Narcissism is one of the most misunderstood concepts in psychology and personal power.

While pop culture frames it as toxic ego and poor relationships, the research paints a more nuanced picture showing that **narcissism affords important advantages**.
Leave the moral framing behind, and narcissism is an effective high-variance evolutionary strategy for status, power, and reproduction.

Done right, narcissism delivers confidence, agency, and the drive to rise. Done poorly, it undermines growth, relationships, and mental health.

This guide provides a comprehensive, research-backed overview of narcissism: its traits, underlying psychology, and—most importantly—how to model its adaptive side while avoiding the costly downsides.

What Narcissism Is

Narcissism is a personality trait characterized by grandiosity, self-focus, entitlement, and an intense preoccupation with status, power, and superiority.

Key Measures

Empirical research on narcissism relies on validated psychometric scales to measure its different facets:

- **NPI (Narcissistic Personality Inventory):** The most popular scale, primarily measures **Grandiose Narcissism**, more correlated with positive outcomes.
  (Take the NPI Test Here ↗)
- **Hypersensitive Narcissism Scale (HSNS):** Measures **Vulnerable Narcissism,** assessing the defensive and anxious side of the trait
  (Take the HSNS Test Here ↗)
- **NARQ (Narcissistic Admiration and Rivalry Questionnaire):** Differentiates between the two strategies that determine adaptive success or maladaptive failure:
  - **Admiration:** Assertive self-enhancement, confidence, and approach-oriented behavior.
  - **Rivalry:** Antagonistic self-protection, competitor derogation, and envy.
    (Take the NARQ Test Here ↗)

Disclaimer: online tests are non-clinical, for informational use only, and are not a substitute for psychological assessment. Take them to get an idea, then use this article to put it into practice

Benefits: Why It Matters for Ambitious Men

Narcissism provides too many advantages for ambitious men to ignore. These advantages are why the trait persists in the human population, despite its social costs.

Advantages include:

1. Leadership Emergence

Narcissists are natural-born leaders.

Many of the famous figures you study in history books may have had narcissistic traits

They rise in leaderless settings, structured organizations, and even in politics (Brunell et al., 2008; Nevicka and Sedikides, 2021; Watts et al., 2013).
Narcissist research and leading authority Keith Campbell wrote that he's not swayed by presidents' narcissism because he *expects* presidents to be narcissistic.

Narcissists aren't necessarily more effective leaders; they instead have higher variance (Resick et al., 2009; Chattterjee & Hambrick, 2007). Effectiveness instead seems related to an optimum balance of narcissism (Grijalva et al., 2015). In any case, narcissists are effective at *getting* to the top.

2. Better Dating Outcomes: Higher Attraction & Exciting Lovers

Narcissists have more sexual partners and are exciting lovers.
Says Campbell in the *Handbook of Narcissism and Narcissistic Personality Disorder*:

> individuals reported that they were attracted to narcissists because of the narcissists' charm, popularity, and sexual attractiveness. By contrast, their attraction to their non-narcissistic partners was far less exciting; the non-narcissistic ex-partner was frequently described as "nice" (e.g., the boy/girl-next-door type).

In simplistic terms, **non-narcissists are "nice" and narcissists are "exciting."** This functional split recalls the cliché of the reliable but boring "nice guy" versus the exciting (but dangerous) 'bad boy' or 'asshole'.

This may be a central aspect of narcissism, as it's been hypothesized that narcissism evolved for short-term mating—a lover strategy, instead of the more common provider approach.

3. Mental Power & Health

Based on research, healthy sub-facets give grandiose narcissists:

- **Higher self-esteem** (Campbell et al., 2002)
- **Higher life satisfaction and subjective well-being**, including happier (Rose, 2002; Sedikides et al., 2004)

- **Greater sense of meaning** in life (Zondag et al., 2009)
- **Resilient psychological profile,** reporting lower levels of neuroticism, anxiety, loneliness, and depression (Akehurst & Thatcher, 2010; Watson et al., 1988).

They are also more **creative** and can boost a team's creativity (Raskin, 1980; Concalo et al., 2010).

4. Higher Status

Narcissists are effective at gaining status and fame.

The recent and persuasive hierometer theory suggests that while self-esteem tracks both status and inclusion, **narcissism evolved to focus on status pursuits**. And it works (Mahadevan et al., 2016; Mahadevan and Jordan, 2021).

5. Great First Impressions

Narcissists lead with initial charisma and people like and respect them.
They seem competent, attractive and leader-like (Paulhus, 1998; Oltmanns et al., 2004; Judge et al., 2006).

Narcissists *want* to charm, impress, and display high value. And they *succeed* at it.

6. Clutch Players

Studies showed that narcissists thrived when given the chance to prove their superiority, even when performance pressure was induced.

It's worth noting though that narcissists' performance suffers in mundane, low-visibility tasks.

The Two Main Types of Narcissism

This is important for us because grandiose narcissists have been described as "successful narcissists" while vulnerable ones as 'failed narcissists' (Back & Morf, 2018):

- **Grandiose**: High self-esteem, happy, extroverted, and arrogant
- **Vulnerable**: low self-esteem, neurotic, defensive

Here is a quick overview:

Trait	Grandiose	Vulnerable
Self-esteem	**High** (but can be contingent)	**Low** and fragile
Social tactics	Overt self-promotion, charisma, attention-seeking	Reassurance-seeking, victimhood, fishing for compliments
Approach orientation	Approach-oriented, reward-seeking. **Predator-like**	Avoidance-oriented, threat-escaping. **Prey-like**
Relationships	Transactional, shallow ties; prone to discard	Anxious/clingy attachment; fear of abandonment.
Emotionality	**Positive affect** (optimism, excitement, high life satisfaction)	**Negative affect** (shame, stress, envy, anxiety)
Aggression	More direct aggression	Narcissistic rage from hurt fragility; **passive-aggressive**
Correlates	Extraversion, histrionic, antisocial (ASPD)	Neuroticism, borderline personality disorder (BPD)
Control	**High** perceived control	**Low** perceived control

Based on leading research handbooks: *Handbook of Narcissism and Narcissistic Personality Disorder* (Campbell & Miller, eds.); *Handbook of the Psychology of Narcissism* (Besser, ed.); *Handbook of Trait Narcissism* (Hermann, Brunell, & Foster, eds.)

Note: We focus more on grandiose narcissism and how to positively model grandiosity because it better fits our goal of men's empowerment.

The Narcissistic Mind & Psychology

The Dynamic Self-Regulatory Processing Model posits that narcissists' psychology and behavior serve their need to maintain a grandiose self-image (Morf and Rodhewalt, 2001).

Narcissists look for opportunities to bolster the self, while simultaneously defending against potential threats to their ego.
Some tactics include:

- **Disparaging outperformers** to defuse negative comparison (Morf & Rhodewalt, 1993; South et al., 2003). This is part of a general 'social comparison bias' to look superior, wich may include focusing on poorer performers
- **Gain power** (Perceived Control Theory): to reinforce an image of competence and autonomy (Hansen-Brown, 2018)
- **Self-serving feedback reframing**, devaluing negative feedback and upweighing positive feedback across domains (universal), time (permanent), and identity (personality-based)
- **Fantasies of grandiosity** to boost identity, mood, and maintain biased positive comparisons with 'average others'
- **Narcissistic perfectionism**, hypothesized to stem from the fear of revealing an ordinary, flawed self. It predicts derogation, conflict, anger, and entitled rage above and beyond 'normal perfectionism' (Nealis et al., 2015 and 2016)
- **Hostility under ego threat** ('Threatened Egotism Theory'): aggressive response to provocation, rejection, or job constraints. Potentially re-establishing power to rebuild the ego (Bushman & Baumeister, 1998 ; Martinez et al., 2008; Twenge & Campbell, 2003; Raskin et al., 1991)
- **Low accommodation in relationship conflicts**, and I speculate it's for a focus on hurt ego and/or restoring power rather than solutions (Campbell & Foster, 2002)
- **Psychological control as parents**: narcissistic mothers may use emotional manipulation like guilt-tripping, intrusiveness, or withdrawal of love (Schürch & Morf, 2010; unpublished data)

The Origins: Where Does It Come From?

Narcissism is both nature and nurture.

The main twin studies on heritability suggest **40–60% of variance is genetic** (Livesley et al., 1998; Togersen et al., 2000; Kendler et al., 2008).
The remaining variance is usually attributed to non-shared environments. However, parenting can be non-shared, and studies show that it matters:

- **Overvaluation promotes grandiose narcissism**. I.e., 'golden child', gifted, and entitled to special treatment. Especially coupled with cold parenting, but only in children with high self-esteem
- **Warmth and affection promote healthy self-esteem**, rather than grandiosity

There are important differences between narcissistic and 'healthy' self-esteem:

Narcissistic Self-Esteem vs. Healthy Self-Esteem

The belief system underlying narcissism and self-esteem, adapted from Brummelman, 2018

Narcissistic Self-Esteem	Non-narcissistic Self-Esteem
Based on **superiority**; "God complex"	**Worthy**, not necessarily superior
Agentic traits (competence, intelligence)	Both **agentic and communal** traits
Inflated self-view,	**Realistic** self-view
Look down on others	**Respect** others; sees intrinsic worth
Craves others' admiration; may suffer without it	**Independent**, secure in self-worth
May lead to **rage** and **aggression**	More **forgiving** (Locke, 2009)

Based on Brummelman's chapter '*What Separates Narcissism from Self-esteem? A Social-Cognitive Perspective*, providing an overview of the research literature on narcissism and self-esteem

While some authors refer to non-narcissistic self-esteem as 'healthy' self-esteem, it may not always and necessarily be 'better'. Instead, **narcissistic grandiosity may provide a significant advantage in certain contexts**.

For example, narcissistic grandiosity may pass for **unmitigated confidence** and be more attractive in certain dating contexts; or it can better galvanize followers to pursue challenging goals (think of Steve Jobs' 'reality distortion field').

And remember that by hierometer theory, narcissistic self-esteem focuses on *status*, rather than inclusion. That means that **narcissistic self-esteem is higher agency**, and may be more effective for self-advancement and goal achievement.

To integrate high-status grandiosity with psychological resilience, see the TPM framework:

- **Antifragile grandiosity**

Narcissism vs. The Dark Triad

Narcissism has been conceptualized as part of a 'dark triad' also including Machiavellianism and psychopathy (Paulhus & Williams, 2002).

The unifying features are antagonism, low empathy, and a disposition toward using others.
And, potentially, **unrestricted sociosexuality** with predisposition for short-term mating (Jonason et al., 2011).

Trait	Brief Description — Pros & Cons
Narcissism	Grandiose, arrogant, and ego-focused. ⍰ Confidence, charisma, leadership attainment ⍰ Neediness for admiration and recognition, hypersensitvity
Machiavellianism	Strategic, long-term minded, pragmatic, ends-oriented mindset. ⍰ Strategy, political skills, leadership emergence ⍰ Over-cynicism, poor intimacy in relationships
Psychopathy	Impulsivity, low empathy, low anxiety, fearlessness, and boldness. ⍰Fearlessness, boldness, high stress tolerance ⍰ Impulsivity and irresponsibility undermine long-term achievement; substance addiction

Table based on *The Dark Triad of Personality* (Lyons, 2019), and other research

An ideal mix for maximum performance would be: narcissists' grandiosity, confidence and social charm, strategic predisposition of Machiavellians, and the ability to be selectively fearless and cold.
Add an honorable man's approach, and you get to TPM's transformation.

Adaptive vs. Maladaptive Narcissism

! Read it: This section is crucial for leveraging narcissism's positives, without the negatives **!**

The NARQ model subdivides narcissism into two main modes:

- **Admiration enhances the self** = assertive self-enhancement, high-agency, and approach-oriented
- **Rivalry tears others down**= antagonistic self-protection with competitor devaluation, derogation, and envy

This is important for life success because admiration largely accounts for mental and social power, while rivalry undermines both (Back et al., 2014).
It's admiration that delivers positive outcomes like early status, respect, and attraction. And it's rivalry that squanders it over the long run ('chocolate cake model', see below).

Admiration	Rivalry
Assertive self-enhancement (seeking admiration and status)	**Antagonistic self-protection** (defending grandiosity, blocking threats)
Dominance *and* prestige; charming; self-promotion	**Dominance and derogation** of others
Positive affect, confidence	**Negative affect** (envy, anger); lower self-esteem
Good first impressions, leadership emergence.	Conflict; toxic relationships; negative association with communion

Facets of Narcissism

Facets of narcissism have also been associated with adaptive and maladaptive outcomes (Watson & Biderman, 1993; Watson & Morris, 1991).
Categorizations differ by source, but authority and self-sufficiency are always considered adaptive, and entitlement and exploitativeness always maladaptive. Superiority and vanity are categorized as adaptive or neutral, and

exhibitionism as neutral or maladaptive.

Sub-facet	Explanation
Self-Sufficiency	Belief in one's **competence** and independence; not relying on others to succeed. ✅ Independent and confident. ❌Avoids seeking help.
Authority	Belief in one's **leadership skills**, power, and persuasiveness. ✅ Leads, drives initiatives. ❌ Can come off domineering.
Superiority	Feels **above others** and 'better'. ✅ High ambition, confidence. ❌ Arrogance, poor self-assessments, alienation.
Vanity	Excessive concern with **appearance** and attractiveness ✅ Improves impressions. ❌ Shallow, validation-seeking, fragile looks-based ego
Exhibitionism	Excessive **need to be the center of attention**. ✅ Charisma in groups. ❌ Obnoxious, insecure when ignored, poor 1:1 relationships
Entitlement	The **expectation of special treatment**, above the rules. ✅ Win exceptions or appear higher power. ❌Conflicts, chronic anger and frustration, repels quality men
Exploitativeness	Willingness to **manipulate or use others**; disregarding others' well-being ✅ Rapid short-term gain. ❌ Loss of trust, drive quality people away, isolation

Even the 'maladaptive' facets can help achieve goals, at least in the short term.
But even when excluding moral considerations, they come with significant costs. Research shows that **Entitlement and exploitativeness are associated with poorer mental power** and relationship difficulties (including lower self-esteem, higher neuroticism and envy, and lower theory of mind).

Let's dig deeper into the risks of narcissism.

Strategic Liabilities

Narcissism has incredible upsides and potential, but comes with important risks, especially when associated with rivalry, vulnerability, and unhealthier facets (exploitativeness and entitlement).

Some of the major liabilities include:

1. Limited Growth and Stagnation

Several issues may compound to limit narcissists' growth over time:

- **Competence-proving may cost in competence-*building***: while some focus on learning goals, narcissists focus on proving competence. Paralleling a fixed mindset, failure-avoidance may compound this issue (Elliot & Thrash, 2001; Gerhardt & Le, 2013)
- **Admiration over feedback**: rational learners would analyze critical feedback for self-development, but narcissists push back with self-protective behaviors (e.g., Kernis & Sun, 1994)
- **Little ownership**: Narcissists are less likely to learn from mistakes because they blame others (Campbell et al., 2004)

2. Poorer decision-making

Narcissists overvalue their expertise and ignore expert advice; it's not a good recipe for optimal decision-making (O'Reilly and Hall, 2021).

Narcissists' overconfidence can also cost financially.
A myopic focus on reward and over-optimistic expectations swelled narcissists' losses in gambling experiments (Campbell et al., 2004; Lakey et al., 2008).

3. Poorer Strategy & Results

The need for superiority often harms effective social strategy.
For example, says Wallace in the *Handbook of Narcissism and NPD*:

> Narcissists report Machiavellian willingness to manipulate others (e.g., Paulhus & Williams, 2002), but their perpetual grandstanding regardless of context suggests that they lack the craftiness to maximize self-benefits.

Narcissists may also lack calibration:

> Narcissists' self-enhancement prospects are limited by inflexibility (…) admiration-eliciting behaviors in one context could induce the opposite in another, so admiration-seekers should calibrate to the environment. Narcissists apparently lack this wisdom. They employ the same unsubtle, exhibitionistic style of self-promotion regardless of the situation (Campbell et al., 2000; Collins & Stukas, 2008).

4. Escapism From Reality (Geek Culture & Collective Narcissism)

Faced with challenges, narcissists may escape into alternative realities instead of persevering. This is the Great Fantasy Migration hypothesis, and there is some evidence to back it up.

For example, narcissists engage in more fantasies of great feats and heroism, and are over-represented in geek culture and cosplay (Itamar and Shahar, 2014; McCain et al., 2015; W. Andrews and McCann, 2022).

A different but overlapping escapism from individual reality is tribalism.
Good empirical support now exists for collective narcissism, largely concerning *vulnerable* narcissists (de Zavala, 2019).
This is how the originator of the concept summarizes the available research in *The Handbook of Trait Narcissism*:

> the reviewed research suggests that **collective narcissists engage in intergroup hostility to protect their vulnerable self-worth invested in in-group's exaggerated greatness**.

Such as: individuals with disappointing personal lives feed their need for grandiosity through the group, rather than the self.

5. Souring Friendships & Social Networks

Narcissism is beneficial in the 'emerging zone', but increasingly detrimental as acquaintance increases in the 'enduring zone' (Campbell and Campbell, 2009).
As early favorable impressions fade, narcissists are seen as arrogant, hostile, and braggarts (Paulhus, 1998).

⚠ **Even early impression can be *un*favorable if rivalry is activated and empathy is required.**
In debating experiments that likely triggered rivalry, coders rated narcissists negatively (e.g., as acting irritable, hostile, bragging, and ignoring their partner).
Previous studies with more intimate and interactive contexts also showed lower popularity (see Küfner et al., 2013, for an overview).

6. Poorer long-term relationships

Narcissists' relationships may start more exciting, but plummet fast instead of growing.

The chocolate cake model of narcissistic relationships (Chart revised by Buffalmano, 2025)

A 2014 German study may explain this common trend: narcissists **switch from admiration to rivalry over time**. First, they search for admiration with self-enhancement or value-adding approaches. And once the partner is secured, they switch to rivalry. The authors hypothesize that putting the partner down serves the same goal of self-enhancement.
Partners indeed described the narcissist as game-playing, deceptive, and manipulative, and they feel less valued (Campbell et al., 2002; unpublished data as cited by Morf et al., 2011).

TIP: keep rivalry at bay, pick supportive partners, or consider atypical relationships
It's possible to have good relationships with or as a narcissist. If you're not the type for relationships though, consider the alternatives. Don't decide out of social pressure: it may cost everyone.

7. Contingent Self-Esteem: Makes You Needy For Positive Results

The mask model of grandiose outer shell but low implicit self-esteem has fallen in disfavor, but **narcissists' self-esteem may still be *contingent* on positive outcomes** and feeling superior.

Studies showed that when grandiose narcissists have low intellectual self-esteem, their well-being was *lower* than people low in grandiose narcissism.
Maladaptive facets of Entitlement / Exploitativeness also showed unstable self-esteem when facing interpersonal threats (Zeigler-Hill & Besser, 2013).

8. Psychological Fragility When Faced With Uncontrollable Obstacles

Strength without resilience and adaptability makes systems vulnerable.

Indeed, there is some evidence to suggest that the higher the delusional sense of invincibility, the higher the risk and severity of PTSD and generalized anxiety disorder.
Besser, the author, hypothesizes that **narcissists' inflated and inflexible sense of control sets them up for failure** when events are uncontrollable.

Effective Narcissism™: 7 Traits to Cultivate

> **Effective Narcissism™** describes the high-functioning expression of narcissistic traits that reliably produce agentic, life-relevant outcomes (e.g., status, mating, influence, and resource acquisition), while reducing the self-defeating costs associated with maladaptive narcissistic expressions.

Effective Narcissism vs. Healthy & Adaptive Narcissism
Effective Narcissism™ is TPM's applied synthesis of leading empirical handbooks, peer-reviewed research, and Lucio Buffalmano's long-term analysis of power dynamics.
Related constructs appear as *healthy* narcissism (popular discourse), emphasizing assertiveness and prosociality, and *adaptive* narcissism (academia), typically treating entitlement and exploitativeness as uniformly maladaptive. TPM departs from the moral frame: in specific, strategically constrained contexts, entitlement and exploitativeness may yield instrumental advantages—even when they operate outside of traditional morality (George-Levi S., 2025; Brunnel et al., 2013, Study 4).

Effective Narcissism is the goal; **Strategic Narcissism™** is the work. It is the process of cultivating the traits that fuel power while consciously avoiding the toxic ones.

There is no one-size-fits-all to 'maximize narcissism' because it depends on the individual's starting point.
But at a high level, we can say:

- **Narcissists must reduce toxic traits** while keeping or increasing the empowering ones
- **Non-narcissists must develop the empowering traits**, while avoiding the toxic ones

Here are the most effective, research-backed behaviors and mindsets of successful narcissists:

1. Be High Agency

High agency includes:

- **High sense of control**: believe you can influence your lives and outcomes
- **Bias for action**, solution-oriented

High agency does not necessarily require competitiveness or narcissism—but it's a defining trait of successful narcissists. Narcissists' inflated self-views may also combine with high agency into unmitigated self-confidence.

Lastly, research shows narcissists don't care about communion, giving undivided focus on agency:

Agency	Communion
Get ahead	Get along
Goals	Relationships
Power	Warmth
Assertive	Kind
Independence	Interdependence

You can have both achievements and relationships—but high agency with an internal locus of control is a must.

2. Pursue Your Goals & Focus On Yourself (Approach-Orientation)

Grandiose are approach-oriented and sensitive to rewards, whereas vulnerable narcissists are avoidance-oriented and sensitive to threats (Foster & Trimm, 2008).

Approach orientation is associated with positive emotionality and boosts life effectiveness.
Writes narcissist researcher Keith Campbell with a dating example:

> Grandiose narcissists (…) **might ask ten people on a date to get one to say "yes."** (…)

Playing the numbers game when failure costs are low is a winning strategy—we've long espoused it here at TPM.

⍰⍰ **Approach orientation + self-focus addresses help fix rivalry**
Self-focus sidesteps the other-focus that fuels rivalry. Mindset: 'the competition doesn't even exist'.

3. Be High Self-Esteem

High self-esteem is the main driver of narcissists' mental health and power.

Self-esteem is in part genetic (Raevuori et al., 2007; Luo et al., 2013). But, like most traits, there is much you can do to increase it
See this video for a complete guide on increasing self-esteem and confidence, or consider Confidence University.

Narcissists' Tactic: Positively-Biased Attributions

Narcissists attribute successes to ability and failure to task difficulties while non-narcissists and vulnerable narcissists do the opposite (Stucke, 2003; Krusemark et al., 2015).

One may argue that this is a cheap trick that distorts reality. We agree, but… **It works**.
While you address self-esteem at its root, this tactic can help.

4. Be Self-Sufficient & Independent

High self-sufficiency is both empowering and attractive.
It doesn't mean you have to be alone. It means you *can* be.

⍰♂Lucio's Take: **Strong men walk alone**

Lucio:
I take this aspect to an extreme and take pride in self-sufficiency.
I believe strong men walk alone, while weak men seek refuge in groups (there is also some evidence for this). The ultimate measure of a man's power is the ability to carve his own path, on his own.

5. Approach, Talk, & Lead In Groups: Strategic Extraversion

Extraversion with confidence and social power fuels narcissists upward.

You don't need to become an extrovert if you're not; **you only need to *momentarily* act like an extrovert**. Think of it like 'switching on' when it matters. After performance time, you're back doing whatever you want.

This study attributed narcissists' initial success to:

- **Fancy appearances** (e.g., fashionable dress and stylish hair)
- **Charming facial expression** (i.e., looked more self-assured and friendly)
- **Self-assured body language** (e.g., straight posture, confident walk, smooth movements)

6. Calibrate Strategically: The Advanced Game

Despite popular 'power laws', the name of the advanced game is balance and calibration.
For example:

- **Use narcissism publicly** more than privately
- **Add warmth to the dominance**: lead with confidence, while also building intimacy
- **Display value with nonverbals first**, then double down verbally when they recognize it (think: *confirm* their reality instead of forcing it)
- **Calibrate work self-promotion based on culture & visibility**: self-promote more in individualistic cultures and for low-visibility work

Check this foundational article on being *both* dominant and warm.

7. Conquer With 'Honorable Narcissim™'

> **Honorable Narcissism™** builds on Effective Narcissim by placing **strategic honor™**, power-aware smart cooperation™, and a preference for win–win as the baseline

Writes Keith Campbell on combining narcissists' success with win-win:

> You demand power, status, leadership, material, and respect. That's great, and it often works. However, in turn, you should give back (…) that general trade-off is important ethically to conceptualize (…). Are you bringing more to the system than you're taking? Are you causing less suffering than you're creating? These questions can be tough to answer (…) but they're the ones that we need to consider.

We agree, and that's exactly our approach: **win, with win-win.** Or, at least, without being a value taker.

Strategic Takeaways

How does narcissism affect success—both short-term and long-term?

Narcissism tends to boost success early on because agentic traits like confidence, leadership, and self-promotion help people stand out, take initiative, and position themselves for opportunities.
More maladaptive forms of narcissism however grow and become more visible over time, and become a liability. Entitlement, hypersensitivity to criticism, and neediness for admiration and superiority can undermine teamwork, learning, and stable relationships.
The overall pattern supported by research is clear: the adaptive sides of narcissism help with early advancement, while the antagonistic sides often erode long-term success if left unchecked.

Can I intentionally adjust my narcissistic traits—up or down?

Yes. Non-narcissistic individuals can learn to amplify the adaptive traits linked to achievement, such as assertiveness, charisma, ambition, and confident goal pursuit. These are skills and dispositions that can be intentionally developed without sliding into toxicity. Narcissistic individuals can also reduce, or at least strategically avoid acting on, the more harmful facets such as rivalry, entitlement, or overreacting to criticism.

Is narcissism always a weakness in relationships?

No. Narcissism often increases early attraction because confidence, status, and leadership signals are appealing in dating and narcissists are described as 'exciting'.
Problems tend to appear later, when charm and confidence failed to build intimacy and give way to devaluation and competitiveness.
But research shows that with the right tools, like perspective taking, affirmations, and supportive partners, narcissists can improve their behavior and relationships.

Next Steps: A Winning, Honorable Narcissist

Narcissism is not a binary 'good' or 'bad', but a high-octane fuel.

As we have seen, the science is clear: the **Adaptive** traits (Authority, Self-Sufficiency, Approach-Orientation) are correlated with leadership, resilience, and happiness. They're fuel for power and achievement.

However, the **Maladaptive** traits (Rivalry, negative Entitlement, Neediness) are the brakes. They are the reason why so many high-potential men crash over the distance—or find themselves isolated at the top.

Now that you understand the *mechanism* of the narcissistic mind, you can delve deeper into the *how*.
In our follow-up guide, we detail how to nuke toxic traits and harness the adaptive ones:

- How to be an effective narcissist
- **Power University**: The complete, integrated system for mastering high-agency, Machiavellianism, and strategic dominance.

How to Be a Strategic Narcissist: Achieve Power Without Toxicity

Lucio Buffalmano · 8 December 2025 · Archived copy · Original

Narcissism is often framed as toxic, yet narcissism drives many of the world's most successful leaders, entrepreneurs, and innovators.

When harnessed correctly, the confidence, ambition, and high agency of narcissism can propel you toward achievement, influence, and meaningful impact. This article shows how to channel narcissistic energy toward productive outcomes while neutralizing its toxic aspects.

Our 'strategic narcissism™' framework will show you how to:

- **Harness narcissistic fuel** (agency, ambition, and confidence)
- **Remove toxic traits** (rivalry, fragility, and entitlement)
- **Win long-term**, including good relationships

And add value to others as well with our 'honorable narcissism™' additions.

Let's dive in.

Strategic Narcissism™ — TPM's applied framework
This guide presents Strategic Narcissism™, an approach for cultivating the adaptive sides of narcissism while neutralizing the downsides to reach the end goal of Effective Narcissism™.
It combines the research on adaptive/healthy narcissism with TPM's proprietary insights, translated into actionable steps for ambitious men.

Many historical figures who built civilizations had narcissistic traits, but everyone benefited from them

  - Next Steps

Phase 1: Building The Engine (Adaptive Traits)

The first step is to develop the effective narcissistic traits that help you advance in life, and achieve goals.

1. Be High Agency

High agency includes:

- **High sense of control**: you influence your life and outcomes
- **Goal-focus**
- **Bias for action** and drive
- **Solution-oriented**
- **Persistence**

You can have both achievements and relationships, but narcissists focus on agency because they care little about communion (Campbell et al., 2002):

Agency	Communion
Get ahead	Get along
Goals	Relationships
Power	Warmth
Assertive	Kind

Agency	Communion
Independence	Interdependence

Extreme agency can have downsides like overestimating control, rushing actions, blaming yourself for uncontrollable setbacks, and impatience. But it's a highly empowering trait, and you can avoid the downsides.

Takeaway: start with the mind: an internal locus of control—you decide what happens in your life.

2. Be High Self-Esteem

High self-esteem is the main driver of narcissists' mental power.

Self-esteem is only moderately heritable, meaning you can actively increase it (Raevuori et al., 2007; Luo et al., 2013)

Here are some quick tips:

- **Self-love** + self-acceptance + self-compassion = foundations
- **Cognitive behavioral therapy** to challenge negative thoughts
- **Increase competence**, make progress towards your goals
- **Increase social status and acceptance**: self-esteem tracks both
- **High power behavior** to self-signal you're worth of (your own) respect
- **Integrity**: live consistently with your values

Skip affirmations, being too nice to gain acceptance, or grandiose thinking without matching work.
Check this video for a deeper overview, or consider Confidence University.

P.S.:
Narcissists attribute success to their ability and failure to external constraints (Stucke, 2003; Krusemark et al., 2015). It's a distortion of reality, but it works.

3. Be Self-Sufficient

High self-sufficiency is both empowering and attractive.
Here's what it looks like:

Positives	Risks
A deep **belief in one's own capabilities**	Overestimation of one's capabilities
Independence, belief in one's ability to succeed on his own	Missing opportunities for collaboration
Trusting own opinion or one's own ability to find good answers	Distrust of expert advice, rejection of feedback, fear of looking deficient
Emotional self-sufficiency, not needing anyone for a happy internal life	Avoidance of intimacy, seen as weakness and dependence
High self-regard	Devaluing others as inferior, unable to help

Self-sufficiency is an adaptive and empowering trait. It doesn't mean you have to be alone, but it means you *can* be alone, and still be content.

🤔Lucio's Take: **Strong men walk alone**

Lucio:
I score high on this facet, and I take pride in it. Some of my beliefs and life philosophy are built around self-sufficiency.
I believe strong men walk alone, while weak men seek refuge in groups (there is some evidence for this). And the ultimate measure of a man's power is the ability to carve his own path, on his own.

4. Pursue Your Goals (Approach-Orientation)

Approach-orientation is active, agentic, and high-power, while approach avoidance is defensive.
Researcher Keith Campbell draws parallels with the animal kingdom:

> **Predators**, such as hawks or lions, have eyes that face forward with an intense focus on the goal. When predators commit to an action, they go for it full on (…) Their motivation is considered an *approach* tactic. **Prey animals** are different. Their eyes sit on the sides of their head (…) They are often skittish (…) Their motivation is considered an *avoidance* tactic.

Grandiose narcissists are approach-oriented and reward-seeking (Foster & Trimm, 2008), boosting their life effectiveness.
Writes again Campbell with a dating example:

> Grandiose narcissists (…) **might ask ten people on a date to get one to say "yes."**

That's a smart strategy.
Finally, approach orientation is associated with higher mental health (Elliot & Thrash, 2002).

5. Approach, Talk, & Display Value: Strategic Extraversion

Extraversion is a crucial trait for narcissists' early gains in status, leadership, and popularity.

Mimic this approach when entering new groups: be more outgoing, talkative, and slightly higher energy—but with

effective dominance, don't be a jester.

🤔Lucio's Take: **Introverts can 'switch on' when needed**

Lucio:
Despite being introverted, I score maximum points in the 'authoritativeness' facet of grandiose narcissism because I approach socialization strategically.

Entering new groups is 'performance time' for me: approach, socialize, and value-signal.
You can do the same, think of it as a 'switch-on mode'.
With a few hours and a few repetitions, you can become a high-status member. Then, you can chill.

6. Dress to Impress & Mind Your Looks

Looks matter, and narcissists look better.

There are no inherent genetic advantages; the difference is all in the presentation (Odom-Dixon, 2015).
This study lists:

- **Fancy appearances** (e.g., clothes and hairstyle)
- **Charming facial expression** (i.e., self-assured and friendly)
- **Confident body language** (e.g., straight posture, confident walk, smooth movements)

Phase II: Manage the Ego (Neutralizing Maladaptive Traits)

Many historical and present leaders can be even more successful if they manage their narcissism

Once built the foundations, we 'tame the beast'.
This is helpful for all, and a necessity for those high in narcissistic traits.

7. Reflect On Superpowers... *And Toxicity*

Narcissists are aware of their narcissism and its advantages, but underestimate the downsides (Carlson, 2018).

These unaddressed weaknesses cap your potential and may even cause your downfall.
And remember:

The more power you gain, the more careful you must be.
Power gives you sychophants, lulls you into a false sense of invincibility, and worsens narcissistic overconfidence (Macenczak et al., 2016).

So let's fix those weaknesses:

8. Use Haters & Competitors For Fuel, But Focus On Yourself

It's crucial to manage a competitive streak strategically.

The NARQ model subdivides narcissism into two main modes:

- **Admiration enhances the self** = assertive self-enhancement, high-agency, and approach-oriented
- **Rivalry tears others down** = antagonistic self-protection with competitor derogation, envy

Rivalry may still afford some status because it correlates with the dominant approach to gaining status. But admiration is superior because, as per our power and warmth model, it uses *both* dominance and prestige (Zeigler-Hill et al. 2017).

You can use rivalry as fuel to work harder and push further.
However, this is dangerous fuel that can make you look ugly on the outside, and poison your inner life. Use

sparingly and focus more on *learning to avoid* the uglier aspects of rivalry for both mental health, social prestige, and quality relationships.

⚠ **N.B.: Rivalry accounts for most of Narcissism's toxic aspects**
It lowers self-esteem, ruins relationships, and disempowers you mentally and socially (Leckelt et al., 2015; Wurst et al., 2017; Neufeld & Johnson, 2016; Geukes et al., 2017).

Takeaway: Use haters and competitors to fuel your drive. But focus on yourself as baseline bahvior: it sidesteps rivalry, and you work more effectively.
Also see:

- Winners' mindsets: 'the competition doesn't even exist'

9. Find Pride In The Self, Never The Group

Failed narcissists seek to feed their grandiosity through the group, rather than fixing their lives.

Says de Zavala, the originator of the concept in *The Handbook of Trait Narcissism*:

> Collective narcissism was related to low self-esteem via vulnerable narcissism (i.e., frustrated and unfulfilled sense of self-entitlement, de Zavala et al., 2017). Thus, both collective narcissism and nationalism seem to be underlain by low self-esteem, and both are likely to use their national identity instrumentally to compensate for deficits in their sense of self-worth.
> (…) related to sensitivity to intergroup threat and retaliatory hostility (de Zavala et al., 2016).

