also set identities and provide a base for self-esteem.
For example, some men may think of themselves as 'independent players' and be proud of it, potentially inhibiting more long-term relationships or father roles.

5. Self-Identification (Yes, It Matters)

According to the *APA Handbook*, self-identification may shape nonverbal cues more than gender.

For example, feminine self-identification appears to predict decoding accuracy more than biological sex.
Write the authors:

> ***psychological gender may be more critical than biological gender.***
> *(…) nonverbal behaviors may often be telltale indicators of femininity and masculinity rather than manifestations of biological femaleness and maleness.*
> *The critical issue may thus be the degree to which any male or female personally subscribes to societal definitions*

> *of masculinity and femininity. In some cases, psychological gender dovetails with biological gender*

The authors also add that psychological gender can also match biological gender, which it often does.

All Factors Co-Influence Each Others

These factors may sometimes clash, but often reinforce each other.

For example, biology may set preferences. These inclinations may lead to choosing early-life plays and later jobs that hone certain skills. Those jobs turn into roles, self-identifications, and social expectations.

Bias vs Reality

It's challenging analyze topics like mating and gender differences without any bias (see power dynamics below). Bias can come from both sides: the *denial* of differences, and the *overstatement* of differences.

The Denial of Gender Differences

Several prominent scholars claimed that human innate mechanisms have been denied and suppressed in the social sciences.

Since our takes already align with evolutionary science, we refer to our review of Pinker's *The Blank Slate* for more, and address the opposite side of the argument.

The Overstatement of Differences

Table dichotomies and pop-psychology authors can exaggerate differences, and popular perceptions turn gradients of gradual differences into categorical polar opposites.

For example:

Masculine Traits	Feminine Traits
Assertive	Agreeable
Dominant	Nurturing
Stoic	Expressive
Independent	Interdependent
Competitive	Cooperative
Relaxed	Neurotic

Partly true—but without context, it's just pop-psychology (and manipulation attempts, see below)

These claims aren't totally wrong.
But they *overstate* differences. For example, Janet Hyde's review of 46 meta-analyses found that many small differences are context-dependent. And the largest gaps (e.g. aggression, sexuality) are still moderate in size (Hyde, 2005).

Pop Psychology-Consuming Masses Perpetuate The Myths

Dichotomous distinctions also persist because cognitively unreflective audiences cling to simplistic explanations.

Simplistic explanations, be it 'we're all the same' or 'we're opposites' are easy to process and remember.
The more truthful but complex explanations are more for 'the few' in the upper percentiles.

Misleading Scholars In Evolutionary Studies

While the denial of differences may sometimes be less factually correct, scholars may also not be immune to *overstating* the differences.

Stewart-Williams explains it in *The Cambridge Handbook on Human Behavior*:

> Kanazawa (2003) observed that, "In every society, men prefer young and attractive women, and women prefer wealthy and powerful men".
> Such descriptions suggest substantial, dichotomous differences. The evidence for these differences, however, invariably consists of relatively modest differences in the central tendencies of highly variable and overlapping distributions.

The Truth: Overlap, Individual Variation

There are real and important gender differences, with large overlaps.

Virtually no trait is *exclusive* to men or women, and the difference is more a matter of degrees.
Gender differences often follow this pattern:

Crucially, it's worth remembering that there is enormous variation *within* each sex. For many traits, intra-sexual variation is larger than inter-sexual vartiation.

Evolutionary Perspective: Mating Differences & Life Phases

From an evolutionary perspective, men and women should differ most in reproduction-related traits.
For example, men's higher preference for variety and women's higher preoccupation with forced copulation.

And as would be predicted by evolutionary models, several differences decline after the 'core reproductive years'.
For example, the 'smiling gap' in public narrows as women get older (LaFrance et al., 2003).

Importantly, the differences may be smaller or non-existent in survival-related traits like general intelligence or

cognitive biases.

Small Differences Matter: Emergent Behavior & Social Dynamics

There is much truth in the claim that 'differences aren't that big'.
But it would be a major mistake, and an unfortunately common one, to conclude that 'since gender differences are not so large, they don't matter'.

Instead, even small gender differences matter. Especially if they are persistent across time and situation, as many are.
There are three levels to this:

- **Individual differences add up.** A woman who negotiates 20% less often, 30% less assertively, and rarely demands a promotion ends up earning considerably less money across her life
- **Differences aggregate at population level** to produce large social effects
- **Outliers have the largest impact** even if most average men are just a little more ambitious or ruthless, the

This is how we naturally end up with more female kindergarten teachers, most male billionaires, and almost all top athletes and dictators being males.

In brief: gender is a crucial factor to predict personality and behavior, while still being one factor among many.

Power Dynamics Explain It All

> Masculinity gets ahead, femininity gets along
>
> *– A generalization, with an uncomfortable backdrop of truth*

The root cause of many gender-biased takes come down to power dynamics, as shaped by evolutionary drives, and fueled by subconscious self-interest.

Masculinity is associated with power/independence and femininity is associated with submissiveness/*inter*dependence. This has tremendous implications for gender relations and public discourse. It's the unspoken notion that drives all modern 'gender cultural wars'.

Both genders defend or undermine those associations based on their motives and self-interests.

Men stress the biological roots of gender dichotomies because they underpin their mating strategies.
If everyone accepts male power and feminine dependence, men maintain social power and women seek male 'provision and protection'. Protection-seeking women fall straight into men's arms, fulfilling their sexual and reproductive drives.

On the other hand, some **modern women reject the biological roots of gender differences because it better supports their preference for women's power.**
If differences aren't biological, then men aren't 'naturally' higher power, and women can be equally high-power and independent.
Women who champion women's empowerment fear that 'admitting' femininity's association with coyness and women's ancestral 'need for male provisioning' undermines their cause.

This is why feminist-leaning scholars lean culture/social constructionism, and male scholars lean biology/evolution.

These underlying power dynamics and opposing interests make an unbiased discourse challenging.
Bar for a few enlightened individuals…

TPM's Stance: Individual Empowerment Sets You Free

We take no side because we champion *individual* empowerment, rather than group or gender-based power.

Empowered *individuals* do better in life, and are also mentally unbiased. They are unbiased because they can be; they don't depend on their gender to do well.
If anything, empowered men *gain* with women's empowerment (see this video for more).

Want to become this type of man?

9 Types of Seducers: Robert Greene's The Art of Seduction Explained

Lucio Buffalmano · 26 October 2025 · Archived copy · Original

In the first part of *The Art of Seduction,* Robert Greene describes 9 seducer archetypes.
He says that these archetypes are timeless, and they are:

1. Sirens
2. Rakes
3. Charmers
4. Charismatics
5. Ideal lovers
6. Dandies
7. Naturals
8. Coquettes
9. Stars

Let's delve deeper into each one of them:

  - Seducer Types FAQs

1. The Siren

The siren is a highly sexual woman, offering the promise of endless pleasure mixed with a bit of danger.

- **Historical Example**: Cleopatra
- **Modern Example**: Marilyn Monroe
- **Symbol**: Water

The Secret of the Siren

Robert Greene says sirens are the most powerful seductresses because they operate on a man's most basic drives, and these work on everyone.

Dangers of Sirens

Intrasexual competition is the main risk.
Meaning that other women can get jealous and plot against the siren.

Example:
Robert Greene talks about Marilyn Monroe's orgasmic faces. Here is an example for you:

How To

Be sexual and attractive.

Read more on siren seduction here:

- How to seduce a man case study.
- How to make him crazy

2. The Rake

The Rake is a man who insatiably adores women.

He is a great female fantasy because, deep down, women crave to be desired.
Unfortunately for some women, the rake is a lover at heart. He desires *every* woman, so he may be unfaithful. But

that only adds to his appeal.

- **Historical Example**: Giacomo Casanova
- **Modern Example**: Don Juan
- **Symbol**: Fire

The Secret of the Rake

The Rake is a guilty pleasure offering what society does not allow women: **an affair of pure pleasure**.
Plus, the excitement of rebelling, danger, and doing 'something bad'.

How To

Love women, love romance, love seduction.
Then, let that passion fuel your action.

Learn more here:

- The psychology of womanizers
- Lovers, providers, & friends: the 3 male sexual roles
- Lovers vs providers: picking your best strategy

3. The Charmer

Charmers are highly skilled social players.

Instead of thinking about themselves, they *remove* themselves from the equation.
Their spotlight and focus is on their target, and with their high empathy they learn what makes you tick, what you want, and… Your weaknesses.

- **Historical Example**: Benjamin Disraeli
- **Modern Example**: Oprah Winfrey
- **Symbol**: The Mirror

The Secret of the Charmer

With their full focus on the target, charmers **make you feel understood**, and targets bond deeply with them.

The Dangers of Charm

Greene says that some people may view Charmers as slippery and deceitful. They can come across as less masculine, and struggle to gain respect and status.

So Charmers must know when to stop being 'nice' and adaptable, and act with more dominance.

Learn how here:

- **How to be more dominant**, without being aggressive

How To

Learn advanced social skills, be smooth, charm *everyone*, not just your targets.
That will help you gain social status and diffuse admiration, making you an object of desire.

Learn more:

- How to be charming (with video examples)
- How to bond and connect

> How to Build Emotional Connection With Women & Friends

4. The Charismatic

Charisma is an exciting presence.
Inner qualities like confidence, unwavering belief, or a sense of purpose drive charisma. Others are drawn to charisma because they lack these qualities

- **Historical Example**: Joan of Arc and Rasputin
- **Modern Example**: Elvis Presley
- **Symbol**: The Lamp

The Secret of the Charismatic

Charismatics are highly influential leaders whom people flock to.
They thrive the most during turmoils, when fearful people look up to their conviction and belief.

Dangers of Charisma

Charisma can be as volatile as the emotions it creates, says Robert Greene.

TPM Note: Only extreme charisma is volatile
Greene refers to extreme, quasi-possessed personalities like Savonarola. More balanced and calibrated charisma isn't nearly as volatile.

Learn more:

- Law of optimum balance, so you don't overdo charisma
- **How to calibrate**

> The Science of Social Calibration: 7 Steps to Mastery

How To

Learn more:

- How to be charismatic

> How to Be Charismatic: A Practical Guide (W/ Examples)

5. The Ideal Lover

Ideal lovers learn their targets' broken dreams and fantasies and make them feel like they may now live them in real life.
Do you long for adventures, romance, and losing yourself in the moment? The Ideal Lover will provide it for you.

- **Historical Example**: Madame de Pompadour

- **Modern Example**: Christian Grey from Fifty Shades of Grey
- **Symbol**: The Portrait Painter

The Secret of the Ideal Lover

The ideal lover is so powerful because most people live a life of quiet desperation. They gave up their dreams and never enacted their fantasies.

Dangers of Ideal Lovers

You create a fantasy that involves the idealization of your own character. If your faults get in the way, you will destroy that fantasy.

The Ideal Lover is rare in the modern world because it takes much effort and time.

How To

> **Lucio**: I made her open up and share her full self. Then, I made love to her. And she fell in love

You must acquire empathy and theory of mind to learn about your target.

What they say is part of it, but even more important is what they *don't* say. And what they may not even know themselves.
Discover the fantasies that they don't even realize they have. And position yourself as the conduit to live them in real life.

If they're ambitious, appeal to lofty ideals together with carnal desires. And sexual affairs will become sense-engulfing love affairs.

6. The Dandy

Dandies focus on appearances, offering androgynous allure (example: Rolfo Valentino).

Dandies live for pleasure and surround themselves with beauty, while also 'beautifying' themselves.

He is also insolent like the Rake. But while the Rake's insolence is in his pursuit of women, the Dandy's insolence is towards society and conventions. He's not rebelling against the monogamy ideal, he's rebelling against *all* conventions.

- **Historical Example**: Marlene Dietrich
- **Modern Example**: Prince, Russel Brand
- **Symbol**: The Orchid

The Secret of the Dandy

Men and women often don't understand each other. That creates mistrust and prevents a deeper connection.
The Dandy is reassuring, feels comfortable for having similar traits, and bonds deeper with their targets.

Dangers of Dandies

Greene says that Dandies may be accused of **lacking masculinity** for men, or lacking femininity for women.
And their habit of breaking conventions can irk and annoy people.

How To

The key is ambiguity and straddling the line.
You are 70% heterosexual, but some people sometimes may not be 100% sure.

And embody both masculine and feminine energy.
Lead resolutely in dating, but when it comes to bonding, lean more feminine to make your target feel bonded and understood.

Learn more:

- Russell Brand dandy style: a video analysis

7. The Natural

Naturals are spontaneous and open.
They bring us back to childhood by embodying child-like qualities such as spontaneity and sincerity.

- **Historical Example**: Charlie Chaplin
- **Modern Example**: Zendaya
- **Symbol**: The Lamb

The Secret of the Natural

Childhood is the golden paradise we consciously or unconsciously try to recreate.

Dangers of Naturals

Total childishness can be annoying, so the best Naturals combine adult traits like experience and wisdom with a childlike manner.

How To

Rediscover your 'thirst for life'.
Be excited to see and try new things, discovering new foods and tastes, and experiencing all life has to offer.

The key is to truly rediscover your inner 'sense of wonder'. The more absorbed you seem in your own joy-filled world, the more seductive you become.

But when the conversation turns serious or there are goals to be achieved, move back to rationality.
It's the *mixture* of qualities that is most attractive.

- How women use Natural seduction: a 'regression' seduction example

8. The Coquette

Coquettes may alternate nice girl behavior with little devil upheaval

Coquettes are narcissistic, self-absorbed, and high-power.
They can come on strong, act in love and all over you… Only to later turn cold and distant.

- **Historical Example**: Empress Joséphine Bonaparte
- **Modern Example**: Andy Warhol
- **Symbol**: The Shadow

The Secret of the Coquette

The Coquettes' power is emotional enthrallment.
Tease and temptation are the initial lures, but the **coquette's superpower is emotional withdrawal** after they have gained emotional leverage over you.

The withdrawal also **makes targets insecure**, and the more insecure you feel, the more you cling to them.

Dangers of Coquettes

Volatile emotions can turn destructive, and love can easily be replaced by hate.

Their game of presence/absence can also lean too strongly on the absence, and the targets may break free for good.

Finally, too many negatives compared to positive moments can ultimately lead to stronger targets cutting contact for good.

How To

Be an object of desire, give yourself initially, but never fully. Alternate presence with withdrawal, romance with drama, and target-admiration with self-admiration.

- How coquettes seduce a man for a real-life example
- Emotional manipulation

9. The Star

The Star is a larger-than-life figure who captivates with their glamour, mystery, and presence.
They are ethereal, distant, and envelop themselves in mystery.

- **Historical Example**: John F. Kennedy
- **Modern Example**: Beyoncé
- **Symbol**: The Idol

The Secret of the Star

Daily life is mundane and boring.
The star represents the **escape into fantasies and dreams**.

Dangers of Stars

People may tire of your illusion, and stardom is always transient. After your 15 minutes of fame, people may move to the next up-and-coming star.

Once people move on, it it will be difficult to regain your spot in the sun. And there may be psychological blowbacks as well. Unless you develop an antifragile ego, you may feel depressed as a 'has-been'.

How To

Greene in *The Art of Seduction* says you must transform yourself into a glittering object.

We agree, but we believe that the key is popularity and fame. Weak stars *play* the star, without being well-known. That's entitlement.
Powerful stars are at least social circle-level popular. Ideally, famous.
And fame is one of the best 'seduction hacks' possible:

- Sexual market value hacks: shortcuts to seduce and win at dating

> 10 Sexual Market Value Hacks to Boost Your Attractiveness

Are Greene's Seducer Types Correct?