This form of tribalism is socially toxic, mentally disempowering, and keeps you stuck at the bottom.
Here's how to fix it:

- **Focus on yourself**
- **Switch mindset: honor the group with your results**
- **Embrace larger and diverse belonging**, like civilization or humanity
- **Switch from in-group belonging, to 'great men belonging'**, an elite group without geography or time
- **Switch to a weaker but healthier in-group satisfaction**

A foundational article on this:

- Empowered individualism

Address The Issues, Never Escape From Reality

Empirical support for the Great Fantasy Migration suggests that narcissists escape into alternative realities when life is disappointing (Itamar and Shahar, 2014; McCain et al., 2015; W. Andrews and McCann, 2022).

Don't let that be you.
There is no shame in having some work to do. The only shame is never beginning the work.

10. Move to Healthy Entitlement

Good entitlement is empowering.
You demand your worth, maximize social exchanges, and date more attractive partners.

But the 'bad' element disempowers you mentally and socially.
The crucial difference is that toxic entitlement demands far in excess, without doing the work, and reacts emotionally instead of strategically.

Bad Entitlement	Empowered Entitlement
I'm special	**I *prove* to be special** with work that develops competence and results
I'm due special treatment	**I don't need anything, but will earn whatever I want**. I'm due basic decency and respect
I'm due special service	**I'm due what I paid** for and will demand it
I'm owed attractive partners	My special someone will be **lucky to have me**, and silly to lose me

⍰⍰♂Lucio's note: I also embrace and advise an ethical and communal aspect:

Bad Entitlement	Honorable Entitlement
I'm entitled to consume it all until depletion	I can use as much as I want. But **I *choose* to be a responsible citizen**, preventing tragedy of commons and passing future generations a better world

11. Replaces Others' Admiration, With Your Own

Admiration-seeking is at the heart of narcissism psychology and behavior (Morf and Rodhewalt, 2001).
It can be useful, motivating you to gain respect, status, and the accolades that come from achievement.

But it's also the source of important limitations, including a need for others' adulation.
With rivalry, it also leads to reactive defensiveness and aggression (Bushman & Baumeister, 1998; Martinez et al.,

2008; Twenge & Campbell, 2003; Raskin et al., 1991).

To get the positives without the negatives, seek *your own* respect first and foremost.
Prioritizing your own respect gives you the motivation to excel, while freeing you from external dependencies.

🧔♂️Lucio's Take: **It worked wonders for me**

Lucio:
I narrowed down the people whose esteem I wanted to three. My father, I, and the collective of humanity.

Adding value to humanity is the north star to guide my path, but no single individual can assess my contribution. So once I made my father proud, I was left as my own sole judge—and it noticeably improved my life.

Tip: strike a positive balance. A demanding judge, but with enough self-love and self-compassion.

12. Learn The Value of Hard Work

Toxic entitlement makes some narcissists feel entitled to success, without the skills and hard work required for it.

So they stay stuck in menial jobs they half-ass while feeling too good for them.
A study confirmed this risk: narcissists thrived under pressure and when they could prove their superiority, but underperformed in mundane, low-visibility tasks.

Instead, **successful narcissists learn that hard work leads to success**.
Says clinical psychologist Bernstein:

> The narcissist who drops being special and instead works his ass off to *become* special, those are the narcissists who succeed.

I can attest to this progress as I went through a similar personal transformation.
Here are some tips:

- **Think of apprenticeship as a starting phase** that may include pointless work
- **Work on your own** or on what you love: it short-circuits this process
- **Find pride in hard work**, rather than in the end goal alone

13. Learn The Value of Continued Growth

Narcissists fall behind in skill-building because they try to *prove* competence, seek admiration instead of feedback, and deflect blame rather than learn (Elliot & Thrash, 2001; Gerhardt & Le, 2013; Kernis & Sun, 1994; Campbell et al., 2004).

In goal-orientation theory—similar to a fixed mindset—the biggest handicap to long-term growth is avoiding difficult tasks because one fears looking bad ('performance avoidance orientation' (VandeWalle, 1997; Dweck, 2006)).

The solutions are:

- **Approach orientation** and growth mindset
- **Pursue and value growth** above performance when you're learning
- **Be strategic**: it can be smart to avoid showing incompetence. Show competence to superiors, learn through mistakes in private

Context also matters, and a learning-oriented environment helps shift from performance to growth (Button et al., 1996; Mangos & Steele-Johnson, 2001)

14. Develop Antifragile Self-esteem

Self-esteem contingent on success is risky—you may lose it when struggling, *exactly when you need it the most.*

Fix: develop your self-esteem around values that are equally empowering but more in your control.
For example:

- **Grit** and perseverance
- **Resourcefulness** and finding ways, including strategic thinking
- **Honor** and integrity, living by your values, speaking your mind, and avoiding petty games

Embrace Your Mortality & Fragility

Believing in one's invincibility looks strong on the surface, but it fails when uncontrollable, unfavorable events hit. There is indeed evidence that, faced with uncontrollable military attacks, higher narcissism was correlated with higher risk and severity of PTSD.

Hence, despite counterintuitive, **accepting mortality and fragility is the true foundation of mental resilience.**

Also read:

- Embrace your mortality
- Positive cynicism

🤵♂️Lucio's Take: **Grandiosity Meets Positive Fatalism**

Lucio:
It's grandiose to believe that our work at TPM is important, and can add a small yet significant contribution to humanity.

I live a healthy life in good part to see this mission through.

However, I also accept that I may not personally see it through. Or that I may never see the impact of this work in my lifetime. Or that it may never have the impact I think it can.

And that would not be ideal, but it's OK.
See the TPM framework for **Antifragile grandiosity**.

15. Unplug From Social Media, Ignore Marketing

Social media attracts narcissists, and marketing can prime state narcissism (Casale and Banchi, 2020; De Bellis et al., 2016).

Most likely, they recruit the vanity and exhibitionism facets, offering larger downsides than upsides (neediness for attention, time sink, and low masculinity).
They also stoke materialism, associated with self-doubt and inner fragility (Kasser & Kasser, 2001; Chang & Arkin, 2002; Braun & Wicklund, 1989).

Remember: chasing brands is for the low-power masses.
The real power move is when brands chase *you* for the privilege of being associated with you.

Solution: focus on agentic goal achievement, ignore marketing and social media.

Phase III: Sustain Power & Success (Long Game)

Finally, let's use healthy narcissism to *sustain* success.

16. Long-Term Health: Work Out, Without Excesses

Narcissists exercise more, but have also higher rates of compulsive exercise, bulimia, and disordered eating thoughts and behaviors (Lichtenstein et al., 2017; Gordon & Dombeck, 2010; Dakanalis et al., 2015).

Balance may seem obvious to most people.
But some highly agentic men are unbalanced by definition. The trick is to recruit their own high-power psychology and associate weakness with excesses.
Here's how:

Weak & Ineffective	High Power & Effective
Over-exercising	Exercise + recovery + work + loving life = winner
Grueling exercise for self-acceptance = needy, weak ego	Feeling great about yourself no matter what = power
Stressing over food = not masculine	Healthy diet baseline without stressing = masculine

P.S.:
Unplug from compulsive biohackers, enhanced gym influencers, and masochistic compulsive exercisers.

17. Long-Term Relationships & Alliances: Maintain Win-Win

Narcissists are great at *starting* relationships. But for long-term success, *maintaining* is key.
Here's how:

Relationships: Do Them Smart, Or Not At All

Narcissists' relationships start strong, but plummet fast (Back, 2013).

The plummet has been associated with rivalry, which is why it's so crucial to keep it at bay.
However, even avoiding rivalry, high agency alone can 'crowd out' communion and relationships suffer without at least some quality time.

Do this:

- **Decide whether commitment is good for you**. If it isn't, don't do it (see 'player psychology')
- **Pick communal and supportive partners**, it increases satisfaction and commitment (Finkel et al., 2009)
- **Lay out the rules**, including your priorities
- **'Agentify' relationship quality**: making it a goal combines agency with win-win communion
- **Think about win-win**, focus on the common goals and similarities (Konrath et al., 2006)

Alliances: Maintain Win-Win

While there isn't enough data on friendships, researchers suspect it follows the same pattern of good start, poor ending.
Here are some tips to avoid it:

- **Quit the aggrandizement** on 1:1
- **Learn to bond and connect**, valid for both friends and women
- **Keep it win-win**, don't be afraid of instrumental friendships, but always seek to give back
- **Be happy for their success**, use this mindset: 'the more my friends advance, the stronger my network becomes'

18. Long-Term Career: Calibrate Your Leadership

Narcissism helps you climb higher, especially if combined with a Machiavellian grasp of office politics.

Once you're higher up, you can make a difference.
Unfortunately, most leadership resources are generic, naive, and uncalibrated.

For example, while a minimum level of respect-giving is good, Steve Jobs was very effective with what semeed to be an asshole style. Yet what worked for Jobs' ambitious reports doesn't work for mid-level management.
Instead, here's how to calibrate:

- **Hard charging with ambitious and strong followers** who can thrive with profit shares (Campbell, 2020)
- **Strong but respectful of other dominant men**, or you'll lock horns, and they'll soon leave
- **Mellower for more submissive & low self-esteem followers**: they're more likely to experience impostor syndrome, lowering performance
- **Match to career phase**: adapt when new, call your shots once at the top

Resist The Downward Pull of Cult-Like Followers: Hire for Competence

Powerful narcissists can repel high-power men and attract sycophants.
Says Bernstein:

> Narcissistic Legends create alternate realities that push powerful people away and attract the weak (…) People who doubt themselves are attracted to Narcissistic certainty

Dominance complementarity theory offers some evidence for this dynamic (Grijalva & Harms, 2014).
It also aligns with psychology: it's titillating for the ego to surround yourself with fawners and admirers. Resist the temptation. Contrary to popular 'laws', leading a cult is never peak power or success. Cult leaders lead losers. To win big, you need winners.

Surround Yourself With Smart Experts

Narcissists overestimate their expertise and ignore expert advice (O'Reilly and Hall, 2021).

Include the sychophants telling you what you want you hear, and you've got a recipe for ineffective decision-making.

Solution: surround yourself with experts with the courage to speak the truth. And hire strong men who drive results for all

19. Build Your Legacy, Add Value ('Honorable Narcissism™')

The ultimate step is to channel grandiosity into projects that outlast you.

Something that uplifts humanity and future generations.

The highest expression of effective narcissism seeks value-adding honor. It means building, never destroying.
Great men have built before you, paving the roads of civilization. Your goal is to add your meaningful brick to go further yet.

A successful legacy requires escaping the lures of short-term thinking, materialism, and edonism.
Instead, marry agency with long-term thinking, vision, and responsibility. The responsibility to win and lead not just for yourself, but for those who will come after you.

This is the 'honorable narcissist™' stage, a man whose goal is to add value.

Next Steps

You now have the complete blueprint for calibrated power and honorable dominance.
But the path to peak performance requires systematic mastery of power dynamics and strategic execution.
If you're ready to move from strategy to **flawless execution** and join the world's most accomplished men, your next step is **Power University**.

Notes

About the Author:
W. Keith Campbell is a leading social psychologist and professor at the University of Georgia, best known for his pioneering research on narcissism. Campbell has published over 120 peer-reviewed papers, several books, and has been the editor of the first handbook on narcissism, *The Handbook of Narcissism and Narcissistic Personality Disorder* and authored a chapter in *The Handbook of Trait Narcissism* (⍰⍰♂ Lucio's note: I very much appreciate top researchers who also contribute to handbooks that provide an empirically grounded overview of the field).

Chapter 1: Defining Narcissism

> At its core, narcissism is about self-importance, antagonism, and a sense of entitlement. Narcissists believe they matter more than other people and deserve to be treated that way.

Narcissism spans a spectrum: grandiose (ambitious, charming, high self-esteem) and vulnerable (insecure, depressed, low self-esteem), sharing a core of entitlement but differing in traits.

Some people have a mix of both, like Kaynie Waste, who is both grandiose and thin-skinned, reactive to criticism. Elliot Rodger's case exemplifies vulnerable narcissism with grandiose elements.

- **Psychotherapists don't often see grandiose narcissists** because they don't struggle socially or in life
- **Trifurcated Model of Narcissism bridges vulnerability and grandiosity**: *connects grandiose and vulnerable narcissism as two related but separate traits. Both share a core of disagreeableness, self-importance, and a sense of entitlement, but they differ. With grandiose narcissism, you see confidence, boldness, and self-esteem, but with vulnerable narcissism, you see low confidence, anxiety, and low self-esteem.*
- **The mask model is incorrect, and grandiose narcissists don't have a weak core**: *Under this interpretation, however, it would mean that when President Donald Trump goes home at night and looks in the mirror, he sees Woody Allen staring back at him. This is a neat idea, but like many neat ideas, it doesn't hold up to scrutiny.*

Models For Understanding Narcissism

Model	Description	Example
Nomological network (trait model)	Narcissism is a stable trait that exists in a network with other traits.	Narcissism is linked with psychological entitlement.
Self-regulation model	Narcissism is a trait but needs to be actively maintained by meeting goals.	Narcissism leads to forming friendships, which in turn leads to self-esteem.

Model	Description	Example
Evolutionary model	Narcissism is a trait, but needs to be actively maintained by meeting goals.	Narcissism predicts short-term mating success.
Cultural model	Narcissism is created, modified, and spread by cultural forces.	Narcissism was formed and spread by the broader focus on individualism.

Chapter 2: Measuring Narcissism

Narcissism scales include NPI (grandiose, 40 items) and HSNS (vulnerable, 10 items).

The author invites to testing yourself, but with self-awareness: interpret the scales as indicator to measure traits, not disorders.

Rigor vs. Pop Science

Campbell also calls into question some pop-culture personality tests:

> I'm sure you've taken a personality quiz or two—who doesn't love those? Under the Myers-Briggs Type Indicator, you may be an ENTJ or an ISFT. Many variations exist, and chances are, **many of them have little or no grounding in scientific evidence**, especially if they are related to pop culture.
> (…) Quiz takers often encounter what psychologists call the Barnum Effect, who apocryphally said, "**There's a sucker born every minute**." The Barnum Effect works by giving vague, ambiguous feedback that applies to everyone.

As well as some definitions, for example referring to the *Six Pillars of Self-Esteem*:

> This massively popular work expanded the definition of self-esteem (…) yet it also captures many variables that today's psychologists would place beyond self-esteem, such as mindfulness and self-efficacy.

Chapter 3: Basic Traits and the Narcissism Recipe

Trait Level	Name	Description	Comment
Meta-trait	Big One	E + O + A + C – N	The "positive" poles of the Big Five
Meta-trait	Big Two	A + C – N E + O	Stability (also Alpha) Plasticity (also Beta)
Trait	Big Five	E, O, A, C, N	All-around most useful but has trade-offs of precision and generality
Aspect	Medium Ten	Extraversion split into enthusiasm & assertiveness	Useful for more specific questions
Facet	Thirty Facets	E split into activity, assertiveness, excitement-seeking, gregariousness, positive emotion, warmth	Useful for building complex profiles

levels of personality traits

The author describes personality with the analogy of a recipe.

Personality traits are stable descriptors; Big Five (OCEAN: openness, conscientiousness, extraversion, agreeableness, neuroticism) form the foundation:

> The Big Five traits are the ingredients that cover almost all other personality traits. At the same time, a

> personality recipe loses precision when using the Big Five traits; it's a recipe that lists meat as an ingredient but doesn't specify steak, pork, or chicken. The recipe is simple and straightforward, but vague

Narcissism's "recipe":

- **Low agreeableness** (antagonism) is the 'key ingredient'. Antagonism has been called entitled self-importance or darkness.
  It includes:
  - sense of entitlement
  - lack of empathy
  - manipulativeness
  - superiority.
- **High extraversion** for grandiose, which includes:
  - Sociability
  - Boldness
  - Drive

> With extraversion, a much higher functioning individual compensates for the antagonism with likeability or success. If someone who is powerful or attractive is also energetic and likable, he can also be somewhat mean and get away with it. This extraversion is also what allows narcissism to spread across social media and upward into positions of power.

For vulnerabile narcissism the second ingredient is neuroticism, which includes insecurity, anxiety, depression, and hypersensitivity.

> a vulnerable narcissist is essentially someone who is self-important, self-centered, and entitled but also insecure, depressed, and self-conscious. Vulnerable narcissists are sometimes thought of as thin-skinned: they expect special treatment and are hypersensitive to criticism and "perceived slights," or situations that most of us wouldn't make a big deal out of

Extraversion Facets

> Most importantly, extraversion splits into *enthusiasm* and *assertiveness*. People are drawn to enthusiasm, or a high-positive-energy personality such as personal development coach Tony Robbins.
> People are moved by assertiveness, or the idea of pushing themselves, goals, or an agenda. Sometimes we respect assertiveness, and sometimes we push back against it. Narcissism correlates with both aspects of extraversion but especially the assertiveness side.

Chapter 4: Narcissists' Goals and Motives

Grandiose narcissists pursue approach (rewards) over avoidance (threats) goals, favoring extrinsic (status) over intrinsic (growth).
Self-regulation maintains an inflated ego via self-serving bias.

Vulnerable narcissists do the opposite.

Grandiose are approach-oriented (BAS), Vulnerabe approach-avoidant (BIS). Note: I removed 'self-serving bias' from the vulnerable as it may apply to grandiose too and replaced 'aggression' with 'passive aggression'. Based on Campbell, 2020

Narcissists' Pursuits: Sex, Status, & Stuff

Narcissists' core aim is to **boost their ego**. Their external goals—public praise, power, status, and sexual success—are tools to make themselves feel important. I summarize them as the "three S's": **sex, status, and stuff**.

- **Sex** is about feeling desirable and powerful, not intimacy. Narcissists want to be seen as attractive, often pursue short-term partners, and may choose "trophy" spouses. Even turning others down can serve the same purpose—it signals that *they* are the desirable one.
- **Status** is about social rank. Narcissists want admiration, dominance, and top positions—whether as leaders or trendsetters. The focus is the prestige and influence that come with the role, not the responsibility.
- **Stuff** refers to owning high-value items—luxury cars, designer brands, fashionable pieces. They want things that make them look impressive. It's not about appreciating quality or craftsmanship, but about boosting their image.

> **Sex relates to social power**, not intimacy. Because sex is about the self for narcissists, rejecting sexual requests from others can also be a goal. In this case, sex itself isn't the goal, but the fact that the narcissist is desirable.

⍰♂Lucio's Take: **Women play the rejection game more than men**

Lucio:
The author is correct.
I'd add that you see the game of spurning someone's advances far more from narcissistic women, than men.

Since from an evolutionary point of view men gain from an added sexual partner, it's rarer for men to turn down sex, but more common in women.

I list this as a game women play, sometimes a dating red flag, and would caution men to avoid considering women who play this game for a relationship.

Grandiose Pursue Their Goals, Vulnerable Withdraw In Fear

Grandiose actively seek the rewards they crave.
Vulnerable narcissists don't: they fear failure and withdraw up in their own world.

> In the social world, however, it is easier. The research shows that grandiose narcissistic motivation is related to learning through rewards to their ego.
> On the other hand, vulnerable narcissists are particularly avoidance-oriented and often suspicious, fearful, and mistrustful. The world is seen as predatory. The vulnerable narcissist protects the self from that and fights for the recognition that is owed. Most of this fighting is mental and emotional because vulnerable narcissists are often too fearful to confront people directly. In the research, these narcissists report being angry but not particularly aggressive.

Vulnerable narcissists may want to read the following:

- Stop being a beta male
- Passive-aggressive psychology and fixes
- Passive communication style

Chapter 5: Narcissistic Personality Disorder

NPD is extreme, inflexible narcissism causing impairment (prevalence ~1-6%).
However, **it's only diagnosed as a personality disorder if it leads to impairment**. Such as, the personality disorder is not based on levels: one could be a full-blown dark narcissist, but if he functions well in life, it's not a personality disorder.
Says tha author:

> these traits should only be diagnosed as narcissistic personality disorder if they lead to significant impairment. In the end, if someone has enough status and power and can get away with a large amount of narcissism, it may not be clinically impairing, even if it is extreme.

- **Impulsivity differentiates NPD from antisocial**: *One good differentiator between NPD and antisocial personality disorder (or psychopathic personality disorder) is impulsivity, or the need to act on impulsive thoughts and feelings. Narcissism is not typically associated with impulsivity, but antisocial personality disorder is. In the "real world," impulsivity might mean stealing somebody's watch or cheating on a spouse. In extreme cases, people who are antagonistic and highly impulsive often end up in and out of jail.*
- **Hypomania has confidence, but not attention-seeking**: *the grandiose phase of mania can create the confidence, energy, and grandiosity of narcissism, but they're typically not driven by antagonism and attention-seeking. Someone with hypomania may want to achieve a lofty goal like building the tallest structure in the world but not want to put his name on it. Plus, manic episodes tend to be cyclical*

Chapter 6: Narcissism's Cousins: The Four Triads

Triads group related traits:

- **Dark Triad** (narcissism, Machiavellianism, psychopathy): antagonistic core
- **Vulnerable Dark Triad** (narcissism, borderline, Factor 2 psychopathy): instability.
- **Light Triad** (Kantianism, humanism, faith in humanity): prosocial opposite.
- **Energized Triad** (narcissism, hypomania, extraversion): bold energy.

The light triad may help combat narcissism.

What's Most Effective Depends On Context

> Flat organizations are becoming more popular (…) Narcissistic leadership thrives in a hierarchy, so when organizational power becomes hidden in a network rather than formalized in a hierarchy, researchers aren't quite sure how narcissism will work.
> Based on the current research, my guess is that narcissists may gain some centrality in organizational networks, yet they will eventually be pushed aside or isolated due to company culture. Classic Machiavellians might be able to navigate a web of social power, so it likely depends on the network and those who are employed.

Wannabe Machiavellians

> Machiavellians are often callous and highly manipulative, believing that the importance of their aims justifies even immoral means. In real life, though, Machiavellians of this level are hard to find. Many wannabe Machiavellians think they are highly manipulative and clever, but they actually look and act like impulsive psychopaths.

Learn better:

- How to be an honorable Machiavellian

> 15 Steps to Be A Good Machiavellian: Your Secret Playbook

Chapter 7: Relationships and Narcissism

> A narcissist wants a relationship with someone who can boost self-esteem through high status, physical attraction, or money. Essentially, the narcissist's partner is a tool for inflating the narcissist's ego.

Strategy	Examples
Effective adornment	Hair and makeup
Flashy and neat dress	Stylish Colorful
Charming facial expression	Self-assured Upbeat
Self-assured body movement	Straight posture Dominant behaviors

Grandiose Narcissists Got Game

> Many people wait for their soul mate to show up at a bar and pick them up, using the perfect conversation starter and saying everything they want to hear. Well, someone just might do that—if that person is a narcissist.

But are built for short-term:

> Narcissists love the honeymoon period that's filled with excitement, passion, and confidence, but we all know it

> doesn't last forever. (…) Over time, however, that feeling wears off (…) replaced with familiarity and comfortable conversation.

And that's when narcissists may begin to act out, or start angling for the door.

Vulnerable Narcissists Are Needy

> vulnerable narcissism, in particular, is associated with insecure attachment styles, and vulnerable narcissists tend to need a partner who reassures them, makes them feel accepted, or ensures that they are connected in the relationship. This experience of being with a partner who is needy is not pleasant, especially as it develops into a long-term relationship.
> In the short-term, providing this comfort can make partners feel good about themselves because they're helping someone, stabilizing that person, and reinforcing their own idea that they matter. In the long-term, however, this pressure becomes exhausting because the partner exists to establish someone else's self-esteem, and this builds as both partners realize they don't like being in a relationship with the other person anymore.

From Nice to Abusive: Admiration & Rivarly

Chocolate cake model of narcissistic relationship: start higher, end lower

Researchers split narcissistic behavior in relationships into two sides: **admiration** (the charming, confident, attention-seeking side) and **rivalry** (the competitive, critical, antagonistic side).

A 2014 German study suggested that narcissists **switch motives over time.**
Early in dating, they seek admiration from a new partner. But once they feel they've "secured" that person, the boost fades. Then they shift to rivalry—putting their partner down or competing with them to maintain their own sense of worth. Other studies show the same pattern.

Overall, the **admiration** side is appealing at the start and becomes neutral later, but it never turns negative. It goes from positive → neutral. The **rivalry** side starts slightly negative and becomes more damaging over time.

Chapter 8: Leadership and Narcissism

> **Narcissism and leadership go together** like picnics and ants. Leadership is a goal for narcissists because it means status, power, and attention. It means wealth, and it even means sex. Especially for men, leadership is a great way to gain the affection of—or simply to exploit—others for sex.

Talking about Trump, Campbell even says that he *expects* leaders to be narcissists.

This is only true for grandiose narcissists, though.
The neuroticism of vulnerables impairs leadership emergence and performance.

🤔Lucio's Take: **Is Trump not embezzling funds?**

Lucio:
The author mentions '*The Dangerous Case of Donald Trump*' and says he has little doubt that Trump is narcissistic, but doesn't believe it represents a clinical level of impairment.

He cites as examples that '*he has not overreacted to threats or promoted himself over others to the extent that I thought was possible, has not been caught having affairs or stealing funds from the government*.'

I wouldn't even consider affairs as a level of impairment and wouldn't necessarily disagree with him (besides the expected and known leadership issues with high narcissists that I still personally find deplorable).
But stealing funds is debatable since one can leverage the presidency to make money. Think of launching crypto coins, receiving expensive gifts, or mis-spending on narcissistic pursuits like military parades, larger ballrooms, or cracking down on enemies.

Grandiose and Vulnerable Together Make For Poor Leaders

> Leaders who exhibit both types of narcissism may not do well either. Bob Hogan, a well-known personality psychologist and industrial psychologist, has said that this is the worst combination he sees when working with high-level executives. People who are highly narcissistic but also neurotic and vulnerable take slights easily and

> are immune to criticism. They go off the handle. They throw things. People who are power hungry but also have thin skins are a problem.

Narcissistic Leaders Need Tough Followers

Research actually shows that certain followers *benefit* from having a narcissistic leader.
A consultant friend of the author calls his approach “feed the eagle, starve the pigeons,” and actively seeks out narcissistic leadership for that reason.
Employees with high confidence and strong self-esteem may excel under these leaders where they work hard, close sales, and boost performance.

In contrast, people with low self-esteem, insecurity, or impostor-syndrome tendencies struggle. They often feel intimidated, mistreated, or exposed.
So for narcissistic leaders to be effective, they need followers who are tough, resilient, and able to handle—and even perform better under—their demanding style.

In Stable Organizations Avoid Narcissists, But In Uncertain Times...

Context strongly shapes when narcissistic leaders become effective.
During stable, prosperous times, organizations don’t need them—people prefer steady, competent, good-natured leaders who simply keep things running.

But in periods of chaos or uncertainty—economic instability, social confusion, or a general sense that life is out of control—people are drawn to narcissistic leaders who project certainty, strength, and clear direction, even if they can’t actually deliver it.

The danger is that these conditions are exactly what allow destructive figures to rise—such as Hitler during Germany’s post–WWI collapse—or charismatic extremists like Jim Jones, who filled spiritual or emotional voids by building cult-like power.

Energy Clash Model: narcissism vs. system resistance

Campbell, 2020

The Energy Clash Model explains what happens when a grandiose narcissistic leader enters an organization. The system reacts to their disruptive style in three stages:

1. Perturbation (Shock Phase)

The organization becomes unstable.
People don't know what the new leader will do.
The leader announces bold changes, and employees feel nervous but generally supportive.

2. Conflict (Pushback Phase)

As the leader starts reorganizing teams and pushing new directions, those who lose power or feel threatened push back.
Opposition forms, leading to internal battles, resistance, or departures.

3. Resolution (Integration or Rejection)

Eventually, the system settles.
Either the leader's vision becomes the new norm (*integration*, e.g., Home Depot's CEO case),
or the organization rejects the leader and removes them (*rejection*, e.g., Time Inc.'s CEO Jack Griffin).

The model also fits **political leadership**, such as Donald Trump's presidency: a brief honeymoon, immediate instability, prolonged conflict between supporters and opponents, and eventual resolution.

Dominance vs. Prestige

Two main pathways explain why certain people rise as leaders: **dominance** and **prestige**.

Dominance (the narcissistic path)

Leaders rise through force, confidence, intimidation, and aggression.

Dominance in dating and relationships can come across as bullying or abuse and can translate into physical, emotional, or mental domination. In the research world, narcissistic abuse in relationships comes from the core feature of antagonism, regardless of grandiosity or vulnerability.

A classic example is **General George Patton**: charismatic, bold, and visually commanding—but ultimately self-focused.
His decisions prioritized image over soldier safety (e.g., forcing removal of improvised armor because it "looked weak").
Dominance can get people to the top, but it often destabilizes teams and derails careers over time.

Prestige (the prosocial path)

Leaders rise because followers respect their **competence**, **ethics**, and **care** for the group.
Example: **General Omar Bradley**, who focused on logistics, survival, and troop welfare.
Prestige-based leaders are more agreeable, emotionally stable, less aggressive, and seen as wise.
This is the model of "servant leadership"—think Martin Luther King Jr., Gandhi, Mother Teresa.

How pride reveals the difference

Research by Jessica Tracy shows two forms of pride:

- **Dominance-pride:** aggressive, "I'm better than you," ego-driven (fits narcissism).
- **Prestige-pride:** authentic pride—joy, self-efficacy, non-threatening confidence.

The leadership challenge

Organizations need confident people who want to lead *and* who care about followers.
But the people most eager to lead tend to be disproportionately **grandiose narcissists**.
We're "fishing for tuna with shark bait": the selection process attracts the wrong personalities.
The solution is to design systems that look beyond raw emergence cues and reward the qualities of prestige-based leadership.

Personality Trait	Prestige Score	Dominance Score
Narcissism	0.15	0.56
Aggression	-0.38	0.55
Neuroticism	-0.39	0.13
Extraversion	0.59	0.20
Agreeableness	0.27	-0.61
Ethics	0.26	-0.41
Intellectual ability	0.16	-0.06

Chapter 9: Social Media and Narcissism

> New smartphones, for instance, with new filters and high-resolution, front-focused cameras, have evolved for the narcissist's modern habitat.

Social media amplifies narcissism via self-promotion/audience. Selfies correlate with grandiosity. Cause-effect unclear; networks built strategically. Studies: meta-analyses link narcissism to activity; selfies/nose jobs. Practical takeaways: Curate profiles mindfully; recognize platforms reward narcissistic behaviors.

Humblebragging

> In this example, you are on the plane and may ask a flight attendant to take the photo. Then you share the picture on various social media accounts. You might be a little sophisticated in your self-enhancement and realize that openly bragging might make you look obnoxious, so you try a classic humblebrag by writing a caption that is more socially acceptable. In this case, #greatdayforflying and #blessed seem right. You show a little gratitude and people like you even more.

Also read:

- How to self-enhance without bragging

Chapter 10: Geek Culture and the Great Fantasy Migration

> For those who don't have real-world ways of expressing their superiority, success, and status, virtual worlds could offer a better way to do this.

Geek culture (anime, furries) allows narcissistic fantasy escape.

Chapter 11: Using Narcissism Strategically

When Narcissism Helps	When Narcissism Hurts
Initial meetings with people	Long-term relationships
Public performance	Ethical performance
Context where risk pays off (bull markets)	Context where risk hurts (bear markets)
Short-term romantic relationships	Long-term romantic relationships
Charismatic leadership	Ethical leadership
Social media connections	Meaningful friendships

The five rule for effective narcissism:

1. Use it briefly.
Narcissism works best at the start—first impressions, interviews, or quick introductions. A little confidence or bragging can help early on, but overstaying it turns people off.

2. Use it publicly, not privately.
Narcissists shine in front of an audience—they perform better under attention. Confidence helps on stage, in meetings, or in high-visibility situations. Just switch it off at home or with close relationships, and treat support staff respectfully.

3. Be bold—but controlled.
Narcissistic boldness can drive success: taking risks, putting yourself out there, trying new things. The key is balancing bold action with accountability and knowing when to stop—especially when others' needs genuinely matter more than your ego.

4. Build a broad network.
Narcissists are good at forming wide social networks that help in careers. The healthy version: reach out, connect, ask, offer help, and exchange favors. Breadth matters for opportunities; just avoid slipping into exploitative behavior and also make quality friends and connections.

5. Advocate for your worth—rationally.

Antagonistic people often earn more because they ask. The adaptive approach: confidently request what you're truly worth and provide a clear, evidence-based case for it. You're not "bragging"—you're giving your boss the business argument they need to support you.

Being A Good Narcissist: The Rule of Positive Bottom-Line Value

I couldn't agree more, and this may as well be The Power Moves' ultimate goal: succeed for the self, while adding value to the world.

I'm so glad Campbell wrote this in his book, and I hope he is OK with us using his words for this concept:

> You demand power, status, leadership, material, and respect. That's great, and it often works. However, in turn, you should give back more than you take. If you build networks and are a friendly person, you will help the world with that narcissism. If you demand a fair wage at your job so you can support your kid, everybody wins. If you lead a company and make millions of dollars and also build a great product and employ a large number of people, that's the way it should work.
> In those cases, **the ego needs are being offset by a general benefit to society itself**. No matter the situation, small costs and small benefits will occur, and large costs and large benefits will occur, but that general trade-off is important ethically to conceptualize, especially when thinking about your own narcissism. Are you bringing more to the system than you're taking? Are you causing less suffering than you're creating? These questions can be tough to answer in our lives. They're hard to answer in the lab, too, but they're the ones that we need to consider.

Chapter 12-13-14: Reducing Narcissism

Make then want to change, and be a good parent, but don't stress about it: parents have limited control.

Chapter 13: Reducing Your Own Narcissism

Potential solutions for narcissism, (Campbell, 2020)

Some solutions:

- Awe for grandiosity
- Avoid spending time with attractive others for commitment
- Self-compassion for fragility/thin skin
- Open to love and engage in the community for big-picture changes: If you invest yourself in the community, you will become a community-focused person—with the personality traits of a community-focused person. At the individual level, changing narcissism is about opening up to love. At the social level, it's about connecting to the community more broadly.

Chapter 14: Psychotherapy for Narcissism

Different therapies are available, but the data is sparse. Focus on a good therapist first and foremost, and try out a few.

Chapter 15: Future Science Around Narcissism

Genetics has huge potential, including the birth of genetically modified babies.
Psychedelics and virtual reality may also help.

Epilogue: Are We Improving Or Not?

Campbell is very optimistic about the future:

> Fortunately, I believe we're beginning to shift to a moment where narcissistic leaders aren't able to rely on their dishonesty and manipulative nature because society as a whole is beginning to see through the façade.
> On social media, for instance, content is already shifting away from promotion and brand-building to entertainment and information sharing. The most successful businesses and solopreneurs are teaching others and providing true value through learning, and brand is becoming secondary.
> In addition, we're seeing a boom in podcasts and long-form content. Although studies show that our attention spans continue to shrink, we're spending more time on longer videos, audios, and articles that we think are worth our time.

I'm also an optimist, but I'm not as optimistic.
I still see endless conmen gurus, narcissistic leaders and influencers, and I gotta wonder about the quality of some of those long-form podcasts.

Let's hope AI can raise the average :).

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Humanity Needs New Systems For Leadership Emergence

> Groups need people who want to lead, are confident in leading, and care about followers. However, those who want to lead may come from a pool overrepresented by grandiose narcissists. As I see it, we're fishing for tuna by using shark bait, and we wonder why we keep getting sharks. In the end, the key to getting the right people into leadership positions is creating systems that look at qualities beyond these emergent leadership qualities.