Greene's seducer types are interesting, and we may argue that some of them include proven attractive traits.

However, it's important to notice that **it's not an empirically validated, exhaustive, or experience-based list.**

Some valid criticisms that can be leveled include:

- **Foundations of attractiveness are missing** including, at the higher level, high mate value that underpins *any* effective seducer
- ***Social* seduction mixed with romantic seduction**: The two overlap, but aren't the same. The 'charismatic leader' for example isn't always a seducer
  - Homosexual and heterosexual mixed, and heterosexual men may be set up for failure following homosexual tactics
- **Some archetypes feel more arbitrary and less effective**. The Ideal Lover for example hardly qualifies as a distinct, self-contained archetype and may have more limited scope.
- **Some archetypes are over-psychologized**. The 'rake' is simply a player type, and the 'star' leverages fame/status

And of course, and this is valid for any archetype: they're simplifications of reality. Advanced operators may integrate several styles, or change them to suit different partners and situations.

That said, Greene's analysis remains valuable in many parts, offering plenty of valuable lessons.
To integrate it with a more science-backed approach to male-only seducers, see:

- The most effective male seducer types

> 10 Proven Seducer Types That Drive Women Wild

Seducer Types FAQs

What are the 9 types of seducers?

Robert Greene's nine seducer types are Siren, Rake, Ideal Lover, Dandy, Natural, Coquette, Charmer, Charismatic, and Star. These are archetypal styles, not an exhaustive, science-backed taxonomy. For a more practical approach to dating, it is often more effective to look into more validated seducer archetypes that embody foundational traits like high status, physical attractiveness, and social dominance.

Are Greene's seducer types real?

No, Greene's seducer types are not empirically validated, discrete categories. Each highlights a trait or strategy based on Greene's analysis (e.g., Siren = overt sexuality; Dandy = androgynous flair; Coquette = presence/withdrawal), but they're not based on modern psychology of attraction.
While they offer interesting insights into human behavior, they lack the foundational elements of evolutionary psychology, such as Mate Value (SMV) and status.

Which of the 9 seducer types is the best or most effective?

The Siren is often considered the most powerful because it's the only one based on a more empirically validated attraction trigger. Otherwise, there is no "best" archetype among the 9 types because they are arbitrary and do not represent a hierarchy of effectiveness. Success in seduction rarely comes from picking one category to mimic. Instead, the most effective operators build a strong foundation of high mate value and then calibrate their social style.

Do Greene's 9 seducer archetypes work?

Some of Greene's seducer traits are effective, but they are not substitutes for the core drivers of attraction, such as physical attractiveness, status, and dominance. Greene's archetypes work better as a "stylistic layer" on top of a high-value foundation, rather than a standalone strategy.

Hamza Ahmed Review: Great For Beginners, But Top-1%?

Lucio Buffalmano · 3 November 2025 · Archived copy · Original

If you're searching for a "Hamza review" or asking "is Hamza legit?", you're in the right place. The YouTuber Hamza Ahmed has become one of the most polarizing figures in the men's self-improvement space.

To his fans, he is the "**benevolent big brother**" who pulled them out of a cycle of video games and porn.
To his critics, he's a "**grifter**" or "cult leader" who overcharges for repacked advice on his "Adonis School" and promotes a simplistic, black-and-white worldview.

So, which is it?
We review what Hamza gets right, what he gets dangerously wrong, and where his advice *must* stop if you want to graduate to the top 1% of strategic effectiveness.

⁉ Note: This review focuses on Hamza's teaching & Adonis Skool
Some controversies raised questions about Hamza (TRT use, some power moves, and public split with a former partner). We reference them when they affect Hamza's teaching and products.

  - Adonis Skool
  - Hamza Advanced Course Common Objections
  - Hamza Course vs. Power University
- Hamza Ahmed: Short Review

What's Good

Hamza promotes discipline, habits, and consistency, all critical foundations for men's development.
These foundations help men succeed while also becoming more value-adding members of society.

This is great for all, and it's what we like about Hamza.

1. Effective Onboarding Ramp Into Self-Development

Hamza's greatest strength is that he has gotten tons of beginners into self-help.

He effectively targets and "converts" the bottom 20% who are dopamine-addicted and stuck in a loop of video games, porn, and junk food.

For this demographic, his simple mantras are helpful. **Hamza is the new "gateway drug" to self-improvement.**
And that's a compliment, not a criticism.
Hamza gets countless young men to take the first, most critical steps:

2. Clear & simple routines install better habits

Hamza builds a predictable ladder for teenagers and young men: morning and evening habits, simple workouts first, 3 minutes of meditation to start, etc. etc.

It's exactly what a demographic of doom-scrolling may need to kick-start their self-development journey.
Little by little, they can replace negative habits with better ones, and the outcomes will follow.

3. Hamza's Advice Is Good For The Basics

Hamza is not only charismatic but also largely correct on many of the basics.

His 'whys' are sometimes more pop-psychology than we like, but the main 'medicine' works for most young men.
For example:

Topic	Bad Theory	Good Practice
Masculinity	Masculine/feminine 'energy' with some made-up traits	Gets many foundations right & embodies masculine presence

Topic	Bad Theory	Good Practice
Social analyses	Sometimes simplistic or even misleading; imprecise evolutionary logic	External enemies & 'tribal unity' under Hamza galvanize action
Long-term > short-term	Simplistic. Short-term focus 'delivers' for dark triad sexual strategies	Long-term focus is often healthier and better for most Western men

Overall, while the theoretical foundations are improvable, Hamza delivers where it matters most: practical activation for beginners.

4. Correct Diagnosis: Build Value Before All Else

From a power dynamics perspective, Hamza's core premise is correct: become a high-value man.

His "Adonis" metaphor is a repackaging of "building your Sexual Market Value."
His "monk mode" is a method for building your Workplace and Social Value.

He correctly diagnoses that before you can even *think* about dating, status, or influence, you must have a baseline of *personal value*. He gets men to stop *consuming* and wishing and start *building* social exchange leverage.

5. The 'Adonis Ideal' Is An Honorable Role Model

Hamza's Adonis isn't just an attractive man, but also a man of values.
In some instances, Hamza also embodied that ideal. For example, talking about Sneako, he says:

> **Hamza**: You are not a man of character, you cheated on your last girlfriend, you have no integrity

That's an approach we like and respect.

Learn more:

- **How to be honorable and effective**

> The Honorable Man's Guide: Power, Respect, and Success

6. Strong Aspirational Persona

Hamza is a success story that inspires attainable success: proven average beginning, and visible results.

While the reproducibility may not apply to general money-making success, it works for almost everything else.

What Can Be Improved

While Hamza is perfect for many guys starting out, more advanced men may start hitting a ceiling once they progress.

1. Basic Advice Only Takes You So Far

Hamza discusses many topics with deep confidence.

That's both a pro and a con: it helps him set the guru frame and recruit followers.
But he also loses authority with the more advanced folks, and leads men astray when he's wrong.

We see some opportunities for improvement in power dynamics, dating, and high-power mindsets.

For example:

- **Hamza's habits only take you so far**: gym is great to start, no faps can help you stop porn. But you need more to be a top-1%
- **Lacks advanced power awareness, strategy, & psychology**, all foundational for a successful life
- **Calibration could be better**: 'more' isn't always 'more effective'. For example, Hamza's masculine focus makes him seem older. Good in certain contexts, but it must be calibrated for younger crowd dating
- **Generic dating advice,** solid foundations, but some generalizations decrease effectiveness.
  - *Not* for open-minded men: idealization and reactionary repression of free dating don't serve men seeking experience.

Also see:

- **Self-development 101:** the TPM way

> The 10 Steps of Self-Empowerment Everyone Must Follow

Limits & Downsides of Hamza's Routines Should Be Considered

Hamza could also better discuss the downsides to his approach instead of displaying only the positives.

In this video (deleted) he frames TRT fast recovery as a positive. But what caught my attention is that he injured his back three times doing kettlebell swings. Not exactly peak health and longevity.

3 times back injury for Hamza. Something that may weigh in older age and that you may want to avoid

His routines alone also wouldn't be enough: Hamza underwent three surgeries (gynecomastia, varicocele, and otoplasty).

2. Some Naivete Left: Idealization

Despite a 'red pill background', we see some 'blue pill idealization'.

For example, just from this one recent video, Hamza discusses:

- **Idealize fatherhood of father passing wisdom to son**: That's an idyllic image of fatherhood, but it's idealistic **<—- ⍰⍰♂ Lucio's critical note:** bad expectations. You don't fully control your child's personality. He may not care about your 'wisdom' and do the opposite of what you teach
- **Idealized 'virgin good girl' waiting for his Adonis:** Hamza introduces 'Anastasia': the ideal woman who resisted society's corrupting vices. She's different, remained a virgin for her Adonis, and they make a perfect couple **<—- ⍰⍰♂ Lucio's note:** This is idealization of women and relationships, and textbook Madonna-whore dichotomy.

This type of content to me feels like a mix of hilarious, cringy, and… A setup for future disappointment.

Read more:

- **Escape the Madonna-whore complex to be a successful lover**

> The Madonna-Whore Complex: What it Means to You

3. Power Awareness Improvable

Sometimes I see room for growing power awareness and manipulation dynamics.
For example, in this video (later deleted), he says:

> **Hamza**: *I met this beatuful young Russian woman in a 5-star hotel, teaching me about wine* <— See if you spot the red flags ⍰
> *I wanted to be a better man for her* <— ⍰⍰♂

Attractive young woman in a 5-star hotel, expert on expensive wines… What do you think?
Do you think her job was sommelier, or that Hamza fell for the charm of a professional?

> **Lucio**: Quit pedestalizing! She's just a girl

4. Money-Making Advice Won't Work For Most

Hamza's business experience is monetizing a follower base as a self-help influencer.

But that may not be the best business for everyone—and likely isn't.
The influencer path is a frequency-dependent, winner-take-all dynamic. Since there can only be so many influencers for the same audience, this dynamic also means that **all Hamza students are inherently Hamza's competitors.** Power-aware men know this dynamic prevents good mentorship.

That may also explain Hamza's vitriolic downfall with his business partner when he started making self-development videos.

In contrast, Power University's frameworks are broadly applicable to **any field** (politics, corporate, dating, etc.), ensuring students are not competing for the same slice of a saturated influencer pie.

⚠ **Careful with Hamza's business & financial advice**
In one video he advises against ETFs in favor of highly volatile and risky investments. Recommending Iman Gadzhi in older videos may also raise some questions.

5. Guru-Disciples Dynamics Disempower Followers

Hamza doesn't hide that he wants a cult:

> **Hamza**: I see myself as a cult leader

Some dark triad traits may be expected for influencers, and they can be advantageous for the guru himself.
The biggest problem is that **cults and cult leaders suck for the cult *members*.**

Some gurus prefer their followers to remain disempowered in order to maintain control.
These gurus may resent empowered followers and actively undermine them.

Besides the recent controversies, we've also noticed various power moves that we didn't like.
For example, in this video, he says:

> **Hamza**: I make so much money, joke's on you, I'd be doing this for free <— ⍰⍰♂**Lucio's note:** Not the mindset of an influencer who respects & empowers his audience

An audience of beginners may not catch those moves, or when they're being talked down to.
But it will still cap their mental empowerment.

6. Some Disempowering Mindsets

Some of Hamza's mindset and attitudes don't align with a true top-1% man.

For example:

Hamza	TPM
⍰ Men are repressed in society	Top 1% strategists don't complain because they win anyway. There has never been a better time in history to be a smart, strategic man
⍰ Fapping & dating is bad	Guilt for one's drives and sexuality is a moralistic straightjacket. Empowered men accept their drive to release and date
⍰ Endocrine warfare is killing your T	Don't overblow things and be a b*tch about it, focus on masculine agency: avoid plastic, eat healthy, and move on.
⍰ You must be strong/masculine	Pick antifragile identities, adapt & calibrate, and be a man who achieves goals
⍰ Habits as goals	Habits can be scrapped or changed at any time: they are a means to an end. Achieving goals is what matters

We also see some of this:

Idealization & resentment of white women

Idealization of white women is not uncommon in some ethnicities, and some men resent women embracing their sexuality.

Recognizing this helps men develop a more practical, high-leverage approach to dating.

Hamza may also want to look into possible hidden resentment towards white male players.
See here for example:

> **Hamza**: (show signs of possible resentment against women's sexuality)
> **Lucio**: that's a poor mindset for men who want to gain experience

⍰ Bonus: 20-Something On TRT... ?

In a deleted video, Hamza shared his TRT routine while we prepared this analysis.

I applaud men who own up to it, especially if they do it before being found out.
And at the same time, I gotta wonder if it's a good example for young men.

Good habits should *prevent* medications, including jumping on TRT that early.

⍰⍰ **P.S.: Be more decisive: inconsistency undermines authority**
Shifting opinions and sharing-then-deleting (like with the TRT video) undermines the trust and authority of a supposed masculine leader.

From Beginner to Top-1%

If you started with Hamza, you have the minimum viable toolkit: discipline, routines, and social courage.
The next stage is the advanced level:

1. **Calibration** to function and win in any context
2. **Antifragile mindsets** that don't need muscle or habits and maintain self-esteem
3. **Manipulation dynamics** to defend yourself and win
   - Reading people to pick better and avoid value-takers

Hamza vs. Lucio: Comparison

Aspect	Hamza Ahmed	Lucio Buffalmano
Strength	**Masculinity**, habits, discipline, presence	Power dynamics, **strategies**, calibration, goal-achievement
Transformation	Disciplined and gym-going Adonis member of a '**tribe**'	High-power, effective, emotionally & socially **self-sufficient**
Worldview	Clear-cut: good vs. bad habits, Adonis vs. Jeffrey	**Nuanced**: Shades of grey, contexts
Method	**Personality-driven**, routines, rapid activation	**Evidence-based** and framework-driven; methods adapt to people/contexts
Risk	Plateuing; **relies on group identity** and group support for sustained effort	Overdoes self-reliance; May not stress the basics enough
Best For	**Beginners**, for activation, identity, and a 'kick in the butt'	**Sophisticated** & high performing men, for next level in human dynamics

Hamza Courses Review

Hamza's offers an entry-level Skool community and a pricer course.
The course is listed on Skool as Hamza Advanced Course, going from basic to what he frames as the advanced 'Hamza-level'.

Adonis Skool

Hamza's Skool community does a good job at one thing: getting young men (usually 14–22) to cut their dopamine distractions and start healthier habits.

If you're:

- Addicted to gaming or porn

- Have no discipline
- No masculine role models
- No positive male peer group

Then **Adonis School can genuinely help**.
It provides a community of men on the same journey, accountability, momentum, and *identity* ('I'm a man into self-development').

However, once you've:

- Built basic discipline
- Have a gym routine
- Have some focus
- Know how to hold eye contact
- Aren't completely lost socially

There isn't much next-level progression there.
The culture is very "one-note masculinity":

- Grind
- Go to the gym
- Grind some more
- Go to the gym again
- Become Adonis and more like Hamza

All important foundations, but for smart men who weren't completely lost it plateaus fast.
There's **little nuance on**:

- Social intelligence
- Power dynamics
- Leadership & influence
- Calibration
- Top-1% mindsets beyond stop being weak

If you stay too long, it can become dogmatic, overly performative, and even **cap your progress to becoming your own man** with that tribe mentality.

Stage of Development	Should You Join?
Beginner (no discipline, unhealthy habits)	**Yes** — it helps build momentum
Intermediate (gym, some discipline, improving socially)	**Maybe short-term**, but don't expect advanced growth
Advanced (top 20–1% goals: influence, status, leadership, strategy)	**No** — it doesn't teach high-level skills

In short:
Adonis Skool is a **good *launching pad***.
Once you outgrow the 'stop being a child' phase, you'll need more than masculinity motivation to become effective, influential, and respected in adult social environments.

Hamza Advanced Course Common Objections

- **Hamza-based**, rather than framework-driven; lessons are what worked for Hamza, not systematised models
- **Not much advanced** compared to the basic mentorship and community
- **Questioned credibility after TRT**, especially as the marketing stressed the 'latest transformation
- **Beginner-heavy**: advanced men are less likely to stick in 'cults', so fewer role models who are at advanced level

Hamza Course vs. Power University

Power University is for intelligent and more advanced men who want less motivation and more effective strategies for status, respect, and attraction (with measured results).

Feature	Hamza Advanced Course	Power University (TPM)
Focus	Smart men seeking an edge in life	Men's empowerment, strategies, life effectiveness
Evidence	Building on Hamza's personal experience	✅Higher — based on scientific research and Lucio's stronger affinity with scientific reasoning
Price	✅Lower	Higher
Community	✅ Community access; strong motivation is helpful for beginners	Self-study with the option of coaching and/or joining the community
Replicability	Lower — tactics are tied to Hamza's persona and may not generalize	✅Higher — includes calibration to apply across personalities and contexts
Target	20-somethings who want more from Hamza	Smart men seeking an edge on life
Goal	Accelerate: build on routines & discipline, 'stay with the tribe'	Compound: lifetime of critical skills for status, attraction, & power. Self-sufficiency unlocked
Risks	Idealization, groupthink, backslip into blue pill, Madonna-whore complex, self-help plateuing	Skipping some basics, dropping out without coaching, over-analyzing & overfocusing on power phases

What should you go for: if you lack basic discipline and must kick negative habits, start with Hamza and his course. Then move to TPM for higher-level strategies.

Hamza Ahmed: Short Review

Is Hamza legit? Hamza's teachings are a legit starter package to get young, undisciplined men moving. For many men, he delivered better habits, mindsets, and encouraging early wins.

Hamza takes you to the starting grid and gets you running.
Then, once you're ready to graduate from 'better-looking, better-scheduled' to 'high-status, high-leverage' you'll want the deeper and more advanced angles covered by The Power Moves.

Adonis Skool Review: Do his 90-day bootcamps to acquire basic discipline and habits. Then come back here for the systems and strategies of the top-1%.

Strategic Thinking for Top-1% Men: 3 Real-Life Case Studies

Lucio Buffalmano · 10 November 2025 · Archived copy · Original

In life, many men focus on effort: working harder, pushing more, or simply being more aggressive.

Effort matters, of course, but consistent winners don't just work hard: they move and **think strategically**. Strategic thinking is the ability to look beyond the immediate action, predict the long-term consequences, and position yourself for maximum leverage and minimal effort.

Most men think they're strategic.
But **few are truly strategic at a high level**. And high-level strategic thinking is almost an **unfair advantage** in life.
We'll show you to think strategically like the top 0.1% with three real-life case studies:

- **Win a Competitive Job Interview** by leveraging social dynamics you might not even realize are in play
- **Engineer Financial Freedom** with long-term decision-making
- **Master Seduction** by controlling the emotional arc of a date to build deep connection and attraction.

Let's dive in:

Contents

  - Post-Intimacy Extra Date For Maximum Connection
  - Refusing Night Together, In Style
  - Couple Frame: Make Her Positively Obsess
- Life Gets Easy

Story 1: Getting My Dream Job

After graduating, I had been shortlisted for a talent rotational program in Prague.

I wanted that job badly, and to get it, I had to ace the assessment center.
While the bulk of the work was done with preparation, presentation, and general high-power behavior, here are two advanced moves that helped:

Socialize with the attractive girl, but leave early to signal you're not a player

It was six of us: five men, and a woman.
If that wasn't enough to grab attention, she was also a typical Swede with blond hair and sparkling blue eyes.

During our socialization lunch break I made sure to talk to her, and get some good vibes.
That displayed:

- **Confidence** to talk and vibe with the attractive girl
- **Social charm** to get an attractive girl invested in you

BUT I also ensured not to get too close or flirty or, God forbid, exchange contacts.
And I also ended it myself to socialize with the other guys.

Why?

It's not to be 'professional'; it runs deeper.

Besides two female HR managers there were many senior managers to 'assess' us.
And **some high-status men feel like *they* are owed the women's attention in their teams**, not men below them.
These men may also be more possessive, and **they see charming men as competition**. **High status men don't to hire competition, they want to get rid of it**.

If you think 'this is petty', answer this:

What runs deeper in a man's psyche, sex and reproduction, or being a good professional and company allegiance?

Of course some men will be good professionals. But many others won't. So I played it for those who don't.

Leverage The Loner To Display Prosocial Leadership

During the break, a guy remained at his seat, and wasn't socializing.

Why do you think I went to talk to him?
Because it was the perfect chance to display pro-social leadership and kindness. This is especially something that

more empathic women in HR note.

It also worked for the more senior managers.
Everyone likes kind people, and it's not only for 'good' reasons.
Kind people tend to be less cutthroat, less competitive, and… **Kind people are lower competition**. Exactly what the most alpha types assessing that day may prefer.

Today, with the hindsight of years of experience, I would have even improved on that move.
Can you think how?

I should have built some rapport with that loner, and then said 'Oh you're interested in Y? That guy there is the same, come, I'll introduce you'.

That signals you're the type of leader who notices the weak link, helps him up, and brings him back into the team.
That's the dream empathic team manager who gets the most out of the team.

Story 2: Dream Life Pursuing My Mission

This is how I went from employed to entrepreneur, doing what I love, and living life on my terms.

My goals were to:

- Adventures and travels
- Purchase a flat for security
- Start TPM

Here is how I did it:

Leave At High Leverage Point to Travel & Explore

My employer was a startup, and I left at the highest point of my 'job market value'.

I had just 'won' my position against a competitor (details in Power University), I was the only full-time salesperson, and I had recruited all our active customers.

Maintain Rapport & Leverage

It was also an easy time to sour things because they needed me, and two, I thought I had good reasons not to be too fond of some people there.

But I kept it friendly and remained in touch because of the principle of 'make friends, not enemies'.
It's always better to have an extra option, and with the leverage I had, I could gain bigger concessions in the future.

So while I traveled the world and lived the life, I also did some freelance work for them.
Some extra money didn't hurt, but mostly I maintained the relationship, stayed in the loop, and maintained leverage for when I'd come back.

Strategically Negotiate a Higher Base Salary: Good For Mortgage

I came back, explored other options as well of course, and negotiated with them.

I asked for some perks I knew they'd reject as a tactic to get a larger base salary, and I got an important salary increase.

I wanted a larger base salary for my next move: purchasing a flat at the lowest possible interest rate.
You can't time the market, but real estate prices were great in my opinion and interest rates had no room to go any lower.

It turned out to be right, the mortgage rate has been below inflation most of the time, and the property value increased by around 70-80% in less than ten years.
But my goal wasn't appreciation, it was this:

Use Your New Place For Side Income

My main goal was securing years of financial independence, without ever working for anyone else.

To do that, I wanted a place with two rooms, furnish both as bedrooms, and use one for extra income.

If things got dire, I could move out and use both rooms for income, so I could still make mortgage payments.
I could go back home with my parents or find something cheap.

Soft Negotiation In Seller's Markets

I found the perfect place, in the perfect location.
It was close to main hubs (perfect for dating), but super quiet, and close to a park.

The seller called me to their office to discuss my proposal and they just said 'no'. I expected a power move because I knew it was a seller's market.

But I rolled with the punches.
This is what many people don't get: they think that being powerful is to always be dominant or call out power moves.
But strategy *always* beats dominance.

The place was perfect: ideal location, ideal location for extra income rent, and an attractive price already (it was a great price because in part because it had some conditions attached for another 10 years, but let's not go into too many details).

I negotiated with two goals in mind:

- Close fast
- Don't seem overly eager that they may pull a last-minute price hike
- Walk the line between easy-going but not a chump

Appearing 'docile' was a strategy.
The seller had other units in the building, and they were property managers. One of their clauses was to vote on my behalf for 2 years. That suggested they had some power struggles going on, and that they preferred easy-going buyers, potentially even naive, who wouldn't interfere with whatever they wanted.

And this is exactly what turned out to be.
My neighbor also wanted the flat before I even entered the picture. But she was *not* easy-going; she was litigious, and was passed over for me.

So I played disappointed, I said 'just give me some time to think about it', and little later I said 'OK, I'll take it if you can put a bed already inside to facilitate my move. If you can do it, you can pick the date of the transaction.

It was small enough for them to say 'yes', they did.
After that, I was 'secure enough' to work on TPM without too many worries.

Story 3: Strategic Seduction

This is a date with an attractive woman at the peak of her mate value.

Things were *just OK* in the beginning, but the dinner conversation was sputtering.

This is where many men talk more, trying to force a connection.
But remember: one, a connection is great but not always strictly needed. *Especially* not for short term. It's more important that she thinks you're a confident, dominant, and higher value man. And the more you rush to fill the silences, the more you chase, the more you signal that you're *lower* value.

> If anyone is uncomfortable with the silences, ensure it's not you.
>
> ✒ *TPM Proverb*

Two: **connection equals not conversation**. Connection is feelings and emotions. Bonding with someone's *presence* in the silences is even more powerful.
When you can do that, people then open up naturally, without forcing it.

The Question That Made Her Open Up

Indeed, when I next took her for a smoothie, she was ready for the question that changed everything.
The question was:

> 'Who do you hate'.

It can be an effective question. Don't try too hard to stay positive. Life is *both* light and dark, and your task isn't to be Tony Robbins.

And connecting on the dark is even more powerful because that's the part she doesn't share with everyone.
More than once that question changed the game, and this was the case.

Her reply was 'my mother', and that opened the floodgates.

Strategic Handling For Deeper Bonding

I replied 'Oh that's interesting', with flat tonality.

Why did I say 'interesting' instead of 'crazy'?
I use crazy a lot, but I use it for interesting situations to liven up the conversation and make her share more.

But **you never say 'crazy' when it's truly shocking or sad.**
It makes you come across as over-reactive, judgmental, and piles up pressure.

This is not the time to display dominance, this is the time to be interested, without displaying any surprise.
Remember: it's your skills that allow her to open up.

You must be interested, but not overly eager and free of any emotional over-reaction.

Think of enticing a cat that's unsure whether to advance. You move little, you speak softly. You display some interest, but you don't chase. You give space for the cat to come

That attitude also displays value.
It's the value of the man who's not impressed because he is *worldly*. He's been there done that, nothing shocks him.
And he knows people and human nature, and may offer guidance.

Display Uplifting Power to Change Tone

She opened up more as I asked thoughtful questions.

Then, callback humor: she'd mentioned Paris dreams, so I quipped, 'Soon you'll snap a pic with a Chanel bag under the Tour Eiffel and text her: "Shouldn't have left me behind, mom."'

It lightens things up, but with a powerful darker edge.

It's not a naïve 'you can do it', but a darker mix of victory and vendetta. And uplifting, implying she will reach her goals.

Remember, in dating you have a dual role: actor and conductor.
So I'm thinking 'right after the dark: lighter mood, transition, and 'pull".

So when she mentions guys from a certain country being 'nice.' I joked back: 'Yeah, but they have a small penis though'.

Lighten The Mood For Emotional Arc

She laughs, I join her: I only smiled at first, I laugh along with her to cement the bond.
That's perfect *emotional control*.

Think about the arc.
You went from comfort with little talk, then wading through the dark, and now you take her OUT of the dark.
Therapists linger in darkness. Seducers lead back into the light, and into sexual tension.

That joke displays sexual confidence and links that topic to *you*.

Last Power Move: Display Dominance

When it was time for the bill, the waiter said they had closed the terminal and couldn't take card.

I had cash, but told them to please check again>
It was tactical: I wanted to display I don't readily submit to external forces and that, if thigns went well, that I could get things my way.

It became a bit of a struggle as they came out once again, and she offered me to pay.
A good sign, but I waved it off saying 'It's all good dear', with a reassuring smile sub-communicating 'You're in good hands, don't have to worry about anything when you're with me'.

After I paid card as I wanted, I told her while walking away:

> 'Remember, in life you never take the first no'.

It's a high-power mindset and framed-expanded that you're used to negotiating things your way.
A high value trait.

10X Post-Intimacy Bonding

I then invite her home and do a signature, brief first escalation move in the elevator.

She already felt close to me, so as expected she just welcomed every move.

I made it a good session despite not being the best time of the month, and that's also always helpful.

Most guys think it ends after intimacy.
But that's where top seducers switch to the next gear instead.

I propose to go for a drink. But after a few minutes.

To understand this move, you need again strong theory of mind.

At this point, many women wonder what's up in the relationship, if they were 'too easy' and triggered his Madonna/whore dichotomy, and may fear they'll be invited to leave.

This is crucial because it prevents you from maximizing bonding and romance.

When you propose a drink, you go from a negative to a positive. It reassures her and lets her enjoy the pillow tlak, and makes her look forward to more and better. It 10xes the romance, bonding and connection.

Post-Intimacy Extra Date For Maximum Connection

I picked a winery and framed it as 'a great place to try'.
Also a tactical move: makes her look forward to a new experience together, and a romantic vibe.

Plus, a drink or two caps the evening for her as a dreamy escape from normal life.

We sat side by side, and at a certain point, she looked around and went to kiss me.

Compare: low power PUA
I read a blog of an older guy who went out with a young girl he was seeing. He told her he would 'get a kiss', made out with her in a hallway, and was all proud and braggy that he had her say 'yes, sir'.
I couldn't help but think how weak it was for a middle-aged man to chase kisses.

Refusing Night Together, In Style

Later, as the night drew to an end, she asked me, hopeful and submissive, if she could sleep over.

Notice how this all came full circle:

She started higher value as a very attractive young woman.
And now *she* is chasing for my company.

I say no because I needed to wake up early, a high-value frame.
And then I added that 'I snore anyway', with a smile. This is high-power 'vulnerability'. It power protects her so she doesn't feel spurned and self-reject, and positively humanizes you now that she already thinks you're so awesome.

Couple Frame: Make Her Positively Obsess

But I say that 'we can meet another day, and maybe go watch a movie'.

After seduction, a 'boyfriend frame' becomes effective.
Again, you must see it from her point of view. At this point, a woman may even fear of falling for the wrong guy.

But when you mention the possibility of closer emotional intimacy, she can let go.

Then, I'm getting picture with cats with hearts in her eyes.

This is good, effective seduction.
Start with little or no leverage and the man usually chasing, to her wanting more of you, and falling in love.

Life Gets Easy

When you get to this level, life gets easy.

High-level strategic thinking is almost an unfair advantage in life.

Indeed, I started my self-development journey very late BECAUSE life was too easy.

Strategic thinking is partially inborn, but it's also a skill.
We teach how to acquire it in Power University.

The Oxford Handbook of Infidelity: Summary & Review

Lucio Buffalmano · 17 November 2025 · Archived copy · Original

The Oxford Handbook of Infidelity (2023) is the most comprehensive scientific reference on why people cheat, bringing together leading researchers to provide a global, evidence-based picture of who is most likely to be unfaithful, why, and with what consequences.