Selfless Leaders Are Remarkably Rare: 2.000 Years Gap

> To put this in perspective, when George Washington gave up the presidency of the United States, it was such a remarkable act that Washington was compared to Roman leader Lucius Quinctius Cincinnatus, who was the most recent prior example of a leader to take rule when needed in war and then step aside. Washington was even carved in marble as Cincinnatus, showing the bond between these two generals who relinquished power. Selfless leaders are remarkably rare in history.

Chaos vs. Stability

> Plasticity drives change, and change means the destabilization and even destruction of older realities. When Silicon Valley folks talk about moving fast and breaking things or dump five hundred electric scooters in a town to see what happens, that is the work of high plasticity.
> On the other hand, stability solidifies and slows change. People high on the stability scale do this by getting along with others, following rules and tradition, and remaining calm. For example, Elon Musk represents someone very high in plasticity, so high that the SEC and some shareholders want him surrounded by stabilizing individuals. Many entrepreneurs get the boot after they are successful in building an organization because entrepreneurs thrive on plasticity, yet big structures need stability in the form of rules, manualized policies, and laid-out systems.

Life Follows The Law of Balance

> Humans evolved so that “average” and “normal” would be the desirable qualities. People want to be a little taller than average, but not too tall. The most attractive faces are symmetrical and a little different from average, but not too unique. For instance, we want a medium-sized mouth and eyes that aren’t too close or too far apart. We want a slightly wider smile than average or eyes that are a little larger, but we don’t want lips like a largemouth bass or guppy eyes.
> This same truth applies to personality (…) Thanks to the praised idea of individualism, those in the Western world want to be slightly outside of normal—a little above average on extraversion, openness, agreeableness, and conscientiousness and a little below average on neuroticism. The extremes of personality can lead to problems, even for what we see as “positive” personality traits. (…). Even extremely low neuroticism can be a problem. Humans get anxious because it protects them from danger. People with extremely low neuroticism can become overly risk-taking, sometimes with the result being an early grave..

And extremes

Also read:

- The law of balance
- Law of balance in dating

Everyone Wants Status, Not Just Narcissists

> As a highly social species, we are motivated to secure or increase our place in the community and the dominance hierarchy. Often, social psychologists talk about these as the needs for belongingness or connection and power or status. As modern humans, we have a highly complicated self that we build and defend. We worry about image and self-esteem but also feel lonelier than ever before.
> Narcissists’ goals and motives are grounded in the same systems as everyone else. That is, no narcissism-related motive or goal is solely exhibited by this small group of people;

Learn more:

- What is social status
- How to increase social status

> How to Gain Social Status as a Man: A Field Guide

Narcissism May Undermine Growth

> On a manageable everyday level, basic self-enhancing ego distortions may lead us to believe that we're slightly more attractive than we are or that our professors are to blame for a bad grade.
> At the same time, this self-enhancement has negative costs. Feeling good about appearance replaces improving attractiveness. Blaming others for failure prevents studying harder for the next exam. For narcissists, this self-enhancement delusion works well emotionally but doesn't lead to self-improvement. Storytelling continues to build their importance as long as others—and reality—will tolerate it.

Love Bombing: A Pop-Psychology Myth?

At the time of writing, virtually all articles and books on 'narcissistic relationships' list 'love bombing'.

AI models follow suit, also listing it as a common technique or phase.

I never thought that added up logically.
High-effort and high-cost courtships tend to disempower the *pursuer*, and be more associated with lower mate value men.

Exceptions always apply but, in principle, **high-value men are less likely to pursue high-cost courtships** by virtue of their greater optionality.

Plus, since narcissists tend to be more attuned to power dynamics, it didn't add up that they'd give all their power away.
From personal experience, I had also never witnessed it.

On this topic, Campbell writes:

> *I'm often asked about "love bombing" and whether narcissists have a tendency to overload you with affection and then ghost you once they're bored.*
> *Although research shows that narcissists tend to be more positive and attractive during the initial phase of a relationship,* ***researchers haven't found any good evidence to back up the idea of love bombs*** *in particular.* ***There's a possibility that this behavior could be related to vulnerable narcissism*** *and the tendency to seek love and attention through a sense of neediness and entitlement.*

Campbell's hypothesis makes more sense and may clarify this conundrum.

However, vulnerable narcissists may also be less likely to 'discard' a partner because they're needy, lower mate value, and wouldn't trust themselves to find a new one.
So maybe pop psychology just mixes the two: discarding from grandiose, and love bombing from vulnerables.

All in all, I still remain unconvinced by 'love bombing'.
See the current TPM power-theory here:

Grandiose = Predator, Vulnerables = Prey

The author says that predators are approach-oriented, like grandiose—who are also sometimes seen as predatory. Vulnerable narcissists instead act more like prey, trying to *evade* threats.

> For instance, grandiose narcissists focus on looking good, so they constantly hunt for opportunities to shine. Vulnerable narcissists focus on not looking bad, so they scan the environment for potential ego threats. The result in both cases is a life filled with course correction. Narcissists constantly search for short-term opportunities to look good or avoid feeling bad.
> (…)
> These two motives are even easy to spot across different species. Predators, such as hawks or lions, have eyes that face forward and stalk with an intense focus on the goal. When these predators commit to an action, they go for it full on (…) Their motivation is considered an *approach* tactic.
> Prey animals are different. Their eyes sit on the sides of their head, so they have a large field of vision. They are often skittish, mistaking a passing shadow or breaking branch for a potential predator. Their motivation is considered an *avoidance* tactic.

Narcissists Date Effectively With Approach-Orientation

> Grandiose narcissists, in particular, are approach-oriented and sometimes seen as predatory. For example, a grandiose narcissist might ask ten people on a date to get one to say "yes."

Campbell is exactly right.
The number one reason why some men rack up the lion's share of total lifetime partners is that they *seek* more women, approach more, and make the law of the large numbers work for them.

QUOTES

On narcissism as a blessing:

> Finally, and I have to say this cracks me up every time I read it, the DSM notes that "many highly successful individuals display personality traits that might be considered narcissistic."

On communal narcissists 'gaslighting quality' for their private relationship:

> This type of narcissism is also particularly tricky because leaders who are pillars of the community may fall into this category. Although they are devoted to the community and are generally positive in public interactions, their antagonism and self-focused nature hurts their private relationships, which can make it tough for spouses, children, and other relatives to grapple with the reality of their loved one's personality.

On the appeal of geek culture for those seeking an escape:

> A middle manager who works in a cubicle farm by day can run a guild in *World of Warcraft* by night. Those who struggled with athletics as a kid might be a legend in fantasy sports. The girl who got cut from the cheerleading squad can dress as a Klingon princess at a convention, and the men will line up.

⍰⍰♂ Lucio's Analysis

NPI Issues: Two Examples

The author raises some concerns about some NPI items.

I completely agreed with him, and had some on my own.
Consider this forced-choice pair:

- *I can easily influence or manipulate others.*
- *I dislike it when I notice myself manipulating someone.*

In my case, influencing or manipulating others **is easy**, mainly because I study social strategies and understand those dynamics well. That reflects **competence**, not a tendency or desire to take advantage of people.

The second statement also doesn't resonate: I avoid manipulating decent, trustworthy, or honorable individuals. But I don't feel the same restraint toward people who act in bad faith. So selecting that alternative would misrepresent me.

However, on the NPI, choosing the first response automatically counts as greater exploitativeness.
That's where the measure may conflate **ability** with **intent**: the respondent answers based on skill, while the scale interprets it as an exploitative mindset or moral stance.

The NPI's Entitlement Item Could Also Be Clearer

This also felt unbiguos:

- *I will never be satisfied until I get everything I deserve.*
- *I like to do things for other people*

I'm happy if I can help others, but I'm very high agency, so it shouldn't come at a loss of my time and my priorities.

And I initially read the first option as expressing drive and effort toward one's goals—essentially **high agency** rather than high entitlement.
This could have been just me, but I think it's possible that at least some other high agency folks would choose the first, without necessarily being highly entitled.

Are Sex, Status, & Stuff Fleeting Compared to Family?

The author writes:

> However, chasing sex, status, and stuff in the interest of building one's ego presents a couple of major problems. The first is the *fading goal problem*. Reaching a goal that is relatively stable, such as having a loving family, can provide a long-lasting source of self-esteem and satisfaction. Fleeting goals such as sex, status, and stuff do not create sources of stable self-esteem.

I'd like to add some caveats to this:

- **Enduring family benefits only apply in successful marriages and families**. Men who lost their shirts in costly divorces and can barely see their children may not see it the same way
- **Success in sex, status, and stuff may be enduring**: Maybe some people constantly need more. But I found that the success I've had dating made me feel more accomplished in my pursuits for life. Without necessarily needing new ones

REVIEW

The New Science of Narcissism is an excellent, well-referenced scientific book with a self-development angle that

remains fully accessible to the general public.

It delivers a simple yet thorough overview of narcissism, and also doubles as a solid introduction to personality psychology for anyone who wants a clear, research-based foundation.

The only note I have, which is also very subjective, is that while I appreciated the pop-culture examples and references, I didn't get most of them (and I had to wonder: how does Campbell even manage to be a father, professor, top researcher… And still view all those series? ⍰)

I loved it, I'm grateful to Campbell for his extraordinary work, and I can highly recommend it.

Get it on Amazon, or check the best books on narcissism.

The Handbook of the Psychology of Narcissism: Summary & Review

Lucio Buffalmano · 15 December 2025 · Archived copy · Original

The *Handbook of the Psychology of Narcissism* (2014) is an edited research volume that surveys intrapersonal, interpersonal, and clinical perspectives on narcissism.

FULL SUMMARY

About the Author:
The *Handbook of the Psychology of Narcissism* is a multi-author edited volume, with each chapter written by subject-matter experts contributing their perspectives. The collection is edited by **Avi Besser** (Hadassah Academic College), who served as the general editor and organizer of this anthology of research.

Note: I focus more on empirical chapters and may skip chapters based on DSM, more psychoanalytic chapters, and one-study chapters.

Chapter 1: Do Narcissists Really Love Themselves? The Psychodynamic Mask Model

Authors: Ashton C. Southard, Amy Noser, Virgil Zeigler-Hill

The authors examine whether narcissists truly have high self-esteem or merely project grandiosity to cover deep feelings of inadequacy.
The psychodynamic mask model posits that **narcissists' outward confidence and self-esteem hides fragile and negative self-views** formed through early interpersonal wounds. The chapter reviews classic psychoanalytic roots, and reasons for inconsistent findings in modern research.

The Mask Model of Narcissism Posits:

- **Narcissistic grandiosity masks inner inferiority.** Freud (1914), Kohut (1966, 1977), and Kernberg (1975) all viewed narcissism as defensive overcompensation for fragile self-esteem developed in childhood.
- **Overcompensation maintains self-worth.** Narcissists seek admiration, exploit others, and self-enhance to maintain the façade (Morf & Rhodewalt, 2001).
- **Deep shame vs grandiosity:** Subconscious deep shame and insecurity contrast with conscious grandiosity, causing constant validation-seeking.
- **Volatility, defensiveness and anger explained by the model.** Narcissists' self-love is conditional and easily threatened, which explains both their charisma, volatility, and aggressive reactions when criticized

Testing the Model

- ✕ **Early research confirmed the model**, showing narcissists score high on explicit measures but lower on implicit measures that assess automatic self-worth (Greenwald & Banaji, 1995).

  - Discrepant high self-esteem is the name often used to refer to the mix of high explicit and low implicit self-esteem (Bosson et al., 2003)
- ✅ **More recent research shows mixed results and challenges the model.** Later studies (Campbell et al., 2007; Bosson et al., 2008) failed to replicate the pattern consistently.

Why Results Differ

Several theories may help explain why the results differ:

- **Unreliable implicit measures.** Tools like the Implicit Association Test and Name-Letter Task are noisy, context-dependent, and weakly correlated.
- **Domain-specific self-esteem.** Narcissists may feel agentic superiority but communal inadequacy—strong in power/competence, weak in warmth/connection (Campbell et al., 2002).
- **Grandiose vs vulnerable: multiple narcissism types.** Grandiose narcissists show true high self-esteem; vulnerable narcissists exhibit the low implicit self-esteem predicted by the mask model <— ⍰⍰♂ **Lucio's note**: this seems to be most important element

Chapter 2: Tales of Glory — The Narcissistic Ideal as a Defense Against Being Forgotten

Author: Robert Waska

Through a psychoanalytic case study, Waska explores how idealized self-images protect individuals from fears of insignificance and abandonment. Narcissistic idealization serves both as armor and as an obstacle to authentic emotional life.

⍰♂Lucio's Take: **Therapists should encourage positive expressions of power**

Lucio:
The man in therapy was bullied, and when he switched classes took the opportunity to start higher power: he entered, shook everyone's hands, got classmates' respect, and felt powerful and in control.

I thought ‘fantastic move’, that’s exactly what you needed!

But the therapist never acknowledged or encouraged that, and instead focused on his ‘broken core’.
I believe effective therapy doesn’t have to limit itself to exploration, but can also encourage positive expressions of power and self-growth. Status and man’s respect have been proven to also have positive mental effects.

Chapter 3: Narcissistic Perfectionists — the Quest for the Perfect Self

Authors: Gordon L. Flett, Simon B. Sherry, Paul L. Hewitt, Taryn Nepon

This chapter connects perfectionism and narcissism, distinguishing the narcissistic perfectionist—driven to appear flawless and feel flawless—from the neurotic perfectionist who fears failure.
It also highights the risk of narcissistic drive for perfection and possible suicide or psychological problems later in life when the high standards fail to turn into reality.

On the plus side, some narcissists view **grandiose standards as attainable**, not impossible goals, but as rightful standards.

Chapter 4: Narcissism and Heroism — A Rendezvous?

Authors: Shai Itamar, Golan Shahar

Itamar and Shahar introduce the **Heroic Self (HERS)** concept—the belief in oneself as a hero or wanting to see oneself as a hero—linking it to narcissistic pathology.
Heroic Identification (HI) predicts scores on the Pathological Narcissism Inventory.

The Heroic Self Model

- **Three HERS dimensions** reflect different narcissistic needs for glory.
  - Self-as-Conqueror
  - Self-as-Savior
  - Heroic Identification

🤔Lucio’s Take: **I see heroic self and strive towards heroism as more positive than negative**

Lucio:
This was very instructive, I can imagine it's more linked to grandiose narcissism than vulnerable narcissism.

I also don't happen to see it negatively since a heroic status is connected to honor and adding value, and it may as well be the ultimate positive male aspiration.

Chapter 5: Bodies and Men — Vicissitudes of the Masculine in Man

Author: Stefano Monzani

Monzani explores how masculinity and narcissism intertwine in shaping male identity, drawing on psychoanalytic theory from Stoller to contemporary authors.

Masculinity and Narcissism

- **Gender identity builds uniqueness and vulnerability.** The male ego ideal—phallic power and autonomy—anchors self-esteem but is fragile.
- **Freudian "psychic bisexuality."** Masculine and feminine elements coexist; denying one creates conflict.
- **Life-stage crises reveal masculine fragility.** Case studies show narcissistic collapse in midlife, psychotic adolescence, and castration anxiety.

Interesting Insights

- **Masculine narcissism can be a cover to defend against dependence.** Exaggerated strength hides relational fears.
- **Integrating softness and vulnerability yields maturity.**

🤔Lucio's Take: **Fragile masculine self-identities is why we stress antifragile identities here**

Lucio:
It was good to see this and it confirmed TPM's takes on self-identities, including masculine ones, and their risk for future weakness and psychological problems.

Read more on our guide on how to be more masculine, with future-proofed resilience.

Chapter 6: Narcissism in the Third Millennium — Disorder or Cultural Phenomenon?

Author: Gidi Rubinstein

Rubinstein questions whether today's narcissism is a pathology or a normal adaptation to a self-promoting culture. Modern society may reward narcissistic traits more than in the past, and the line between disorder and adaptation is also cultural.

The authors also examine reality-TV candidates, gym trainees, and cosmetic-surgery patients, all scoring higher in narcissism than control groups (in that order).

However, there is a positive in higher narcissism when it comes to body image and fitness:

> Research has found that individuals who score higher for narcissism are more satisfied with their bodies than those with lower narcissism scores (e.g., Davis, Claridge, & Brewer, 1996; Jackson, Ervin, & Hodge, 1992). Jackson et al. (1992) found that both males and females with high levels of narcissism evaluated their physical appearance, fitness, and sexuality more favorably than those with lower narcissism scores. However, these individuals also participated in more fitness and appearance-related behaviors and placed greater importance on fitness and appearance than less narcissistic individuals did (Brown & Graham, 2008).

Chapter 9: Physiological and Health-Related Correlates of the Narcissistic Personality

Authors: Sara Konrath, John Paul Bonadonna

This chapter reviews how narcissism relates to health, physiological markers, and mortality.
At first blush, narcissists seem to be doing great:

> In terms of many traditional indicators of well-being and mental health, narcissistic individuals appear to be thriving.
> For example, compared to less narcissistic people, more narcissistic people are **happier** (Rose, 2002), **have higher levels of life satisfaction and subjective well-being** (Rose, 2002; Sedikides, Rudich, Gregg, Kumashiro, & Rusbult, 2004), have a **greater sense of meaning** in lives (Zondag, Van Halen, & Wojtkowiak, 2009), are **more creative** (Raskin, 1980), and have **higher self-esteem** (Aalsma, Lapsley, & Flannery, 2006; Campbell, Rudich, & Sedikides, 2002; Locke, 2009; Raskin, Novacek, & Hogan, 1991; Rose, 2002).
> More narcissistic people are also **less neurotic, anxious, obsessive-compulsive, lonely, and depressed** (Aalsma et al., 2006; Akehurst & Thatcher, 2010; Raskin & Novacek, 1989; Sedikides et al., 2004; Spano, 2001; Watson, McKinney, Hawkins, & Morris, 1988)

However, the authors spend the chapter adding important caveats.

Healthy vs Unhealthy Grandiose Narcissism

The Narcissistic Personality Inventory (Raskin & Terry, 1988) can be divided into two subscales of healthy (or adaptive) narcissism versus unhealthy (or maladaptive) narcissism (Reinhard, Konrath, Lopez, & Cameron, 2012).

- **Healthy** includes Authority, Self-Sufficiency, Superiority, and Vanity subscales
- **Unhealthy** includes Entitlement, Exhibitionism, and Exploitativeness subscales

Healthy narcissism is associated with lower levels of depression, loneliness, and pessimism, as well as higher self-esteem and greater optimism (Emmons, 1987; Hickman, Watson, & Morris, 1996; Watson & Biderman, 1993).
But unhealthy narcissism is associated with more negative mental-health indicators like pessimism, depression, anxiety, and lower optimism and self-esteem (Hickman et al., 1996; Raskin & Novacek, 1989; Watson, Taylor, & Morris, 1987).

But Self-Esteem May Confound Findings

Overt narcissism measures (e.g., the NPI) are typically associated with higher self-esteem.

This may be interpreted as a mental-health implication of narcissism in itself. However, several scholars have demonstrated that when self-esteem is controlled for, the relationship between narcissism and positive indicators of mental health is reduced or nullified (Rose, 2002; Rosenthal & Hooley, 2010; Sedikides et al., 2004).

In other words, narcissistic people might only appear to have good mental health because they have high levels of self-esteem.

⍰⍰♂ Lucio's note: it may be still correct to say that grandiose narcissism is associated with better mental health
still great chapter and great insight, very instructive. I may not fully agree though that this would remove the association between grandiose narcissism and health. If greandiose narcissism is associated with high self-esteem, isn't it the same to say that grandiose narcissism promotes mental health since, technically, it may not matter what aspect of narcissism triggers better mental outcomes?

Vulnerable Narcissism Is Unhealthier

Covert narcissists tend to be more timid, insecure, and low in self-confidence, often fearing negative evaluation from others (Arble, 2008).

Unlike overt narcissism—which correlates with greater happiness and lower levels of depression and

anxiety—covert narcissism is linked to reduced happiness, well-being, optimism, self-esteem, life satisfaction, and sense of meaning (Hickman et al., 1996; Rose, 2002; Wink, 1991; Zondag et al., 2009), along with higher levels of pessimism, depression, and anxiety (Hickman et al., 1996).

- **Hypersensitivity is the most harmful trait**: *the most consistent finding was that Hypersensitivity (a type of unhealthy narcissism) is associated with poor health and well-being many years later*

Longitudinal Studies

Longitudinal studies on narcissism and mental health are scarce, but existing research highlights key patterns:

- A study by Zuckerman & O'Loughlin (2009) followed students over eight months and found that narcissism was linked to higher well-being, but only through its association with high self-esteem. Narcissists also showed greater emotional instability after negative interpersonal events. Importantly, narcissism did not predict future well-being. Instead, initial high well-being and low emotional reactivity predicted later increases in narcissism, suggesting that well-being may foster narcissism—not the other way around.

- Another long-term study (Cramer & Jones, 2008) used three narcissism-related traits—Willfulness, Hypersensitivity (unhealthy narcissism), and Autonomy (healthy narcissism)—to track participants from their 30s to their 70s. High unhealthy narcissism combined with high identification with others predicted declines in psychological health. Autonomy was consistently associated with better psychological health across all time points but did not predict improvements. The author hypothesizes that '
psychological health might feed into healthy narcissism, rather than healthy narcissism causing improved psychological health'. But since no third variables were included in the model, causal inferences are speculative.

- A third study (Edelstein, Newton, & Stewart, 2012) found that only Hypersensitivity predicted long-term declines in well-being, including more depression, physical health problems, and lower life satisfaction. However, increases in both Willfulness and Autonomy over a 10-year span were associated with improved health at age 53.

Finally, in another section, the authors suggest that chronic vigilance for ego threats and higher hostility can cause 'physiological wear' despite apparent confidence.

Study	Results
Zuckerman & OřLoughlin (2009), 8 months	– Narcissism does not predict future well-being. – Well-being and low emotional reactivity predict future narcissism.
Cramer & Jones (2008), 40+ years	– Unhealthy narcissism (Hypersensitivity, Willfulness) and overidentification predict future poor psychological health. – Healthy narcissism (Autonomy) does not predict future psychological health.
Edelstein et al. (2012), 10 years	– Unhealthy narcissism (Hypersensitivity) predicts more depressive symptoms, physical health problems, and lower life satisfaction. – Increases in Willfulness and Autonomy predicted better health.
Wink & Donahue (1995), 30+ years	– Covert narcissism predicts poor psychological health. – Overt narcissism is linked to career success, but also substance use and relationship difficulties.

Interesting Notes

- **Delaying gratifiation matters**: *Given that the ability to delay gratification (i.e., self-control) is associated with a host of benefits (Baumeister, Vohs, & Tice, 2007; Tangney, Baumeister, & Boone, 2004), it is likely that this tendency toward immediate gratification leads to a number of self-defeating behaviors that limit their ultimate potential to succeed (Miller et al., 2009)* <— ⁉️♂️ **Lucio's note**: the benefits of delaying gratificaiton are

context-dependent though

- **Fragile self-esteem issue**: *when we focus on overall overt narcissism scores, we find that narcissism is still associated with a host of defensive and self-protective strategies, making narcissists*' supposedly robust mental health seem more fragile than *it may appear. (See Bosson et al., 2008, for a review.)*
  - Defensive self-esteem: social cognition studies have found that when narcissistic people are exposed to ego-threatening information, concepts of worthlessness quickly come to their minds and are then suppressed (Horvath & Morf, 2009)
- **Poor financial decision making**: *'Taken together, narcissism is associated with poor financial decision-making'*
- **Sexual risk-taking**: *among people living with HIV or AIDS, narcissism is associated with a number of unsafe sex practices, including a higher likelihood of having sex after substance use and a lower likelihood of using condoms with a new partner (Martin, Benotsch, Perschbacher Lance, & Green, 2013)*
- **Substance Use and Addiction** Narcissism is linked to a variety of problems with substance use and addiction
- **Driving behavior**: *Other research has found that it is the unhealthy aspects of narcissism (e.g., exhibitionism, entitlement) that are specifically associated with aggressive driving behavior; whereas the healthier aspects of narcissism (e.g., superiority, vanity) are associated with less aggressive driving behavior (Schreer, 2002)*

Biological Correlates

Taken together, the studies point to potential stress-regulation problems among narcissistic people.

- **Cardiovascular reactivity elevated.** Narcissists show higher heart-rate and blood-pressure responses under ego threat.
- **Hormonal and neural patterns.** Greater cortisol spikes and distinct neural activation during self-relevant feedback.
- **More than 50% heritability:**, *the proportion of the variance in narcissistic traits that can be attributed to genetic factors (i.e., the heritability, which is referred to as a2) ranges from 53 to 64% in Canadian and American adult samples (Jang, Livesley, Vernon, & Jackson, 1996; Livesley, Jang, Jackson, & Vernon, 1993; Vernon, Villani, Vickers, & Harris, 2008)*
  - Shared environment matters little studies all found that no proportion of the variance can be explained by shared environmental factors (i.e., having been raised in the same family; referred to as c2). Instead, the rest of the variance (between 36 to 47%) can be attributed to nonshared environmental factors (i.e., unique to each individual; referred to as e2)
- **Culture matters**: a substantial portion is shaped by nonshared environmental factors. The rise in narcissism among American college students over the past 30 years points to the strong influence of cultural and societal forces (Twenge et al., 2008).
- **Narcissism can be at least 'momentarility decreased'**: a brief interventions—such as promoting empathy, interdependence, or perceived similarity with others—can temporarily reduce narcissistic traits and their harmful effects (Finkel et al., 2009; Giacomin & Jordan, 2014; Konrath et al., 2006).

Study	Neural Regions Implicated
Cascio, Konrath, & Falk (2014); Adolescent males	Narcissistic participants show more activation in "social pain" regions (AI, dACC, subACC) during social exclusion compared to inclusion.
Choi et al. (2013); Adolescents	No correlation between covert narcissism and reward responses. Possibly due to small sample size.
Fan et al. (2011); Adults	High narcissism linked to reduced activation in right AI during empathy. Also less activation in right DLPFC, posterior cingulate cortex, and right pre-motor cortex.

Study	Neural Regions Implicated
Schulze et al. (2013); NPD patients vs. controls	NPD patients show less gray-matter volume in left/right AI, rostral/median cingulate cortex, and dorsolateral/medial prefrontal cortex.
Beer & Hughes (2010); College students	Those who see themselves as “above average” show less OFC and dACC activity during self trait judgments.
Barrios et al. (2008); College students	TMS stimulation of MPFC reduces self-enhancement, especially for egoistic traits.
Kwan et al. (2007); College students	TMS stimulation of MPFC reduces self-enhancement; stimulation of SMA increases it.
Luber et al. (2012); Adults	TMS of MPFC and right lateral parietal region at 160 ms SOA reduces self-enhancement. Left lateral parietal stimulation at 240 ms SOA also reduces self-enhancement.

Summary of neural regions associated with narcissism and related processes

Chapter 11: Everyday Deceptions — Narcissism, Psychopathy, and Lies

Authors: Chelsea Rose, Marc Stewart Wilson

While most people lie, some lies—like white lies which include concern for others—are seen as more acceptable and are told more often than more harmful “black lies.”
Subclinical narcissism and psychopathy were linked to a greater tendency to tell both types of lies, but especially black lies, suggesting that these darker personality traits are more strongly associated with harmful, self-serving deception.

Narcissism and Deception

- **All people lie, but motivations differ.** Narcissists lie for self-enhancement, image management, and manipulation, while others lie more for harmony or tact.
- **Narcissism blurs moral distinctions.** Both black and white lies serve self-interest rather than empathy.
- **Social skill masks manipulation.** Charm and verbal fluency allow narcissists to appear honest while strategically deceiving.

Chapter 14: Narcissism in Teams

Author: Esther Unger-Aviram

Unger-Aviram investigates how narcissistic employees affect teamwork and organizational performance.

Narcissism Facilitates Leadership

Narcissism is strongly linked to leadership emergence in group settings.
Studies by Brunell et al. (2008) found that individuals high in narcissism not only saw themselves as leaders during leaderless group discussions, but were also perceived as leaders by others. This effect held true in both student groups and among practicing managers, indicating that narcissistic traits consistently promote leader emergence across contexts.

The authors conclude by saying that ‘**Therefore, narcissists appear to emerge as leaders in team settings**.’

Narcissism Increases Volatility, But Doesn’t Necessarily Lower Organization Performance

Research shows that narcissistic leadership may not significantly impact team or organizational performance. Studies found no meaningful link between narcissistic CEOs and team success in professional baseball (Resick et al., 2009) or firm-level performance (Chatterjee & Hambrick, 2007).

Narcissistic leaders may introduce more volatility in decision-making, but their presence does not lead to consistent gains—or losses—in performance outcomes.

Maybe Good For Short-Term, Poor For Long-Term?

The contextual reinforcement model (Campbell & Campbell, 2009) explains how narcissists impact teams differently depending on the relationship duration.

In **short-term or emerging contexts**, like new or temporary teams, **narcissists often thrive**: they come across as charismatic, confident, and willing to lead, which can temporarily benefit team performance (Brunell et al., 2008; Schnure, 2010).

However, in **long-term or enduring contexts the same traits become harmful**. Narcissists' entitlement, arrogance, competitiveness, and need for constant validation strain relationships and undermine collaboration. They are seen as poor team players who take credit, manipulate others, and avoid accountability (Bergman et al., 2010).

While short-term settings may benefit from narcissistic traits, enduring contexts typically suffer. More research is needed to clarify how long "short-term" lasts, what factors moderate these effects, and how teams with multiple narcissists perform. Some evidence suggests two narcissists may even boost team creativity in specific cases (Goncalo et al., 2010).

?️?♂ Lucio's note: I agree
While this is a broad generalization and doesn't apply to every situation or context, it captures a clear and consistent temporal pattern.

Goal Orientation Theory: Short-Term Results But Little Learning for Long-term Growth (growth mindset)

Goal orientation theory distinguishes between **performance goals (PGO)**—focused on proving competence and gaining approval—and **learning goals (LGO)**—focused on developing skills and mastering new challenges (Dweck, 1986, 1999).

Performance-oriented individuals view effort and failure as threats to their competence. They prefer easy tasks that ensure success and avoid challenges that might expose weaknesses. Learning-oriented individuals, instead, see effort and mistakes as natural parts of growth. They respond to setbacks adaptively—by adjusting strategy, increasing effort, and improving mastery and may even relish difficult tasks as opportunities to improve skills.

Scholars and research suggest **narcissists adopt a performance-goal orientation**: they aim to demonstrate superiority and avoid failure rather than learn (Elliot & Thrash, 2001; Gerhardt & Le, 2013). High narcissism predicts stronger PGO and weaker LGO tendencies.

However, goal orientation can be both **trait-based and situational** (Button et al., 1996). When the environment promotes learning—such as in a **shared team learning climate**—even performance-oriented individuals, including narcissists, may temporarily adopt a learning approach.

Teams that foster **a collective learning climate**—encouraging experimentation, feedback, and learning from mistakes—show better long-term adaptation and performance (Bereby-Meyer et al., 2004; DeShon et al., 2004; LePine, 2005). In contrast, teams emphasizing **performance climates**—focused on comparison and competition—encourage surface-level effort and hinder growth.

In short, **narcissists thrive in performance-driven environments but struggle in growth-oriented ones**. Yet, with strong situational cues and supportive team cultures, even narcissistic members can be guided toward learning behaviors that enhance long-term team performance.

?️?♂ Lucio's note: Incredibly insightful, worth its weight in gold!

This was a crucial piece of information for me, and it will inform our articles and Power University module on dark triads. Very thankful to author and researchers ⍰⍰.

Interesting Notes

- **PGO to prove or to avoid**: research (VandeWalle, 1997) found that a PGO can be further divided into two independent dimensions:
  - performance-prove orientation: Individuals with a performance-prove goal orientation focus on demonstrating their competence and gaining favorable judgments from others
  - performance-avoid orientation: individuals with a performance-avoid goal orientation focus on avoiding the demonstration of difficulties or incompetence, as well as avoiding the unfavorable judgment of others
- **Teams depend on cooperation.** Narcissists' competitiveness and need for credit undermine cohesion.
- **Generation Y narcissism on the rise.** Younger workers value visibility and recognition more than harmony.
- **Narcissism increases creativity**: *Flynn, and Kim (2010) found that narcissism contributes to group creativity* <— ⍰⍰♂ **Lucio's note:** creativity isn't necessarily a net win. if we define creativity as novel ideas and approaches, it isn't necessarily positive unless those ideas are more effective
- **Narcissists may ace job interviews**: I*n the emerging zone (i.e., during initial encounters), narcissists are mostly perceived by others as highly outgoing, likeable, self-confident, charismatic, and* very likely to succeed. *Research has shown that narcissists usually shine in these situations and even the most experienced judges (i.e., experienced interviewers*

Chapter 15: Adolescent Narcissism and Interpersonal Relationships

Authors: Rebecca L. Kauten, Christopher T. Barry, Marion T. Wallace

The authors review how adolescent narcissism manifests socially and predicts aggression, popularity, and peer perception.

Interesting notes

- **Aggression for status.** Narcissistic teens aggress instrumentally to maintain superiority.
- **Perceived vs. actual popularity.** They rate themselves as well-liked, but peers view them as antagonistic and arrogant.
- **Focus on relationship power and games:**

> In addition to narcissism being linked to game-playing in romantic relationships, Campbell and colleagues (2002) noted that it is also associated with a "pragmatic and selfish" approach to romantic relationships (p. 351).
> They explained that a noncommittal approach to relationships is beneficial to an individual who expresses high levels of narcissism by allowing him or her to garner the esteem-boosting benefits of being in a relationship while simultaneously collecting positive appraisals from extradyadic interactions. The game-playing approach to relationships, then, affords power over the relationship partner.

Chapter 16: Not Such a Funny Thing — When Humor Meets Narcissism

Authors: Liat Itzhaky, Avi Besser, Virgil Zeigler-Hill

Two studies explore how humor styles reveal grandiose and vulnerable narcissism, and highlight how humor can be a mask for covert aggression.

- **Grandiose narcissists favor aggressive humor.** Sarcasm and ridicule maintain dominance and superiority.
- **Vulnerable narcissists use self-defeating humor.** They mock themselves to elicit approval or deflect shame.
- **Humor mediates stress and self-esteem.** Different humor styles explain divergent emotional outcomes.

Learn more:

- How to handle aggressive humor

Chapter 17: Associations between Narcissism, Empathy, Personality, and Imagined Interactions

Authors: James M. Honeycutt, Michelle E. Pence, Christopher G. Gearhart

This communication-psychology study examines how "imagined interactions" (internal dialogues) relate to covert narcissism.

> Honeycutt et al. (2012) found relationships between antisocial traits (in the form of neuroticism and lack of conscientiousness) and imagined interactions. The extant literature on antisocial, dark-side attributes and imagined interactions includes research involving imagined interactions and Machiavellianism (Allen, 1990).Additionally, and especially pertinent to the current study, Machiavellianism has been studied in relation to imagined interactions. Allen found positive correlations between Machiavellianism and having proactive and retroactive imagined interactions (IIs) involving a diverse set of imaginary conversation partners and topics

Findings

- **Hypersensitive narcissism predicts hostile inner dialogues.** Rumination and imagined arguments reflect unmet ego needs.
- **Low empathy and high neuroticism.** Narcissists rehearse conflicts mentally but fail at perspective-taking.
- **Anxiety and anger co-occur.** The inner monologue reinforces entitlement and grievance.