Contents

- Notes
  - Chapter 1: Are Certain People More Prone Toward Infidelity?
  - Chapter 2: Predicting Infidelity in the Context of Race and Ethnicity
  - Chapter 3: Hormonal Predictors of Infidelity

Notes

About the Authors:
Each chapter of The Oxford Handbook of Infidelity *(2023)* is authored by leading scholars and researchers in psychology, sociology, evolutionary biology, and related fields. The editors are:

Todd K. Shackelford, PhD – Distinguished Professor of Psychology at Oakland University, where he directs the Evolutionary Psychology Lab. He has over 500 scholarly publications and extensive editorial experience in evolutionary psychology. He also edited the *Cambridge Handbook of Evolutionary Sexual Behavior* (4 volumes), and the *Oxford Handbook of Evolutionary Psychology and Romantic Relationships*.

Tara DeLecce, PhD – Assistant Professor of Psychology at California State University, San Bernardino. Her research focuses on romantic and sexual relationships, infidelity, and the psychological and cultural factors that influence mating strategies.

Chapter 1: Are Certain People More Prone Toward Infidelity?

Authors: Emma E. Altgelt, James K. McNulty, Andrea L. Meltzer

This chapter reviews how personality traits and individual differences predict infidelity in both the individual and their partner.
Findings show consistent links between low conscientiousness, low agreeableness, and higher infidelity, with added risk from extraversion and (for women) neuroticism. The Dark Triad (narcissism, psychopathy, Machiavellianism) is strongly associated with cheating. Attachment insecurity and unrestricted sociosexuality also predict infidelity. Partner traits matter as well—being with a partner low in conscientiousness increases the likelihood of straying.

- **Low conscientiousness and low agreeableness are consistent predictors** of higher infidelity.
- **Extraversion and female neuroticism track higher risk**, though effects are smaller.
- **Dark Triad traits correlate strongly with cheating**, via low empathy and manipulativeness.
  - Sexual narcissism is most predictive of infidelity (McNulty & Widman, 2014), rather than general narcissism, which can sometimes be inconsistent ⍰⍰♂ **Lucio's note**: narcissism as a whole may also lead to mixed findings when vulnerable narcissism is included. I'd expect vulnerable narcissists to cheat less because of fewer options
- **Attachment insecurity increases infidelity likelihood**, especially avoidance.
  "people higher in attachment avoidance see others as relatively unreliable and thus engage in cognitive and behavioral strategies aimed at gaining distance from partners (Mikulincer & Shaver, 2003)"
- **Unrestricted sociosexuality robustly predicts infidelity**, beyond other traits.
- **Partner low conscientiousness raises your cheating risk**, indicating partner effects.

⍰⍰♂ **Lucio's suggestion**: fantastic work and opening chapter. For the tables, I'd suggest considering a more immediately clear visual representation. For example, green, grey, or red cell for positive, no, or negative correlation—paired with textual annotations indicating the strength of each relationship

Chapter 2: Predicting Infidelity in the Context of Race and Ethnicity

Authors: Kelly Campbell, Tiffany L. Brown, Brandyn-Dior McKinley

This chapter examines infidelity prevalence across U.S. racial and ethnic groups. The findings are blunt: infidelity rates are **highest among African Americans**, followed by Latinos, then Whites, and **lowest among Asian Americans**.

The authors stress that race itself rarely serves as a direct predictor of infidelity. Instead, it's the factors that correlate with race, such as cultural norms, socioeconomic pressures, religiosity, and social exchange dynamics and

sexual marketplace dynamics. <—🤦♂ **Lucio's note: This may partly read like a CYA for the cultural zeitgeist**. It's likely partially true. Still, I don't remember having seen definitive evidence that would fully rule out a contribution of race/ethnicity.

Religiosity suppresses infidelity across groups, while acculturation stress raises risks in immigrant populations.

- **Infidelity prevalence is highest among African Americans**, *with some estimating that African American men are twice as likely as White men to have relationships outside their primary partnership* (Pinderhughes, 2002)
  - Followed by Latinos, Whites
  - Lowest infidelity is among Asian Americans, because of emphasis on family union, sex for procreation and, potentially, options, since Asian American men have less sexual experience than women

Write the authors on the difference in sexual experience between male and female Asians:

> A partial explanation for this difference is the influence of sexual stereotypes that portray Asian women as submissive and exotic sexual objects and Asian men as asexual, emasculated nerds and outsiders (Mukkamala & Suyemoto, 2018; Wong et al., 2012). Possibly, the eroticization of Asian women exposes them to more sexual opportunities relative to men

🤦♂ **Lucio's note**: Asian women *may* have some more opportunities, although I'm doubtful and it largely depends on individual's behavior and attractiveness. I suspect the main difference lies in the fewer options than their male counterparts, rather than the more options of Asian women

- **African American men have more options than African American women** leading to 'man sharing' for some women.
  The reasons are:
  - Black women outnumber men: *Largely due to higher mortality and incarceration rates, as well as disproportionate rates of substance abuse and poor healthcare related to racism (Penn et al., 1997), there are more available female partners than there are men within the Black community (Utley, 2011)*
  - Black men can 'date outside their race'
  - 🤦♂ **Lucio's note**: Another issue for American women is the even larger education gap. See this article on 'difficult dating markets for successful women'
- **Religiosity suppresses infidelity rates** across groups.
  - Conservative political attitude may also suppress infidelity, mention the authors
- **Acculturation stress elevates risk**, especially for immigrants.
  - The value of individualism relates to infidelity because people prioritize personal fulfillment over relational, family, or collective goals, potentially feeling entitled to fulfill their needs through EDI, even if it damages the primary relationship (Attridge & Berscheid, 1994).

Power In Relationships

At the relational (micro) level, power stems from controlling valued resources such as money or sex. The more a partner desires that resource, the more power the provider holds (Lennon, Stewart, & Ledermann, 2013). Power also shifts toward the less dependent or less committed partner—typically the one with better alternatives. Dependence and commitment are shaped by the ability to secure valued resources elsewhere.

At the macro level, societal structures (e.g., gender, race, class) influence power dynamics within couples (Coontz, 1997). Partners bring intersecting dominant or minority statuses into the relationship, and mismatches may lead to tension. The more powerful partner may falsely assume both have the same freedom, but only they do. If they deny or ignore their power, the other cannot initiate change.

Across cultures, men tend to hold more macro-level power, making women more relationship-dependent and more vulnerable to infidelity and exploitation. In interracial or interethnic couples, the partner from the dominant group (e.g., European American) typically holds more dyadic power as well, increasing the risk of conflict or exploitation.

The authors also point out that while the higher power partner may assume the other shares similar freedoms, only the powerful partner can act freely.
And more equitable change is only possible by admitting the power gap. I quote: '*When a person with power does not acknowledge their power or pretends not to have it, the other partner cannot implement change; they require recognition of the imbalance by the power-holder to achieve desired outcomes*'.

Power also fluctuates in predictable patterns depending on the relationship phase.

Also see:

- Stages of relationship power

> Relationship Power Dynamics: Strategies for All 9 Stages

Value exchanges overlap with power dynamics

A crucial concept we also unveiled on this website, value exchanges and power dynamics overlap, as the authors correctly note:

> In terms of equity, those who feel overbenefited (i.e., receiving more outcomes than they deserve) as well as underbenefited (i.e., receiving fewer outcomes than they deserve) report more EDI than those in equitable relationships. Equity is linked to power, in that people who are less dependent on their partner for rewards (satisfying outcomes) have more power in a relationship and are more inclined toward EDI (Prins, Buunk, & VanYperen, 1993)

Macro power differential may explain the gender gap in infidelity

> A variety of intrapersonal factors predict EDI across racial/ethnic groups. In nearly every culture studied, men are more likely than women to engage in EDI (Mark et al., 2011); however, a major reason for this gender difference may relate to power differentials between the sexes. When comparisons are made between men and women with similarly high levels of power and status, infidelity rates are comparable (Lammers et al., 2011)

Chapter 3: Hormonal Predictors of Infidelity

Authors: Lindsay Bochon, Brian M. Bird

Hormones strongly influence mating behavior. T
estosterone, estradiol, oxytocin, vasopressin, and cortisol interact with life history strategies to predict infidelity. Higher testosterone is linked with more short-term mating and extradyadic sex. Women's estradiol peaks correlate with greater attraction to alternatives around ovulation. Oxytocin and vasopressin promote bonding but, when dysregulated, can weaken exclusivity. Cortisol interacts with stress and opportunity, amplifying risk.

- **Higher testosterone aligns with greater extra-pair interest**, especially short-term mating.
  - Testosterone in men is associated with continued mating efforts
  - Men with unrestricted sociosexuality retain testosterone similar to single men
  - Mothers with higher postpartum testosterone show reduced affectionate behavior toward offspring (Fleming et al., 1997), suggesting that reductions in testosterone are necessary for nurturing behavior

- **Testosterone adapts to needs**: T, similar to other hormones, can drive behavior, but also responds flexibly to environmental cues of challenge and/or mating opportunities
- **Fertile-phase estradiol shifts increase attraction to alternatives**, particularly in some partnered women.
- **Bonding hormones can stabilize or destabilize exclusivity**, depending on regulation and context.
- **Fast life-history strategies predict more cheating**, reflecting short-term orientation.

Extra notes

- **Sociosexual orientation is malleable**: *men become relatively more restricted as mating opportunities become scarce (Arnocky et al., 2016) and as they transition from single into marriage and fatherhood (Gettler et al., 2019)*
- **High T women prefer masculine men**: Research by Welling and colleagues suggests that preferences for these sexually dimorphic facial characteristics—including women's attractiveness ratings of masculine men's faces (Welling et al., 2007) are associated with elevated endogenous testosterone concentrations (but see Marcinkowska et al., 2019)
  - High T men prefer feminine faces (Welling et al., 2008)
- **Status and power matter**: *polygynously married men had equivalent testosterone levels compared to their monogamously married counterparts* (Gray et al., 2007) *Polygynously married men, however, are older than men in monogamous marriages, suggesting that age and the continued acquisition of wealth and sociopolitical power is more important for marital status than testosterone-mediated behavior.*

Chapter 4: Operational Sex Ratio and Infidelity

Author: Daniel J. Kruger

The balance of men to women in a population changes infidelity dynamics.
Where men are scarce, men cheat more and commit less; where women are scarce, women extract commitment and resources, but men still may stray. Skewed sex ratios affect not only relationships but social stability, divorce, culture, and public health outcomes.

- **Male scarcity increases male infidelity** and reduces commitment.
- **Female scarcity lets women secure more commitment**, though cultural sanctions may limit female infidelity.
- **Women marry younger when there are more men**: Because women can secure male commitment earlier in relationships, they tend to marry at younger ages (Kruger et al., 2010).
  - Some men also marry younger to secure a prospective partner before another man does, but on average:
- **The variance in male marital age increases with more men**, because men need to acquire greater social status and resources to be considered eligible for marriage (Kruger et al., 2010).
- **Skewed sex ratios correlate with higher STIs and instability**, affecting public health.

Sex Ration Changes Cultures

In post-Roman Europe, Germanic invasions, population collapse, and rural subsistence with a preference for sons led to male-biased sex ratios (Herlihy, 1973; Coleman, 1976) and **the birth of courtly love can be traced back to sex ratio**, with men also idealizing unconsummated relationships and married women ("courtly love"; Guttentag & Secord, 1983).

In the late Middle Ages, this shifted because of losses of men to the Crusades, monastic life, and plague mortality. The new **female-biased sex ratios sparked early feminist thought.** Unmarried women formed Beguine communities—quasi-secular female communes—that produced radical proto-feminist literature and advocated for education and autonomy, though most women remained uneducated and unaware of these movements (Bolton, 1976; Herlihy, 1973).

By the 19th century, female-biased ratios coincided with a resurgence of feminist movements advocating for female independence (Gordon, 1976; Herlihy, 1973).

Cultural shifts continued into the **20th century**, where fluctuating sex ratios influenced media and relationship behavior: male-biased decades (1930s–50s) emphasized male commitment, while female-biased periods (1960s–70s) saw more casual male sexual strategies and rising divorce rates (Pedersen, 1991; Guttentag & Secord, 1983).

Chapter 5: It's Not You, It's Us—Relationship-Based Predictors

Authors: Jana Hackathorn, Brien K. Ashdown

Relationship factors are stronger predictors of infidelity than personality. The key is commitment, shaped by satisfaction, investments, and alternatives. Infidelity risk spikes with low satisfaction, high-quality alternatives, and boredom. Cohabiting couples show more infidelity than married couples. Risk also changes over time: women's risk peaks around 7 years, men's later, around 18 years.

> Satisfaction within various domains in one's primary relationship predicts a person's attitudes toward infidelity, and less satisfaction increases the likelihood to engage in an affair, as individuals who are happy tend not to stray from the things that make them happy

- **Low satisfaction and commitment are strong predictors** of infidelity.
  Conversely:
- **Relationship quality lowers infidelity**: quality is negatively related to intense attraction to others and to infidelity (Gibson et al., 2016).
- **higher quality of alternatives** is among the strongest predictors of cheating (Emmers-Sommer et al., 2010)
- **Cohabitation shows higher cheating risk than marriage**, partly due to weaker constraints.
- **The earlier the marriage, the higher the cheating**: *Respondents who were married at a young age (i.e., 16 years or younger) reported four times more infidelity than those who were married in their early 20s.*
  The likelihood of infidelity decreases steadily as the age at which participants were married increases (Atkins et al., 2001).
- **Dependent women cheat more**: Lower relative income (i.e., economic dependency on one's current partner) is associated with higher odds of infidelity (Munsch, 2015). For women, those who are economically dependent on their partner are more likely to engage in infidelity than either women who provide all the income in a household (i.e., the breadwinners) or women who are in an economically equal relationship (Munsch, 2015).
  <— ⍰⍰♂ Lucio's suggestion & note: This was super interesting to find out, and something I suspected based on experience and power dynamics. I really wanted to see here there effect size or at least a directional estimate—how much more likely? I'd advice the authors to share the effect size whenever possible
- **Risk timing differs by sex**, peaking ~7 years for women and ~18 years for men.

However, remember that infidelity can also happen in happy relationships:

> (while) demographic and individual characteristics are inconsistently associated with infidelity, relationship variables are the most consistent and robust across multiple studies (Haseli et al., 2019; Vowels et al., 2020). However, this research on relationship factors accounts for, on average, only one-fourth of the variance in infidelity behavior (e.g., Atkins et al., 2001; Blow & Hartnett, 2005; Tsapelas et al., 2010), leaving a large amount of variance unexplained. Simply put, infidelity does sometimes occur in happy relationships (Perel, 2017)

Social Exchange, Commitment & Infidelity (Handbook of Infidelity)

The **investment model of commitment**—validated and replicated across cultures—is based on **social exchange theory**, which holds that people seek relationships where rewards outweigh costs (Nye, 1979; Rusbult et al., 1998). Commitment is strongest when satisfaction is high, alternatives are low, and investment is substantial (Le & Agnew, 2003).

Low satisfaction, weak interdependence, and abundant alternatives predict infidelity across groups (Treas & Geisen, 2000; Atwood & Seifer, 1997; Nowak et al., 2014). In contexts like the African American community, gender imbalances and structural inequality reduce investment and increase infidelity risk (Adamopoulou, 2013; Penn et al., 1997). Religiosity can act as a protective factor (Atkins et al., 2001).

Globally, **economic-sexual exchanges**—such as transactional relationships—also contribute to infidelity, especially where emotional fulfillment is lacking (Smith, 2010; Lang & Smart, 2002; Scelza et al., 2020).

Chapter 6: Social Versus Sexual Monogamy

Authors: Catherine Salmon, Jessica Hehman

This chapter offers an important differentiation between social monogamy, when couples pair bond and live together, and sexual monogamy, which entails sexual exclusivity.
'Genetic monogamy' can occur without sexual monogamy if no extrapair paternity occurs.

Humans often practice social monogamy (long-term bonds) with expected but not guaranteed sexual exclusivity. Evolution shaped dual strategies: pair-bonding for cooperation and occasional extra-pair sex for genetic diversity or status. Cultures differ in how strictly they enforce sexual monogamy.

- **Social monogamy does not imply sexual exclusivity**, even in stable bonds.
- **Extra-pair sex is common in socially monogamous societies**, varying with norms and enforcement.

Interesting notes

- **Polygyny is more common overall, but monogamy is more common in societies with more evolved political systems** (Sanderson, 2001)

Chapter 7: Cultural Differences and Similarities in Correlates of Infidelity

Authors: Inmaculada Valor-Segura, Gemma Sáez, Abraham P. Buunk

Cross-cultural data show universal predictors—low satisfaction, high alternatives—while culture shapes expression and stigma.
Cultures of honor (e.g., Mediterranean, Middle Eastern) punish women's infidelity more harshly. Religious and collectivist cultures have lower infidelity prevalence, while urban, individualist settings foster higher rates.

> infidelity is not typically accepted or approved in Western countries such as Spain, Great Britain, or the United States, and is seriously disapproved of in many Islamic countries, with often serious consequences for the adulterer. On the other hand, in many African countries infidelity is sometimes tolerated, while in Eastern countries such as Thailand, people are more tolerant because sex has traditionally been marketed, thus increasing the approval or consent of extradyadic sex (Mackay, 2001)

- **Male infidelity is more accepted**: Mackey and Immerman's review (2001) of 216 cultures showed that male infidelity is less unacceptable than female infidelity. Even today many cultures view it as more 'understandable' if a betrayed party sought revenge (Buunk et al., 2018).
- **Low satisfaction and high alternatives predict infidelity universally**, across cultures.

- **Honor cultures penalize women's infidelity harshly**, shaping behavior and reporting.
- **Modernization and urbanization expand opportunities**, weakening sanctions.

Chapter 8: Predicting Online Infidelity

Authors: Carey J. Fitzgerald, Crystal Moreno, Jody Thompson

Online spaces expand opportunities for infidelity: sexting, private messaging, pornography alternatives, and dating apps. Hidden apps and passwords may help keep it hidden. Many people consider these behaviors infidelity, even without physical sex.

Chapter 9: Predicting Infidelity in Nonheterosexual Relationships

Authors: Jonathan M. Bowman, Benjamin L. Compton

Infidelity in nonheterosexual couples follows many of the same patterns as heterosexual couples: low satisfaction, weak commitment, and good alternatives. But there is a key difference: many LGBTQ couples negotiate consensual nonmonogamy. Infidelity is thus defined not by sex with others per se but by breaking the couple's agreed rules.

- **Low satisfaction and commitment predict cheating across orientations**, mirroring heterosexual patterns.
- **Men perceive same-sex cheating as less threatening** (Confer & Cloud, 2011; Denes et al. 2015; Compton & Bowman, 2017)

Interesting notes:

- **Bisexual women are more likely to rate higher on Machiavellianism** than straight or lesbian women (Lippa, 2020) and on the Dark Triad (Semenyna et al., 2018) <— ⍰⍰♂ **Lucio's note**: this reminds me of the book 'Confessions of a Sociopath', where the author states that bisexuality is her red flag for possible sociopathy

Chapter 17: Infidelity in Nonheterosexual Relationships

Authors: Justin J. Lehmiller, Dylan Selterman

Patterns of infidelity in nonheterosexual couples parallel heterosexual dynamics but with unique stressors. Minority stress, secrecy, and smaller dating pools shape behavior. Consensual nonmonogamy is more common, but infidelity still occurs when agreements are broken. Gay men report higher rates of sexual infidelity than lesbians, but less distress if agreements are clear.

- **Rule clarity defines fidelity in CNM**, not monogamy itself.
- **Gay men report higher sexual infidelity**, lesbians lower but more emotional boundary issues.
- **Minority stress elevates secrecy and boundary challenges**, impacting trust.

Chapter 10: Emotional and Sexual Infidelity—Evolutionary Origins

Authors: Julie A. Planke, Jacqueline M. Di Santo, Glenn Geher

This chapter explains why men and women differ in what they find most threatening.
Both sexes find infidelity of any type distressing. But men, on average, evolved to be more distressed by sexual infidelity (risk of paternity uncertainty), while women, on average, evolved to be more distressed by emotional infidelity (risk of losing resources and commitment).
Large-scale cross-cultural data support this pattern, though individual variation exists.

- **Men report greater distress at sexual infidelity**, women at emotional infidelity.
- **These sex differences appear cross-culturally**, consistent with evolutionary threats.

- **Individual differences modulate reactions**, including orientation, attachment, and culture.

Chapter 11: Sexual Novelty Motivations for Infidelity

Authors: Limor Y. Gottlieb, David P. Schmitt

A powerful driver of infidelity is the search for novelty. People cheat not only because of dissatisfaction but because novelty is inherently rewarding. Cross-cultural surveys show both men and women report sexual variety as a major motive, with men slightly higher. Evolutionarily, novelty seeking could spread genes and maintain excitement.

- **Men are higher in novelty-seeking**, though present in women.
- **Novelty seeking operates even in satisfied relationships**, not just those with deficits.
- **Psychopathy predicts novelty-seeking**, the robust link between psychopathy and novelty-seeking and infidelity (in both men and women) could indicate a reproductive strategy (Mealey, 1995) aligned with a fast life history strategy (Jonason, Koenig, & Trost, 2010).

Machiavellianism vs Psychopathy

Psychopathy predicts infidelity in men, while both psychopathy and **Machiavellianism** predict it in women.

One explanation: women face higher relational costs for infidelity (e.g., breakup risk; Brand et al., 2007), so Machiavellian traits—like planning, impulse control, and secrecy (Jones & Paulhus, 2011b)—may help them cheat more strategically and avoid detection.

Unlike psychopaths, Machiavellian individuals are less likely to destroy their relationships after infidelity. This suggests that **novelty-seeking women may use Machiavellian strategies** to maximize genetic or sexual benefits while minimizing social risk.

Chapter 12: The Mate Switching Hypothesis

Authors: Mike Abrams, Lidia Dengelegi Abrams

Infidelity often functions as a mate-switching strategy. Cheating may signal the end of one relationship and the start of another, especially when the new partner is perceived as higher value. Affairs often precede divorces. This hypothesis explains why many long-term affairs result in new committed partnerships.

- **Infidelity often serves as a mate-switching tactic**, paving the way for a new partner.
- **Affairs frequently convert into primary relationships**, especially with higher perceived mate value.
- **Women more often use affairs as exit strategies**, when dissatisfied or unsafe.

Interesting Notes

- **Infidelity is heritable, especially in men**: a study of 7,378 twins revealed that extrarelationship sex had a heritability of 62% in men and 40% in women (Zietsch et al., 2015).
  The higher heritability of infidelity in men is concordant with men's larger fitness benefits from infidelity
- **Low self-esteem pushes away partners**: Low self-evaluations may inadvertently convince a partner that this is the case.
  The solicitations the self-effacing partner offers may prompt a re-evaluation of relationship equity (Schmitt, & Buss, 2001; Arnocky et al., 2013)

Also read:

- Dating women with low self-esteem

Why Jealousy Is Inborn

> A man in such an epoch spending even a year or two providing sustenance and care to the progeny of another male paid a devastating price in genetic fitness. Men who were vigilant for competing males, put significant effort into mate guarding, and responded with violent rage when their monogamy was threatened, were more successfully in avoiding cuckoldry.
> (…)
> An early human who took a laissez-faire approach to his mate's behavior would have an increased chance of investing in other males' offspring and a diminished likelihood of leaving his own offspring and genes to survive in posterity. **As a result, "jealous" genes are more prevalent in modern men**

Dual Sexuality Hypothesis

> Sexual infidelity in relationships in which a partner perceives their mate to have less value may be explained by the "good genes hypothesis."
> Women have evolved a dual mating strategy—obtaining parental and other investment from one man while surreptitiously seeking and mating with those they find more sexually attractive. A woman drawn to a more sexually attractive man represents her nonconscious quest for "better" genes. Indeed, the willingness of many women to risk the consequences of an affair denotes the compelling attraction to someone with a superior genome. The quest for better genes is more motivation for women than for men, who, unlike women, will often have affairs even when satisfied with their current relationship (Shackelford & Buss 1997b). Their motives are the quest for novelty and opportunity to propagate their genes (consciously or unconsciously).

Read more in our article reviewing the corresponding manosphere mantra:

- Low status provides, high status has sex?

Mate Value Dissonance & Subconscious Devaluation

The authors describe an interesting subconscious process.

Mate switching as the result of a **slow, subconscious shift in assessment**. When one partner's **self-perceived mate value rises**—due to aging differences, career gains, or social advancement—they may begin to feel increasingly mismatched with their partner (Schmitt & Buss, 2001).

This internal dissonance builds gradually and often leads to **attributing dissatisfaction to the partner's flaws** (Abrams, 2012). As attraction fades, infidelity becomes more likely—and **infidelity feels justified based on the partner's flaws**, rather than regretted.
The unfaithful partner may then devalue their current mate while idealizing the new lover, paving the way for **infidelity to evolve into full mate switching**.

⍰⍰♂ Lucio's Note: Survival of the relationship may not depend much on the partner's attractiveness

The authors say that as love fades, relationships are more likely to survive if one or both partners possess high mate value—such as male status and masculine features (Jacob et al., 2002), or female markers of reproductive health like a .7 waist-to-hip ratio and facial neoteny.

However, I think that the survival of either love or the relationship may depend less on a partner's absolute attractiveness, and more on how well the partners' **mate values match**, and how those values compare to **available alternatives**.

Paradoxically, partners who are not much in demand or lower in confidence may be hold up better and happier

together.

Chapter 20: Formation of a Primary Relationship with an Infidelity Partner

Authors: Charlene F. Belu, Lucia F. O'Sullivan

Some affairs evolve into primary relationships. However, these new relationships face challenges: lower trust, fear of repeat cheating, and stigma. Success rates are lower than relationships formed outside infidelity contexts, but some do stabilize if partners rebuild trust.

- **Affair partners sometimes become primary partners**, but trust deficits linger.
- **Trust erosion and suspicion remain elevated**, challenging stability.
- **Relationships born from affairs break up more often**, relative to typical starts.

Mate Poaching May Lead to Poor Relationships Because of Poachers' Traits

> In line with traits that cue dominance, successful mate poaching by males was best predicted by their height, greater self-esteem, criminal tendencies, and greater display of cold affect (Sunderani et al., 2013). Targets of mate poaching attempts were higher on average in physical attractiveness (Sunderani et al., 2013). Together, these profiles indicate that the traits that characterize those who engage in infidelity or who are likely to be lured away from an exclusive relationship are not traits conducive to long-term committed relationships

Chapter 13: Deception and Secrecy in Infidelity

Author: Susan M. Hughes

Infidelity requires deception—concealing time, digital activity, finances, and emotions. People use verbal lies, technology tricks, and behavioral cover-ups. Detecting infidelity is difficult because cheaters refine concealment. Gender differences exist: men more often deny, women more often omit or emotionally redirect.

- **Gaslighting,** a term used to describe the manipulation of information and distortion of reality in such a way that the victim questions their own sanity (Gass & Nichols, 1988). Cheaters may lie, falsify the facts, and distort reality to convince their mates that they are crazy and that what their mate perceives is not happening
  - Also read 'signs of gaslighting' to protect yourself
- **Most infidelity victims remain ignorant**, which allows the transgressors the ability to sustain their primary relationship (Weiser & Weigel, 2015). Dowd (2012) found that most participants (78%) in the study never disclosed their infidelity to their partner, so it remained unknown
- **Withdrawal (39.5%) was the most commonly reported sign of a partner's infidelity** in Dowd's study (2012). Different types of withdrawal patterns included less frequency in phone contact, less physical contact, a diminishing sex life, a general loss of interest in their partner, being less communicative, emotional detachment, and breaking patterns of usual behavior (Dowd, 2012; Shackelford & Buss, 1997).
- **People can identify infidelity in others' romantic relationships**: Lambert et al. (2014) found that participants who watched a short video clip of a couple interacting could accurately detect which targets had cheated on their romantic partners. They found that this detection was mediated by ascriptions of commitment and trustworthiness of the persons they were observing
- **Men more likely to be suspicious** (Brand et al., 2007), to judge their partner will be unfaithful in the future, and to detect infidelity (Andrews et al., 2008).
  This is explained by 'error management theory': since men's costs of infidelity are higher, they err on the side of caution
- **Men more often deny; women more often omit or redirect**, in disclosure patterns.

- **Greater relationship satisfaction leads to more confessions**: *individuals who reported having greater satisfaction with their relationship were more likely to reveal their infidelity secret to their partner than those in less satisfying relationships* (Dowd, 2012)
- **Women are more likely to disclose infidelity than men** (Brand et al., 2007). But it may not all be because of 'honesty', but as a step to terminate the relationship:
  - Women were also marginally more likely than men to break up with their partner after they had cheated and subsequently more likely to then start a new relationship with the affair partner
- **Securely attached partners less likely to cheat** and more likely to confess or consider confessing
- **Men seeking extrapair concealed the relationship**, while women were more likely to reveal they had a committed partner

Interesting Notes

- **Mate value influences reactions to infidelity**. Those who perceived themselves to be high in mate value reported greater levels of indignation in response to infidelity, whereas those who perceived themselves to be lower in mate value reported greater levels of insecurity (Phillips, 2010)
- **Masculinity is an important facial indicator**: *Facial masculinity seemed to mediate women's accuracy, with women rating more masculine-looking men as more likely to be unfaithful and as having a sexual history of being unfaithful. Women were correct in their estimates because masculinity ratings correlated significantly with men's infidelity*
- **Lower-pitched voices judged more likely to cheat** for both sexes (Hughes and Harrison, 2017), while higher pitched voices more trustowrthy (O'Connor & Barclay, 2017)

Men and Women's Approaches to Concealing Infidelity

When attempting to attract a new partner while still in a committed relationship (i.e., **mate poaching**), men and women use different tactics to **conceal their intentions** from both their current partner and their social circle.

- **Men** tend to **increase displays of commitment** to their current partner to conceal infidelity. This includes talking about a shared future, expressing emotional closeness, showing satisfaction with the relationship, and fulfilling the partner's resource and emotional needs. Men also **hide the affair socially** by withholding information and isolating the extradyadic relationship from their broader network (Schmitt & Shackelford, 2003).

- **Women**, on the other hand, maintain **stable routines** to avoid drawing attention. They often **increase sexual and romantic behavior** with their current partner, making the extradyadic interest less detectable through consistent behavior and apparent emotional investment (Schmitt & Shackelford, 2003).

In short, men perform **over-investment**; women maintain **consistency** and increase intimacy—both aimed at hiding infidelity.