Chapter 18: Theory of Mind in Vulnerable and Grandiose Narcissism

Authors: Chinmay Aradhye, Jennifer Vonk

Aradhye and Vonk explore how grandiosity and vulnerability differ in social-cognitive skills such as empathy and perspective-taking:

- **Vulnerable narcissists show deficits.** They misread others' mental states and display emotional blindness.
- **Grandiose narcissists perform well cognitively.** They understand others but use insight manipulatively.
  - Grandiosity masks cold cognition**.** Cognitive empathy without compassion enables exploitation.
- **Emotional vs. cognitive empathy distinction.** The ability to reason about feelings doesn't equal caring.

> Altogether, the current corpus of research supports the general understanding that individuals scoring high on some aspects of narcissisms, such as grandiose narcissism, perform better on social cognitive tasks and seem to possess superior social skills than those who score higher for vulnerable narcissism

The authors also propose a link between ToM and narcissists' social orientations, with grandiose narcissists who are extraverted and exploitative thanks to ToM, while vulnerables who are self-focused because they fail to properly function socially.

Chapter 21: Narcissism and Psychological Distress to War Trauma

Authors: Michael Weinberg, Avi Besser, Virgil Zeigler-Hill, Aaron L. Pincus, Yuval Neria

The team studies Israeli civilians under missile threat to assess whether narcissism moderates PTSD and anxiety responses.

> The results of this study revealed an association between exposure severity and acute PTSD symptoms and GAD symptoms for individuals with high levels of pathological narcissism, but not for those with low levels of pathological narcissism

- **Pathological narcissism heightens trauma impact.** High-narcissism participants showed stronger PTSD and GAD symptoms after exposure.
- **Low-narcissism individuals are more resilient**

The authors hypothesize that grandiosity may collapse harder when external control vanishes against uncontrollable threats:

> Unlike others, who may view themselves as reasonably safe from harm, individuals with narcissistic personality features may believe that they are invulnerable (e.g., Barry, Pickard, & Ansel, 2009). This sort of mental representation of the self has been referred to as an overvalued schema (Foa & Riggs, 1993) or an inflexible positive schema (Elliott & Lassen, 1997). Following a traumatic event, individuals with narcissistic personality features are commonly confronted with the fact that they are actually quite ordinary and as vulnerable to these events as any one else. This sudden and often dramatic change in self-view may trigger feelings of inadequacy or self-loathing, which may culminate in extreme emotional reactions to these traumatic events

⁉️♂️ Lucio's question: a U-curve where moderate narcissism is the sweet spot?
These results seem to show a linear association where lower levels of narcissism are more resilient. But wonder there may also be a U-curve where too high narcissism backfires, but lower narcissism may be more resilient than too low narcissism?
The following chapter suggests so:

Chapter 22: Normal Narcissism as a Buffer against Eating Disorders and PTSD

Author: Eytan Bachar

Bachar differentiates pathological, deficient, and normal narcissism in two longitudinal studies, showing that 'an optimum balance of narcissism' is the healthiest.

- **Pathological excess predisposes PTSD.** Grandiose and vulnerable forms heighten trauma susceptibility.
- **Deficient narcissism predisposes anorexia.** Self-neglect and self-erasure ("death narcissism," André Green) predict restrictive disorders.
- **Normal narcissism protects.** Healthy self-regard buffers both trauma and body-image pathology.
- **Healthy narcissism = self-investment.** Moderate pride and self-care maintain psychological immunity.

In the introduction, the authors point out that an 'optimum balance' applies to many areas of life:

> Several studies have demonstrated the adaptive role of normal narcissism in coping with everyday life, including good adjustment to college life (Lapsley and Aalsma, 2006), development of normal eating attitudes among college women (Brunton, Lacey, and Waller, 2005), and normal feelings of shame (Hibbard, 1994). Normal narcissism has also been shown to enhance interpersonal dominance (Brown & Zeigler-Hill, 2004)

Chapter 23: Vulnerable and Grandiose Narcissism under Threat — Disparities and Similarities

Authors: Orr Spivak, Avi Besser, Virgil Zeigler-Hill

Spivak and colleagues compare emotional reactions of vulnerable vs. grandiose narcissists to achievement and interpersonal threats.

Comparative Reactions

- **Grandiose narcissists respond with anger and self-protective behavior.** Achievement threats elicit outward aggression, blame, or derogation.
  - Self-protective behavior response: *When threatened by comparison with a better performing other (e.g., Morf & Rhodewalt, 1993) or by negative feedback (e.g., Kernis & Sun, 1994), narcissistic individuals often respond with self-protective behaviors, such as derogation or devaluation*
  - ⍰⍰ **Grandiose narcissists react against *achievement*-related threats**, rather than interpersonal ones, since they don't care as much about others
- **Vulnerable narcissists react with shame and withdrawal.** Interpersonal rejection triggers collapse and rumination.
- **Both share hypersensitivity to ego threat.** Defensive intensity differs, not underlying fragility.
- **Two faces, one insecurity.** Grandiosity externalizes, vulnerability internalizes the same wounded self.

Interesting Notes

- **Grandiose narcissists strive for power rather than intimacy** within relationships (Emmons, 1989)
- **Parenting may make the difference**: *Otway and Vignoles (2006) found grandiose narcissism to be associated with recollections of parents as both cold and excessively admiring; whereas vulnerable narcissism was found to be associated with anxious attachment. In line with these findings, Young, Klosko, and Weishaar (2003) described grandiose narcissists as suffering from difficulties experiencing love or being loved by others*

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

You can't spot lying 'cues' because people aren't nervous about lying

We noted a few times on this website that relying on 'nonverbal cues' to spot lies and 'read people' is not very effective.
The fact that many people who lie don't feel nervous or bad about it further reinforces that stance.

From chapter 11 by Chelsea Rose, Marc Stewart Wilson:

> For instance, research reveals that people tend to hold incorrect beliefs regarding lying behaviors, as they assume that lying is nonnormative and that liars will feel guilty and nervous regarding their socially unacceptable and morally reprehensible lie-telling, and so leak corresponding emotional cues (Bond & DePaulo, 2006; DePaulo, Lindsay, Malone, Muhlenbruck, Charlton, & Cooper, 2003; Global Deception Research Team, 2006; Taylor & Hick, 2007).
> In contrast to this everyday wisdom, empirical findings indicate that people lie frequently and may not feel much remorse for doing so.
> For example, in DePaulo et al.řs (1996) classic diary study regarding everyday lying, college students and community members admitted to telling an average of two lies and one lie per day, respectively. Participants indicated very little regret regarding their untruths and 70% indicated they would tell the reported lie(s) again if faced with the same situation.

And add the authors:

> If common wisdom suggests that remorse or guilt dispose the liar to noticeable lie-indicating behaviors, these results pose a problem for the stereotypical view of the liar. A deceiver may not necessarily feel guilty or nervous when telling a lie and so cues signaling these states would not be useful in detecting deception

Machiavellianism & 'social adroitness': two twigs of the branch

> the studies to date consistently implicate manipulative personality traits in both perceived acceptability and frequency of lies.
> These traits are well-captured by the construct of Machiavellianism (Christie & Geis, 1970), which is characterized by personality traits such as a lack of concern with conventional morality, the tendency to view others cynically, and admission to the use of lying and manipulation of others for personal gain (Christie & Geis, 1970; McHoskey, Worzel, & Szyarto, 1998).
> Another construct capturing the manipulative personality is social adroitness, which portrays a subtler degree of manipulativeness and carries fewer negative connotations (Kashy & DePaulo, 1996). Both Machiavellianism and social adroitness were assessed by Kashy and DePaulo (1996) in their (previously mentioned) diary study of lying behaviors. Their results indicated that people scoring higher on these measures told more lies and provided partial support for the prediction that people exhibiting high levels of these traits would tell more self-oriented
> (…)
> Similarly, Gozna, Vrij, and Bull (2001) reported that participants with high scores on the Machiavellianism and social-adroitness scales indicated they felt little guilt when telling everyday lies and would feel more comfortable when telling a high-stakes lie, as compared to lower-scoring participants.

I've noticed that with some personalities who seem very sociable, extraverted, and socially skilled and successful. They tend to touch others, smile a lot, and confidently move from person to person or group or group.

They seem very charming and charismatic.
But they also have a 'casual' approach to truth and, if you learned how to read people, it shows. You can tell they're socially effective, but also manipulative and 'slimy' when not backed by positive dominance.

Narcissism is adaptive within a certain range

From chapter 22 by Eytan Bachar:

> The idea that normal narcissism can be adaptive is quite new in research and in theory. Watson, Hickman,

> Morris, Milliron, and Whiting (1995) stated that the assumption that scores on purposed narcissism scales may correlate positively with adjustment came as a great surprise.
> They went on to say that researchers had been working from the "obvious" assumption that valid instruments of narcissism would predict maladjustment. Indeed, not many researchers were open to examine the possibility that normal levels of narcissism might be adaptive. Most of the studies in this area have examined nonclinical populations in the context of daily life activities. They have found that normal narcissism is associated with good adjustment to college life (Lapsley & Aalsma, 2006), normal eating attitudes among college women (Brunton et al., 2005), and normal feelings of shame (Hibbard, 1994). Similarly, recent studies carried out among nonclinical, mostly student populations have found that normal narcissism helps individuals assert interpersonal dominance (Brown and Zeigler-Hill, 2004) and fuels approach and achievement motives, such as competitive and mastery strivings, while lowering avoidance motivation (Foster & Trimm, 2008; Lukowitsky, Roberts, Lehner, Pincus, and Conroy, 2007; Wallace, Ready, & Weitenhagen, 2009)

I find it surprising that for a long time researchers didn't consider narcissism could be adaptive, especially considering that much of the research has been in more individualistic countries like EU and US.

Early psychoanalysts like Freud and Kohut may share some responsibilities.
An evolutionary approach instead would have at least posed that question much more easily: if narcissism is so widespread and also increasing in certain areas and cultures, then it's possible that it's adaptive.

Relatedness & Independence: Both Are Necessary

Chapter 20 by Patrick Luyten et al., made me reflect on the psychology of avoidants and anxious attachments, as well as on my own development.

They explain that **healthy personality development depends on a balance between two fundamental psychological needs**: **relatedness** (the capacity for deep, reciprocal relationships) and **self-definition** (a clear, integrated sense of self and identity). Each supports the growth of the other—strong relationships help shape a stable self, and a solid self fosters healthier relationships.

When this balance is disrupted—due to genetics or adverse life experiences—people may over-rely on one line at the expense of the other:

- **Overemphasis on relatedness** leads to excessive dependency, fear of abandonment, and heightened sensitivity to rejection.
- **Overemphasis on self-definition**, as seen in self-critical perfectionists, results in rigid concerns over achievement, autonomy, and self-worth—often paired with the same sensitivity to rejection and ostracism.

Healthy narcissism involves a balance between relatedness and self-definition as it is not only associated with essentially positive feelings about oneřs self (self-definition), but also facilitates the development of mature interpersonal relationships (relatedness; Freud, 1914; Kohut & Wolf, 1978; Pincus & Lukowitsky, 2011).

The authors note that in their study, only covert narcissism was related to sensitivity to ostracism, which may suggest that grandiose narcissism is more independent of others' acceptance.

Narcissists are the hypergamous kings

Despite some authors focusing on 'female hypergamy', narcissists may intrinsically be looking to trade up:

> Although individuals who are invested in their partner are generally inattentive to attractive alternatives (Maner, Gailliot, & Miller, 2009), it seems that individuals with high levels of narcissism actually pay special attention to attractive alternatives (Campbell & Foster, 2002). The authors explain these results by putting forth several propositions. Narcissistic individuals could be looking to "trade up"; thus, they are interested in

> potential relationship partners who could serve their ego to a greater extent than their current partner

QUOTES

On the 'banality of deception':

The use of deception in everyday life is ubiquitous and our motivations for using deception are varied (DePaulo, Kashy, Kirkendol, Wyer, & Epstein, 1996)

On why it's impossible to say that 'lying' is intrinsically 'bad' or manipulative (also see 'persuasion vs manipulation'):

> We lie to avoid punishment, to prevent hurt feelings, to sweeten an encounter with a potential date, and to create the façade of a desired self, to name just a few reasons (Bell & DePaulo, 1996; DePaulo, Ansfield, Kirkendol, & Boden, 2004; Rowatt, Cunningham, & Druen, 1998).
> These varying reasons for deceit render blanket judgments of the morality of lying problematic for many (Vrij, 2008); telling a lie to comfort a friend is clearly of a different vein than lying to a professor about oneřs plagiarized work or to a prospective investor in a dodgy venture

On the ultimate takeaway on narcissism and adaptiveness (which sounds ironic, given that it doesn't say much):

> Perhaps the clearest conclusion that can be drawn regarding narcissism is that it is a mixed blessing (Campbell & Campbell, 2009; Campbell et al., 2011)

⍰⍰♂ Lucio's Analysis

Some possible ideas to improve an already great volume for a possible future update:

Maladaptive needs a redefinition

While the scholarly discourse around narcissism improved when it started considering narcissism may be adaptive, I think it may still have to go a few steps forward.

For example, it seems like most authors still list 'Exploitativeness' or 'Entitlement' as 'maladaptive'.
I'm not convinced either necessarily are maladaptive, at least when it comes to acheiving certain self-serving goals.

Suggestion: edit out the repeated basics

Cutting the history of narcissism, the DSM definition or the core traits can help streamline the volume.

Suggestion: skip or combine one-study chapters

This may be more personal to how I approach handbooks, which is to gain an overview from different studies, commented by researchers themselves and scholars experts in the field.

It's a 'look at the combined trees to provide a forest-level view'.
Full chapters about a single study may be interesting, but may also risk over-focusing on individual trees rather than the forest.

REVIEW

The *Handbook of the Psychology of Narcissism* is an excellent, research-rich volume.

I learned a lot from it, and it directly helped improve several TPM articles—including our upcoming cornerstone

piece on narcissism. That's the highest compliment I can give any author: their work elevated ours.

I'm grateful for their contribution and look forward to reading more from them.

Handbook of Trait Narcissism: Summary & Review

Lucio Buffalmano · 22 December 2025 · Archived copy · Original

The Handbook of Trait Narcissism (2018) offers a comprehensive, research-based overview of narcissism as a personality trait, covering its development, structure, social dynamics, and real-world consequences.

Contents

- FULL SUMMARY
  - Chapter 1: Distinguishing Between Grandiose, Vulnerable, and NPD
  - Chapter 2: The Narcissism Spectrum Model
  - Chapter 3: Perceived Control Theory of Narcissism
  - Chapter 4: The Distinctiveness Model of the Narcissistic Subtypes (DMNS)
  - Chapter 5: Narcissism vs. Self-esteem: A Social-Cognitive Perspective
  - Chapter 6: The Narcissistic Admiration and Rivalry Concept
  - Chapter 7: Communal Narcissism: Theoretical and Empirical Support
  - Chapter 8: Collective Narcissism: Exaggeration of the In-Group Image
  - Chapter 9: The Psychodynamic Mask Model of Narcissism: Where Is It Now?
  - Chapter 10: Distinguishing Between Adaptive and Maladaptive Narcissism
  - Chapter 11: State Narcissism
  - Chapter 12: The Many Measures of Grandiose Narcissism
  - Chapter 14: Homogenous Scales: Grandiosity, Entitlement, and Exploitativeness
  - Chapter 15: Parents' Socialization of Narcissism in Children
  - Chapter 16: The Etiology of Narcissism: A Review of Behavioral Genetic Studies
  - Chapter 17: Narcissism and the Economic Environment
  - Chapter 18: Narcissism as a Life Span Construct: Fluctuations

- Chapter 19: Did Narcissism Evolve?
- Chapter 20: Generational Differences in Narcissism and Narcissistic Traits
- Chapter 21: Narcissism and Dark Personality Traits
- Chapter 22: Narcissism and the Big Five/HEXACO Models of Personality
- Chapter 23: Physiological Reactivity and Neural Correlates of Trait Narcissism
- Chapter 24: Narcissism and Memory
- Chapter 25: Narcissism and Involvement in Risk-Taking Behaviors
- Chapter 27: How Does It Feel to Be a Narcissist? Narcissism and Emotions
- Chapter 28: Narcissistic Need for Perfection
- Chapter 29: What Do Narcissists Know About Themselves? Narcissists' Self-Knowledge
- Chapter 30: Narcissists' Perceptions of Narcissistic Behavior
- Chapter 31: Narcissistic Consumption
- Chapter 32: The Narcissistic Pursuit of Status
- Chapter 33: Early Impressions of Grandiose Narcissists: A Dual-Pathway Perspective
- Chapter 34: Narcissism and Romantic Relationships
- Chapter 36: Understanding and Mitigating Narcissists' Low Empathy
- Chapter 37: Narcissism and Friendships
- Chapter 39: Narcissism's Relationship with Envy: It's Complicated
- Chapter 40: Narcissism and Prosocial Behavior
- Chapter 41: Grandiose Narcissism and Religiosity
- Chapter 43: Narcissism and Leadership: A Perfect Match?
- Chapter 44: Narcissistic Followership
- Chapter 45: Trait Narcissism and Social Networks
- Chapter 46: Momentarily Quieting the Ego: Short-Term Strategies for Reducing Grandiose Narcissism
- Chapter 49: Narcissism and Bullying
- Chapter 50: Narcissistic Individuals and Implications for Treatment

FULL SUMMARY

About the Authors:
Many researchers and experts in the field authored different chapters. The main editors are:
Anthony D. Hermann is a leading researcher on self-processes and interpersonal dynamics, known for his work on self-evaluation motives, self-presentation, and how narcissistic traits shape social behavior.
Amy B. Brunell is a prominent scholar in personality and social psychology whose research focuses on narcissism's influence on relationships, leadership, entitlement, and decision-making across real-world contexts.

Joshua D. Foster is a recognized expert on narcissism, self-regulation, and personality processes, with influential work on the structure of narcissistic traits and their behavioral consequences.

Chapter 1: Distinguishing Between Grandiose, Vulnerable, and NPD

Authors: Brandon Weiss and Joshua D. Miller

> Comprehensive empirical literature demonstrates that narcissism and narcissistic personality disorder are well described by models of general personality and, in particular, three primary traits including (low) agreeableness (or antagonism, entitlement, and self-involvement), agentic extraversion (or boldness, behavioral approach-orientation), and neuroticism (or reactivity, behavioral avoidance-orientation).

> Our review led to three primary conclusions.
> First, the FFM trait correlates of NPD and grandiose narcissism overlap quite substantially. Second, the two differ to some degree with regard to the role of extraversion, with stronger relations found for grandiose narcissism than NPD. Third, extant data suggest that vulnerable narcissism represents a construct that is largely divergent from NPD and grandiose narcissism

This chapter analyzes grandiose, vulnerable, and Narcissistic Personality Disorder (NPD) with the framework of general personality models, particularly the Five-Factor Model (FFM).
It asserts that these constructs are best described using three primary traits: **low Agreeableness (Antagonism), agentic Extraversion (Boldness), and Neuroticism (Reactivity).**
The review concludes that while NPD and grandiose narcissism share a substantial overlap in FFM trait correlates, vulnerable narcissism is largely a divergent construct defined primarily by negative emotionality.

Trait	Grandiose	Vulnerable
Core presentation	Outwardly bold, dominant, attention-seeking; projects superiority.	Quiet, defensive, anxious; hides grandiose needs behind sensitivity.
Self-esteem / confidence	Inflated, overtly confident (often contingent on admiration).	Fragile and contingent; reports low confidence and high shame.
Achievement & ambition (TPM)	High visible status drive; seeks prominence and trophies.	Wants achievement but is held back by fear of exposure and social anxiety.
Social tactics / self-promotion	Overt self-promotion, charisma, attention-seeking performance.	Subtle reassurance-seeking, victim stance, covert fishing for compliments.
Approach orientation	Approach-oriented and sensitive to rewards. Predator-like	avoidance oriented and sensitive to threats (Campbell & Foster, 2007 ; Foster & Trimm, 2008 ; Krizan & Herlache, 2018 ; Pincus et al., 2009). Prey-like
Attachment / relationships	Transactional, shallow ties; prone to discard when value drops.	Anxious/clingy patterns; fear of abandonment.
Emotionality	**Positive affect**, including feelings of cheerfulness, excitement, and overall high life satisfaction	**negative affect**, including **shame, stress, envy, and anxiety**, reflecting its core as an anxious and sensitive personality style.
Reactive Aggression	instrumental aggression to assert dominance in the face of strong direct status threats.	narcissistic rage from a fragile sense of self, but often bottled up and passive-aggressive
Correlates	extraversion, histrionic and antisocial personality disorders	Neuroticism; borderline and avoidant personality disorders (Dickinson & Pincus, 2003).
Sense of Control	high perceived control over outcomes	Low perceived control

Comparison table by Lucio Buffalmano, using content from both this chapter and others

Notes

- **Grandiose Narcissism is associated with high Extraversion and low Agreeableness**, encompassing traits like immodesty, dominance, self-absorption, and callous manipulation.
  - It is typically related to **low psychological distress and high self-esteem**.
  - Grandiose narcissism is closely tied to social dominance, which is a tendency toward social status and leadership over others (Brown & Zeigler-Hill, 2004 ; Hodson, Hoggs, & MacInnis, 2009)
- **Vulnerable Narcissism is primarily defined by high Neuroticism (negative emotion)**, with increased psychological distress, anxiety, shame, and low self-esteem, alongside egocentric and hostile interpersonal behaviors.
- **Interpersonal antagonism is the essential feature shared by both subtypes**, although the intensity of this trait tends to be empirically weaker in vulnerable narcissism as currently measured.
- **NPD's trait correlates substantially with Grandiose Narcissism**, though its relationship with Extraversion is somewhat weaker, indicating that the full diagnostic picture includes a degree of emotional fragility not captured solely by grandiosity.

Interesting Observations

- **Vulnerables are less aggressive with lower testosterone**: at least one study suggests that, contrary to grandiose, vulnerable individuals report higher reactive aggression, but not higher behavioral aggression or increased testosterone production in a laboratory-based behavioral aggression paradigm (Lobbestael, Baumeister, Fiebig, & Eckel, 2014)

Chapter 2: The Narcissism Spectrum Model

Authors: Zlatan Krizan

Narcissism can be conceptualized along a continuous spectrum from grandiosity to vulnerability.

The three core axes of the narcissism spectrum. (by Sage Publications (Copyright 2018))

Notes

- **Parental overvaluation contributes to grandiosity**, while emotional neglect fosters vulnerability.
- **NSM explains oscillations between states**: Narcissists may shift from grandiose to vulnerable states in response to ego threats.
- **Entitlement and self-importance are shared traits** that most often co-occur with both grandiose and vulnerable features of narcissism in both normal and clinical populations (Cain, Pincus, & Ansell, 2008 ; Krizan & Johar, 2012 ; Miller & Campbell, 2008)

⁉️♂ Lucio's note: I'd like stronger argument or evidence before being persuaded
I remain open to the possibility of the spectrum model being a valid model, but I wasn't convinced by it just yet. Albeit it's true that individuals can oscillate between the two, I don't feel that a spectrum is necessary to explain the oscillation.

Chapter 3: Perceived Control Theory of Narcissism

Authors: Ashley A. Hansen-Brown

The Perceived Control Theory of Narcissism (PCTN) suggests that narcissism is rooted in the need to acquire, maintain, and assert a high sense of personal control.
Grandiosity and entitlement are complex regulatory strategies designed to reinforce an image of competence and autonomy. This framework provides a motivational explanation of narcissistic behavior, interpreting their actions as goal-directed efforts to manage feelings of efficacy and control over their lives and interactions.

Notes

- **High agency supports self-esteem (or undermines it)**: *perceptions of agency mediated the link between each type of narcissism and self-esteem, with grandiose narcissists' high agency statistically accounting for their high self-esteem and vulnerable narcissists' low agency statistically accounting for their low self-esteem* (Brown, Freis, Carroll, & Arkin, 2016)
- **Grandiose high agency may be partially true**: grandiose narcissism predicted perceiving higher relationship-specific control, and partners of grandiose narcissists perceived lower control in the relationship compared to their narcissistic partner (Hansen-Brown & Crocker, 2017)
- **Grandiosity and dominance serve to assert and defend a sense of superior control**, by projecting an image of power, the individual shields their self-concept from any perceived threats of incompetence or helplessness.
- **The difference between grandiose and vulnerable is in perceived control**: grandiose narcissists have high perceived control over their own outcomes, the behavior of others, and the world around them, whereas vulnerable narcissists' perceived control is low.
- **Entitlement and reactive aggression are compensatory responses** aimed at restoring a threatened sense of control, helping the individual re-establish a subjective feeling of power or influence when circumstances undermine their autonomy

Chapter 4: The Distinctiveness Model of the Narcissistic Subtypes (DMNS)

Authors: Stephanie D. Freis

> DMNS proposes that GN and VN share a particularly strong need to differentiate themselves from others and

> be seen as distinct or "special." However, the subtypes differ in how they orient to this motivation: whereas GN are promotion-focused in their need for distinctiveness, VN are prevention-focused. This leads GN to concentrate on gains and seek new opportunities to become more distinct. In contrast, VN worry about suffering losses and thus remain vigilant to defend against diminishing special ness.

The Distinctiveness Model of the Narcissistic Subtypes (DMNS) argues that both subtypes are defined by a common **Antagonistic Core** but are differentiated by orthogonal (independent) dimensions.
This approach is essential for explaining why empirical research often finds a weak or non-existent correlation between the seemingly distinct behavioral profiles of the two forms.

Chapter 5: Narcissism vs. Self-esteem: A Social-Cognitive Perspective

Authors: Eddie Brummelman, Çisem Gürel, Sander Thomaes, and Constantine Sedikides

The key distinction lies in the fragile, entitled, and contingent nature of the narcissistic self-view versus the secure, stable, and healthy sense of self-worth characteristic of high self-esteem.
Narcissistic self-regard is driven by a constant, aggressive need for superiority and validation, making it inherently unstable and dependent on external praise.

Key Differences

Domain	Narcissistic Self-Esteem	Healthy Self-Esteem
Self-View	Believes they are inherently superior; "God complex"	Believes they are worthy, not superior
Traits Valued	Primarily agentic traits (competence, intelligence)	Both agentic and communal traits (warmth, kindness)
Reality Alignment	Inflated self-view, ignores evidence	Grounded, realistic self-view

Domain	Narcissistic Self-Esteem	Healthy Self-Esteem
View of Others	Look down on others; may dehumanize; see others as subservient	Respect others; see intrinsic worth; not a means to gain admiration
Dependence on Others	Craves admiration, external validation; experiences withdrawal if lacking	Independent of others' approval; secure in self-worth
Response to Rejection	Shame-rage cycle; may lash out aggressively	Forgive, seek reconciliation; maintain relationships
Origins	Parental overvaluation: seen as extraordinary/entitled; partly genetic	Parental warmth: treated as valued and worthy; partly genetic
Motivation	Motivational properties: narcissists *want* to think highly of themselves	Evaluative, reflecting how that person views oneself
Developmental Trajectory	Peaks in adolescence, declines gradually; stable due to self-reinforcing behaviors	Drops in adolescence, rises gradually; stable due to cooperative engagement
Malleability	Harder to change; resists interventions; can change if core beliefs targeted	Can be increased through interventions and supportive environments

- **Narcissism seeks and needs superiority, not adequacy:** The pursuit of superiority, not merely adequacy, is the key motivational difference that separates narcissism from self-esteem. Narcissists aim to be seen as *better than* others, while high-self-esteem individuals simply feel satisfied with who they are.
- **Narcissism requires external validation**, self-esteem is internally regulated. Narcissistic self-worth is dependent on outperforming others, receiving admiration, and maintaining a grandiose image through constant self-enhancement efforts.
- **High self-esteem is stable, narcissistic self-esteem *may* be less stable (contingent):** self-esteem reflects a secure and non-contingent self-view, meaning the individual's worth is stable. Narcissists are effective at maintaining self-esteem, but require more 'work'
- **Self-esteem predicts healthy relationships**, narcissism predicts conflict and exploitation.

Developmental Pathways

- **Parental warmth fosters self-esteem**
- **Overvaluation fosters narcissism**
- **Parental guidance**: provide warmth and realistic feedback, not exaggerated praise.

Chapter 26: How Do Narcissists Really Feel About Themselves? The Complex Connections Between Narcissism and Self-Esteem

Authors: Ashton C. Southard, Virgil Zeigler-Hill, Jennifer K. Vrabel, and Gillian A. McCabe

Grandiose narcissism is strongly and genuinely linked to high, stable explicit self-esteem, refuting the pervasive "mask model" for this subtype, while **vulnerable narcissism is linked to low, unstable self-esteem**. The chapter highlights that even for the grandiose type, a lack of **implicit self-esteem (unconscious self-regard)** might exist, suggesting a complex, *defensive high self-esteem* where the grandiosity is aggressively maintained through external means.

Explicit and Implicit Self-Regard

- **Grandiose narcissists have high, stable explicit self-esteem**, suggesting a genuine and conscious belief in their own superiority, which contributes to their low distress and high life satisfaction.

- **Vulnerable narcissists have low self-esteem and instability**, validating its conceptualization as a defensive and anxious form of self-focused personality.
- **A "defensive" high self-esteem suggests a fragile high self-regard** that, while consciously positive, is **maintained through constant self-enhancement efforts** and aggression against any perceived threat.
- **Facets matter: rivalry's self-esteem fluctuates**: admiration was positively associated with self-esteem level, whereas rivalry was positively associated with self-esteem instability.
  - Self-esteem levels of individuals with high levels of narcissistic admiration were particularly reactive to changes in their perceived levels of daily status (i.e., being respected and viewed as important).
- **Self-esteem is for inclusion and status, narcissistic grandiosity for status only**: *Considering the current evidence for sociometer theory and hierometer theory, it seems that self-esteem may be entwined with both inclusion and status, whereas narcissism seems to be primarily associated with status (see Zeigler-Hill, McCabe, Vrabel, Raby, & Cronin, this volume, for an extended discussion)*

Hierometer Theory of Narcissism: Status, Not Inclusion

> Recently, Mahadevan, Gregg, Sedikides, and de Waal-Andrews (2016) proposed hierometer theory which argues that both self-esteem and narcissism evolved to help individuals navigate status hierarchies.
> Status hierarchies are pervasive among humans (e.g., Sidanius & Pratto, 1999) and, because there are benefits to being at the top of this hierarchy (e.g., greater reproductive success; von Rueden, Gurven, & Kaplan, 2011), humans likely evolved a psychological system to aid in navigating them.
>
> On a conceptual level, the theoretical underpinnings of hierometer theory are similar to those of sociometer theory. That is, they both suggest that self-regard helps individuals track their social value.
>
> However, whereas sociometer theory argues that state self-esteem tracks relational value (e.g., perceptions of acceptance, liking, and affiliation) and regulates affiliative behaviors aimed at increasing social inclusion, **hierometer theory argues that both self-esteem and narcissism track instrumental value (e.g., perceptions of respect and admiration)** and regulate assertive behavior aimed at gaining status.
>
> Previous studies have provided some initial support for hierometer theory.
> For example, Leary et al. (2001) found that self-esteem changes in accordance with feedback concerning status such that individuals who perceive themselves to be in a relatively dominant social position tend to report higher levels of self-esteem. In addition, Mahadevan et al. (2016) found that the combination of self-esteem and narcissism fully mediated the associations that status and inclusion had with assertiveness and affiliation, respectively. Further, Zeigler-Hill et al. (in press) found that state selfesteem increased on days when individuals perceived themselves as having higher levels of status even when statistically controlling for perceived inclusion, which suggests that this hierometer process (i.e., state self-esteem changing in accordance with status) is distinct from the sociometer process (i.e., state self-esteem changing in accordance with relational value). Together, these studies provide preliminary evidence that supports the existence of the hierometer system.
> (…)
> Zeigler-Hill et al. (in press) found that the selfesteem of individuals with high levels of narcissistic admiration tends to be highly reactive to perceived status but not perceived inclusion.
> This is consistent with the tendency for narcissistic individuals to care far more about being respected and admired than about being liked.

The authors summarize saying that self-esteem and narcissism may have evolved for similar goals, but while self-esteem includes communion and 'fitting in', narcissism zeroes in on agentic goals of status pursuits.

Chapter 6: The Narcissistic Admiration and Rivalry Concept

Authors: Mitja D. Back

> The goal to create and maintain a grandiose self can be pursued by two social strategies (narcissistic self-promotion and narcissistic self-defense) that translate into two sets of dynamics (narcissistic admiration and rivalry) with distinct affective-motivational, cognitive, and behavioral states that tend to have different social consequences (social potency and conflict).

Conceptual and empirical relations of narcissistic admiration and rivalry to the overarching structure of narcissism

The Narcissistic Admiration and Rivalry Concept (NARC) posits that the core social strategies of narcissism are agentic **Admiration**, based on self-promotion, and antagonistic **Rivalry**, based on self-defense.
The fundamental motivation is the maintenance of a grandiose self-image, achieved through either self-promotion (Admiration) or self-defense (Rivalry).

Individuals differ in the balance of the two and they're not always fixed: ego threats can trigger a switch from admiration to rivalry.

The Dual Pathways to Grandiosity: Admiration and Rivalry

- **Admiration is the successful, agentic, and bright side of narcissism**, characterized by **striving for uniqueness, assertiveness, and grandiosity**; it predicts initial social success and high self-esteem.
- **Rivalry is the antagonistic, dark, and defensive side of narcissism**, characterized by **devaluation of others, aggression, and the hostility to protect the ego**; it predicts long-term interpersonal conflict and hostility.

Consequences: Rivalry vs. Grandiosity

- **Self-esteem is higher for agentic admiration**: *admiration was related to high and rather stable self-esteem, whereas rivalry was related to lower and more fragile self-esteem. (…) perceived lack of social approval might be one mechanism driving rivalry's self-esteem fragility (Geukes et al., 2017 , p. 783).*

- **Admiration gets jobs & money, rivalry gets jobless poverty**: In a population representative investigation, admiration was found to be related to employment, leadership, income, and job prestige, whereas rivalry was found to be related to unemployment and lower financial satisfaction (Leckelt, Richter, Wetzel, & Back, 2017)
  - High-net-worth individuals scored higher on admiration, and this difference held when gender, age, and education were controlled for with propensity score matching analyses (Leckelt et al., 2017)
- **Admiration gains initial popularity, rivarly loses it:** Leckelt et al. (2015) showed that admiration predicts initial popularity among peers, whereas rivalry predicts a decline in popularity over time.
- **The NARC provides a common empirical structure** that allows researchers to move beyond semantic debates by unifying different manifestations of narcissism under two predictive pathways.

Chapter 7: Communal Narcissism: Theoretical and Empirical Support

Authors: Jochen E. Gebauer and Constantine Sedikides

In Communal Narcissism, grandiosity is expressed with **pro-social, communal, and moral domains** rather than the typical domains of power and status. The communal narcissist believes, signals, and seeks admiration for being the "**most helpful**," "**most ethical**," or "**most compassionate**". The construct is shown to be *narcissistic* in its underlying process of entitlement and need for self-enhancement, but *communal* in its content, seeking superiority within an ostensibly caring context.