Machiavellian's Strategic Approach to Deception

Individuals high in Machiavellianism tend to **control what information they reveal**, making them more capable of **plausible and convincing lies** (Giammarco et al., 2013).

They often **endorse lying for personal gain** and feel **confident in their ability to deceive**, which makes them more likely to engage in **blatant lies** rather than subtle omissions (Brewer & Abell, 2015).

However, because they're also **risk-averse when it comes to detection**, especially in cases like infidelity, they still employ **strategic caution** in how they lie (Adams et al., 2014).

Learn more:

- How to be a good Machiavellian, using the positives within an honorable man's approach

Chapter 14: Infidelity Across the Ovulatory Cycle

Authors: Virginia E. Mitchell, Jenna M. Lunge, Alex Orille, Mercedes Hughes, Lisa L. M. Welling

Women's sexual interest fluctuates across the ovulatory cycle. During fertile phases, women are more likely to show attraction to men with markers of genetic quality, sometimes outside their primary partner. This creates a predictable window of higher infidelity risk, though it does not apply equally to all women or all relationships.

- **Attraction to alternatives increases near ovulation**, for some partnered women.
- **Testosterone and estradiol are positively associated with women's preferences for facial masculinity** (e.g., Bobst et al., 2014; Welling et al., 2007; although see Marcinkowska et al., 2019; for estradiol, see Dixson et al., 2018; Roney & Simmons, 2016; Roney et al., 2011).
  Estradiol levels are also positively associated with women's preferences for masculine male voices (e.g., Feinberg et al., 2006; Pisanski et al., 2014) and behavioral displays of dominance (e.g., Lukaszewski & Roney, 2009, although these authors used estimated rather than measured hormonal assessments)
  - **Progesterone** is negatively associated with facial masculinity preferences (e.g., DeBruine et al., 2019; Marcinkowska et al., 2018)
  - ⍰⍰♂ **Lucio's note**: **Estradiol** is more strongly associated with *feminine traits, fertility, sexually selective behavior* and even *mate value*.
    Progesterone is more associated with *nurturance and long-term bonding*, higher *post*-ovulation, and **inversely** related to masculine preference.

⍰♂Lucio's Question: **Is masculinity preferred by feminine or masculine women?**

Lucio:
The authors refer to women high in both testosterone and estradiol as preferring masculine men.

However, the two seem to be opposite: testosterone is associated with masculinity and dominance (and not most attractive in women), and estradiol with femininity (and often more attractive).

I wonder how these two square off together, if at all.

I found out that these two hormones seem to be moderately correlated.
So I suppose it's possible for a woman to be high testosterone, but not high estradiol, and the opposite.

Is it a coincidence that both prefer masculine men, or not?

Finally, progesterone seems to be negatively correlated with testosterone and be a stereotypically 'feminine hormone'.
Shouldn't this make a woman more likely to be feminine? ⍰

- **Infidelity risk peaks around ovulation**, especially when partner satisfaction is low.
- **Partner mate-guarding intensifies during fertile windows**, reflecting evolved counter-strategies.
- **Hormonal contraceptives change tastes and behaviors:**
  - Exotic dancers don't get extra tips during ovulation when using HCs (Miller et al., 2007)
  - Reduced preferences for male masculinity (Feinberg et al., 2008; Gori et al., 2014; Little et al., 2002; Little, Jones, & Burriss, 2007; but see Jones, Hahn, Fisher, Wang, Kandrik, Han, et al., 2018)

Theories of Women's Sexual Strategies

1. Dual Mating Hypothesis

Main idea:
Women evolved a dual mating strategy:

- **Long-term mates**: chosen for investment, reliability, and cooperation
- **Short-term mates (at peak fertility)**: chosen for genetic quality (e.g., masculinity, symmetry, health markers) *(Pillsworth & Haselton, 2006a)*

Message: Women may seek good genes via extrapair sex while keeping a dependable long-term partner.

Support:

- Some support from cycle-based shifts in preferences (e.g., increased attraction to masculine men near ovulation)
- But **replication is mixed**, and newer studies question how strong or consistent the effect is across individuals and cultures.

Also, it's possible that women may be in a relationship with high mate value partners, in which case the 'ovulatory shift' in attraction may favor the current patner:

> Moreover, women with more sexually desirable partners report feeling closer to their partners and experiencing more relationship satisfaction around ovulation than women who have less sexually desirable partners.
> Conversely, women with less sexually desirable partners report being less critical of and feeling closer to their partner during low-fertility versus high-fertility points in their menstrual cycle (Larson et al., 2013)

---

2. Extended Sexuality Theory

Main idea:
Women's sexual behavior **extends beyond fertile windows** and serves a **bonding function**, especially in low-fertility (luteal) phases

(Grebe et al., 2013; Thornhill & Gangestad, 2008)

Message: Non-conceptive sex helps maintain long-term bonds, ensure male investment, and protect against risks (e.g., coercion, resource loss) during pregnancy.

Support:

- More support than Dual Mating in explaining **why women engage in sex when not fertile**
- Aligns well with human pair-bonding and concealed ovulation patterns.

Concealed Ovulation

Main idea:
Unlike many mammals, **women show no obvious signs of ovulation** (Nunn, 1999), and have sex across the cycle (Dixson & Altmann, 2000).

Message: Concealed ovulation evolved to:

- Increase **paternal investment** (men can't time their effort just around ovulation)
- **Reduce paternity certainty** to deter male infanticide (Hrdy, 1979)
- Allow covert extrapair mating at peak fertility

Support:

- Strong theoretical grounding
- Supported by comparative research and observed human mating patterns
- Fits well with both **Dual Mating** and **Extended Sexuality** theories

In chart:

Theory	Core Message	Support Level
Dual Mating Hypothesis	Women pursue genes short-term, investment long-term	Mixed — some evidence, contested replications
Extended Sexuality	Non-fertile sex evolved to maintain bonds and ensure support	Moderate to strong
Concealed Ovulation	Hides fertility to enable female choice, reduce infanticide, and increase male investment	Strong evolutionary rationale and comparative support

Chapter 15: Long-Term Infidelities

Authors: Dana A. Weiser, Jaclyn Cravens Pickens, Adam V. Thomas

Long-term infidelities involve emotional bonding and sometimes parallel relationships. These affairs can last years and involve deep secrecy. They often coexist with otherwise stable marriages, showing that infidelity is not always about dissatisfaction but can create a "dual life."

Chapter 16: Cultural Differences in the Nature of Infidelity

Author: Farid Pazhoohi

Cultures differ not just in prevalence but in type. In more gender-equal societies, women report more sexual infidelity; in patriarchal societies, men dominate infidelity rates.

Punishments also differ: in some Middle Eastern countries, female infidelity is punishable by death, while male infidelity may be tolerated. In contrast, Western cultures often normalize male infidelity but stigmatize female cheating less than in the past.

- **Greater gender equality correlates with higher reported female infidelity**, narrowing gaps.
- **Patriarchal cultures harshly punish women's infidelity**, while tolerating men's more.
- **Western societies show narrowing gender gaps**, with shifting norms.
- **Higher male provisioning = higher infidelity punishment**: both men and women viewed male more than female sexual and emotional infidelities more harshly in cultures in which direct paternal investment and provisioning is higher
  - Frequency and permissiveness of social norms toward extramarital sex were associated with higher female-biased sex ratios and lower paternal investment (Scelza et al., 2020a)
- **Infidelity acceptance and rates may be rising**: from 2000 to 2016, the percentage of American adults who report that extramarital sex is always wrong has declined from 79.4% to 75.8%
  - In China, infidelity rates have risen over the period 2000–2015 from 12.9% to 33.4% for men, and from 4.7% to 11.4% for women (Zhang et al., 2021).
- **Nature may beat culture**: It is argued that women from male-dominated societies such as Japan in the 1970s do not approve of extramarital infidelity; however, once they are exposed to such an opportunity they are as likely as American women to be unfaithful (Maykovich, 1976).

Chapter 18: Relationship Dissolution Following Infidelity

Authors: Caroline E. Shanholtz, David A. Sbarra

Infidelity is the number one predictor of divorce worldwide. Most relationships do not survive discovery of cheating, especially sexual infidelity. Factors influencing whether couples stay together include presence of children, financial dependence, and willingness to forgive. But overall, infidelity is the leading cause of breakup across societies.

- **Infidelity is the leading global cause of divorce**, across societies.
- **Testosterone has been associated with precursors to unforgiveness**, including more anger rumination (Herschl et al., 2012) and less empathy (Hermans et al., 2006).
- **Infidelity can be a catalyst toward growth** after a separation: *women who end very low-quality marriages show gains in psychological well-being over time and appear to be relatively free of the tumultuous period of adjustment that often surrounds the end of marriage* (Bourassa et al., 2015)
- **Couples with children and shared resources are likelier to stay**, despite betrayal.
- **Emotional affairs can be as breakup-inducing as sexual ones**, depending on values.

Chapter 19: Forgiveness for a Partner's Infidelity

Authors: Megan R. Dillow, Amanda Denes

Forgiveness after infidelity is rare but possible. Predictors include high relationship investment, religious values, and genuine partner remorse. Women are slightly more forgiving of emotional infidelity, men of sexual infidelity. But forgiveness does not always restore satisfaction—it sometimes only prolongs the relationship.

- **Forgiveness depends on remorse, investment, and values**, more than time.
- **Gendered forgiveness patterns exist**, with women more forgiving of emotional, men of sexual infidelity.
- **Forgiveness does not guarantee satisfaction recovery**, and may only extend the relationship.

- **Forgiveness can be healthy**: forgiveness-granting has been associated with decreased anxiety, depression, stress, and negative affect; in addition, it improves positive affect and overall life satisfaction (Riek & Mania, 2012; Toussaint et al., 2016). Conversely,
- Unforgiveness has been related to increased subclinical anxiety and depressive symptoms (J. Davis et al., 2015)
- ⚠ **Careful forgivingthose who don't deserve it**, like repeat offenders

> Women's forgiveness of a partner's abuse may reinforce unequal power distributions and may be equated with tolerance of abuse (Lamb, 2002). Dominant abusers who are able to elicit empathy from their female targets are more likely to be forgiven, implicating a vicious cycle wherein empathy-driven forgiveness is associated with continued patterns of abuse (Tsang & Stanford, 2007)

Forgiveness-Seeking Tactics

Checkmarks that one that seemed to work better, x the ones that didn't.

- ✅ **Explicit acknowledgment** — apologizing, expressing regret, taking responsibility, directly asking for forgiveness
- ✅ **Nonverbal assurances** — behaving especially nicely, showing affection, attentive behavior
- ✅ **Compensation** — doing favors, buying gifts, offering to "do anything"
- **Explanation** — giving reasons or context for the offense
- ❌ **Humor** — joking about the situation or trying to lighten the mood *(rare and ineffective for serious transgressions)*

What seems to work best then, as predicted by power dynamics theory, is to **re-empower the cheated partner**.

Sincere apologies, visible remorse, and **accepting responsibility** increase empathy and forgiveness (Metts & Cupach, 2007; Davis & Gold, 2011; McCullough et al., 1997).
and **commitment to change** and offering reparations further improve chances of being forgiven

Chapter 21: Renewed Love Between Partners After Infidelity

Authors: T. Joel Wade, Rebecca L. Burch, Maryanne L. Fisher

Some couples experience renewed passion after infidelity, triggered by jealousy, fear of loss, or honest confrontation. These cases are uncommon but show that crises can sometimes reignite attraction. Still, the new closeness often fades with time as post-infidelity passion tend to be 'spikes' in attraction.

Chapter 22: Relationship Quality Without Renewed Love

Authors: Mohammad Hassan Asayesh, Elaheh Golpasha

When couples stay together after infidelity without renewed love, the relationship often declines in quality. Trust erodes, communication worsens, and dissatisfaction increases. These marriages often continue due to obligation (children, finances) but are marked by low well-being.

- **Children and finances keep couples together**, despite chronic dissatisfaction.
  - Some victims form child coalitions, 🤦♂ **Lucio's note**: some coalitions can turn toxic and against the cheating partner. I've experienced this from an ex's family

Chapter 23: Violence and Homicide Following Infidelity

Authors: Steven Arnocky, Adam Davis, Ashley Locke, Larissa McKelvie, Tracy Vaillancourt

Infidelity is a leading trigger for intimate partner violence and homicide. Men are more likely to respond violently, especially when paternity uncertainty is threatened.

- **Biparental care provides benefits but also risks**, including infidelity.
  - Infidelity is a major reproductive challenge
- **Violent reactions correlate with male sexual proprietariness:** the many potentially violent consequences to real or suspected infidelity (ie.: psychological, physical, or sexual violence against partner, violence against affair partner, abuse and killing of children) all are robustly links to (typically) male sexual proprietariness, which embodies men's attempts to control and monopolize the reproductive decisions of women to stymie infidelity, reduce paternity uncertainty, and prevent women's attempts to defect from the romantic relationship (Daly & Wilson, 1988; Taylor, 2012; Wilson & Daly, 1996).
- **There is a link between infidelity and abuse**, several studies show. *Taken together, this body of evidence highlights that infidelity and IPV frequently intersect; real or suspected female infidelity likely precipitates and maintains, but does not justify, violence against women*
  - Women who committed infidelity during their prior relationship were more likely to experience sexual and physical abuse at the hands of their partner (Shields and Hanneke, 1983)
  - Men who suspected a partner was likely to cheat reported more controlling behavior, which in turn predicted violence against intimate partners (Cousins & Gangestad, 2007)
  - Arnocky, Sunderani, et al. (2015) supported positive correlations between anticipated partner infidelity and IPV (physical assault, partner injury, sexual coercion, and psychological aggression) in a sample of college-aged men
- **IPV may be considered a form of cost-inflicting mate retention behavior**, including emotional manipulation, controlling behavior, and physical abuse, that functions to stymie women's and men's infidelity and to reduce the likelihood of defection from the mateship (Albert & Arnocky, 2016; Davis et al., 2018; Miner, Shackelford, et al., 2009; Miner, Starratt, et al., 2009)
- **IPV may be adaptive**, with several lines of evidence
  - Domestic assault appears to function primarily to prevent infidelity, whereas in-pair sexual assault seems to be a response after infidelity has been committed (Camilleri & Quinsey, 2009; Daly & Wilson, 1992; Goetz & Shackelford, 2006)
  - ⚠ Don't jump to conclusions, though: it is difficult to determine the extent to which infidelity directly leads to abuse. Abused individuals may instead be more likely to be unfaithful (Arnocky, Sunderani, et al., 2015). And men suspected of infidelity are also more likely to commit IPV (WHO & LSHTM, 2010) (…)
    IPV is also risky, including violent retaliation, increased odds of relationship termination (discussed in Davis et al., 2018, Duntley & Shackelford, 2012, and Miner, Starratt, et al., 2009), and women deciding to terminate pregnancies when victims of IPV
- **IPV isn't male only, women can also perpetrate**, particularly in gender-parity cultures women and men perpetrate common forms of emotional and physical violence to a similar extent (Archer, 2006, 2018; Graham-Kevan & Archer, 2003; Straus, 2009).
  - Most IPV appears to be bilateral, whereby both partners are engaged in mutual violence toward one another (Babcock et al., 2019; Madsen et al., 2012).
- **Intimate partner homicide is considered an extreme form of male sexual proprietariness** (Daly & Wilson, 1988)
  - Uxoricide may best qualify as an evolutionary byproduct rather than the designed behavioral output of an adaptation because of its high costs and smaller payoffs <—- ⍰⍰♂ **Lucio's note**: I agree. And was surprised the author didn't list what seemed to be the strongest cost of uxoricide: losing one's mate with an act that may make it even harder to find a new one
- **Culture of honors may promote IPV,** men are more tolerant of male jealousy and male-perpetrated IPV, and

men tend to seek power and dominion over women and are more likely to treat them as sexual objects

Interesting Notes

- **Women focus on female rivals, men focus on their women**: women focus their attention on threats to infidelity from potential rivals (other women), compared to men who focus on monitoring their own partner's intents to commit infidelity (Ein-Dor et al., 2015).