The Paradox of Pro-Social Grandiosity

- **Communal narcissists exaggerate their communal traits** and believe they are uniquely caring and supportive, creating a **misalignment between self-perception and reality**, as observers do not rate them as genuinely warm.
- **The core motivation remains a need for superiority and entitlement**, simply expressed through moral achievements, leading to a strong expectation that others should recognize their unparalleled benevolence.
- **The communal pursuit is maladaptive over time**, as their self-enhancement efforts can lead to distress and anger when their perceived moral superiority is not validated by others. Over time, it can harm the communities they may lead, and it can create a painful disconnect between toxic personal relationships but positive outward appearances

---

Chapter 8: Collective Narcissism: Exaggeration of the In-Group Image

Authors: Agnieszka Golec de Zavala

> Collective narcissism is a tendency to exaggerate an in-group's importance and desire for its external recognition.
> The concept was coined to help explain the mass support for the Nazi politics in Germany. Recently, several successful populist campaigns were based on collective narcissistic calls for revival of national purity, uniqueness, and greatness.
>
> Collective narcissism is differentiated from (a) nationalism (i.e., a desire for national supremacy) based on its approach to ingroup's vulnerability, (b) in-group satisfaction (i.e., feeling proud to be a member of a valuable group) based on its approach to in-group's membership, and (c) individual narcissism (i.e., exaggerated self-image dependent on admiration of others) based on its means to fulfill self-entitlement.

> Collective narcissism is associated with retaliatory intergroup hostility over and above other predictors such as nationalism, blind patriotism, right-wing authoritarianism, or social dominance orientation.
> It is associated with exaggerated responses to in-group criticism, conspiratorial thinking, and a tendency to perceive the ingroup as threatened by external hostility. It is predicted by low self-esteem via vulnerable narcissism (i.e., frustrated and unfulfilled sense of self-entitlement).
>
> Thus, the reviewed research suggests that c**ollective narcissists engage in intergroup hostility to protect their vulnerable self-worth invested in in-group's exaggerated greatness**.

This chapter examines Collective Narcissism, defined as an entitled and exaggerated belief in the greatness of one's in-group (e.g., nation, political group) that is highly contingent upon external validation. **Unlike healthy group pride, collective narcissism** is a **fragile and defensive** form of group love, where **the group's alleged superiority is used to bolster a fragile personal sense of self-worth**. This type of narcissism has severe intergroup consequences, as the in-group's need for external validation often translates into hostility and aggression toward out-groups perceived as threats to the in-group's superior image.

Collective Narcissism and Politics

The authors don't shy away from recent political examples:

> When Theodore Adorno first proposed that collective narcissism motivated support for theNazi politics in Germany, he argued that the exaggerated sense of national entitlement compensated for hidden weakness of the self.
> Recently, appeals to national collective narcissism could be observed in political campaigns alarming about the loss of national greatness in the USA ("Make America great again") and in the UK ("Take back control").
> Collective narcissism predicted the Brexit vote in the UK because of the perception that the country was threatened by immigrants and foreigners (Golec de Zavala, Guerra, & Símão, 2017).
> Collective narcissism predicted an increase in conspiratorial thinking during Donald Trump's presidential campaign (Golec de Zavala & Federico, 2018) and the Trump vote in the 2016 American presidential election (Federico & Golec de Zavala, 2018).

⍰⍰♂ Lucio's reminder for readers: Don't leverage science as an opportunity to pathologize conservative voters
de Zavala did amazing work for which I'm grateful for and her analyses are on point. Just a reminder for readers that while it's plausible and, in some cases, empirically supported that collective narcissism plays a role in recent political movements, it would be an overreach to treat it as *the* explanation for the success of certain parties or leaders. Wanting to regulate migration, prioritizing national sovereignty, or opposing more liberal or social-democratic policies are valid and sometimes sensible preferences that don't automatically stem from collective narcissism.

And in the case of the Iraq war:

> Collective narcissism predicts retaliatory intergroup hostility after the in-group image is undermined by other groups. For example, American collective narcissism predicted support for military intervention in Iraq in 2003 because American collective narcissists felt besieged by hostility of other countries (Golec de Zavala et al., 2009)

Fragile Group Esteem and Intergroup Hostility

- **From self to social**: collective narcissism extends the concept of individual narcissism as an exaggerated self-image dependent on admiration of others (Morf & Rhodewalt, 2001) onto the social level of self.

- **Nationalism is agentic, collective narcissism is defensive**: recent results indicate that collective narcissism and nationalism may be underlain by different motivations. Nationalism was related to individual grandiose narcissism (i.e., a sense of agentic superiority over others) and only inasmuch as it was associated with grandiose narcissism was it also related to high self-esteem. Otherwise, nationalism was related to low self-esteem. Collective narcissism was related to low self-esteem via vulnerable narcissism (i.e., frustrated and unfulfilled sense of self-entitlement, Golec de Zavala, Guerra, Sedikides et al., 2017). Thus, both collective narcissism and nationalism seem to be underlain by low self-esteem, and both are likely to use their national identity instrumentally to compensate for deficits in their sense of self-worth.
  - Defensive vs. dominant aggression: While nationalistic intergroup hostility is actively aggressive and openly dominant, collective narcissistic intergroup hostility may be subjectively defensive. Collective narcissists protect the in-group rather than assert the in-group's dominance (Golec de Zavala et al., 2016).
  - Collective narcissists are more thin-skinned: *when the overlap between nationalism and national collective narcissism was controlled, collective narcissism, not nationalism, was related to sensitivity to intergroup threat and retaliatory hostility (Golec de Zavala, Peker, Guerra, & Baran, 2016).*
    Collective narcissism uniquely (in comparison to individual narcissism, right wing authoritarianism, social dominance orientation, national in-group identification, and blind and constructive patriotism) predicts hostile retaliation to in-group criticism.
- **Collective narcissists personalize group attacks:** c*ollective narcissists reported that negative opinions about their in-group were threatening them personally. In retribution, collective narcissists made resource distribution decisions that harmed the criticizing out-group. The perception of the in-group criticism as personally threatening mediated the relationship between collective narcissism and retaliatory aggression* (Golec de Zavala, Cichocka, & Iskra-Golec, 2013).
- **Collective narcissists are potentially paranoid**: *collective narcissists are hypersensitive to signs of the in-group image threat and perceive an insult to the in-group even when it is debatable, not perceived by others, or not intended by the other group. Collective narcissists do not have a sense of humor as far as their in-group is concerned, and they are disproportionately punitive in responding to what they consider the in-group image threat.*
- **Failed narcissists use the group for grandiosity**: *In line with Adorno's suggestion, recent studies suggest that collective narcissists protect their ingroups' exaggerated greatness so vehemently because they regard those in-groups as vehicles for fulfillment of their frustrated sense of entitlement*
- **Low sense of control**: *collective narcissism was linked to low sense of personal control – not having the ability to influence the course of one's own life (Deci & Ryan, 2000). resulted in heightened collective narcissism, suggesting that increased investment in the in- group's exaggerated greatness may be a way of compensating for loss of personal control (Cichocka, Golec de Zavala, et al., 2018)*
- **Negative affectivity and self-views**: Collective narcissism was also associated with self-criticism, low self-acceptance, negative affectivity, and a tendency to react strongly to environmental stimuli (Golec de Zavala, 2017)
- **Reactive and antagonistic**: The fragility of the in-group's perceived status drives a highly reactive and antagonistic stance toward other groups.

Interesting Notes

- **Individualistic culture may boost collective narcissism**: *individualistic cultural contexts that allow for the development of a strong ego may enhance the positive relationship between individual grandiose narcissism and collective narcissism (…) In collectivistic cultures, commitment to the ingroup may be associated with the submission of individual needs or goals, thus diminishing the association of grandiose individual narcissism and collective narcissism.*

- **Collective narcissists demand external recognition for their in-group's greatness**, feeling that the group's

importance is not sufficiently appreciated by others, which is the **hallmark of collective entitlement**.

- **Hostility and prejudice toward out-groups are direct consequences** of collective narcissism, as any criticism or perceived slight toward the in-group is interpreted as a **personal threat requiring aggressive defense or retaliation**.
- **The construct is independent of genuine in-group pride or patriotism**, as high collective narcissism is uniquely linked to intergroup antagonism and defensive reactivity.

Healthy In-Group Satisfaction vs. Collective Narcissism

> Collective narcissism with in-group positivity partialled out can be interpreted as **groupbased entitlement without the comfort of the sense of belonging to a valuable group**. In-group satisfaction with collective narcissism partialled out can be interpreted as **a confident, positive evaluation of the in-group, independent of external recognition and resilient to threats and criticism.**
> Indeed, unlike collective narcissism, in-group satisfaction did not predict hypersensitivity to intergroup threat (Golec de Zavala et al., 2016), it was not related to conspiracy beliefs about Jews or siege mentality (Golec de Zavala & Cichocka, 2012), and it was negatively related to the belief in conspiracy explanations of intergroup situations (Cichocka et al., 2016). Recent studies showed also that unlike collective narcissism, in-group satisfaction was associated with positive affectivity, psychological well-being, and greater life satisfaction. In-group satisfaction was also associated with feeling safe and grounded in social networks and the tendency to experience gratitude.

When the overlap between the two was removed, the difference was even starker:

- *Pure* in-group satisfaction → **clearly healthy, confident, grounded, high self-esteem, grateful, more tolerant.**
- *Pure* collective narcissism → **clearly insecure, defensive, low gratitude, hypersensitive to threat, hostile.**

Collective narcissism was also hostile compared to in-group satisfaction's higher tolerance:

> This literature suggests that nonself-determined motivations to identify with the social group – such as collective narcissistic investment of one's self-worth in group identity – are linked with in-group bias, defensiveness, and negative attitudes toward outgroups. Positive, noncontingent, intrinsic in-group satisfaction is related to high self-esteem and intergroup tolerance (Amiot & Aubin, 2013; Amiot & Sansfaçon, 2011; Legault & Amiot, 2014).

Fixing Collective Narcissism

If it were possible, moving towards in-group satisfaction may address the harmful effects of collective narcissism:

> Studies indicate that negative consequences of collective narcissism for inter group relations are reduced when collective narcissism overlaps with in-group satisfaction (Cichocka et al., 2016 ; Golec de Zavala, Cichocka, & Bilewicz, 2013 ; Golec de Zavala et al., 2016).

One of our pillar articles walks men from weak collective narcissism to empowered in-group satisfaction with self-empowerment.
Check our article:

- **Enlightened individualism**: from collective narcissism to empowered in-group satisfaction

🧔♂️Lucio's Take: **Collective narcissism research supports TPM's call for self-focus over group-focus**

Lucio:
This chapter was one of my favorite and it provided further empirical support for TPM's long-held principle of deprioritizing group focus and pride in favor of the self.

We support individuals over group because it's:

- **Mentally empowering**, since it's higher agency and control (you control the self much better than a collective)
- **Higher-achievement**, since you focus on the self
- **Healthier** also for society: it supports cooperation and human advancement

These studies in this chapter lend further empirical credibility to this view.

Chapter 38: New Directions in Narcissistic Aggression: The Role of the Self-concept on Group-Based Aggression

Authors: Daniel N. Jones and Adon L. Neria

This chapter focuses on the nature of **narcissistic aggression**, particularly its manifestation in **group-based contexts**. Narcissistic aggression is more **reactive** than in non-narcissists, driven by a perceived **threat to the ego or self-concept** (narcissistic injury). The authors extend this to the group level, arguing that when a narcissist strongly identifies with a group (e.g., political party, gang, military unit), threats to that group's status are internalized as **personal threats** that trigger an aggressive, defensive response, even more so than for non-narcissistic group members. This suggests that narcissism contributes to the intensity of intergroup conflict and hostility.

Reactive Aggression and the Injured Ego

Aggression is a primary strategy for restoring a grandiose self-image following a perceived slight.

- **Aggression is strongly linked to ego-threat**, where any form of criticism, failure, or ridicule is met with a **hostile and often violent defensive reaction** to restore the perceived superior status.
  - Narcissists are most reactive in the dark triad: *Although psychopathy and sadism have emerged as the most*

overtly aggressive of these traits across most situations (e.g., Buckels et al., 2013), narcissism is unique in that it is associated with responding aggressively to the widest array of ego-provocations. For example, those high in other dark traits do not react aggressively to ostracism (McDonald & Donnellan, 2012) or insult (Jones & Paulhus, 2010).

- **What narcissists react to depends on how they define themselves**: *However, what defines a narcissistic ego may vary across individuals. Some may define themselves through agentic and individualistic qualities, whereas others define themselves through a communal framework or group identity. Thus, how narcissistic individuals define themselves may impact which ego-relevant domains become sensitive, and those domains may be relevant in predicting different forms (e.g., group-based vs. interpersonal) of aggression. of narcissism: individual, collective, and communal.*
- **Narcissistic leaders or group members amplify intergroup conflict**, as threats to the collective group-image are processed as **narcissistic injuries**, fueling retaliatory and disproportionate aggression against out-groups.
  - Narcissists are likely to lead those groups: *Because of their charisma, charm, and thirst for power, it is also likely that narcissistic individuals, with a fused group identity, will gravitate toward leadership positions in those groups. This gravitation would come from their sense of moral certainty, charm, charisma, and the need to be at the center of events. Take for example moral certainty (Skitka, 2010).*

Chapter 9: The Psychodynamic Mask Model of Narcissism: Where Is It Now?

Authors: Sophie L. Kuchynka and Jennifer K. Bosson

The Psychodynamic Mask Model of Narcissism posits that a grandiose, arrogant exterior conceals a **fragile, secretly insecure, or damaged core of low self-esteem**. The empirical review concludes that **contemporary research does not strongly support that grandiose narcissism uniformly masks deep-seated insecurity**. Instead, the authors argue that the relationship is more nuanced: **the mask model fits the vulnerable subtype** well, but i**t largely fails to describe the grandiose subtype**, which genuinely reports high explicit self-esteem.

The Main Hypotheses to The Test

- **Discrepant self-esteem** hypothesis (narcissism reflects high explicit self-esteem combined with low implicit self-esteem)
- **Unstable self-esteem** hypothesis (narcissism reflects high trait self-esteem that is unstable and reactive to contexts)
- **Contingent self-esteem** hypothesis (narcissism reflects high self-esteem that is contingent on achievement in agentic domains)

Hypothesis	Empirical Evidence / Results
Discrepant self-esteem hypothesis (high explicit + low implicit)	✕ **Overall: Not supported.**– Early studies seemed promising but *unreplicated* (Myers & Zeigler-Hill, 2012).- Likely failures due to broad measures of self-esteem, not examining agentic vs. communal domains, or relying on difficult-to-detect explicit × implicit interactions.- Implicit measures contain high error, making evidence inconsistent.
Unstable self-esteem hypothesis (high but unstable and context-reactive self-esteem)	⍰ **General hypothesis: Not supported. Specific version: Supported.** Grandiose is unstable only in response to negative achievement-related events (Zeigler-Hill et al., 2010). One facet, Entitlement / Exploitativeness, shows unstable self-esteem in response to interpersonal threats.

Hypothesis	Empirical Evidence / Results
Contingent self-esteem hypothesis (self-esteem depends on success in agentic domains)	⍰ **Strong, consistent support.**– Grandiose narcissists explicitly tie self-worth to agentic (achievement/competition) goals, not communal ones.- Consistent with literature showing inflated agentic self-views.- NPI scores correlate with statements like "My self-worth is influenced by how well I do on competitive tasks" and negatively with communal-based items like "My self-esteem would suffer if I did something unethical" (Crocker et al., 2003).- Grandiose narcissists openly acknowledge their self-esteem depends on achievement.

Revisiting the Fragile Core Hypothesis

- **Grandiose narcissism is consistently associated with genuinely high explicit self-esteem**, suggesting that for this majority subtype, the grandiosity is **not a facade** for a conscious sense of inadequacy.
- **The "mask" concept is more applicable to vulnerable narcissism**, which is marked by high neuroticism, shame, and feelings of inferiority, aligning with a defensive and anxious self-image.
- **The concept of "defensive high self-esteem" remains a plausible model** for the grandiose subtype, where self-esteem is genuinely high but is aggressively and defensively maintained against any threat.

Deep Dive: Self-Esteem And Narcissism

Grandiose narcissists' self-esteem is affected by agentic and achievement-related events, not so much by other interpersonal and social events.
The authors say that 'although they like attention, they are relatively unconcerned with gaining others' approval (Morf & Rhodewalt, 2001)':

> For example, scores on the NPI were positively associated with contingent self-esteem in domains of competition and appearance, they were negatively associated with contingent selfesteem in the domains of others' approval and virtue (being a good and moral person), and they were unrelated to contingent self-esteem in domains of academic competence, family support, and God's love (Crocker, Luhtanen, Cooper, & Bouvrette, 2003)

When grandiose narcissism is treated as a single construct, it appears more reactive to negative achievement-related than interpersonal events. But when broken into facets, Entitlement/Exploitativeness emerges as the interpersonally fragile facet.
Those scoring high on Entitlement/Exploitativeness show drops in state self-esteem on days with social rejection (Zeigler-Hill & Besser, 2013), indicating fragility in interpersonal contexts. In contrast, those high on Exhibitionism maintain stable, high self-esteem even when rejected, showing little reactivity to negative interpersonal events (Zeigler-Hill & Besser, 2013).

Chapter 10: Distinguishing Between Adaptive and Maladaptive Narcissism

Authors: Huajian Cai and Yu L. L. Luo

This chapter addresses the dichotomy between the "bright" (adaptive) and "dark" (maladaptive) aspects of narcissism, with the core distinction made between the **Grandiosity/Leadership** facet (adaptive) and the **Entitlement/Exploitativeness** facet (maladaptive).
The authors emphasize that while the self-assured qualities can drive success, the trait's overall impact is undermined by the destructive, antagonistic element of entitlement.

The Function of Narcissism's Bright and Dark Sides

Intrapersonal Trait	Adaptive (Leadership/Authority)	Maladaptive (Exploitativeness/Entitlement)
Self-esteem	Higher self-esteem (Brown et al., 2009; Emmons, 1984; Rhodewalt & Morf, 1995; Watson & Biderman, 1993; Watson et al., 1992)	Lower self-esteem (Brown et al., 2009)
Neuroticism	Lower neuroticism (Emmons, 1984; Rhodewalt & Morf, 1995)	Higher neuroticism (Emmons, 1984)
Actual–ideal self-discrepancy	Smaller discrepancy (Emmons, 1984; Raskin & Terry, 1988; Rhodewalt & Morf, 1995)	Larger discrepancy (Rhodewalt & Morf, 1995)
Self-consciousness	Lower	Higher self-consciousness (Watson & Biderman, 1993)
Mood variability / emotional intensity	More stable	Greater mood variability & emotional intensity (Emmons, 1987)
Envy	leadership/authority component protects grandiose narcissists from dispositional envy (Neufeld & Johnson, 2016)	entitlement and antagonism, common to both grandiose and vulnerable forms of narcissism, predict malicious envy (Lange et al., 2016; Neufeld & Johnson, 2016; Porter et al., 2014).
Empathy	Higher	Lower (Watson & Morris, 1991; Barry et al., 2003; Hepper et al., 2014)
Social skills	High social skills ('cold cognition')	Low social skills (low ToM, empathy)
Psychological well-being	Higher	Lower, including anxiety, social anxiety, depression, personal distress (Emmons, 1984; Watson & Biderman, 1993; Watson & Morris, 1991)

- **Adaptive narcissism (Grandiosity/Leadership)** is characterized by **assertiveness, confidence, and goal-directed behavior**, which is associated with positive outcomes like career success and initial popularity.
- **Maladaptive narcissism (Entitlement/Exploitativeness)** is characterized by **manipulation, arrogance, and aggression**, which is linked to negative outcomes like relationship dysfunction, criminality, and long-term antagonism.
- **Neuroticism is low for adaptive, high for maladaptive**: *while relatively healthy factors, such as leadership and authority, are negatively associated with neuroticism; relatively unhealthy factors such as entitlement and exploitativeness are positively associated with it (Ackerman et al., 2011 ; Brown, Budzek, & Tamborski, 2009 ; Corry et al., 2008 ; Hill & Roberts, 2012).*
- **Aggressiveness is mainly associated with unhealthy components** such as entitlement and exploitativeness rather than the relatively healthy self-sufficiency and superiority components (Moeller, Crocker, & Bushaman, 2009 ; Reidy, Zeichner, Foster, & Martinez, 2008 ; Washburn, McMahon, King, Reinecke, & Silver, 2004)
- **Lack of empathy is more likely to be associated with unhealthy components** rather than the healthy ones
- **Delinquency is higher for maladaptive narcissism**: longitudinal study investigated a group of children and young adolescents over a 4-year period (Barry et al., 2007). Results showed that while maladaptive narcissism predicted delinquency and police contact at all follow-ups, adaptive narcissism exhibited no significant correlation with delinquency and a significantly negative one with police contact.
- **Intervention should focus on maladaptive**: people with the same NPI score may have different levels of adaptive and maladaptive narcissism. The authors suggest that since the dark side of narcissism mainly involves its maladaptive component, future intervention should focus on how to curtail the maladaptive aspect while perhaps leaving the adaptive aspect intact (e.g., Hepper et al., 2014)

> Taken together, it is maladaptive narcissism rather than adaptive narcissism that is associated with interpersonal problems.

Factors Underlying NPI

Factor-analytic studies show that the NPI does **not** have a single, consistent structure. Instead, researchers have identified multiple possible factor solutions:

- **Two-factor structures:**
  - Power and Exhibitionism (Kubarych, Deary, & Austin, 2004)
  - Leadership/Authority and Exhibitionism/Entitlement (Corry, Merritt, Mrug, & Pamp, 2008)
- **Three-factor structures:**
  - Power, Exhibitionism, and Specialness (Kubarych et al., 2004)
  - Leadership/Authority, Grandiose/Exhibitionism, and Entitlement/Exploitativeness (Ackerman et al., 2011)
- **Four-factor structure:**
  - Exploitativeness/Entitlement, Leadership/Authority, Superiority/Arrogance, and Self-Absorption/Self-Admiration (Emmons, 1984, 1987)
- **Seven-factor structure (most widely used):**
  - Authority, Self-Sufficiency, Superiority, Exhibitionism, Exploitativeness, Vanity, and Entitlement (Raskin & Terry, 1988)

Despite this inconsistency, researchers agree that the NPI contains both **healthy** and **unhealthy** components (Emmons, 1984; Raskin & Terry, 1988), and they're most obvious in the in the seven-factor model, where **authority** and **self-sufficiency** represent healthier traits linked to self-confidence and assertiveness, whereas **entitlement**, **exploitativeness**, and **exhibitionism** represent unhealthy traits associated with poor psychological well-being and social adjustment (Raskin & Terry, 1988; Watson & Biderman, 1993).
Superiority and vanity are neither adaptive nor maladaptive.

Using these factors, researchers have developed two NPI subscales with acceptable reliablity and validity (Barry et al., 2007; Cai, Shi, Fang, & Luo, 2015; Hepper et al., 2014) that gauge adaptive and maladaptive narcissism separately (Barry, Frick, & Killian, 2003).

Chapter 11: State Narcissism

Authors: Miranda Giacomin and Christian H. Jordan

> These findings suggest that narcissism does fluctuate across con texts or situations to some extent. Although people do vary in their narcissism across time, the majority of variation in daily reports of narcis sism occurred between persons suggesting that narcissism does have a significant stable component.

The concept of State Narcissism conceptualizes narcissistic grandiosity and entitlement not as purely stable traits, but as temporary, **context-driven states** that fluctuate in response to situational factors. The key insight is that even individuals with moderate trait scores can exhibit temporary spikes in narcissistic cognitions (e.g., self-absorption, superiority) when faced with ego-threatening or ego-boosting situations, but that there seems to be a 'stable average level'.

Situational Triggers of Grandiose States

- **Ego-boosting situations (e.g., praise, winning)** can also cause a temporary spike in state narcissism, leading to a momentary sense of heightened self-importance and entitlement.
- **Narcissism varies *less* than other personality traits**: T*he Big Five personality traits, in comparison, display considerably more within-person variation (50–70%) than between-person variation (Church et al., 2013 ; Fleeson, 2001 , 2007 ; Fleeson, Malanos, & Achille, 2002). People are thus more likely to fluctuate, or fluctuate to a greater extent, in their extroversion or agreeableness than their narcissism.*
- **Life satisfaction may increase narcissism, and the other way around:** *In addition, we found that people reported higher state narcissism on days when they reported more positive affect, more hostility, and were more satisfied with their lives.*
  - Daily state narcissism predicts greater daily well-being, more positive affect, and higher life satisfaction, even when controlling trait narcissism and state self-esteem (Giacomin & Jordan, 2016b).

Chapter 12: The Many Measures of Grandiose Narcissism

Authors: Joshua D. Foster, Jennifer A. Brantley, Melissa L. Kern, Jan-Louw Kotze, Brett A. Slagel, and Krisztina Szabo

This chapter provides a comprehensive review of the various instruments used to measure **grandiose narcissism**, highlighting the evolution of measurement tools beyond the Narcissistic Personality Inventory (NPI). The authors discuss the necessity of a **multi-method assessment strategy** to capture the complexity of the trait.

- **The Narcissistic Personality Inventory (NPI) remains the most widely used measure**, but its limitations include a **focus primarily on grandiosity/agency** and a lack of coverage for the antagonistic/exploitative aspects of the trait.
- **Facet-specific scales** have emerged to measure distinct components of narcissism more precisely, showing that **entitlement and exploitation** are often the most maladaptive and predictive facets of the trait.
- **Behavioral and implicit measures** provide a way to assess the construct beyond conscious self-enhancement, offering insight into non-conscious self-regard and objective behavioral outcomes.

Chapter 13: Psychometric Properties of the Narcissistic Personality Inventory

Authors: Robert A. Ackerman, Conrad A. Corretti, and Kevin J. Carson

The authors confirm the NPI's overall strong psychometric profile and its effectiveness at measuring a dimension of non-pathological, agentic/grandiose narcissism. However, they address ongoing structural debates, such as whether it best fits a 3-factor or 4-factor model, and its primary limitation: a weak capacity to capture the full spectrum of pathological and vulnerable traits essential to Narcissistic Personality Disorder (NPD).

- **The NPI demonstrates strong internal consistency and test-retest reliability**, confirming that it is a **stable and consistent measure** of the general construct of grandiose narcissism.
- **The factor structure remains debated**, with common models identifying facets such as Authority/Leadership, Exhibitionism/Grandiosity, and Entitlement/Exploitativeness, showing its multi-faceted nature.
- **Its primary limitation is its weak assessment of core NPD pathology**, as the NPI is more strongly correlated with high **Extraversion and low Neuroticism**, missing the maladaptive antagonism and vulnerability central to the clinical diagnosis.

Chapter 14: Homogenous Scales: Grandiosity, Entitlement, and Exploitativeness

Authors: Amy B. Brunell and Melissa T. Buelow

This chapter advocates moving toward fine-grained subscales to study narcissism, rather than relying on a single composite score from multi-faceted measures.
Specific, pure components such as Grandiosity, Entitlement, and Exploitativeness provide superior predictive validity and researchers can establish clearer, non-redundant links to outcomes.

The Power of Facet-Level Measurement

- **Entitlement and Exploitativeness** are the most toxic and predict a wide range of maladaptive behaviors (e.g., unethical actions, aggression), while the purer Grandiosity component is more closely linked to agentic behaviors.
- **Entitlement is consistently shown to be the most pernicious element of narcissism**, correlating strongly with **aggression, hostility, and a lack of empathy** due to the belief that one deserves special privileges and preferential treatment.
- **Exploitativeness and entitlement have lower empathic concern**, lower agreeableness, and higher impulsivity and sensation seeking
  - Exploitiveness is more strongly associated with grandiose narcissism and weakly associated with vulnerable narcissism (Brown & Brunell, 2017 ; Brunell & Buelow, 2018)
- **Only exploitativeness was associated with lower perspective-taking**
- **Only grandiosity was associated with positive mental health** and higher extraversion, lower personal distress, lower neuroticism, and lower anxiety and depression
- **Exploitativeness is the behavioral manifestation of Antagonism**, characterized by manipulation and using others for self-benefit, and is a critical predictor of unethical behavior and relationship conflict.
- **Grandiosity, when isolated from entitlement, primarily predicts agentic outcomes**, such as high confidence and an assertive pursuit of goals, which can be initially beneficial in achievement settings.

Bait and Switch Manipulation Tactic

Brunell et al. (2013) tested behavior in a commons dilemma using the forestry-harvest paradigm from Sheldon & McGregor (2000) and Campbell et al. (2005). Participants acted as forestry companies deciding how much of a limited, regenerating forest to harvest while competing with another company. The authors predicted that exploitative individuals would conserve less.

Results showed that **exploitative individuals cooperated early in the task but became less cooperative over time**, conserving fewer shared resources. Brunell et al. interpret this as a possible **"bait-and-switch" manipulation tactic**: gaining trust initially, then defecting once the partner is easier to exploit.

These effects persisted when controlling for psychological entitlement, which did not predict behavior in the commons dilemma. This suggests that **exploitativeness and not entitlement may influence a cheater's strategy.**

Read more in:

- **Manipulation tactics**

> Manipulation Tactics Abusers Use: Recognizing and Protecting Yourself

Chapter 15: Parents' Socialization of Narcissism in Children

Authors: Sander Thomaes and Eddie Brummelman

> Results supported social learning theory and contradicted psychoanalytic theory: Parents' overvaluation predicted increases in children's narcissism over time, whereas parents' lack of warmth did not. Parental warmth did predict increases in children's self-esteem over time, whereas parental overvaluation did not. Together, these findings are consistent with the view that children come to view themselves as they believe they are seen by their parents (Brummelman, Thomaes, & Sedikides, 2016).
> When their parents see them as more special or entitled than others, children may infer a sense of superiority—which is the core of narcissism. By contrast, when their parents appreciate and love them for who they are, chil dren may infer a sense of being valuable—which is the core of self-esteem.

Drawing on longitudinal research, the authors present a clear distinction between **parental overvaluation fostering narcissism** and **parental warmth fostering healthy self-esteem**.
This work debunks the myth that narcissistic children are simply a product of neglect, pointing instead to a specific, ego-inflating parenting style.

The Overvaluation vs. Warmth Distinction

Specific parental behaviors, rather than general styles, are the crucial etiological factors for self-regard.

- **Parental overvaluation (inflated praise)**, where parents treat the child as superior or special, is the primary environmental predictor of childhood narcissism.
  - But only in high self-esteem children: *Parents' use of inflated praise predicted increases in narcissism over time—but only among children with high self-esteem (assessed at the study start). They may perceive inflated praise as falling perfectly within their latitudes of acceptance (e.g., "Yes, of course I am incredible"), leading them to form more inflated, narcissistic views of themselves. By contrast, children with low self-esteem may perceive inflated praise as falling outside of their latitudes of acceptance (e.g., "No, how parental overvaluation may manifest in relatively subtle behaviors or communication styles that may foretell the development of narcissism.*
- **Parental warmth and affection** are the **primary environmental predictors of healthy self-esteem**, teaching the child that they are loved and accepted for who they are.
- **Narcissism is not a compensatory defense against parental rejection**

Chapter 16: The Etiology of Narcissism: A Review of Behavioral Genetic Studies

Authors: Yu L. L. Luo and Huajian Cai

> These findings suggest that about half of the variation of grandiose narcissism can be attributed to genetic influence, with the remaining half attributed to non-shared environmental influences, a pattern which holds true across cultures.

Behavioral genetic research, primarily with twin studies, show that narcissism is **moderately heritable**, indicating a significant genetic influence, but also with high influence from **non-shared environmental factors** (unique experiences not shared by siblings) over shared environmental factors (family-wide influences).

It suggests that individual life experiences play a larger developmental role than the common family environment.

Heritability and Environmental Factors

- **Narcissism is moderately heritable**, with genetic factors typically accounting for approximately **40–60% of the variance** in trait scores.
- **Non-shared environmental influences (unique experiences)** account for the majority of the remaining variance, confirming that individual life events and different peer groups are **more influential than the shared family environment** in shaping narcissistic traits.
- **Microenvironments still matter**, *both theories and empirical findings have demonstrated the importance of microenvironments, such as family (Brummelman et al., 2015 ; Kohurt, 1966), and macroenvironments, such as social culture (Cai et al., 2012 ; Twenge et al., 2008). However, the twin studies suggest that most influences aris ing from environments are unique to an individual.* **<— ⍰⍰♂ Lucio's note**: though I found this confusing since it didn't seem to be corroborated by the twin studies' data, where genes + nonshared environment added up to 100%, leaving no room for microenvironments.
- **The Grandiose and Vulnerable subtypes show different patterns of heritability**, supporting the notion that they are distinct constructs with potentially divergent genetic and environmental underpinnings.
- **Narcissism is stable over time**: *narcissism is highly stable in terms of rank order: a person with high narcissism still tends to be narcissistic years later (Cramer, 2011 ; del Rosario & White, 2005 ; Edelstein, Newton, & Stewart, 2012 ; Luo, Wang, & Cai, in preparation)*

⍰⍰♂ Lucio's note: Why such high discrepancy?

I couldn't help but wonder why such large discrepancies among studies when it comes to genetic vs environmental influences:

- Livesley, Jang, & Vernon (1998) – Canadian twins (686 pairs, nonclinical sample)
  - **Genetic influence:** 44%
  - **Non-shared environment:** 56%
  - **Shared environment:** 0% (no significant influence)
- Torgersen et al. (2000) – Norwegian twins (221 pairs, at least one twin treated for mental disorder)
  - **Genetic influence:** 77%
  - **Non-shared environment:** 23%
  - **Shared environment:** 0%
- Kendler et al. (2008) – Norwegian twins (2794 siblings, larger sample)
  - **Genetic influence:** 37.3%
  - **Non-shared environment:** 62.7%
  - **Shared environment:** 0%

Would be interesting to hear the authors' possible explanations.

⍰♂Lucio's Take: **Shares vs non-shared confused me, given that parenting matters**

Lucio:
Parenting is typically considered part of the shared environment, and research clearly shows that parenting style can shape narcissism. Twin studies reporting 0% shared environmental influence seem at odds with this literature.

Maybe the twin studies effectively partialed out parenting, but I would have liked to see at least a note on this.

Chapter 17: Narcissism and the Economic Environment

Authors: Emily C. Bianchi

Economic conditions can either facilitate or constrain the expression of narcissism. Periods of economic boom and prosperity may encourage narcissism by promoting individualism and a sense of limitless opportunity, whereas periods of recession or instability may suppress the trait's expression or favor its vulnerable form.

The Facilitating Role of Prosperity

- **Narcissism may be exacerbated by economic prosperity**, as a seemingly endless stream of opportunities and resources fosters the belief that **one is uniquely deserving of success and status**.
- **Wealthier people are more narcissistic**: *Piff (2014) found that wealthier people have higher narcissism. People with greater resources typically face fewer financial, psychological, and even physical challenges. As such, less adversity may underlie these trends*
  - But 'wealthy environment' may matter: *past work suggests that wealthier and better educated people inhabit cultural worlds that emphasize individuality and uniqueness (e.g., Snibbe & Markus, 2005). As a result, people growing up in these settings may be particularly influenced by conditions that seem to thwart it.*
- **Economic recessions can threaten the grandiose self-image**, forcing narcissists to confront external limitations, which may increase psychological distress and potentially foster the vulnerable expression of narcissism.
- **Downturns may foster more communion**, since they're associated with greater interdependence and less

individualism.

- **Generational increases in narcissism (e.g., the 'Narcissism Epidemic')** may be partially explained by shifts in the **socioeconomic context** that encourage individualism and self-focused ambition over collective concerns.

Chapter 18: Narcissism as a Life Span Construct: Fluctuations

Authors: Patrick L. Hill and Brent W. Roberts

With new methodological approaches to track mean-level changes and rank-order stability of narcissistic traits, the authors conclude that **narcissism remains stable relative to peers, but with systematic trends**. The most overtly maladaptive aspects (e.g., Entitlement and Exploitativeness) tend to decrease in intensity across the adult lifespan. This may be due to the maturation process and the demands of stable adult roles like parenthood and long-term employment.

Developmental Declines in Narcissism

- **Narcissism demonstrates moderate-to-high rank-order stability**, meaning that individuals who are more narcissistic than their peers in young adulthood usually remain so later in life.
- **Mean-level narcissism, particularly entitlement, tends to decline across adulthood**, suggesting that the acquisition of **adult roles (e.g., stable career, long-term partnership)** necessitates a reduction in self-centered, exploitative behavior.
- **Life transitions (e.g., retirement, empty nest)** are crucial periods to study, as they may either threaten or reinforce the narcissistic self-view, leading to corresponding fluctuations in trait expression.

Deep Dive: Generational Power Moves vs. Data

This discussion also typically involves attacking the opposing generation by demonstrating how they were too "entitled" or harbored unjustified perceptions of their own grandiosity.

However, research on generational differences in narcissism has produced mixed and often weak evidence. Empirical studies find at best modest differences (Twenge et al., 2008) and frequently little to no variation between cohorts (Donnellan et al., 2009; Roberts et al., 2010; Trzesniewski et al., 2008).

Some recent analyses even suggest a downward trend in narcissism when using more sophisticated methods (Wetzel et al., 2017). As a result, scholars increasingly recommend focusing on within-person fluctuations and developmental changes in narcissism rather than assuming meaningful generational differences (Hill & Roberts, 2011).

Chapter 19: Did Narcissism Evolve?

Authors: Nicholas S. Holtzman

Narcissism persisted in the human population because it conferred specific **short-term mating or status advantages** to ancestral individuals.
The argument is that narcissistic traits like charm, assertiveness, and risk-taking (the "bright" side) made individuals more competitive for resources and mates, counterbalancing the potentially negative long-term consequences of antagonism. The chapter frames the trait as a **strategy for social dominance and high visibility**, a trade-off that may have been reproductively successful in specific environmental contexts.

Criterion	Evaluation
Narcissism is heritable	✅ Evidence is clearly in favor of this
There are genes for traits tightly linked to narcissism	✅ Some evidence is in favor of this
There are genes for narcissism specifically	❓ No evidence; little research done
Narcissists pursue short-term mating (STM)	⚖️ Mixed evidence for this. Estimate of small to medium in size (perhaps r = 0.15–0.25).
Other people select narcissists for STM	✅ Evidence in favor of this
Narcissism confers unadorned attractiveness	❌ Correlation is near zero
Narcissism is linked to a reproductive pathway that could lead to fitness benefits	✅ Evidence is in favor of this

Narcissism as a Socio-Sexual Strategy

- **Narcissism may be a strategy for securing status and mates**, as the grandiosity and superficial charm allow for **rapid attainment of social visibility and access to mates**, particularly in short-term contexts.
- **The trait's costs (e.g., aggression, relationship failure) are viewed as trade-offs** for the **benefits of early dominance and reproductive success**, maintaining the trait's presence in the gene pool.
- **The high visibility and initial charisma of the grandiose narcissist** would have served as an **evolutionary signal of genetic fitness** and resource control to potential mates, leading to the trait's perpetuation.

Other possible explanations for narcissism's evolution

> Taken together, the evidence leaves room for other perspectives on the evolution of narcissism—such as perspectives about dominance (Cheng, Tracy, & Henrich, 2010), overconfidence (Johnson & Fowler, 2011), and reactive heritability (Holtzman, 2011 ; Holtzman & Donnellan, 2015), where reactive heritability means that there are no genes for the trait per se but rather genes for physical traits to which an individual calibrates their psychological selves (Lukaszewski, 2011 ; Lukaszewski & Roney, 2011 , 2015 ; Tooby & Cosmides, 1990)

🤔♂️Lucio's Take: **Ultimately, the bottom line of evolutionary logic is still reproduction**

Lucio:
I would note that, ultimately, all other possible alternative explanations must still point to successful reproduction. Higher dominance or overconfidence must still either increase or at least not lose reproductive fitness for narcissism to develop, spread, and not disappear.

Also see my note below on why 'unadorned attractiveness' doesn't necessarily invalidate the short-term mating hypothesis.

Chapter 20: Generational Differences in Narcissism and Narcissistic Traits

Authors: Joshua B. Grubbs and Allison C. Riley

> across a number of studies using rigorous methods and large sample sizes, there is evidence that NPI scores have risen slightly in recent decades. Although these findings are controversial, arguments that raw NPI scores have not actually increased seem strikingly inconsistent with the body of evidence available.

The authors review cross-temporal meta-analyses and longitudinal cohort studies, which have investigated whether recent generations score higher on measures like the NPI than older generations did at the same age. While some meta-analyses initially suggested a rise in narcissism, more rigorous and recent studies have provided mixed and often contradictory findings. The authors conclude that the evidence for a dramatic, continuous increase in trait narcissism across recent decades is not as robust as commonly believed.

The Debate on the Narcissism Epidemic

- **Initial cross-temporal meta-analyses suggested generational increases** in NPI scores, which fueled the popular notion of a **"narcissism epidemic"** driven by cultural shifts toward individualism.
- **Later research and methodological critiques have cast doubt on these findings**, pointing to **non-linear trends, methodological confounds, and the need for improved measurement** to accurately assess change

over time.

- **Narcissistic traits are influenced by cohort effects**, meaning that certain societal factors (e.g., social media, parenting styles) unique to a birth cohort may contribute to temporary or localized elevations in specific facets of narcissism.
- **They may have risen more for women, not for men**: Twenge and colleagues (2008a , 2008b) found that NPI scores had risen significantly for women over time (d = .28), but were statistically undetectable in men (d = .12, ns).
- **Matching rising narcissism may be adaptive**: I*n the context of individualism, rather than being seen as "good" or "bad," rises in narcissism are simply further evidence of increased individualism and likely confer specific advantages and costs in a more individualistic society (e.g., Sedikides & Campbell, 2017)*

The Takeaways From Literature

1. Narcissism, primarily indicated by scores on the NPI, **has increased in recent decades**
2. Increases have been **rather small** in magnitude, though consistent in replication;
3. Increases have occurred in the context of **rising individualism** more broadly

---

Chapter 21: Narcissism and Dark Personality Traits

Authors: Imani N. Turner and Gregory D. Webster

The authors emphasize the shared core of **callousness, antagonism, and manipulation** among the dark triad. They differentiate narcissism's distinct emphasis on **grandiosity and entitlement** from Machiavellianism's strategic exploitation and psychopathy's impulsivity.

Narcissism's Role in the Dark Triad

- **The unifying features are Antagonism and low empathy**, with all three traits sharing a disposition toward **interpersonal hostility, callousness, and deceit**; this core predicts negative social outcomes and relationship failure.
  - Sociosexuality may also be shared: a single, latent, global Dark Triad trait may explain some phenomena such as sociosexuality better than the three traits themselves (Jonason, Kavanagh, Webster, & Fitzgerald, 2011)
- **Narcissism is distinct from Machiavellianism in its focus on grandiosity**, as narcissists are driven by the need for admiration, while Machiavellians are driven by strategic, calculating manipulation to achieve a goal.
- **Narcissism is distinct from Psychopathy in its impulsivity**, as narcissism is generally less associated with the **extreme impulsivity** that defines the psychopathic core
  - **Emotional distress** may also be a difference depending on the type of narcissism and psychopathy
  - **Grandiose narcissism is closer to primary psychopathy**, characterized by charm and dominance.
  - **Vulnerable narcissists align more with secondary psychopathy**, marked by impulsivity and emotional instability.
- **Narcissism is the "brightest"** and most complex of the Triad, driven by ego-enhancement rather than pure exploitation.
- **Narcissism and Machiavellianism have weakest correlation** among the Dark Triad traits, producing correlations around 0.25 (Paulhus & Williams, 2002)
  - Psychopathy and Machiavellianism are the most highly correlated traits in the dark triad (Keller, Carter, & Lynam, 2016); however, large correlations around 0.50 between narcissism and psychopathy are not

uncommon (Paulhus & Williams, 2002)

Chapter 22: Narcissism and the Big Five/HEXACO Models of Personality

Authors: Beth A. Visser

This chapter maps trait narcissism onto the major dimensional models of general personality: the **Five-Factor Model (FFM)** and the **HEXACO model**. Visser highlights that the addition of **Honesty-Humility** in the HEXACO model provides a superior, non-redundant predictor of narcissistic antagonism compared to the FFM's low Agreeableness, offering a more nuanced explanation for the malevolent side of the trait.

The FFM and HEXACO Profiles of Narcissism

- **Grandiose narcissism's FFM profile is primarily characterized by high Extraversion and low Agreeableness**, reflecting the trait's social dominance, assertiveness, and antagonism.
  - Note: low agreeableness presents some exceptions
- **Vulnerable narcissism's FFM profile is primarily characterized by high Neuroticism and low Agreeableness**, reflecting high psychological distress and anxious antagonism.
- **The HEXACO model provides a stronger, more parsimonious link to antagonism** through the single, highly negative correlation with **low Honesty-Humility**, which captures the core exploitation, greed, and lack of sincerity central to narcissism.
- **Narcissists may use partners as sources of validation**, treating them as extensions of the self.
- **They tend to blame partners for relationship problems**, avoiding accountability.

Chapter 23: Physiological Reactivity and Neural Correlates of Trait Narcissism

Authors: Elizabeth A. Krusemark

> grandiose narcissism involves cardiovascular reactivity in response to aversive stimuli and achievement-related stressors that parallel reactivity associated with similar personality traits (e.g., competitiveness, dominance), exhibiting greater risk for cardiovascular disease. Additionally, grandiose narcissism is associated with acute and chronically elevated levels of cortisol as well as heightened testosterone reactivity and aggression. By contrast, vulnerable narcissism and exploitativeness/entitlement are generally associated with heightened cardiovascular reactivity to interpersonal rejection.

This chapter reviews research using **physiological (e.g., cortisol, heart rate)** and **neuroscientific (e.g., fMRI, ERP)** measures to understand the biological mechanisms underlying narcissistic behavior. Narcissists, particularly the grandiose subtype, often exhibit a **blunted or hyper-reactive physiological response to threats** or social exclusion. Furthermore, neuroimaging studies point to differences in brain regions associated with **self-referential processing, reward anticipation, and empathy**, suggesting that narcissists' self-focus has measurable correlates in their central nervous system functioning.

The Biological Basis of the Narcissistic Self

Biological evidence supports the idea that narcissism is more than just a personality trait, involving affective and cognitive regulation systems.

- **Cortisol responses to social evaluative stress are often blunted in grandiose narcissism**, suggesting a **physiological resilience** or a self-protective mechanism that allows them to maintain a stable, positive self-concept even under threat.
- **Vulnerable narcissism may be linked to stress-related neural and hormonal responses**, including cortisol dysregulation.
- **Lower anxiety for grandiose**: *individuals with high levels of grandiose narcissism reported lower state anxiety, lower overall SCR, and marginally greater SCR habituation, indicating that narcissism may also be associated with a hypo-reactive physiological profile similar to psychopathy (Patrick, 1994 ; Raine & Venables, 1984)*
- **Neuroimaging studies show differences in the default mode network (DMN)**, suggesting an increased focus on **self-referential processing** and a heightened cognitive attention directed toward the self and personal status.
- **Abnormal neural activity in brain areas related to empathy (e.g., prefrontal cortex)** is sometimes observed, potentially explaining the narcissistic deficit in **perspective-taking and emotional response** to others' distress.
- **Grandiose narcissism is associated with heightened physiological reactivity to ego threats**.

Chapter 24: Narcissism and Memory

Authors: Lara L. Jones

Narcissists exhibit **self-serving memory bias**: superior recall for information related to themselves, their successes, and positive self-descriptions, with **poor memory for failures or negative feedback**. This bias is a cognitive mechanism that actively maintains the grandiose self-image by selectively reinforcing positive self-views and filtering out self-threats.

Self-Serving Memory Biases

Memory processes are functionally recruited to sustain the narcissistic self-concept and grandiosity.

- **Superior recall for self-relevant information (self-reference effect)** is consistently observed, indicating that narcissists have a cognitive processing advantage when information is linked to their self-concept.
- **Self-serving attribution bias**: *narcissists exhibited more self-serving attributions in their performance on an intelligence test with successes attributed to ability and failures attributed to task difficulty, whereas less narcissistic individuals exhibited the opposite pattern (Stucke, 2003).*
- **This self-serving memory is an adaptive mechanism for grandiose narcissists**, contributing to their **psychological well-being** and lack of distress by maintaining a continuous, positive self-narrative.
- **Agentic & positive memory bias**: *studies support the agency model of narcissism's prediction of attention biases and memorial enhancement for positive-agentic (e.g., clever, talented) rather than positive-communal (e.g., cooperative, sympathetic) events or information.*
  - Not as much bias for negative events: *However, results are mixed for the attention to and encoding of negative-agentic traits/events (e.g., shameful, stupid). Narcissists are only weakly motivated to avoid negative information. and may depend on the extent to which the information is ego-threatening as well as the subtype of narcissism (vulnerable or grandiose)*
  - High agency recall, low communal: narcissism predicted higher phenomenology ratings across these four constructs for recalled positive-agentic autobiographical memories (i.e., clever, talented) but not for positive-communal ones (i.e., cooperative, sympathetic).
    Instead, self-esteem (but not narcissism) predicted higher recollection and belief ratings for the positive-communal memories.

- **Vulnerable narcissists may ruminate on failures**, reinforcing negative self-views: *Horvath and Morf (2009) speculated that the narcissism subtype influences whether narcissists are hypervigilant or avoidant in their attention toward negative information, with a better ability to disengage and avoid negative information for the grandiose than the vulnerable subtype. Supporting this speculation, vulnerable (but not grandiose) narcissism was associated with an attentional bias in a dot-probe task for a mixture of agentic (e.g., stupid, ignorant, weak) and communal (e.g., selfish, cruel, vulgar) negative words and with greater recognition memory for these words (Krusemark et al. 2015*)

Chapter 25: Narcissism and Involvement in Risk-Taking Behaviors

Authors: Melissa T. Buelow and Amy B. Brunell

Narcissists, particularly the grandiose subtype, show a consistently **higher propensity for risk-taking** due to their inflated sense of competence, overconfidence in their ability to control outcomes, and underestimation of potential dangers. This behavior is motivated by the desire to demonstrate superiority and gain admiration, and the authors stress that this can lead to both spectacular, high-stakes successes (when the risk pays off) and significant, damaging consequences (when the risk fails).

Overconfidence and the Need for Thrills

- **Narcissists exhibit an illusion of invulnerability**, leading them to **underestimate risk and overestimate their personal control** over uncertain outcomes, which encourages risky financial and health decisions.
- **Narcissism was significantly associated with impulsivity** *(Crysel, Crosier, & Webster, 2013 ; Foster & Trimm, 2008 ; Jonason & Tost, 2010 ; Jones & Paulhus, 2011 ; Vazire & Funder, 2006), which itself was linked to involvement in risk-taking behaviors (e.g., Butler & Montgomery, 2004 ; Crone, van Duijvenvoorde, & Peper, 2016 ; Hosker-Field, Molnar, & Book, 2016)*
- **Narcissists also endorsed high levels of BAS** *and low levels of BIS (Foster, Shenesey, et al., 2009 ; Foster & Trimm, 2008 ; MacLaren & Best, 2013 ; Stenason & Vernon, 2016). It is possible the approach behaviors to signals of reward (high BAS), coupled with the lack of avoidance behaviors to signals of potential consequences (low BIS) (Carver & White, 1994), lead to a lack of acknowledgment of potential risks when narcissists engage in risk-taking behaviors.*
- **The desire for admiration and visibility drives risk-taking**, as narcissists are drawn to spectacular, high-stakes activities that have the potential to garner attention and confirm their exceptionality.
- ⚠**Self-report bias may undermine this association**: *That we found few consistent relationships between narcissism and the Iowa Gambling Task* (IGT) *may reflect a difference between what narcissists self-report about themselves (e.g., I am a risk-taker) and what narcissists actually do in a particular situation (…) It might be that narcissists are "all talk," in that they self-report engagement in high-risk behaviors yet fail to follow through on this boasting on behavioral measures*
- **The Entitlement/Exploitativeness facet is the strongest predictor of maladaptive risks** like unethical and criminal behavior, highlighting the dark side of this disposition.

Chapter 27: How Does It Feel to Be a Narcissist? Narcissism and Emotions

Authors: Anna Z. Czarna, Marcin Zajenkowski, and Michael Dufner

> grandiose narcissists appearing, on the whole, more like "successful narcissists" and vulnerable narcissists

> appearing more like “failed narcissists” (Back & Morf, 2018 ; Campbell et al., 2004

This chapter explores the emotional landscape of the narcissistic individual, emphasizing the stark contrast between the **positive affectivity of the grandiose** subtype and the **negative affectivity of the vulnerable** subtype. Grandiose narcissism is linked to high levels of positive emotions, low anxiety, and generally high subjective well-being, reflecting their confident self-image. Conversely, vulnerable narcissism is characterized by a high burden of shame, anxiety, and depression.
The chapter also discusses narcissists’ distinct emotional responses to social interactions, such as their **limited empathy** and their heightened propensity for specific negative emotions, such as **anger and envy**, particularly when their ego is threatened.

Divergent Emotional Profiles

Narcissistic subtypes represent two fundamentally different affective worlds, one of perceived success and one of distress.

- **Grandiose narcissists often report high positive affect**, including feelings of cheerfulness, excitement, optimism, and overall high life satisfaction (Sedikides, Rudich, Gregg, Kumashiro, & Rusbult, 2004)
- **Vulnerable narcissism isnerable narcissists report more negative affect**, including **shame, stress, envy, schadenfreude, and anxiety**, reflecting its core as an anxious and sensitive personality style.
  - Vulnerable = neurotic: Miller et al. (2017) have shown that vulnerable narcissism is almost entirely reducible to neuroticism (the rest being antagonism and hostility) which is a strong and negative predictor of subjective well-being (Diener & Lucas, 1999)
  - Envy and Anger Envy is one of the most important emotions in the lives of vulnerable narcissists – they resent higher status peers and revel in the misfortune of others (Krizan & Johar, 2012; Nicholls & Stukas, 2011).
- **Approach orientation vs avoidance follows emotions**: Grandiose are approach oriented and sensitive to rewards, whereas vulnerable narcissists are avoidance oriented and sensitive to threats (Campbell & Foster, 2007 ; Foster & Trimm, 2008 ; Krizan & Herlache, 2018 ; Pincus et al., 2009).
  - Approach orientation typically goes along with positive emotionality, and avoidance motivation is accompanied by negative emotionality (Elliot & Thrash, 2002).
- **Grandiose Instrumental aggression vs. vulnerable narcissistic rage**: vulnerable narcissism is linked to uncontrollable narcissistic rage that stems from a fragile sense of self and results in disproportionate and dysfunctional aggression. Grandiose narcissism, in contrast, goes along with instrumental aggression that serves the purpose of asserting one’s dominance in the face of strong direct status threats.
- **Facets matter: leadership protects against envy, but entitlement and antagonism promote it:** Grandiose narcissism has a more complicated association and is thus less predictive of envy and schadenfreude (Krizan & Johar, 2012; Lange, Crusius, & Hagemeyer, 2016; Neufeld & Johnson, 2016; Porter, Bhanwer, Woodworth, & Black, 2014). Its leadership/authority component protects grandiose narcissists from dispositional envy (Neufeld & Johnson, 2016), while entitlement and antagonism, common to both grandiose and vulnerable forms of narcissism, predict malicious envy (Lange et al., 2016; Neufeld & Johnson, 2016; Porter et al., 2014
- **Grandiose narcissists were less prone to emotional contagion** than individuals low in grandiose narcissism (Czarna et al., 2015), not “catcingh the emotions” of others, a result corroborating their generally low empathy. This can facilitate frame control
- **Both types struggle with emotion regulation**, Altogether, narcissism, in both its forms, and with its self-esteem (dys) regulation, generates emotional instability (and interpersonal turmoil), especially under ego threat. Difficulties in emotion regulation are more evident in vulnerable narcissism than in grandiose narcissism.
  - Grandiose narcissists’ state self-esteem decreases substantially on days with more negative achievement events, leading to rapidly changing emotions (Zeigler-Hill, Myers, & Clark, 2010).

Narcissist Rage: Deep Dive

> Recent theoretical and empirical work on narcissistic rage suggests that it is indeed narcissistic vulnerability rather than grandiosity that is a key source of narcissistic rage, as its necessary conditions include a vulnerable sense of self, an explosive mixture of shame, hostility, and extreme anger (Krizan & Johar, 2015).
> The resultant outburst of aggression is disproportionate, dysfunctional, and often misdirected.
> Among grandiose narcissists, in contrast, aggression might rather be understood as an instrumental esponse to a threat to their position of dominance; it serves to directly defend and assert it and does not include the intermediary of shame (Campbell et al., 2004).
> Grandiose narcissists are prone to aggression when faced with strong direct threats to the self (such as public impeachments of one's ability, intelligence, or social status), and their aggressive responses might rather be maneuvers aimed at restoring their superiority rather than outbursts of unre strained, uncontrollable rage fuelled by shame and chronic anger (Barry et al., 2007 ; Fossati, Borroni, Eisenberg, & Maffei, 2010).

Chapter 28: Narcissistic Need for Perfection

Authors: Martin M. Smith, Simon B. Sherry, and Donald H. Saklofske

> We conclude that narcissistic grandiosity has unique positive relationships with self- oriented perfectionism (i.e., demanding per fection from the self), other-oriented perfectionism (i.e., demanding perfection from other people), and perfectionistic self- promotion (i.e., promoting one's supposed perfection) and a unique negative relationship with non-display of imperfection (i.e., concern over behavioral displays of imperfec tion). Likewise, we conclude that narcissistic vulnerability has unique negative relationships with socially prescribed perfectionism (i.e., perceiving others demand perfection), perfectionistic self-promotion, and non-display of imperfection.

The authors distinguish between **narcissistic perfectionism** and healthy (adaptive) perfectionism, arguing that the narcissistic form is generally **maladaptive and self-defeating**. This need for perfection is tied to the fear of imperfection revealing an ordinary, flawed self, and it manifests as an entitled demand for flawless performance and extreme over-reactions to minor failures. The authors note that this trait **contributes to stress and** psychological difficulties over time.

Maladaptive Perfectionism

- **Self-oriented perfectionism aligns with grandiosity**, supporting inflated self-standards.
- **Socially prescribed perfectionism aligns with vulnerability**, fostering fear of failure and rejection.
- **Narcissistic perfectionism is a maladaptive style** characterized by **fragile self-worth** that is **contingent on being flawless** and a self-critical component when perfection is not achieved.
- **Perfectionism is linked to the grandiosity and exhibitionism facets**, as achieving "perfect" results is a means of **securing the admiration and superiority** they feel entitled to.
- **Narcissistic perfectionism is different than perfectionism**: *Nealis et al. (2015) also demonstrated narcissistic perfectionism positively predicted daily derogation and daily conflict, even after controlling for perfectionistic concerns. Similarly, Nealis et al. (2016) found narcissistic perfectionism predicted anger above and beyond other-oriented perfectionism, entitlement rage, and pathological narcissism (Nealis et al., 2016). Hence, Nealis et al.'s (2015 , 2016) findings imply narcissistic perfectionism is neither redundant with nor fully captured by similar perfectionism constructs (e.g., other-oriented perfectionism) or analogous narcissism constructs (e.g., entitlement rage).*

- **This perfectionism is often expressed as an entitled demand for flawless performance from others**, which severely strains interpersonal relationships and workplace dynamics.
- **Narcissistic perfectionism can be adaptive short-term**, but is ultimately unsustainable and emotionally costly.

Chapter 29: What Do Narcissists Know About Themselves? Narcissists' Self-Knowledge

Authors: Erika N. Carlson and Reem Khafagy

> While narcissists tend to describe themselves in overly positive ways on some attributes, skills, and abilities, they also admit to being narcissistic, realize that other people experience them in less positive ways, and know that they lose the social status they crave over time.
> However, these insights are overshadowed by the fact that they seem to think that their darker attributes are character strengths that get them ahead. For example, while they admit to being narcissistic and realize that their popularity and status wanes over time, narcissists think that being arrogant, condescending, and hostile get them ahead. Thus, their blind spot might not be a failure to under stand what they are like but rather how their personality undermines their goals.

This chapter addresses narcissists' self-perceptions align with how others see them.
The authors conclude that narcissists have a notable **"blind spot" regarding the potentially maladaptive consequences of their antagonistic traits** (e.g., arrogance, manipulation), which they fail to recognize or admit. However, they have accurate self-knowledge regarding their agentic, charming, and dominant traits, which others also recognize, explaining their initial social success. This suggests that **narcissists know they are charming, but they are genuinely oblivious to their own toxicity.**

The Accuracy of Self-Perception

- **Grandiose narcissists overestimate their likeability and competence**, often unaware of negative traits. They're too positive about their agentic traits, such as high intelligence, charm, and competence
  - This rosy view is maintained with biased memory and interpretations: *They also enjoy receiving feedback and tend to interpret neutral feedback in positive terms. (Robins & John, 1997).*
- **Vulnerable narcissists may be more accurate**, but overly self-critical.
- **Narcissists have accurate self-knowledge regarding their communal attributes** narcissists are too positive about agentic "getting ahead" traits but are more accurate about communal "getting along" traits. knowledge of their darker, rivalry strategies,
- **Feedback from others rarely alters narcissistic self-views** due to defensiveness.
- **Narcissists have good insight on their 'chocolate cake effect'**: *All in all, narcissists seem to have some insight into the fact that they tend to make better impressions on people they just meet than on people who know them well, and they seem to realize that their popularity wanes over time. Despite this insight, they tend to assume they are seen in more positive ways than they really are.*
- **The discrepancy between self- and observer-ratings increases over time**, suggesting that while their positive traits are initially validated, their negative traits become increasingly apparent to others, eroding their long-term social success.
- **Improving self-perceptions may improve outcomes?** *Changing a narcissist's behavior will likely involve changing the way this individual thinks about narcissism. Specifically, narcissists already know that they are*

narcissistic, but what they fail to realize is how their behavior interferes with their ability to hold onto social status they crave. ative consequences of their self-enhancement and poor self-knowledge.

🤔Lucio's Take: **Disagree on self-awareness. Low communion *is* a strength for narcissists**

Lucio:
The authors claim that narcissists don't genuinely understand their conditions because, they say, *'narcissists seem to be reporting character strengths when they say they are narcissistic and less communal. For this reason, we conclude that narcissists' insight into the darker aspects of their personality does not reflect a genuine understanding of their condition, but rather, another form of self-enhancement'.*

I didn't feel the same way, at least on the communion aspect.
It may seem that way if we judge from the point of view that higher communion is good. I may even agree with that point of view from a moral and ethical point of view. However, that's the point: it's a moral stance.

Seen from the point of view of highly agentic people, high communion may be a drag on the achievement they value.

Chapter 30: Narcissists' Perceptions of Narcissistic Behavior

Authors: William Hart, Gregory K. Tortoriello, and Kyle Richardson

Narcissists tend to see their traits as an asset in themselves because they genuinely believe those actions are warranted and necessary for success.
They may not like narcissism in others, but do not see narcissistic traits as negative or undesirable as much as others do.

Justifying Grandiose Actions

- **Narcissists view grandiose traits as functional and desirable**, often rating traits like dominance, entitlement,

and exhibitionism as **positive characteristics** that lead to success and social capital.

- **The perception of entitlement is internalized as a justified belief**, where the narcissist genuinely feels they **deserve special treatment and resources**, rather than seeing it as an external flaw.
- **Narcissists are generally unmotivated to change their behavior**, because they perceive their narcissistic actions as **effective means to their goals** (e.g., status, admiration) and their negative outcomes as external problems (e.g., others' envy).
- **They dislike narcissism in others**, especially when it threatens their own status, but not as much as non-narcissists do
- **Narcissists seek narcissists and high-status mates and friends**: *narcissists pursue mates with narcissistic traits (e.g., Campbell, 1999; Keller et al., 2014; Lamkin, Campbell, vanDellen, & Miller, 2015; see also, Grosz, Dufner, Back, & Denissen, 2015. Other work has explored the characteristics which narcissists deem desirable in friendships. In Jonason and Schmitt (2012), narcissists indicated a multitude of reasons to pursue friendships, some of which implied a preference for narcissistic friends. In addition to seeking similarity in interests, narcissists appeared to seek friends who are strong, intelligent, physically attractive, and high in social status. Also, when modeled with other Dark Triad traits (Machiavellianism and psychopathy), narcissism negatively related to desiring a "kind" friend (a non-narcissistic trait).*
  - Vulnerable narcissists do not appear to pursue narcissists as romantic partners (Lamkin et al., 2015) and do not rate traits such as antagonism or reduced inhibition more positively (Lamkin et al., 2017).

Power Signaling In Narcissists

Narcissists often link power with personal freedom and a lack of restraint, so they may try to signal power by acting as if they never curb their impulses ("I do what I want because I'm the boss").

In Hart et al. (2017), narcissists showed a stronger desire to project a low–self-control image—wanting to appear "unfiltered," "fearless," and "self-indulgent"—and they reported intentionally behaving in ways that create that image more often than non-narcissists.

Their higher power motivation partly explained both this desire and the behaviors used to project low self-control. From the narcissists' perspective, much of their behavior may be a tactical, rational strategy to present a preferred self-image.

> from the perspective of the narcissist, tactical choices that support images of power, confidence, competence, influence, and toughness. Indeed, other work suggests narcissists' flouting of etiquette rules appears to be a strategy to attract attention (Adams et al., 2014), and narcissists' enhanced jealousy induction in mates is a means to demonstrate their mate value and gain power in romantic relationships (Tortoriello, Hart, Richardson, & Tullett, 2017).

And the authors convene on the effectiveness of displaying certain traits:

> Narcissistic behaviors can, when used appropriately, be instrumental in appearing capable, powerful, resilient, confident, and adept at winning competitions (Jones & Pittman, 1982)

Chapter 31: Narcissistic Consumption

Authors: Constantine Sedikides, Claire M. Hart, and Sylwia Z. Cisek

> The preference of grandiose narcissists for luxury (over mundane) products is due to at least four reasons:

> positive distinctive ness, materialism, meaning, and sexual signaling. The preference of vulnerable narcissists for luxury products is due to at least one reason: inner fragility.

Narcissists exhibit a tendency toward **conspicuous, high-status consumption** driven by the need to demonstrate superiority, acquire admiration, and affirm their unique self-image. They are drawn to luxury goods, brand names, and items that publicly signal wealth, power, and prestige. This behavior is less about deriving genuine pleasure from the product and more about the **social signaling function** of the purchase to gain external validation and admiration.

Spending as a Strategy for Status Signaling

- **Narcissists prefer luxury and brands** to signal status and superiority, using material goods as props to construct and maintain a grandiose self-image.
- **The consumption is driven by exhibitionism**, as the primary goal is the **admiration and envy elicited from others**, not the intrinsic enjoyment of the product itself.
- **Financial risk is often a consequence of this consumption style**, as the need to maintain an image of success can lead to **impulsive spending and debt**, demonstrating the maladaptive financial side of narcissism.
- **Vulnerable narcissists may consume to compensate for insecurity**. *More direct evidence indeed points to a positive link between inner fragility (i.e., self-doubt, inadequacy, insecurity) and materialism. For example, insecurity, either reported in one's dreams (Kasser & Kasser, 2001) or as an outcome of death cognition activation (Kasser & Sheldon, 2000), is related to materialism. Also, self-doubt predicts materialism, and manipulation of self-doubt (through memorization of such words as "doubtful," "uncertain," and "insecure") leads to higher level of materialism compared to a control condition (memorization of such words as "inside," "unicorn," and "double") (Chang & Arkin, 2002). Finally, persons expressing inadequacy in a given domain (e.g., tennis) are especially likely to own materialistic displays (e.g., brand-name clothing) that underpin the domain-relevant identity (i.e., tennis players; Braun & Wicklund, 1989). In all, inner fragility is positively associated with, and evokes, materialism, while materialistic displays can restore self-worth among persons high on inner fragility*
- **State narcissism can be primed with marketing**: De Bellis, Sprott, Herrmann, Bierhoff, and Rohmann (2016) also demonstrated that state narcissism can be primed via marketing communication of product uniqueness

---

Chapter 32: The Narcissistic Pursuit of Status

Authors: Virgil Zeigler-Hill, Gillian A. McCabe, Jennifer K. Vrabel, Christopher M. Raby, and Sinead Cronin

> Individuals with narcissistic personality features tend to resolve the potential trade- off between status and affiliation by focusing their efforts on the attainment of status and demonstrating relatively little concern about affiliation (e.g., Campbell, 1999 ; Campbell, Rudich, & Sedikides, 2002 ; Raskin & Novacek, 1991 ; Raskin, Novacek, & Hogan, 1991a , 1991b). To put it another way, narcissistic individuals tend to care a great deal about climbing the status hierarchy, but they are not terribly concerned about whether people like them.

This chapter establishes that the pursuit of social status is a fundamental and organizing motivation for narcissistic individuals. Status is defined as respect, admiration, and rank within a social hierarchy, and narcissists are driven to acquire it through both **prestige (competence-based)** and **dominance (fear-based)** pathways. The chapter clarifies that narcissistic behavior, from self-enhancement to aggression, is often a calculated effort to ascend the social ladder and secure the external validation necessary to stabilize their grandiosity. This pursuit explains much of their behavior in domains like leadership, achievement, and interpersonal conflict.

Status Acquisition Through Dominance and Prestige

- **Admiration facet uses both prestige and dominance, while antagonism uses dominance**: *Zeigler-Hill et al. (2017) found that both narcissistic admiration (assertive self-enhancement and self-promotion) and narcissistic rivalry (antagonistic self-protection and self-defense) from the model (Back et al., 2013) were positively associated with the use of dominance-based strategies for gaining status. However, these two facets of grandiose narcissism had opposing associations with prestige-based strategies such that narcissistic admiration was positively associated with this approach to attaining status, whereas narcissistic rivalry was negatively associated with this approach.*
- **The need for status is important for the narcissist**, as the attainment of high social rank is viewed as **necessary for confirming their belief in their own superiority** and maintaining their self-worth.
- **Vulnerable narcissists may resent status hierarchies**, yet crave validation.

Chapter 33: Early Impressions of Grandiose Narcissists: A Dual-Pathway Perspective

Authors: Mitja D. Back, Albrecht C. P. Küfner, and Marius Leckelt

> narcissists tend to impress others despite the fact that others are able to accurately detect their narcissistic characteristics

This chapter focuses on the **initial charm and subsequent interpersonal costs** of grandiose narcissists, using the **Dual-Pathway Perspective** (interplaying with the NARC concept).
The **Admiration pathway** accounts for the initial positive impression, while the **Rivalry pathway** is responsible for the rapid decay of that impression over time, as their antagonistic core becomes impossible to ignore.
However, beginnings are only positive insofar as the context triggers the admiration pathway, which is not always and necessarily the case.