⍰⍰♂ **Lucio's note on the chapter:** Steven Arnocky and his team stand out for their scientific rigor and critical thinking process. Rather than proposing hypotheses based on confirming evidence, they critically examined the **data and concurrent explanations both for and against** each claim. This balanced, falsification-aware approach is exactly what strengthens theoretical credibility and what we need more of. Both in the world, and in evolutionary psychology specifically.

Chapter 24: Male Sexual Coercion in Response to Infidelity

Authors: Lidia Dengelegi Abrams, Mike Abrams

Some men respond to suspicion or discovery of infidelity with sexual coercion, using sex as a form of control or punishment. This behavior is linked to evolutionary mate-guarding instincts but we shouldn't fall for the 'naturalistic fallacy' and can still condemn it as highly destructive and abusive.

- **Some men escalate to sexual coercion after suspicion or discovery**, as abusive mate-guarding.
- **There is no specific mechanism for rape although it's evolved**. Such as, rape emerges from other evolved male strategies for reproductive competition like aggression, jealousy, mate guarding, sperm competition, lower empathy in some individuals etc., but not because there's a specific neural system or module that evolved *just* for rape.
  - **Male mate guarding is an adaptation** to prevent infidelity and cuckolding, even in its most violent manifestations
- **Genetic differences explain 40% of sexual coercion** and shared environment explain only 2%. The data directly contradicts the social science model holding that sexual is learned
- **Men feeling less desirable than partner deploy more forced in-pair copulation**, and more when she is in, or close to, estrus (e.g., Buss & Shackelford, 1997; Goetz et al., 2005)
- **Sexual violence does not correlate with dominance in the relationship** (Gage & Hutchinson, 2006), contrary to authors who relate sexual partner abuse with need for control and domination (Basile, 2002; Bergen, 1996)

Interesting Notes

- **Emotional vs sexual jealousy may depend on lover/provider strategies**, rather than genders: *A study by Jones and associates (2007) shows that individuals who express high mating effort, characterized by short-term relationships and inconsistent partner-guarding, are more likely to be upset over sexual infidelity than emotional infidelity. Conversely, individuals with low mating effort, who conduct more mate guarding behaviors, but in a way that preserves the future of a relationship, are more likely to be upset by emotional infidelity than sexual infidelity. Moreover, the high-mating-effort individuals are more likely to react punitively to all types of infidelity.*

Sexual coercion is part of a cluster of cost-inflicting tactics

> *Starratt et al. (2008) find a correlation between partner-directed insults and accusations of sexual infidelity and sexual coercion. Resource manipulation, commitment manipulation, and defection threats are correlated with accusations of infidelity and partner insults. Insults such as derogating her physical attractiveness, her value as a partner, her mental capacity, or her value as a person correlate with sexual coercion and can be seen as a type of*

> *mate guarding. Lowering the partner's perceived self-value and self-esteem is meant to diminish her likelihood of attempting to stray*

People Constantly Assess Market Value

> partners to continuously assess their own mate value relative to their current partner and potential new partners. This challenge to relationship fidelity is exacerbated by the inevitable change of a person's status, appearance, health, and emotional stability over the life span. When time treats one partner more harshly than the other, there will emerge an increased disparity in relative mate value
> (…)
> A man's or woman's finding someone they believe to be both available and more suitable can lead to a breakdown in the continuing effort to sustain monogamy. For example, a woman who has a close friendship with a male coworker of a higher status or more physically attractive than her husband may progress to a sexual affair if her husband loses his job or otherwise becomes less desirable in her eyes

However, a good bond can go a long way to keep a partner attracted and in the relationship:

> Conjugate or companionate love can foster a bond that is resistant to the allure of another potential partner.
> (…)
> Unhappily, many relationships do not develop a strong enough familial bond (…) The combination of relationship fragility and the common practice of evaluating potential new partners may motivate a partner's focus on someone who seems to offer more

Dominance, Submission, & Sexuality

Rape and sexual coercion may reflect **exaggerated but evolutionarily grounded mechanisms** that evolved to facilitate reproduction.

Across species, females become less aggressive and less cautious when sexually aroused, particularly during estrus. Even predators like hyenas or lions adopt **submissive postures** to permit copulation when fertile (East et al., 1993). This behavioral shift is **hormonally mediated**—primarily by estrogen—and linked to a **submission circuit in the mammalian brain** that reduces defensiveness to allow close contact with potentially dangerous males (Pfaff et al., 1994; Ciaccio et al., 1979). The theory holds that evolution had to override the natural caution of females to make reproduction possible, given the risks involved.

Freud (1933) misinterpreted this sexual submission as evidence of innate female masochism, but in fact, **sexual masochism is more common in men** than women (Abrams et al., 2019; Donnelly & Fraser, 1998). Studies on sexual fantasies show that:

- **Men's submission fantasies** often involve **BDSM**, pain, or humiliation
- **Women's submission fantasies** typically center on being dominated by a **sexually committed male** (Abrams, 2016)

This female preference is consistent with **ancestral mating logic**, where larger, socially dominant males provided protection for women and offspring (Buss, 2004).
Even **modern socially dominant women** often report fantasies of sexual submission to dominant men (Hawley & Hensley, 2009), suggesting underlying sexual submission/dominance modules.

There is of course overlap in masculine/feminine responses; some men acquire a more submissive sexual response and some women a more aggressive one.

At the extreme end of these dynamics are **sadism and masochism**, which reflect **overamplified versions** of

dominance and submission. Sadism exaggerates the drive for dominance to the point where inflicting pain is sexually rewarding. Masochism does the reverse—turning submission into a need for degradation or pain as a condition for arousal.
Given that **sadistic and masochistic fantasies are nearly universal** (Brown et al., 2020; Joyal & Carpentier, 2017), **they likely reflect deep evolutionary structures**, originally tied to reproductive strategies involving dominance, submission, and mate choice.

Chapter 25 – 26: Nonhuman Animals & Future Directions

Author: Yu-Hsun Hsu

Infidelity occurs across species. Birds, mammals, and primates show extra-pair mating despite pair bonds. Consequences include paternal uncertainty, mate guarding, infanticide, and sperm competition. Animal studies highlight evolutionary roots of human infidelity.

Chapter 26: Future Directions for Infidelity Research

Author: Tara DeLecce

The book closes by urging clearer definitions of infidelity, better measurement (including digital and emotional), and more diverse global samples. Future research should focus on domain-specific personality traits (e.g., sexual narcissism), cultural variation, and the growing role of technology. Understanding both predictors and consequences is crucial for building realistic models of human mating.

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Being Too Nice May Increase Odds of Infidelity?

From chapter 1:

> a study of almost 900 older married individuals that controlled for multiple confounding variables (e.g., demographics, the other Big Five personality traits, religiosity) demonstrated that people higher in agreeableness reported more instances of their partner engaging in infidelity (Mahambrey, 2020). The authors speculated that "perhaps individuals with agreeable spouses become accustomed to their highly understanding and accommodating partners, so much so that they assume even infidelity—if discovered—will be pardoned" (p. 294). Consistent with such speculation, other work suggests people do take advantage of partners who appear particularly accommodating (McNulty & Russell, 2016)

However, the findings are inconsistent on this, so it would be incorrect to say 'the more agreeable, the more you get cheated on'.

I suspect that the difference here is in the variables that sometimes go unmentioned in research, including:

- **Gender**: it's not the same for a man or woman to be overly agreeable
- **Power awareness**: being nice with those who deserve it
- **Social strategy**: being nice in the appropriate situations
- **Personal value**: high value and agreeable is good. Low value and agreeable screams 'overcompensating'
- **Masculinity/dominance** as the baseline behavior with 'agreeable on top'

Ie.: I suspect that being too agreeable, naive, lower-value and submissive *for men* increases the odds of being cheated on.

It may not be the same for women.

And it's probably not the same for men who are 'contextually and smartly agreeable'. Such as, being agreeable without being *overly* agreeable (optimum balance), and knowing when *not* to be agreeable.

On how to combine being agreeable with getting respect and attraction:

- High agreeable, and high power

Does Western's 'Expectation of Monogamy' Set Up People For Failure?

In chapter 12 Mike Abrams and Lidia Dengelegi Abrams write:

> The forces that drive people to seek new mates are in a continual battle with a socially endorsed ideal of lifelong bonds (…) Despite the best efforts of many well-intentioned individuals, innate inclinations often overwhelm the imperatives imposed by marriage or partners' strong intentions of fidelity. We humans simply are not evolved to remain with one partner exclusively and indefinitely. When we nevertheless do so, it is often with frustration and resentment.
> (…)
> In an era with long life spans and permanent marriages, love's relative brevity tends to lead to disappointment. Romantic love almost inevitably fades within a few years, leading to diminished commitment and broken vows

And from chapter 2 by Kelly Campbell et al.:

> The prevailing expectation of monogamy, which appears difficult to uphold considering EDI rates, causes individuals to feel devastated when infidelity occurs (Campbell et al., 2012; Coontz, 2005).
> (…)

> The Western norm of monogamy therefore does not work well, and it would be worth identifying different models that could help individuals and relationships thrive.

I agree with this.
It's understandable that anyone would be distraught by a cheating partner.

Yet there is also an element of naivete in the assumption that 'monogamy is the norm, cheating does not happen (to me)'.
And the higher the pain, the more one has bought into that unrealistic ideal.

Long-term monogamy CAN work for many and potentially even most couples *within certain cultural contexts and societies* (ie.: high social and religious conservatism, fewer options, rural areas, fewer women at work, etc. etc.).
However, that may just not be the case anymore for most Western countries. And it's been so for decades now.

Also linked, is this:

Naivete May Be Linked to Bigger Trauma After Infidelity

From chapter 22 by Mohammad Hassan:

> Balman (1992, as cited in Lusterman, 1998) noted that people who have suffered a severe trauma feel fundamental confusion about the nature of the world cognitively and existentially. Based on Balman's reports, these people had three basic assumptions in their mind before experiencing the trauma: (1) the world is a source of goodness, (2) the world is purposeful and meaningful, and (3) the self is valuable. Following the trauma of unfaithfulness, these assumptions are shattered.

Believing that 'the world is a source of goodness' is an indicator of excessive naivete, unless one also believes the world can be a sourch of 'not goodness' as well.

The More He Spends, The More She Cheats (Power-Imbalance Hypothesis of Infidelity)

From chapter 5 by Jana Hackathorn, Brien K. Ashdown:

> Lower relative income (i.e., economic dependency on one's current partner) is associated with higher odds of engaging in infidelity (…)
> For women, those who are economically dependent on their partner are more likely to engage in infidelity than either women who provide all the income in a household (i.e., the breadwinners) or women who are in an economically equal relationship (Munsch, 2015).

This is something I noted and aligns with power dynamics.

As usual, mate value plays an important role.
Female breadwinners may be more likely to be in a partnership with a more attractive or player type in an unspoken exchange of money for mate value.

For men, the more he earns compared to her, the less likely it is that it's a relationship between equals.
A relationship with higher power imbalance may seem good for the dominant party on paper, but it presents unique challenges.

Unless he's careful and highly power-aware, his financial contributions may turn the relationship transactional (even if she initially likes him for his qualities, the 'crowding out effect' of intrinsic motivation).

Submissive parties tend to avoid assertiveness and instead resort to passive aggression, sneakiness… And

cheating behind the dominant party's back.

I've seen these dynamics often, including with Western men traveling to poorer countries, and this includes younger and good-looking guys, not just the retired ones.
Some of these 'passport bros' believe they struck gold with local, submissive women. But front-facing submissiveness rarely translates to faithfulness.

I suspect that **relationships with a high power imbalance may inherently increase 'in your face submissiveness', but at the cost of increasing 'behind your back sneakiness'.**

Men: Don't Be Too Vulnerable

From an interesting clinical example of a man who made the mistake of 'seekign reassurance':

> In his despair, Val made the common mistake of seeking reassurance from a spouse going through an emotional crisis of her own. <— ⍰⍰♂ **Lucio's note:** Instead a masculine steadying presence, he added his own crisis
> Karen's priorities were her child and child to be, and their life quality now seemed at risk. Her anxieties were leading her to question the trajectory of their marriage. Val's new self-effacing demeanor and his apologetic efforts to do more at home had the paradoxical effect of diminishing his status in Karen's eyes. <— ⍰⍰♂ **Lucio's note:** Giving more in this situation can be framed as a (desperate) effort ot make up for an ever-growing mate value discrepancy
> She now pitied him, and pity is not attractive. As this tension in their marriage increased, their sexual encounters radically decreased in frequency

And then she went on to cheat on him.
I was quite surprised to see such a lucid, power-aware, real-life case study in a handbook.
The authors analyzed this example perfectly well, a TPM-level passage. These are the types of therapists that can put a man back on track.

Also read 'vulnerability without losing power'.

QUOTES

On the reality of humans' (subconscious) calculativeness:

> Partners in relationships are continually assessing their own and their mate's "market value," and their self-appraised mate value will often guide the treatment of their partner and decision of whether to be unfaithful.

On morality vs evolutionary logic:

> Since moral virtue was not an attribute that added to fitness during the epochs in which the preponderance of hominin and human behavior evolved, violence had many upsides and fewer downsides

⍰⍰♂ Lucio's Analysis

This was an exemplary handbook: it analyzed infidelity both broadly and deeply, there was little overlap between chapters to maximize time to insights, and the authors wrote like true scientists.

Just take these examples:

- *it should be noted that this integrative data analysis was based on newlywed couples, a time when infidelity is rare*

and thus we are hesitant to draw strong conclusions from this single analysis <— This is how you critically analyze a sample and think about possible faults with it, rather than immediately generalize the findings (Chapter 1, Emma E. Altgelt, James K. McNulty, and Andrea L. Meltzer)

- *and behavioral displays of dominance (although these authors used estimated rather than measured hormonal assessments)*. <— The author highlights and uncovers an importantant limitation for the readers' benefit (Chapter 14, Virginia E. Mitchell et al.)
- *there are reasons to question whether IPV in response to infidelity constitute adaptations. Cost-inflicting mate retention is a risky reproductive strategy because it may result in violent retaliation and increase the likelihood of termination of the relationship (discussed in Davis et al., 2018, Duntley & Shackelford, 2012, and Miner, Starratt, et al., 2009)* <— this is good critical thinking skills, without jumping to easy conclusions. This is how you make you good evolutionary psychology, without falling for easy storytelling (Chapter 23, Steve Arnocky)

REVIEW

The Oxford Handbook of Infidelity (2023) is an exceptionally insightful and well-crafted volume, written with the rigor and clarity one expects from top researchers.

Each chapter not only summarizes the state of the science but also highlights limitations, unresolved debates, and where evidence remains mixed or merely hypothetical.

I hope more researchers will follow this example.
For TPM, I was able to update and improve several articles. I'm grateful to the authors, and I look forward to learning more from them ⍰⍰.

Check the **best evolutionary books** or get this book on Amazon.