A dual-pathway model of grandiose narcissism and early interpersonal impressions (Mitja D. Back, Albrecht C. P. Küfner, and Marius Leckelt)

The Decay of Initial Charisma

- **Admiration gains early social capital, but antagonism can start poorly**: *The agentic pathway (admiration) includes the tendency to behave dominant and expressive, which leads to being seen as assertive, which is evaluated positively and, thus, fosters popularity. The antagonistic pathway (rivalry) includes arrogant and combative behavior, which leads to being seen as aggressive, which is evaluated negatively and, thus, fosters unpopularity. Depending on which of the two pathways is triggered more in a given situation, at a given acquaintance level, and by a given facet of narcissism, a more or less pos itive/negative association between narcissism and popularity can result.*
- **The more intimate the setting, the more narcissism starts poorly**: T*he mixed findings of previous research can be understood as a consequence of each study realizing a different social context that was more or less self-presentational versus interactive (and increasingly intimate) and thus triggered the two pathways to different degrees. In line with this logic, previous studies that found a positive effect of narcissism on popularity were characterized by a rather self-presentational context, whereas previous studies that showed a negative effect were characterized by a more intimate and interactive context (see Küfner et al., 2013, for an overview).*
  (…) In a pure self-presentational context, differences in arrogant behaviors were not observable, making the antagonistic pathway ineffective—resulting in more positive effects of narcissism (carried via the agentic pathway). Finally, in a more intimate, interactional context (e.g., discussing moral dilemma or each other's positive and negative personality characteristics), uncommunal perceptions (e.g., being seen as aggressive or untrustworthy) were evaluated increasingly more negative, while being seen as assertive was evaluated less (but still) positively
- **Admiration predicts initial popularity, rivalry the loss of it long-term** measures of admiration indeed predicted narcissists' popularity at first sight (via dominant, expressive behaviors and being seen as assertive), while rivalry predicted its decline over time by an increase in arrogant, combative behaviors and being seen as aggressive/untrustworthy (Leckelt et al., 2015)
- **Narcissists have better body language:** narcissist's initial popularity could be explained by individual differences in specific appearances and behaviors: narcissists were liked more, because they dressed fancier (e.g., fashionable dress, stylish hair) and showed a charming facial expression (i.e. looked more self-assured and friendly) and self-assured body movements (e.g., straight posture, smooth movements)—all of which led to positive liking judgments.
- **Grandiosity, assertiveness, and charm create an "acquaintance effect"** where narcissists are quickly rated as **highly desirable and socially competent** in initial interactions

---

Chapter 34: Narcissism and Romantic Relationships

Authors: Joshua D. Foster and Amy B. Brunell

Narcissists tend to prioritize **physical attractiveness, status, and excitement** in partners over warmth and commitment, often viewing partners as "trophies" to enhance their own image.
They exhibit a distinct pattern of game-playing, low commitment, and a greater propensity for infidelity and relationship cycling. The chapter explains that their self-centeredness and inability to empathize lead to conflict, poor conflict resolution, and overall low relationship satisfaction for both partners over time.

Trophies, Game-Playing, and Dissolution

Relationship dynamics for the narcissist are dictated by the pursuit of self-enhancement and a lack of authentic intimacy.

- **Narcissists pursue "trophy partners"** who enhance their public image, prioritizing superficial qualities like **physical attractiveness and status** over emotional depth and genuine connection.

- **Narcissists may not even care they're not 'good at relationships':** *It might be true that narcissists miss out on benefits, such as emotional intimacy and mutual support. It is not clear, however, that narcissists would consider these to be benefits in the first place, given their highly individualistic nature (Campbell & Foster, 2007 ; Campbell, Rudich, & Sedikides, 2002).* <— ♂ **Lucio's note**: I agree, many highly agentic men prefer going through life focusing on their goals
- **Narcissists relationships can work if they're needs are met**: *although, narcissism is linked primarily to negative outcomes in long- term relationships, there are some instances when their long-term relationships function well. Most of these instances, perhaps not surprisingly, occur when narcissists are getting their needs met by their relationships/partners. For example, Foster (2008) demonstrated that narcissists, although generally less committed to their romantic relationships (Campbell & Foster, 2002 ; Foster et al., 2006), can be strongly committed when they feel highly satisfied with them.*
  - Attractive partners strengthen the relationship: *Seidman (2016) further demonstrated that narcissists tend to be most satisfied with their romantic relationships when they perceive their partners as meeting their agentic standards, such as attractiveness and status.*
- **Vulnerable narcissists struggle with intimacy**, often fearing abandonment but sabotaging closeness.

Extra Notes

- **Moderate grandiosity is good**: *Recent research suggests that the positive intrapersonal features of narcissism may be captured best by the lower half of the grandiose narcissism continuum (i.e., relatively low levels of grandiose narcissism), whereas negative interpersonal features are captured best by the upper half of the continuum (Foster, Shiverdecker, & Turner, 2016).*

Chapter 35: Narcissistic Qualities and Infidelity

Authors: James K. McNulty and Laura Widman

> McNulty and Widman (2014) used Widman and McNulty's (2010) measure of sexual narcissism the Sexual Narcissism Scale (SNS), to show that narcissism did predict infidelity when it was assessed specific to the sexual domain. Specifically, the SNS captures the extent to which people report entitlement, exploitation, sense of skill, and empathy in the sexual domain. For example, people report the extent to which they "will do whatever it takes" to have sex (exploitation), are "entitled to sex on a regular basis" (entitlement), are "an exceptional sexual partner" (sense of skill), and tend to be unconcerned with "the feelings of [their] sexual partners" (low empathy). **Although the NPI, a global measure of narcissism, was unrelated to infidelity in these samples, the measure of sexual narcissism was positively associated with the probability of infidelity**.

♂Lucio's Take: **This Sexual Narcissism Scale (SNS) sounds close to psychopathy**

Lucio:
I had some concerns about this scale.
The question of 'do whatever it takes to get sex' first and foremost, but also 'being unconcerned with the feelings of one's partner' and 'entitled to sex on a regular basis'.

The chapter right after added an interesting note:

- Narcissists who are high on rivalry (antagonistic self-protection) are less committed to their romantic partners, while there are no significant correlations for narcissists high on admiration (assertive self-enhancement) (Wurst et al. 2016)

Chapter 36: Understanding and Mitigating Narcissists' Low Empathy

Authors: Claire M. Hart, Erica G. Hepper, and Constantine Sedikides

The authors distinguish between **cognitive empathy (perspective-taking)** and **affective empathy (feeling what others feel)**, arguing that narcissists' deficits are not a *total inability* to understand others, but a *lack of motivation* to engage their empathy. They can understand others' feelings when instructed to do so (cognitive capacity exists), but they choose not to spontaneously, especially if it interferes with their self-enhancement goals. The chapter discusses strategies to potentially mitigate this deficit, mainly by reframing empathetic behavior as self-beneficial.

A Motivational Deficit in Empathy

- **Narcissists primarily demonstrate deficits in spontaneous affective empathy**, meaning they **do not naturally feel concern or distress** in response to another person's suffering.
- **They retain the capacity for cognitive empathy (perspective-taking)**, which can be **activated when they are explicitly motivated** or when it is self-serving to understand another's position (e.g., for manipulation).
  - Conscious focus allows for empathy: although narcissists displayed low empathy across a range of scenarios, they were capable of showing self-reported and physiological signs of empathy when explicitly instructed to

perspective-take (Davis, Conklin, Smith, & Luce, 1996).

- **Maladaptive narcissism is lower empathy**: much of the empathy literature has been concerned with global narcissism, some studies find that low empathy is more closely predicted by maladaptive (e.g., entitlement, exploitativeness) than benign (e.g., superiority, authority) aspects of narcissism (Hepper, Hart, & Sedikides, 2014 ; Hepper, Hart, Meek, et al., 2014 ; Watson & Morris, 1991 ; Wurst et al., 2016).
  - Entitlement and exploitativeness high scorers reported lower empathy for their partner ($\beta = -0.28$, $p = 0.03$), and—crucially—their partners perceived lower affective empathy emanating from them ($\beta = -0.35$, $p = 0.04$).
- **Mitigation strategies focus on appealing to the narcissist's self-interest**, suggesting that engaging in empathetic or pro-social behavior will enhance their image or status (e.g., "Good leaders are empathetic").

Chapter 37: Narcissism and Friendships

Authors: Ulrike Maass, Caroline Wehner, and Matthias Ziegler

Similar to romantic relationships, narcissists are theorized to be initially successful at forming friendships due to their charm and confidence, but for those relationships to deteriorate over time as narcissists use them as admiration sources and status enhancers (i.e., people who reflect well on them).
However, the authors claim that while there is some empirical support for this model in romantic relationships, there isn't yet enough data on friendships. **Friendships may be different than romantic relationships** as there may be more space, variety, and potential for instrumental exchange to make them work for narcissists.

Extra Notes

- Narcissism is related to more disagreeableness, for example, to more anger and swear words (Holtzman et al., 2010

Chapter 39: Narcissism's Relationship with Envy: It's Complicated

Authors: Darren C. Neufeld and Edward A. Johnson

The authors argue that the relationship is complicated because it differs across the narcissistic subtypes: **vulnerable narcissism is strongly and consistently associated with envy** (a painful feeling of inadequacy), while **grandiose narcissism is less associated with destructive envy** and may even be associated with a more **"benign" envy** or feelings of contempt for those perceived as inferior.

Malignant vs. Benign Envy

- **Vulnerable narcissism correlates highly with malignant, self-defeating envy**, characterized by **feelings of pain, inferiority, and a desire to destroy** the target's success, reflecting their insecurity.
- **Grandiose narcissism is less prone to painful envy**, instead employing a defensive strategy of **contempt or devaluation** toward the successful person to maintain their subjective superiority.
  traditional self-report measures of grandiose narcissism (i.e., the NPI) and envy (e.g., the DES) do not find a substantial, replicable narcissism – malicious envy link; if anything, the relationship appears to be generally weak and negative (Krizan & Johar, 2012 ; Neufeld & Johnson, 2016). Second, it is equally clear that measures of vulnerable, pathological narcissism (e.g., HSNS, PNI) demonstrate a robust relationship with dispositional and episodic envy.

- **Maladaptive grandiosity may still promote envy**: *The final verdict on grandiose narcissism and envy may not yet be in, however. Lange et al. (2016) contend that grandiose narcissists are indeed envious, although with a significant caveat: that maladaptive aspects of grandiose narcissism involving narcissistic rivalry are distinctly related to malicious envy, whereas the adaptive aspects involving narcissistic admiration are linked to benign envy.*
  - narcissists' exaggerated sense of entitlement may indirectly contribute to stronger malicious envy reactions when their heightened expectancies are frustrated.

Chapter 40: Narcissism and Prosocial Behavior

Authors: Sara Konrath and Yuan Tian

> We find that narcissistic people self-report more prosocial behavior but are actually less prosocial on more objective measures (peer report, behavioral).

The core finding is that narcissists are **not generally altruistic**, but they *will* engage in pro-social acts **if the behavior is public, visible, and serves to enhance their reputation or status**. Thus, their helping behavior is **self-serving and contingent** upon the opportunity to gain admiration and positive attention. They prefer "heroic" or high-visibility acts (e.g., donating a large, publicized sum) over low-visibility, anonymous helping.

Helping for Self-Enhancement

- **The likelihood of pro-social behavior is contingent on public visibility**, meaning narcissists are **more likely to help when others are watching** or when they receive explicit praise and recognition for the act.
- **Communal narcissists help when feeling insecure**: *the relationship between communal narcissism and pro social behavior depends upon whether their need for power has been satisfied (Giacomin & Jordan, 2015). Communal narcissists are actually less likely to help when their power and status feel secure. However, they are more likely to help when their power and status feel insecure.*
- **Narcissists may not respect the social exchange**: *Another study found that more narcissistically exploitative people felt less obligation to return favors to others who had helped them in the past (Brunell et al., 2013)*
- **Narcissists favor "heroic" or dominant helping roles** that allow them to demonstrate competence and superiority over quiet, communal, or long-term volunteering.
- **The underlying motivation is not genuine altruism but a need for admiration and status**, turning what appears to be a communal act into a self-focused, agentic behavior.

Chapter 41: Grandiose Narcissism and Religiosity

Authors: Anthony D. Hermann and Robert C. Fuller

The authors find that narcissism is generally **negatively correlated with intrinsic religiosity** (a genuine, internalized faith) but can be **positively associated with extrinsic religiosity** (using religion for social status or personal gain). The narcissist's grandiosity often clashes with traditional religious humility, but they may utilize religious institutions or spiritual claims (e.g., believing they have a 'special' connection to a higher power) to enhance their feelings of uniqueness and superiority.

Instrumentalizing Faith for the Ego

- **Narcissism is negatively related to humility and genuine religious internalization**, as the need for

superiority directly conflicts with the core tenets of most humble faiths.

- **Spiritual grandiosity** is common, where the narcissist believes they have a **unique or privileged relationship with the divine**, using this belief to set themselves apart as special and entitled. Religion is co-opted as a social tool to reinforce grandiosity rather than to foster humility or community.
- **Vulnerable narcissists may use religion as a crutch**: *Zondag and van Uden's (2010 , 2011) findings similarly indicate that religious vulnerable narcissists may feel more dependent upon study also showed an intriguing positive correla tion between vulnerable narcissism (and other vulnerable dark traits) and religious fundamentalism (Unterrainer et al., 2016), suggesting that vulnerable narcissists may be drawn to highly structured religious belief systems to compensate for the lack of agency and control they perceive in their personal lives*

Chapter 42: Narcissism and Spirituality: Intersections of Self, Superiority, and the Search for the Sacred

Authors: Joshua B. Grubbs, Nicholas Stauner, Joshua A. Wilt, and Julie J. Exline

Spirituality is a less structured, more personally defined domain than organized religion. The authors identify a construct they term **"Spiritual Grandiosity,"** where the narcissist claims a unique, superior, or profound connection to the sacred, often expressing disdain for conventional religious practices. This reflects a self-enhancement strategy where spiritual experiences are used to affirm their exceptionalism and intellectual superiority over those who follow traditional paths.

Spiritual Grandiosity as a Self-Enhancement Tool

- **Spiritual Grandiosity involves the belief in a unique, deep, or profound spiritual insight** that is superior to the average person's understanding, which is a direct reflection of narcissistic exhibitionism.
- **Divine entitlement = belief in being owed by God**: report attitudes such as, "People like me deserve extra blessings from God," and "I insist on getting what I want out of my spiritual life." More simply, divine entitlement is characterized by the idea, "God owes me" (Grubbs et al., 2017).
  - Entitlement increases struggles with spirituality: entitlement consistently emerges as a robust predictor of R/S struggles with the divine. More narcissistic and entitled individuals report more anger at God in general, more anger at God in response to difficult life circumstances, more disappointment with God, and greater fears that God might be displeased with them.
- **Narcissists are more likely to endorse non-traditional or unconventional spiritual beliefs** that allow them to define their own rules and avoid the humility required by organized religion.
- **This spiritual belief often comes with a sense of entitlement to guidance or protection**, believing that the universe or a higher power should grant them preferential treatment due to their special nature.

Chapter 43: Narcissism and Leadership: A Perfect Match?

Authors: Barbara Nevicka

Narcissists **are highly likely to emerge as leaders** due to their charisma, confidence, and assertiveness, which align with stereotypical leader prototypes. However, their **leadership effectiveness is often mixed or negative** in the long term, due to their antagonism, poor listening skills, and tendency to prioritize personal glory over organizational success, leading to volatile or toxic work environments.

Emergence Is Narcissists' Speciality

- **Narcissism strongly predicts leadership emergence**, as their **high Extraversion, dominance, and confidence** make them appear decisive, charismatic, and "leader-like" in group settings.
  - *Acting dominantly enhances perceptions of competence regardless of actual competence, and thereby leads to attainment of influence in a group* (Anderson & Kilduff, 2009)
  - *Paulhus (1998) found, for example, that at first acquaintance, narcissists seemed to be perceived as intelligent by their fellow group members (see also Carlson et al., 2011)*
- **Narcissists seek leadership**: narcissistic individuals are also likely to actively seek leadership positions themselves. They show a dislike of subordinate positions (Benson, Jordan, & Christie, 2016), unless it presents opportunities to climb the hierarchical ladder (Zitek & Jordan, 2016)
  - Leadership = opportunity for admiration: *Moreover, narcissists' ceaseless pursuit of admiration (Morf & Rhodewalt, 2001) leads them to seek social contexts that enable them to show off their superiority (Wallace & Baumeister, 2002). The leadership role thus provides them with an alluring stage from which they can receive the adulation they seek.*
- **The relationship between narcissism and performance is often non-linear**, suggesting that **moderate levels may be optimal** (assertive but not destructive), while high levels are detrimental.
  - *A recent meta-analysis found no linear relationship between leader narcissism and follower perceptions of leader effectiveness (Grijalva et al., 2015) but did find a curvilinear relationship. Thus, while a certain level of narcissism in leaders appears to be associated with positive evaluations, beyond a certain threshold narcissism is considered negative.*

Advantages of Narcissistic Leadership

- **Decisiveness and persistence:** Narcissists make firm decisions and persist even after failures.
- **Thrive in high-pressure, evaluative environments:** They perform well when under challenge, scrutiny, and opportunities to display competence.
- **Charismatic communication:** They articulate bold visions and are often perceived as charismatic leaders, which helps mobilize followers.
- **Inspire followers toward shared goals:** Their confidence and vision can motivate teams and align people toward organizational objectives.
- **Promote radical innovation:** They are more likely to push for bold, transformative, and unconventional changes.
- **Reduce follower insecurity during uncertainty:** In crises or uncertain environments, their confidence can provide a sense of stability for followers.
- **Effective crisis leadership and agenda-pushing:** Research on U.S. presidents shows narcissism predicts strong crisis management, persuasive public communication, and the ability to push legislation forward.

Cons of Narcissistic Leadership

- **Embezzlement risks**: *Narcissists have been found to use resources for their own gain at a long-term cost to others (Campbell, Bush, Brunell, & Shelton, 2005), which could end up hurting their organizations. Moreover, narcissism has been linked to white-collar crime (Blickle, Schlegel, Fassbender, & Klein, 2006) and engagement in counterproductive work behavior (Penney & Spector, 2002), such as theft, sabotage, interpersonal aggression, and work slowdowns.*
- **Close-mindedness and rejection of different opinions**: narcissists tend to only listen to information they want to hear, believe that their ideas and solutions are the best (Maccoby, 2000), and disregard other people's advice (Kausel, Culbertson, Leiva, Slaughter, & Jackson, 2015)

- **Reduced information-sharing**: *Research on the influence of narcissistic leaders in decision-making teams found that narcissistic leaders were inclined to dominate the discussion and reduce information sharing among their followers, which led to reduced team performance (Nevicka, Ten Velden, De Hoogh, & Van Vianen, 2011).*
- **Risky projects that can cost big**: Narcissists' tendency to ignore expert advice and their need for glory and adulation might also lead narcissistic leaders to pursue unrealistic projects and risky investments or even display unethical and deviant work behavior. Indeed, narcissistic CEOs made riskier investment decisions which generated greater volatility in organizational performance (Chatterjee & Hambrick, 2007).
- **Abuse of followers, potentially losing talent**: *narcissists' lack of empathy and their tendency to attribute failures to others while taking credit for successes (Stucke, 2003) could lead narcissistic leaders to abuse their power and bully their followers, thereby compromising follower wellbeing (Tepper, 2000). For instance, narcissists have been repeatedly found to show aggressive reactions toward criticism or anything they perceive as a threat to their ego (e.g., Barry, Chaplin, & Grafeman, 2006; Bushman & Baumeister, 1998), even showing displaced aggressive responses toward innocent others (Martinez, Zeichner, Reidy, & Miller, 2008)*
- **Power makes it worse**: *Importantly, power seems to exacerbate narcissists' overconfidence (Macenczak, Campbell, Henley, & Campbell, 2016), which implies that the higher narcissists climb in hierarchy, the more toxic their negative characteristics might become*

Many world leaders are narcissists

> *It is thus not surprising that many world leaders and CEOs have been ascribed with narcissistic characteristics (Deluga, 1997; Glad, 2002; Maccoby, 2000). Examples of these leaders range from dictators such as Napoleon, Adolf Hitler, Joseph Stalin, and Saddam Hussein (Glad, 2002) to business leaders such as Steve Jobs and Kenneth Lay of Enron (Kramer, 2003; Robins & Paulhus, 2001) and political leaders such as Donald Trump* (Visser, Book, & Volk, 2017)

Narcissism May Work Short-Term, Not Long-Term

> Specifically, narcissistic leaders are proposed to be beneficial for organizations in the "emerging zone" (i.e., in short-term contexts following ascent to leadership position; during brief periods of instability, insecurity, or crisis; in situations involving unacquainted individuals or early-stage relationships) and detrimental in the "enduring zone" (i.e., in long-term contexts, in situations involving acquainted individuals or continuing relationships; Campbell et al., 2011).

Submissive Followers May Best Fit Narcissists

Dominance complementarity theory says relationships run more smoothly when one person is dominant and the other is passive, and that clashes occur when *both* try to be dominant.

So a narcissistic (dominant) leader paired with a dominant or proactive follower is likely to experience conflict and frustration on both sides. In contrast, submissive followers usually feel more comfortable being directed and structured by a dominant leader. Supporting this view, previous research shows that extraverted (dominant) leaders improve the performance of passive followers but harm the performance of proactive ones.

Narcissistic leaders may also remove strong followers in favor of submissive yes-men:

> Narcissists' need for adulation and desire to work with submissive followers might lead them to curb voices of opposition and surround themselves with sycophants. This makes it all the more important to not be blinded by the positive, sometimes charming, side of narcissistic leaders without realizing that this leadership package also comes with many toxic sides.

Chapter 44: Narcissistic Followership

Authors: Alex J. Benson and Christian H. Jordan

This chapter explores the relatively newer concept of **Narcissistic Followership**, examining how individuals high in narcissism behave when they are in the role of a subordinate.
Narcissistic followers are characterized by **ambition, entitlement, and a willingness to challenge authority**, especially when they perceive the leader as inferior or as standing in the way of their own ambitions. Their behavior is often a double-edged sword: they can be highly innovative and challenging (adaptive), but also disloyal, insubordinate, and disruptive to team cohesion (potentially maladaptive), particularly when their need for recognition is not met.

Ambition and Entitlement in Subordinate Roles

- **Narcissistic followers are highly goal-oriented and competitive**, often driven by a desire to **outperform their peers and eventually displace the leader** for their own advancement.
- **Their behavior is conditional on how the leader reflects on their own image**, showing **loyalty only when the leader is prestigious** and can serve as a source of reflected glory.
- **The most maladaptive aspect is insubordination and friction**, as their entitlement leads them to feel that rules and organizational procedures should be **waived for their superior talents**.
- **Hands-off management may work better:** *Narcissistic followers may respond more favorably to leaders who demonstrate how their own interests align with the collective interests of the group or team (Nevicka, De Hoogh, Van Vianen, Beersma, & McIlwain, 2011).*
- ⚠ **Careful of narcissistic team members**: *research suggests that narcissists intentionally undermine organizational goals, by engaging in counterproductive work behaviors, when they feel constrained by their workplace role (Penney & Spector, 2002).*
  - Low engagement: *narcissists are less motivated in positions of followership. Narcissists are less willing to engage in extra-role behaviors and more concerned about their own interests when assigned to a subordinate role than a project manager position (Benson, Jordan, & Christie, 2016)*
  - Poor mentoring experience: *narcissistic entitlement among protégés translated into mentoring relationships that were shorter in duration and characterized by more negative mentoring experiences (Allen, Johnson, Xu, Biga, Rodopman, & Ottinot, 2008)*

Chapter 45: Trait Narcissism and Social Networks

Authors: Allan Clifton

The research indicates that while narcissists initially have **large social networks** (due to their extraversion and charm), these networks are characterized by **low depth and quality** (low intimacy). Over time, their network centrality may decrease, and they tend to rely more on **weak ties** (acquaintances) than strong ties (intimate friends). The core finding is that narcissists value the breadth of their network as a stage for exhibitionism and a source of status, not as a source of genuine emotional support.

Breadth Over Depth in Social Ties

Social networks are instrumental for performance and admiration, not for emotional connection.

- **Narcissists maintain larger social networks**, consistent with their **high social engagement and drive to accumulate admiration** from many sources.
- **Their networks are characterized by low intimacy and emotional support**, as they prioritize **superficial, high-status ties** that enhance their image over deep, reciprocal relationships.
- **Lots of outreaches but few real friends**: *Narcissism was also associated with higher outdegree, but not indegree. In fact, narcissism predicted a lower reciprocity in connections*
  - Narcissists overestimate quantity and quality: *more narcissistic participants significantly overestimating the number and quality of their connections with others.*
- **They occupy a position of high centrality in their networks initially**, but the quality of these connections often **deteriorates over time** as their exploitative and demanding nature becomes apparent.

Chapter 47: Social Media: Platform or Catalyst for Narcissism?

Authors: Christopher T. Barry and Katrina H. McDougall

This chapter addresses the contemporary debate about the relationship between narcissism and **social media usage**. The authors argue that social media platforms are primarily **enabling environments** (platforms) for narcissistic behavior rather than direct *causes* (catalysts) of the trait. They contend that individuals high in narcissism are simply drawn to platforms that allow for **self-promotion, exhibitionism, and the accumulation of public admiration** (likes, followers). This allows narcissists to efficiently fulfill their core needs through frequent posting, high self-disclosure, and the careful curation of a grandiose online self-image.

Social Media as the Perfect Narcissistic Stage

The platforms offer an ideal environment for exhibitionism and harvesting external validation.

- **Narcissists are drawn to social media due to its affordance for self-promotion and exhibitionism**, as the medium provides an efficient way to **showcase their perceived superiority and attain admiration**.
- **Behaviors such as frequent selfie-posting, aggressive responses to negative comments, and the curation of an idealized persona** are manifestations of their core traits in the digital sphere.
- **Vulnerable narcissists spend more time editing photos**: *vulnerable narcissism is related to spending more time editing photos before posting to Instagram (Sheldon & Bryant, 2016), perhaps because of concern with getting the most favorable responses from other users*
- **The correlation between narcissism and specific social media metrics (e.g., number of friends/followers, frequency of status updates)** supports the idea that the platform is **instrumentalized for ego-enhancement**.

Chapter 48: Theoretical Perspectives on Narcissism and Social Media: The Big (and Beautiful) Picture

Authors: W. Keith Campbell and Jessica McCain

This chapter offers a broader theoretical lens on the relationship between narcissism and social media, viewing the platforms as part of a larger **cultural shift toward individualism and self-enhancement**. The authors place social media within the **Contextual Reinforcement Model**, suggesting that the platforms reinforce narcissistic behavior by consistently rewarding self-promotion with immediate validation. They propose that social media is both a **reflection of and a contributor to** the cultural acceptance of narcissistic self-presentation, providing an echo chamber that actively stabilizes the grandiose self-image.

The Contextual Reinforcement Model

- **Social media provides consistent, immediate, and quantifiable reinforcement** (likes, positive comments) for narcissistic behaviors, which **stabilizes the grandiose self-view** over time.
- **The curated, idealized self-presentation** in the digital sphere allows narcissists to **control the narrative and minimize the appearance of their negative, antagonistic traits**.
- **The impact of social media extends beyond the individual**, potentially contributing to a **broadening of cultural norms** that encourage self-enhancement and focus on external validation.
- **Harsh reality and inflated self leads people into fantasy world**: *Given the stark realities of the economic collapse of the Great Recession, we have been working on another model, the great fantasy migration hypothesis (GFM). GFM presents the following argument: high narcissism plus a belief in a collapsing economic system will push narcissistic individuals into virtual or fantasy realms where their narcissism can be maintained. Or, simply, an inflated self plus a deflated reality predicts fantasy migration. Someone high in trait narcissism and failing economically can still retain an inflated self-view by engaging in an aspect of geek culture (e.g., gaming, sci-fi, cosplay) or social media where the checks of the reality principle are put on hold)*

Chapter 46: Momentarily Quieting the Ego: Short-Term Strategies for Reducing Grandiose Narcissism

Authors: Miranda Giacomin and Christian H. Jordan

This chapter shifts focus to **practical interventions**, specifically short-term strategies that can temporarily **reduce or "quiet" the expression of grandiose narcissistic traits** in a given situation. The authors discuss brief, targeted interventions, often based on cognitive-behavioral principles, that can disrupt the self-enhancement loop. These strategies involve **inducing empathy, promoting humility, or increasing awareness of their own negative impact**, showing that narcissistic behavior is not entirely rigid and can be momentarily modulated by context-specific cues.

Practical Intervention and Easing the Self-Focus

- **Inducing a state of awe or low power can reduce grandiosity and self-focus** (e.g., imagining the vastness of the universe)
- **Enhancing communal orientation** *(through greater empathy or interdependent selfconstrual) led participants to endorse fewer narcissistic self-statements on the NPI. In turn, reducing state narcissism reduced some of the negative tendencies associated with narcissism, such as an overriding desire for fame (Giacomin & Jordan, 2014, Study 4)*
  - Encourage thinking about similarities to others
- **Communal activation**: *Another series of studies examined effects of "communal activation" on relationship outcomes (Finkel, Campbell, Buffardi, Kumashiro, & Rusbult, 2009). Narcissists are generally less committed to their relationship partners, but narcissists who reported that their romantic partners elicit communal traits from them (e.g., make them feel more caring and warm) actually became more committed to their marriages over time. Similarly, priming participants with communal images (e.g., a teacher helping a student) led narcissists to report greater commitment to their romantic partners*
- **Communal mantras**: *Other research found that repeating communal self-statements, such as, "I am a caring person" (even relative to statements such as, "I am a loveable person"; Kopp & Jordan, 2013), reduced endorsement of the entitlement-exploitativeness facet of narcissism for individuals who were initially high in entitlement-exploitativeness. Likewise, recalling a time when they were caring toward someone else reduced participants' entitlement-exploitativeness compared to recalling their typical morning routine. These results are notable because the entitlement-exploitativeness facet of the NPI is arguably its most maladaptive and interpersonally toxic facet (e.g., Watson & Morris, 1991). Thus, a variety of methodologies designed to enhance the extent to which people*

feel connected to others helped decrease their endorsement of narcissistic qualities, at least temporarily
  - Personal value journaling: *self-affirmation can be an effective means of reducing narcissistic aggression in at-risk youth. After completing a self-affirmation exercise or a control writing exercise they found that a values affirmation exercise (i.e., writing a short paragraph on important personal values) reduced narcissistic aggression for an entire school week among adolescents compared to a control writing exercise (Thomaes, Bushman, De Castro, Cohen, and Denissen, 2009)*
- **Perspective-taking interventions (e.g., explicit instructions to take the victim's point of view)** can **temporarily increase empathetic responding**, bypassing the motivational deficit.

Chapter 49: Narcissism and Bullying

Authors: Kostas A. Fanti and Georgia Frangou

> bullying is a complex behavior, in which someone engages purposefully when their goal is to gain power and social status (Olweus, 1993; Vaillancourt, Hymel, & McDougall, 2007)

This chapter investigates the link between trait narcissism and bullying behavior, defining it as a form of proactive and reactive aggression driven by the need for dominance and status. The authors find that narcissism is linked to bullying and bullying is an effective, albeit toxic, way to assert superiority and gain attention. Bullying for the narcissist is often an *instrumental* act to secure or defend high status within a peer group, making it a functional, rather than purely emotional, expression of their antagonism.

Instrumental Aggression for Status

Bullying is a self-serving behavior used to establish and maintain dominance in the social hierarchy.

- **Grandiose narcissism is a robust predictor of both traditional (physical/verbal) and cyberbullying**, as these acts are effective ways to demonstrate **power and superiority** over victims.
- **Maladaptive narcissism is likely more linked to bullyin**g: *prior work supported that only maladaptive narcissistic traits were positively correlated with antisocial and aggressive behavior (Barry et al., 2003), although further research on the topic is required to make a firm association in regard to the relation between maladaptive narcissism and bullying or victimization.*
- **Bullying can be both proactive (instrumental) and reactive (ego-defensive)**, used either to secure a high social rank or to aggressively retaliate against any peer who threatens their status.
- **Low self-esteem and high narcissism is a tool for bullying**: I*t has been suggested that youth low on self-esteem and high on narcissistic traits tend to self-enhance or seek attention with antisocial behaviors to protect their vulnerable self and enhance their grandiose self-image (Baumeister, Smart, & Boden, 1996). Indeed, individuals with low selfesteem and high narcissism tend to use bullying to enhance their self-image, as bullying is a status-related goal behavior (Caravita & Cillessen, 2012; Fanti & Henrich, 2015; Sijtsema, Veenstra, Lindenberg, & Salmivalli, 2009). Findings by Salmivalli, Kaukiainen, Kaistaniemi, and Lagerspetz (1999) also suggested that adolescents with defensive self-esteem (high defensive egotism and average self-esteem) showed high levels of bullying, whereas adolescents with low scores on both bullying and victimization (i.e., belonging in a normative group) scored high on self-esteem and low on defensive egotism.*
  - Bullying as reaction to ego-threats: I*n other words, when the ego of a bully is threatened, he or she might be more likely to exhibit aggression toward peers as a way to compensate for these threats and recover their inflated self-views (Barry et al., 2007; Washburn et al., 2004).*

Chapter 50: Narcissistic Individuals and Implications for Treatment

Authors: Joanna Lamkin

The chapter highlights that narcissists often enter treatment reluctantly, typically only when external consequences (e.g., relationship loss, career trouble) force them to. Their grandiosity and entitlement make them prone to **devaluing the therapist, challenging the process, and struggling with therapeutic alliance**, often leading to poor treatment adherence and high dropout rates.
The core interpersonal traits (antagonism, low empathy, grandiosity) create a **hostile and challenging dynamic** in the therapy room.

The Therapeutic Challenge of Narcissism

- **Narcissists often struggle with therapeutic alliance**, exhibiting **mistrust, demanding behavior, and devaluing of the therapist** as they perceive the professional relationship as a threat to their autonomy and superiority.
- **Narcissists' need for power makes therapy challenging**: *Interpersonal control (e.g., maintenance of a sense of mastery and self-sufficiency) can be a major hindrance to treatment for narcissistic personality disorder (Ronningstam, 2010). Therapy could be perceived as an affront to interpersonal control in that patients may have to relinquish some amount of this control.*
- **Treatment is often prompted by external crises** (e.g., job loss, partner ultimatum) rather than intrinsic motivation for change, making the focus of therapy on **symptom reduction to restore status** rather than genuine personality change.
- **The primary challenge is managing the grandiosity and entitlement** while maintaining a non-confrontational but firm boundary, necessitating a **specialized, supportive, and non-judgmental therapeutic approach**.

Chapter 51: The Treatment of Trait and Narcissistic Personality Disturbances

Authors: Jeffrey J. Magnavita

The author stresses that unlike other personality disorders (e.g., Borderline Personality Disorder), there are no empirically validated, manualized treatments specifically proven for NPD. Instead, clinicians rely on integrative, principle-based psychodynamic and cognitive-behavioral approaches that focus on managing core traits like self-esteem regulation, entitlement, and empathy deficits. The chapter advocates for a holistic, unified approach that addresses the underlying fragility and the maladaptive self-regulatory mechanisms of the disorder.

Integrative Treatment Approaches

Therapy for narcissism relies on general principles due to a lack of disorder-specific empirical support.