The Oxford Handbook of Infidelity: Summary & Review

The Oxford Handbook of Infidelity (2023) is the most comprehensive scientific reference on why people cheat, bringing together leading researchers to provide a global, evidence-based picture of who is most likely to be unfaithful, why, and with what consequences.

Escape The Black Pill: From Incel to High-Value Man

Lucio Buffalmano · 24 November 2025 · Archived copy · Original

Feeling invisible, rejected, or like dating is ‘rigged’ against you?

If you’ve been pulled into black-pill or incel spaces, it can *feel* like women only want the top 1% of men with height, looks, status, and money, while the rest should just accept their fate.

I know that mindset.
And I also know it’s **false**.

This article is for men seeking an **incel exit**—a path to escape the black pill, clearly showing you that it’s possible, and providing you with strategies along the way.

Let’s dive in.

Intro: I Should Have Been An Incel

My name is **Lucio Buffalmano**, founder of **The Power Moves**.

By mainstream dating standards, I should have been 'involuntarily celibate' myself.

I'm short, bald, and *not* stereotypically masculine.
I come from the middle of nowhere and wasn't blessed with an early start either: I'm a late bloomer.

The red and black pill as well as the loxxmaxxer crowds would have labeled me as **doomed to involuntary celibacy.**

Instead, I dated like a top-1% man.

I'm actually above top-1% in lifetime partners. And I largely maintained high standards.
I only approach women I truly like, and you'd classify almost all the women I dated from 'cute' upward. Several were *very* attractive and/or high-quality women that many men would wish to marry.

If I can do it, you can!

I write this post because few coaches are true underdogs.
They may not understand the average and below-average guy's struggles, and many men may not relate to them.

Instead, my background can provide the ultimate proof that **if I can do it, you can do it.**
If you want, you can escape the black pill, and you can escape involuntary celibacy.

And no, you don't even need anything crazy.
I worked hard, took countless shots, and also failed a ton. But I was a *player*. If your goal is to simply have a good woman, you only need *some* smart work.

Mindset:

> If one guy who is no better than me can do 100, you can sure as f*ck do 10
>
> *Empowered man's mindset*

Black Pill Lie #1: Height decides everything

You've seen the videos where girls reject guys for being short.
Short guys watch and give up.

That's the whole problem: those clips show **first reactions**, not long-term results.

First reactions don't predict long-term attraction. **Personality and behavior predict long-term attraction**, not looks.
If anything, great looks with poor mindsets and behavior only predict a downward slope. You start high, but lose attraction and respect.

Science supports this claim. Say Swami and Furnham in *The Psychology of Physical Attraction*:

> Clearly, when an interaction moves beyond the initial 'snap judgements' made about people on first meeting them (Schneider et al. 1979), the effects of static physical characteristics may diminish. Other variables — the dynamic components of physical attractiveness — begin to play a more important role in determining attraction in new or continuing relationships. Here, non-physical characteristics emerge as important factors in determining liking and eventual relationship formation (Byrne 1971).

♂ Proof

An ex of mine, a visibly taller woman, literally told me I 'didn't even exist' for her at first.
Worse yet, she added that for her, 'it was like I didn't even have legs'.

Up until here, just as predicted: a considerably shorter guy isn't even on the radar of an attractive woman.
Now, flash forward a year later, after we ended up together and then broken up. And I'm getting crying calls for another shot at being together.

No pride in that: there is nothing 'good' about causing grief. But it's the proof that attraction can grow. It's not fixed.

Club Queen With Shortest Guy

And you're also not 'condemned' to long-term dating if it's not your thing.

I once pulled a club queen from one of the largest clubs in central Prague. She was on a league of her own that night, and also compared to *other* nights.

When I walked towards her, two friends of hers came to cockblock me. They were both a head taller, but I didn't

let them intimidate me. Instead, I showed resolve. *She* came to shush her protectors, and guess what? I ended up with that girl.

I was one of the shortest guys in that club, and I wouldn't be surprised if I was *the* shortest.
Think about that: the shortest guy, ends up with the club queen. Without status, VIP table, throwing money around, or even having any cool friends there.

How To Beat Short Stature

- **Focus on *mental* empowerment**: can-do attitude, confidence, pride. Self-esteem is foundational to all and predicts mating opportunities (Sprecher et al., 2008)
- **Focus on *behavior*** that sub-communicates value, confidence, and power
  - Good body language: walk with confidence, masculine body language, etc.
  - High power behavior, interpersonal dominance, assertiveness, boundaries, etc.
  - 'Game': as in 'dating skills', largely based on power dynamics awareness

And of course, colors that elongate and boots that add a few centimeters also help.

Black Pill Lie #2: Looks are everything

Yes, good looks help a lot: they get attention and facilitate relationship initiation for both short and long-term.
But even here, both exceptions and nuances exist:

- **Looks matter *less* for men**, compared to women (Kniffin and Wilson, 2004)
- **Individual variance is high**: looks are also cultural, matter more in individualistic societies, and there is plenty of individual variance (Mogilski and Shackelford, 2023)
- **Confidence and attractive nonverbals** are also attractive
  - Some studies show dominance > looks, especially for short-term (Sacco et al., 2022, Bryan et al., 2011)

⍰⍰♂ Proof

I'm short, bald… And I still get plenty of eye contact.

This year I was walking toward a girl, and she stared so long at me that she tripped.

Sounds Hollywood-like, I know, but it happened. That's not genetic. I dressed well, walked like I owned it, and thought highly of myself. That's mental empowerment feeding into behavior.

P.S.: Smart men can find ways
This was in *Europe*, by the way.
I don't even consider some world regions where I also got approached or asked for pictures *several times*. Smart men can also move to strategically increase their mate value with various 'SMV hacks'.

How To Beat Looks

- **Focus on mental and social power**, just like for height
- **Quit comparing**: of course model-looking men are more likely to get initial attention. Great for them! But it has nothing to do with *you*.
- **Do more social circles**: studies show that the longer one is acquainted, the more couples differ in attractiveness (ie.: looks matter less)
- **Focus on life success**

And of course, the biggest nuke:

- **Forget looks, focus on *her***: you'd be astonished at how many attractive women don't care so much about the man's looks

Black Pill Lie #3: High-status men get all the women

This is based on female hypergamy, or the tendency of women to prefer men of higher social class, or greater wealth.

As usual, both red pill and black pill **take a general truth to untruthful conclusions**, forgetting shades of grey, exceptions, and subjective and contextual elements.
For example:

- **Wealth matters less in modern societies** of distributed wealth (Sacco et al., 2022), where romantic love matters more
- **Monogamy dampens hypergamy** since most men get a woman
- **Status matters less for short-term dating** since it's related to provisioning (Buss, 2016)

In general, for most dating scenarios, social status helps, *but only within that specific social circle*.

⍰⍰♂ Proof

At my former company's party my +1 night was, for many men's tastes, the most attractive woman.

At that time, I was a trainee in that company, making me one of the lowest-status men.

A low-status man, with the most attractive woman.
How did that work?
Because I met her with cold approach.

Cold approach bypasses status because it's inherently 1:1 and *outside* of group dynamics. This is an opportunity that our ancestors rarely had. But you do.

P.S.:
I'm also introverted, not very social, and I also wasn't high status in society at large. As a southern European, you're almost preframed as slightly 'below' the northern guys. Still, status didn't stop us.

How To Beat Status

- **Cold approach**, and learn how to approach a girl
- **Enter new circles**, and status resets every time you enter a new circle
- **Learn how to gain status** in new circles, see here

For more on cold approach see:

> Cold Approach: The Science of First Meeting A Woman

Black Pill Lie #4: Strength & muscles are necessary for carnal attraction

The meme ‘do you even lift bro’ suggests getting strong is foundational to men’s life and dating success.

The red pill focuses heavily on physical dominance, sculpted bodies, and weight training.

The message is that ‘women’s true desire’ is based on strong male bodies.
And strength certainly won’t harm you, and may even help a bit. Physical formidability also certainly helps.

But *as long as you stay lean*, the link between strength and attraction is weak.

??♂ Proof

During most of my dating, I had never set foot into a gym.

I didn’t get into the gym until my late thirties, when I slowed down with dating.
To me, the gym was the place you go *instead* of meeting women.

Zero weight training didn’t prevent several women from being attracted to me—and yes, several also to my body. Based on experience, I believe today that many **women see an idealized body of the man they fell for.** I had women take pictures of me while sleeping, or send me pictures of more muscular men’s drawings that ‘reminded them of me’.

The Woman Who Only Wanted Sex

I dated a blonde who showed up in a fur coat, and nothing under it.

No words spoken. She just dropped the coat, came, and then went out with her friend (who was waiting for her in the car parked downstairs).

That’s as raw sexuality as it gets.
And it was based on *sexual* skills, not lifting skills. Good lovemaking requires little muscle. (And most relevant life goals also require little muscle).

How To Beat Gym Muscles

- **Exercise to stay healthy**. Lean is the goal, and muscle is a plus. Definition helps. No need for ‘bulking’
- **Be a good lover**. Getting good at making love is more fun and higher leverage than getting good at lifting

Black Pill Lie #5: 6-feet, 6-pack, 6-figures monopolizes women's choice

This red pill mantra states that women's choices come down to height, great physique, and income.

It's obviously true that height, a good physique, and high income boost a man's value.
What's a lie is that they're *necessary* or almost necessary. In truth, **none of those sixes are necessary for women's choice.**

This red pill mantra, again, over-generalizes and confuses women's *stated preferences* for real-world results. And, as always, it doesn't consider the many exceptions.

⍰⍰♂ Proof

I had a fling during my travels.
She was a designer and artistic type. We met as winter approached and had great chemistry.

We cooked together, had wine, made love, and listened to David Bowie while eating half-naked (not a chance pick by the way: higher odds of appealing to her artistic side).

On my last day, she asked me to remove my cover and climax inside. This wasn't a baby-trap move: she didn't even know my full name.
That was a carnal desire to have my child. And from a guy leaving, no support and provisioning: that is ***peak* mate choice**.

So here's what doesn't need sixes: good seduction.

And in case you're wondering: no, it wasn't a poor country, and it wasn't a country prizing white skin: I don't even take those into account. And, yes, it was a cute 20-something with a great body.
Good seduction doesn't need any sixes.

P.S.:
I was offered money and free accommodation to help a woman conceive (not in her prime though).
And several women I dated wanted or fantasized about children. When I asked one why she wanted a boy, she said that all women want a boy to resemble the man they admire.

How To Beat The 666 Rule

All that we previously said, plus:

- **Learn how to romance and seduce**
- **Take your shots**: finding a woman with whom you have chemistry is a numbers game

Start Now

This post may sound 'motivational', but it's not.
We don't do motivation here, we do *empowerment*.

And we prefer realism over motivation.
Looks, height, money, status… They are all important.
What we're saying is that they're not the end-all-be-all for smart, ambitious, and strategic men.

Of course, this doesn't mean it's easy.
And it doesn't mean everyone reading here will be successful.
Succeeding as an underdog almost by definition means being exceptional, rather than the norm.

What we're saying is that **it's *doable*.**
Anyone can become more attractive and almost anyone reading here can find a woman.

The keys are:

- Take more chances
- Maximize what you have
- Offset what you don't have

Start your self-development journey, and you'll become a higher-value guy.
Check out this primer on self-empowerment:

> 10 Self-Empowerment Foundations For Top-1% Men

Practical steps to escape the Black Pill

Here is the beginner's starter pack to exit the incel life:

1. Mindset

- **Address depression first**, if present. Consider a therapist

- **Embrace healthy nihilism**. So what if right now you're an incel? An incel and a chad are both going back to dust before you realize it
- **Embrace the 'non-fairness' of the world**. There is nothing bad with it, it's just how it is
- **Stop the fatalism**, adopt an internal locus of control
  - Introduce hope & optimism, focus on exceptions and success stories like this one. If religious, even praying can help

2. Basics of Self-Development

- **Quit negative habits** like doom scrolling, excessive porn, or smoking
- **Develop better habits**, like running, gym, meditation, work
- **Start small and aim for progress**, not perfection

Focus on the areas of highest impact, nothing crazy is needed
No need to become a lunatic biohacker with red lights on his package while needling himself to measure ketones

3. Appearance & presence

- **Dress well**
- **Maximize your presence**, from the basics of grooming to hairstyle, tailored clothes etc. etc.
- **Practice posture** and body language

4. Social skills & approach

- **Enter new groups**, practice being social, gaining status, and meeting women and guys alike
- **Cold approach** is a high-leverage skill for low-status men. Practice short opens: one minute, no expectations.
- **Learn to lead conversation**: ask fewer questions, make more statements that demonstrate value

5. Sexual/romantic skill

- **Lead more**: choose location, suggest plans, invite her back
- **Positive dating dominance**: tell her to sit beside you, and don't be afraid to call out inconsistencies. See here
- **Build sexual tension** gradually with touch or teasing

Later on you can graduate to more advanced frame control, sexual tension without touch, or proper seduction and making women fall in love.

FAQ

Is the "Black Pill" theory about female hypergamy and male genetics being everything actually true?

The Black Pill is based on some truths because genetics contributes to attraction and offers initial advantages, but it is fundamentally wrong because it overweights these factors compared to subjectivity, personality, and a man's power to increase his value with actions and learnable skills.
Ultimately, **the black pill is an unmasculine loser mindset** because it submits to an unfavorable view instead of focusing on agentic masculinity and personal power.
The truth, as demonstrated in this guide, is that **any man can become more attractive with learnable behavior**.

Can short or average-looking men still get attractive women?

Yes, if he develops high-power behavior, confidence, and meets several attractive women.

If I'm "genetically poor" (short, bald, low facial aesthetics), what percentage of women am I actually filtered out from?

You will likely get filtered out more often based on **first impression and zero-acquaintance situations** (like dating app swipes and pre-introductions). This is the superficial "funnel" the Black Pill focuses on.
However, you are **not** filtered out whenever you can showcase your other valuable attributes, for example, in social circles, dates, or even good cold approaches. Also, women have different personalities, and many quality women place lower importance on looks.
By becoming a more competent, confident, and successful man you bypass the initial superficial filters and compete for the highest quality.

How to escape the black pill and execute an incel exit?

The most important mindset shift is an empowering **Internal Locus of Control**. The Black Pill is an *external* locus of control (blaming genetics, society, and women).
Escaping requires you to fundamentally believe that **your results are in large part determined by your actions, effort, and skills.** Once you adopt this mindset, every single attractive becomes learnable and achievable. Next, start learning and practicing those skills, and you'll be on your way out of the black pill faster than you know it.

Do women really only want "6-6-6" men (6 feet, 6 pack, 6 figures)? If I don't have those, what chance do I have?

The "6-6-6" standard is a social media meme, not a comprehensive psychological truth. It captures some important qualities that many women value, but **it's not a barrier for smart men who possess none of those sixes.**
The truth is that **Good Seduction** and **High-Value Behavior** don't need any sixes.

Next Steps: From Basics to Mastery

If you're in a dark place, start with mental health first.
Then, simple actions.

Once you remove bad habits, you may be ready for the next step: **mental and social empowerment.** That's where the steepest climb begins.

It's the focus of our mission and flagship course **Power University**.

It's the complete, step-by-step framework that shows you exactly how to cultivate the confidence, game, and positive dominance that makes you the exception, not the rule:

Power University

Narcissism Explained — A Strategic Guide for Ambitious Men

Lucio Buffalmano · 1 December 2025 · Archived copy · Original