- **There is an absence of controlled treatment outcome studies** that demonstrate efficacy for specific NPD-focused therapies, forcing clinicians to use **integrative, principle-based approaches**.
  - the treatment of narcissistic disorders remains rooted in clinical case material
- **Key therapeutic goals include regulating the fragile self-esteem** by encouraging a move from contingent, external validation to stable, internal self-acceptance.
- **Treatment focuses on managing the entitlement and aggression** by encouraging accountability, exploring

the interpersonal costs of their behavior, and slowly fostering a capacity for self-reflection and empathy.

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Overreaction in relationships = low power

> recent research showing that men low in relational power are particularly likely to take aggressive steps to restore their manhood when they are situationally threatened (see Overall, Hammond, McNulty, & Finkel, 2016) suggests perceived power and attempts to restore status may be relevant factors, at least among men.

You must power-protect high-power people to influence them

> More narcissistic people are less likely to help when directly asked (high social pressure), perhaps as a show of interpersonal domination. However, narcissism is unrelated to the tendency to help when under low social pressure.

It was the opposite for vulnerable narcissists instead, who probably caved in to the social pressure.

- How to power-protect, show respect, and get it your way

> How to Show Respect, Maintain Rapport, & Influence People

Weak followers elect narcissists

At TPM we've long believed that empowered men not only do better for themselves and contribute more to society, but also choose better leaders.

In contrast, we've suggested that disempowered men not only fare worse themselves and add less value to society, but also elect worse leaders.

Disempowered men are more easily duped by dark triads (naivete), and more likely to submit and be drawn to dominance, even when value-taking dominance (submissiveness).

This passage lends credibility to this take:

> dominance complementarity theory would suggest that **narcissistic leaders might fit better with followers who are more submissive rather than dominant** (Grijalva & Harms, 2014). This theory posits that more satisfying relationships are achieved when dominant, assertive behavior by one person corresponds with submissive, passive behavior by the other (Carson, 1969; Kiesler, 1983).
> In contrast, when two individuals both demonstrate dominant behavior, this leads to irritation and anger (Shechtman & Horowitz, 2006).
> Thus, a narcissistic leader with a dominant follower might get frustrated in his/her efforts to exert influence over this follower, and likewise, proactive or more dominant followers might get frustrated with assertive leaders. Conversely, submissive followers will feel more comfortable in a position where they are controlled by

> a leader, because this provides them with structure and direction (Thoroughgood, Padilla, Hunter, & Tate, 2012).
> In support of the dominance complementarity theory, prior **research found that extraverted leaders had a positive influence on performance of followers who were passive, but a negative influence on performance of proactive followers** (Grant, Gino, & Hofmann, 2011).

QUOTES

Quote from Arnold Schwarzenegger, and the author comments that 'it didn't matter how he achieved fame':

> The incredible desire to be recognized. […] I got the feeling that I was meant to be more than just an average guy running around, that I was chosen to do something special. At that point, I didn't think about money. I thought about the fame, about just being the greatest. I was dreaming about being some dictator of a country or some savior
>
> -Arnold Schwarzenegger, in an interview with Rolling Stone (Peck, 1976)

On heritability:

> All personalities are heritable (Turkheimer, 2000), and narcissism is no exception.

On the amorality of evolution:

> just because something is morally suspect does not mean that it didn't evolve; indeed, bad things can evolve.

On narcissists' good first impressions:

getting-to-know situations are made for narcissists. These situations offer an opportunity to self-present and impress others, satisfying narcissists' motivation for admiration and glory rather than mutual liking (Campbell & Foster, 2007; Hart, Adams, & Burton, 2016; Miller, Price, Gentile, Lynam, & Campbell, 2012; Rhodewalt & Morf, 1995; Wallace & Baumeister, 2002).

On narcissists' tendency to rise to leadership positions:

> there is a group of individuals and one of them has many narcissistic characteristics, this person will most likely be chosen as the group's leader

A wise advice:

> pay attention to narcissists' actions, rather than their words, and that when narcissistic people do behave prosocially, it might be judicious to question their motives.

⍰⍰♂ Lucio's Analysis

Collective narcissism may also apply to gender identification

de Zavala asks in the 'future directions' section:

> It is not yet entirely clear whether collective narcissism is a general tendency to form narcissistic attachment to all social groups to which people belong or whether some groups inspire collective narcissism more than

> others.

Even before reading the research on collective narcissism, I had observed collective narcissistic dynamics in some manosphere communities and authors, as well as in certain feminist circles.

Some individuals in these movements appear to project their personal ego onto their gender in-group and react accordingly. A 'win' for the in-group becomes a personal win, and a perceived 'loss' or 'attack' on the in-group, even when the comment is simply an observation not intended as criticism, is experienced as a personal attack.
I've seen many disproportionate reactions that resemble narcissistic rage, driven by ego threat and the perceived need to restore personal power or self-esteem.

I'd love to see more research examining how collective narcissism operates specifically in the context of gender-based identification.

See more:

- **Collective narcissism in the manosphere**

The Short-Term Mating Hypothesis Isn't Invalidated By Lack of Unadorned Attractiveness

Holtzman questions whether narcissism may have evolved via short-term mating because narcissists are not physically attractive at the adorned level ('lover strategy').
He says that 'short-term mating situations select for raw attractiveness'.

While I agree that physical attractiveness at the unadorned level may have provided stronger evidence, I believe that the lack of unadorned attractiveness does not undermine the theory because:

1. **Adorned attractiveness matters**, and may matter as much if not more than adorned one
2. **Behavior matters in attractiveness**, with some studies showing that dominance may matter more than looks
3. **Pursuit of short-term mating matters**, in itself. Everything staying the same, the guy who pursues sex the most will also *have* more sex

The idea that narcissism evolved via short-term mating, however, is currently questionable, mainly because narcissists are not physically attractive at the unadorned level; in theory, narcissists should be attractive at the unadorned level

The NPI May Confuse Ability With Disposition For Exploitativeness

One of the NPI choices is between:

- I find it easy to manipulate people.
- I don't like it when I find myself manipulating people.

In my case, I *do* find it easy to manipulate people, but that's because manipulation dynamics is an area I study and understand well. It reflects **competence**, not a desire to exploit others.
And the second option doesn't speak to me because I wouldn't manipulate good, close, or honorable people. But I also don't have the same concerns with individuals who, in my view, are acting in bad faith. So selecting the second option would be inaccurate.

Yet on the NPI, choosing the first item would automatically score as higher *exploitativeness*.
In that sense, the NPI risks **confounding ability with disposition**: I'm answering based on *skill*, but the scale interprets it as *attitude*, *motivation*, or *lack of morals*.

NPI May Be Clearer On Entitlement Questions

I also felt this question could have been phrased better.

> "I will never be satisfied until I get all that I deserve"

I interpreted it as working hard towards what someone want (high agency and lower entitlement).
But since the other option was high communion, I wondered what facet that question analyzed. And was surprised to see it was entitlement.

Suggestions to The Editors

This one was one of my favorite handbooks in both content and structure.
What I loved particularly and which I'd encourage other editors to emulate and systematize is:

- **Summary of the findings at the beginning**: it prepares the mind for what's to come, enhancing comprehension and retention
- **Skip intro on narcissism's history and basics in the chapters** (ie.: Narcissus, definition, etc.): saves time, space, and keeps the chapter high-density of quality information
- **Stick to the topic of the chapter**, limit off-topic to what's relevant to the chapter's topic. This handbook largely excelled at this

REVIEW

The Handbook of Trait Narcissism provides the most comprehensive, empirically grounded overview of narcissism.

Although written for a more advanced, research-oriented audience, it stands as the #1 reference work on the topic at the time of writing.
I've taken extensive notes from it to strengthen TPM's articles and training material, and I'm grateful to the editors and authors for producing such a valuable resource.

Check the best books on narcissism or check our **most recommended books**.

Takeaways

- **Relationships are based on exchanges of value**
- **Men's SMV increases as a function of time**, while women's decreases <— ⁉️♂️ **Lucio's note**: it's more about having different curves, than one rising and one decreasing
- **Relationships & sex are decreasing because people can better meet their needs outside of relationships**

NOTES

About the Author:
Orion Taraban is a clinical psychologist and educator best known for his YouTube channel *Psych Hacks*, where he analyzes dating, relationships, and intersexual dynamics. Taraban got his master's degree from the *California School of Professional Psychology*, part of the for-profit university *Alliant International University*.

Chapter 1: Relationships Are the Media in Which Value Is Transacted

Human relationships are, at their core, value exchanges.
Relationships emerge when people have something the other wants.

People aren't aware of these dynamics because they act based on emotions, but emotions are based on the underlying principles of social exchanges.

The main law of relationships is that **people enter into (and remain in) sexual relationships with their perceived best options.**

The foundation of all relationships is perceived value. And people with more of what others want enjoy greater optionality. High value men (or women), are people who can provide to others more of what they want.

Chapter 2: Sexual Relationships Are Transacted in the Sexual Marketplace

The "sexual marketplace" with its raw drive for sex and reproduction permeates human society, no matter how much we try to sanitize or suppress it.

Understanding this marketplace lens helps us grasp why people behave the way they do. Just as with economic value, sexual desirability isn't evenly distributed. Some people have high demand, others don't. And just like in economics, those with more sexual value enjoy more options and power — unless they squander it or fail to manage it strategically.

Two skills to master to succeed:

- Seduction
- Frame management

See this advanced list of frame control techniques:

> 10 Frame Control Techniques to Out-Frame Anyone

⍰⍰♂ Lucio's note: Some dynamics must be rectified. Attractive women propositioning relationships are successful
The author writes that *'a man who directly propositions a woman for sex generally enjoys as much success as a woman who directly propositions a man for a "serious relationship. These two offers are gendered equivalents of each other.'*".
I get his point, but it's not the case: highly attractive men get away with it, and most average men would be more than happy to take up an attractive woman's offer for a serious relationship.

Chapter 3: Everyone Has a Value in the Sexual Marketplace

This chapter introduces the concept of SMV — Sexual Marketplace Value — the rough "price" at which each person trades in the dating world.
While some are uncomfortable with the idea, most people unconsciously apply SMV when making dating decisions.

⍰⍰♂ Lucio's note: Imprecise estimation of SMV peak

Write the author:

> on a popular dating app found that, across millions of data points, women at age 23 were most attractive to men, while men at age 50 were most attractive to women (…) Collectively, this evidence makes sense (…) at 50 years old, a man might have an established position in society (…) from a wealth and status perspective, a man at this age is in his prime.

This fails to account for *who* preferred these 50-year-olds.
I'd be willing to bet it was mostly *older* women who preferred 50-year-old men, not *young* women at their peak.
And *especially* not younger women matching on raw attraction.

Chapter 4: Everyone Is Trying to Negotiate Their Best Possible Offer

Marketplaces, by nature, encourage the production and offering of value, which is a good thing.

Just like in economics, perceived scarcity, demand, and presentation matter. He draws a parallel with the commercial market: if everyone suddenly had infinite resources, cooperation would collapse. The same applies to people — a constant sense of needing more (love, approval, success) drives participation in the relational marketplace.

⍰⍰♂ Lucio's note: it's not antagonism, it's converging and diverging interests

Taraban's overarching frames are antagonism and competitiveness, but they're not the best high-level frames to understanding these dynamics.

Instead, think of a mix of converging interests that promote cooperation and diverging interests that may promote game-playing and manipulation.

Ultimately, converging interests in relationships have been larger in evolutionary history, or relationships wouldn't have formed.

Chapter 5: Negotiation Is the Fundamental Game of Human Relationships

The human condition is to be always negotiating with others to get our needs met, and generally without violence or coercion.

Negotiation entails manipulation and, says the author, eliciting emotions in others is always a form of emotional

manipulation.

Chapter 6: The More Powerful Player Always Wins the Game

> power is an inescapable dimension of relationships, and if relationships are the media in which people transact for their needs and wants, then (…) it is in everyone's best interests to accept this reality and learn to navigate power dynamics as effectively as possible.

We agree with that, and that's our focus here at The Power Moves: teaching men how to navigate power dynamics to achieve goals and win at life.

This chapter reinforces a common truth from power dynamics: the person with more power determines the outcome.

The author also mentions how the 'willingness to transgress' can confer power:

> Understanding this principle goes a long way toward explaining why those with *dark triad* personality traits – narcissism, Machiavellianism, and psychopathy – often succeed (at least, in the first two phases) in the game of mating and dating.

There are more reasons why dark triads are more successful, and his analysis on 'emotionally weak', may refer to outdated views related to the 'mask model'.

Taraban also lists a few established principles of power dynamics, including the 'law of least social effort' based on social ROI dynamics:

Social ROI Matrix, part of Social Investment Theory (Buffalmano, 2026). The person who gets the most with the least effort is higher power

Also read:

- 5 Principles of dating power dynamics

- Laws of interpersonal power dynamics
- Interpersonal power dynamics: an overview

> The 5 Principles of Dating Power Dynamics: Effective Dating

Chapter 7: Attractiveness Is the Key to Power in Sexual Relationships

Attractive people enjoy more choice, better terms, and can bend norms with less consequence.

⍰⍰♂**Lucio's note**: Taraban's definition of 'attractiveness' illustrates why his work could gain with more simplicity, rather than added complexity:

> My working definition is that attractiveness is the degree to which people align with the gendered archetype of beauty that serves as the standard for their normalized sexual marketplace value, in general, and the degree to which they align with the specific interests, preferences, and desires of a given partner that serves as the basis for their perceived sexual marketplace value, in particular.

We agree with the author though, that:

- **Respect is the foundation of attractiveness for a man.** He says that '*if she can't respect him – she certainly cannot love him*'.
- **Being loved is empowering**, but loving gives away power

Learn:

- How to make a woman fall in love
- How to get respect as a man

> How to Get People to Respect You as a Man: 10 Proven Strategies

Taraban is also correct that a man 'gives more' with commitment by giving up his optionality. See this video to assess if commitment makes sense for you:

> **Lucio**: High-value men give more with commitment

Chapter 8: There Is No Happily Ever After

The story only begins with the relationships.
And relationships have their own power struggles.

The author suggests this to handle 'mutiny attempts' as he keeps using his sailing metaphor:

> "For the sake of our relationship, I can't give you control of the helm. If I allow you to dictate where we go and how we get there, then we're going to run ashore somewhere. Maybe not today, maybe not tomorrow – but eventually. And that's because you don't know how to sail: *I do*. If you knew how to sail, *you'd be your own captain*. And if I didn't know what I was doing, *you wouldn't be here*. So for the sake of everyone's safety and well-being, I can't allow you to commandeer this vessel. And if that doesn't work for you, I'd be happy to leave you with a canteen of water on the next island we pass."

Feels too try-hard to me.
It tries to signal both masculinity and intelligence at the same time, but overdoing both.

Also, strategically, avoid saying that 'she'd muck it up' because the natural response for confident women is to push back.
Instead, **you signal leadership with *your behavior***.

And once she decides to stay and her breakup bluff is called, the author suggests saying this:

> "I'm really happy that you've decided to continue on in the spirit in which we've been traveling. I'm glad that you're here, and I hope that we have many, many good years ahead of us. As long as we're together, I'll make sure that you're comfortable and well-provided for. And if you ever try something like that again, *I'll cast you adrift in a rowboat*. There will be no discussion and no questions asked. Do you understand? Don't *ever* do that again."

This feels like typical therapist-talk at the beginning, and then turns overly aggressive. As if the guy is trying too hard to be a tough guy.

Chapter 9: Love Has Nothing to Do with Relationships

Taraban claims here that romantic love was an 'invention' of Medieval Europe and a religious belief masquerading as relationship ideal.

While he makes some perfectly valid points, this was probably my least favorite chapter, and potentially the least correct one as well.

Lucio's note: pair bonding is the foundation of love. The rest is a strawman argument
Pair bonding, which is based on feelings, is a human universal. Romantic love stems more from pair bonding than from religion, as the author suggests.
Pair bonding is also well-supported by evolutionary logic. More data-driven analyses suggest that romantic love ideals originated from men outnumbering women, rather than pure religious invention.

Chapter 10: You Can't Have Any Relationship With Anyone

> 90% of a successful relationship is selection

Just because someone is attractive or desirable doesn't mean a relationship is viable. The majority of relationship dysfunction, Taraban argues, stems from poor selection. A good match shouldn't even require much work: the more aligned the natural fit, the less "work" is needed to maintain it.

Chapter 11: There Is Always a Better Move

In this chapter the author presents dating and relationships as a 'game' in which you can select superior moves.

We agree with that, and always made strategy a key skill we teach here, but some great strategies weren't listed here.

⍰⍰♂ **Lucio's note: traditional and conservative solutions, and not always most effective**
This chapter shows some possible bias. Taraban advocates for women marrying young and preserving virginity, which is a valid strategy indeed, but while ignoring other effective strategies that may better fit empowered women (for example: have fun young, make money, then select a verified top-10% man from a sperm bank. No need to even risk any relationship with a poor fit).

And again, we see here some generalization of men's SMV trajectory:

Chart of men's sexual market value as hypothesized by Orion Taraban

⍰⍰♂ Overblown estimation of men's SMV

Says the author:

> men's nSMV is lowest (…) at 18 (…) steadily climbs as men approach 40 and (…) holds constant for a good 20 years before gently declining
> (…) This is why their default mode is to wait: (…) men secure (…) more desirable women as a function of time

Based on Taraban's take, a man's SMV remains the same between 40 and 60, highest at 50, and higher at 70 than at 30.
So, based on that strategy, a man should remain single till past 50?

I disagree. This may be true for *highly exceptional men*. Not the *average* man.
Men shouldn't base their dating strategy on this.

Chapter 12: People Don't Really Want Relationships

This was the best chapter in the whole book, and the dating issues can be summarized with this video:

> **Lucio**: men struggle because women are higher power and don't want lower power men, and women struggle because they're higher power and they're not attracted to lower power men

People want *value*, and relationships are merely a vehicle. If those needs can be obtained elsewhere — more easily or at lower cost — people will take the alternative.
That's why relationships are falling: **modern men and women can find fulfillment for their needs with better alternatives than relationships**.

The solution is in 'atypical relationships' while abandoning the marriage/monogamy model.

Lucio's note: Taraban's argument of women finding resources online apply to *attractive* women
Also, things are changing once again, and now real women must compete with AI. So, no… Most women won't stop dating for good because they can make money online with simps.

QUOTES

It's an interesting take, but I'd note that also those low in power try to downplay the importance of power:

> On the other hand, those who argue that power doesn't really permeate all relationships – that such a position is cynical and Machiavellian, and that (in any case) there are far more important things to discuss – generally believe themselves to be the more powerful players in the Game

On desire being a fixed pie:

> people who are highly desirous often allow their partners to desire less.
> It's almost as though the former are doing the desiring for the entire relationship, making any desire on the part of the latter unnecessary. The upshot is that wanting more doesn't translate into being wanted more. In all likelihood, it will have the opposite effect.

⍰⍰♂ Lucio's Analysis

The Value of Others provides valid analyses by applying the same principles of social exchange, behavioral economics and power dynamics that we've long championed here.
So take these notes more as improving on an already solid foundation, rather than challenging the basic premise:

1. Some Fundamental Misunderstanding: LTR & Provider Bias

Taraban's analyses apply to long-term and provider types more than for short-term with a lover strategy.
Some examples:

Book quote	Truth
Women don't like players	women *publicly profess* not to like them, but are privately attracted to them and sleep with them
Women get nothing from players	Women get good genes from players ('sexy sons', and Red Pill's 'alpha fucks, beta bucks')
Women want as many resources for as little sexual opportunity as possible	Women engage in plenty of short-term mating and infidelity because there are payffos (sexual strategies theory)
Seduction is much more effective for women	Seduction is less effective for women because men assess looks and availability more than dating competence

Experience-wise it seems like Taraban may have had more provider experience.
And from a theoretical point of view, he mentions that reading academic texts is 'tedious'. We agree, but you need to if you want to deeply understand these dynamics.

⍰ Watch this: explains the author's provider experience (subs only)

People Seek The Best *Available*

Taraban postulates that the higher value someone is, the more people desire him.
While generally true, people often focus on **available value** and shut off unavailable value.
This is crucial for effective dating. See:

- Value and availability
- Self-rejection

2. Some Ethical Question Marks

The early PUA had a mantra I always liked: 'leave her better than you found her'.

The new crop of more relationship-minded red pill authors may have left that one behind.
The author mentions it's not anyone's job to let you know if they have different intentions for the relationship, which may feel like condoning lying by omission, and stringing along.

I'm sure he doesn't mean it that way, but I would have liked a stronger disclaimer.
I believe **it's your moral responsibility not to string her along if she wants something long-term and you don't.**
At least, if you want to be a man of honor.

It doesn't have to be stated on a first date. But eventually, if she wants a relationship, moving in, and family… It's just dishonorable to withhold what you'd rather not.

There were a few more things to note, but we have other articles on the red pill, so we'll keep it brief.

3. Talking Down On Readers: Teacher Frames & Power Moves

The author is smart, but the book would be even stronger if he simplified some passages and assumed the audience was also capable of following complex ideas.

Several passages read like classic *teacher frames*—power moves that expand the teacher's authority at the learner's expense.
Consider this example:

> This chapter title may come as a shock. However, to the extent that you're surprised by this claim, you haven't been paying attention. I said as much in the first pages when…

In that sentence, readers are not just reminded about 'who's the teacher'—they're also overtly reprimanded.
It doesn't get more 'teacher talking down on students' than that.

4. Is This Taraban's Theory? Credit-Giving Is Honorable

The author refers to 'his own theory', saying '*I call my theory the economic model of relationships*'.

And while at times he says that it's based on behavioral economics, he also frames it as a novel model:

> The time has come to **address the obvious failings in our understanding by creating a new model** that exists in greater alignment with reality. (…)
> This book is a first, fledgling attempt at sharing such a model. And I feel satisfied by my efforts in no small part because I was often surprised by what they produced.

Besides the slightly self-referential tone, many of these dynamics had already been described in existing theories and disciplines—both in academia and in the manosphere. Examples include social exchange theory, behavioral economics, Baumeister's sexual economics theory, evolutionary psychology, and existing red-pill and power-dynamics writings.

Several specific concepts were also extensively covered by earlier authors, from dating and social power principles discussed by TPM and Robert Greene, to the "hypergamy" popularized by Rollo Tomassi.

Changing the name of existing concepts can also feel like a tactic to sound innovative without crediting, for example, ‘frame management’ instead of ‘frame control’, or ‘sexual marketplace value’ instead of ‘sexual market value’.

This lack of credit may also explain some of the negative reactions toward Taraban.
For example:

> **Rollo Tomassi**: I’m sure Dr. Taraban has already claimed he came up with it by now <— Tomassi hints at Taraban appropriating ideas without giving proper credit

And that’s a pity, because the author does offer several original and valuable insights.
Proper credit wouldn’t diminish Taraban’s work—it would reinforce its credibility and position it more strongly within the existing corpus of knowledge.

REVIEW

The Value of Others is a remarkable book applying social exchange theory to dating and relationships — a concept we’ve long embraced at TPM as part of our power dynamics approach.
Both the depth and breadth stand out among other similar red pill books and analyses, making it a top choice in this genre.

Taraban is intelligent, analytical, and only at times philosophical. His prose sometimes parallels that of fellow red pill author Rollo Tomassi, but with more depth—although with less short-term dating experience.

Overall, **we find his analyses good**: sometimes they could gain from a deeper grasp of short-term mating and evolutionary psychology principles, but generally solid and insightful. We also see some room to be more analytically neutral and nuanced.
But mostly, **we diverge more on the practical takeaways** for the highest dating effectiveness, with different top-1% solutions for both men and women.

See our:

- Best dating books for guys or
- **Most recommended books for top-1% men**

Or if you’ve already learned from Taraban, you can consider now how to apply these principles for effective dating

and advanced seduction:

How to Show Value On Dates Like A Top-1%: The 90 to 110 Principle

Lucio Buffalmano · 5 January 2026 · Archived copy · Original

Everyone says *"don't brag"*, but bragging works insanely well to display value and spike attraction *when it's well timed and executed*.
The problem is: **99% of men brag at the wrong time, in the wrong way**.

This guide shows you the exact sequence that makes bragging attractive rather than cringe.

Contents

- Intro: Common Mistakes
  - Why Early Bragging Doesn't Work
- The Value Sequence Model
  - Phase 1: Set the Foundations with Nonverbals (0% to 50%)
  - Phase 2: Display Value Verbally, But Strategically (50% to 90%)
  - Phase 3: The 'Positive Arrogance' Boost (90% to 100%)
  - Phase 4: Long-Term Acceleration (100% to 110%)
- The Principle: 90 → 100 → 110
  - Want Top-1% Dating Strategies?

Intro: Common Mistakes

Women confirm this constantly.
I always ask questions to expand my expertise, and two of the top complaints women have about men on dates are:

1. **Talk too much**: talking *at* her, instead of *with* her
2. **Brag too much**: lacking charm and charisma

Talking too much doesn't work because you cannot bond when she doesn't open up to you.
And bonding is an important element to make her feel understood, safe, and close to you. It's an important part of seduction.
Read more here:

- **How to bond and connect**

> How to Build Emotional Connection With Women & Friends

Why Early Bragging Doesn't Work

Bragging too much doesn't work for *two* reasons:

1. **There is no evidence yet**: Anyone can talk. Without evidence, words mean little.
2. **It confirms a lower value frame**: Bragging early says: *"You're the chooser. I'm here to impress you."*

In power dynamics terms, it's the *dance monkey dance* frame.

The Value Sequence Model

The Value Sequence Model is based on initial nonverbal displays of value with progressively increasing use of verbal value displays, going from indirect first, to very direct later

In general, value sequencing is the optimal display of value balanced and calibrated to context, target, and power. So here is how to display value with advanced calibration:

Phase 1: Set the Foundations with Nonverbals (0% to 50%)

Show up:

- Well dressed
- Nice watch
- Good posture
- Good perfume
- Warm, confident smile
- Light, calibrated hug
- Lead her toward the venue

So far: **zero verbal bragging**, it's all body language and nonverbals.

Learn more:

- **How to lead dates**

> How to Lead A Woman In 5 Simple Steps: Create Trust & Attraction

Phase 2: Display Value Verbally, But Strategically (50% to 90%)

If she is talkative, let her talk the most.
If not, keep it balanced with a 70/30 split: ask, ask follow up questions, and relate back.

This is where indirect verbal bragging begins.
And it's crucial: **you never brag directly at this stage**, but **you brag strategically.**

Don't say

- ✕*"I make good money"* <— Actually, this can work if said with confidence, but it's a provider approach, not a lover. It can set a disempowering dynamic for you of women wanting monetary value
- ✕ *"I've been everywhere"* <— So you want a medal now? The cooler guys travel because exploring is in their nature, being all over is a consequence of their adventurous trait, not a goal
- ✕ *"My ex was a model".* <— It suggests you're head-hunting for looks narcissist-style. Also, top men only date attractive women, so for them, beauty is normal

The early pick up artists used to carry pictures to show themselves as being 'cool' or social. It's the right idea, but it was uncalibrated (it feels forced, and pictures in a club is low power geeky).

Technique #1: Ask Questions That Let You Show Value Naturally

If you've traveled a lot, ask about her dream destinations.

Then relate:

> "Paris? Yeah, it's beautiful but dirty."
> "Japan? Amazing. Super clean, super safe. People don't speak much English, but they're very polite."

You're not *saying* you've traveled — you're **demonstrating** you have.

Result?
She will think, by herself, that you've been everywhere.

Technique #2: Look Good by Comparison

If you met on an app, ask about her experience.

The question is strategic, because most attractive women get matches, but haven't had a good experience (and a few may *say* they haven't had to sound pickier).
Example:

It's so easy to stand out today. Literally all I did in this case was being normal, light joking and vibing

That allows you to display value by contrasting your superior behavior first, and then your experience.

Once she asks you back, this is your first reply:

> **You**: It's OK. I prefer meeting in person anyway <— ⍰ **Sub-communication**: I can meet women in person as well

Then dig deeper about her experience. If she's not forthcoming, ask about the *worst* encounters or chat.
This primes her expectations lower, so you can even more easily come across as impressive.

Then she will likely ask back, and you say that 'I think men have a better experience'. That piques her curiosity, and whe she asks back, you explain that most guys are average, with lots of idiots in-between.

That sub-communicates that you're not one of them, and that she's lucky to be with a cool guy.

Read more techniques here:

- **How to brag without bragging**

> How To Brag Without Bragging: The Covert Brag Technique

Remember: Nonverbal Value *Continues*

Remember that even as you display value verbally, your nonverbals also continue to do the talking for you.
Including:

- Comfortable with silence
- Lead the ordering
- Move smoothly with confident nonverbals
- End the meal

These all stack up to display value.
Also read:

- **Positive dominance in dating**: the key that most men are missing

> How to Use Dominance to Boost Your Sexual Success

Phase 3: The 'Positive Arrogance' Boost (90% to 100%)

If you did things right, she now sees you as a high-value man.

Now direct bragging can work.
And can even boost attraction.

It's the **0.9 → 1 principle**:
Once you're close to "10/10 impressions", a confident direct brag gives the final push.

Not needed, but powerful.
I rarely do it *unless she invites it…*

The 'Good Arrogant Power Move': Brag When She Invites the Brag

If you've really done well, women sometimes ask questions that are *designed* to let you brag.

It's a **test + confirmation ritual**.

At that point, you don't just *have permission* to brag — **you must brag.**

If you dodge it with fake humility, it looks suspicious.
She was already thinking well of you — she simply wants confirmation.

Here are some examples:

> **Her**: "Why do you live in the center?"
> **You**: **"Because I'm fucking rich."**

> **Her**: "Why do you get these big muscle?"
> **You**: **"Because I'm a fucking G."**

The right mindset and attitude to answer these, which you can also use verbatim, is this:

> **"Because I'm a fucking winner."**

The key is that you must **say it like you believe it in your core.**
This is why mental self-empowerment is so foundational.

This is a display of sheer, **unmitigated confidence** that, albeit arguably arrogant, is calibrated to the time and **very attractive**.
Think of it this way: she's just about to fall for you, and that display of power is the final, figurative push.

⚠ Careful With These....

Some brags display value but don't *facilitate seduction*.

Questions like:

> "Why are you single?"
> "Why aren't you married?"
> "Why did you come talking to me?"

Often mean: *"Why hasn't someone snapped you up?"* and *"Why did I get so lucky?"*
They allow you to brag, but they're all dangerously pointing to the fear of dealing with a player.

Lucio's Take: **Why I Rarely Go For 'Arrogant Power Move' (Though It Always Works When Calibrated)**

Lucio:
Once she sees you as a cool, high-value guy, you can escalate to the next stage of true intimacy.

Initiating escalation *is* a display of value and masculine leadership in itself.
And it's the best step you can take.

But whenever I did use direct brags, they never failed. I only got confirming nods, coy smiles, or even 'that's true'.

Phase 4: Long-Term Acceleration (100% to 110%)

After intimacy, she has already chosen you.
That means that she's seen your value, and decided it's good for her.

However, that doesn't mean it cannot further grow. As a matter of fact, high-quality men grow over time in their attractiveness.

And **sprinkling high-confidence brags reminds her of her good choice, while displaying your inner mental confidence.**
Better yet, they thread-expand on your value. It goes like this:

- You brag
- She is reminded of your confidence
- She confirms your value the moment she accepts your brag (is he right? Yes. Confirmed)

This is the 'remind value, display confidence, confirm value'.
In frame analysis **bragging during the relationship works as thread-expansion.**

And at this point, a touch of arrogance is attractive, like a spike of interest and attraction.
A touch of arrogance also works because the relationship dynamics have changed.

Past the 'assessment phase', a good relationship enters a stronger win-win phase where interests align more than in dating.
That means that if you do relationships with a good win-win frame, your value is also her value. And **your brags are more welcome and more believable when the relationship is set as win-win** (Farrell and Rabin, 1996).

⍰⍰♂ **Lucio's note: this is why I 'brag freely' at home.**
Interests with your parents are highly aligned. They'd rather have a confident son who reminds them of his achievements than an overly humble one. But remember that the key is to brag about something true or proven. My brags often start with 'that's why I (did X/achieved Y)'.

Time It Right

Timing is crucial.
You don't brag to 'win a fight', 'out of the blue', or just because you said something smart.

You brag when you did something great, and *you notice that she values it.*
For example, if you said something helpful and intelligent and she seems pensive, you do this:

> **You**: (share something truly insightful or helpful)
> **Her**: (reflective) <— This is your cue that what you said hit a nerve
> **You**: Makes sense, right? <— Confirms your read, thread-expands, and leads *her* to first confirm the value
> **Her**: (nods)
> **You**: Of course, aren't you lucky to have met such a super smart guy

---

The Principle: 90 → 100 → 110

Forget rigid 'laws', there are no laws in advanced power dynamics.
It's all principles that must be calibrated. So here's the principles of bragging:

> **Show first.**
> **Confirm later.**
> **Then add 'positive arrogance' dashes when the moment is right.**

48 Laws of Power, Upgraded for Top-0.1% Men (Alphas & Conquerors)

Lucio Buffalmano · 12 January 2026 · Archived copy · Original

The *48 Laws of Power* is the most popular primer for anyone learning the mechanics of power dynamics, and we recommend it.

But some of its rules are small-time manipulation tactics.
They're too sneaky for honorable men, and too low power for dominant 'alpha male types' and world conquerors.

This article offers 48 laws of power for **top 0.1% winners and life conquerors** who want decisive, dominant, scalable laws without sneakiness and weakness.
Below each new law, you'll find the original law (✕) and a short note on why it doesn't work for life-conquerors.

Law 1: Get Rid of Your Boss: You're Your Own Master

✕ Never Outshine the Master ➡ A law for slaves

Winners don't have 'masters' and don't make themselves smaller to fit others' egos.
Research on narcissism shows it: successful grandiose narcissists are approach-oriented (**predator**), and failed vulnerable ones are avoidance-oriented (Elliot and Church, 1997), like **prey**. Be a conqueror, not a fearful prey.

- Start your own business, nip the 'master' in the bud
- Ally with your boss

Law 2: Set The Highest Bar For Your Close Circle

✕Never Put Too Much Trust in Friends ➡ A law for men with low-quality friends

Your close circle is sacred.
You may never be able to trust anyone 100%, but it's better to have trustworthy allies than not. People differ in their trustworthiness, and some are more trustworthy than others, so:

- Stay close only with high-quality, honorable, and high-integrity people.
- Let everyone else disappear from your life

Read more:

- How to make quality friends

> How to Make Quality Friends as an Adult Man

Law 3: Recruit With Your Plans of Conquest: Attract Ambitious Men

✖Conceal your intentions ➡ a law for value takers

People flock to winners with a vision.
We advise picking honorable goals and framing them as honorable, rather than faking and pretending (it's also possible to have honorable goals but poorly framed).

- Pursue meaningful goals, and share them to create a following
- Keep sensitive intel for yourself

Law 4: Speak up

✖Say less than necessary ➡ A law that applies as well to powerful taciturns as to submissive wallflowers

Dominant men speak up to gain early leadership, influence outcomes, and control the narrative.

- Speak up to gain early status and leadership
- Speak up to set your frame
- Stay quiet when it's not worth your time

Law 5: Develop Character & Systems For Effortless Reputation

✖Protect your reputation at all costs ➡ High ROI reputation develops naturally, and can be expandable sometimes

Reputation is fundamental, but honorable winners develop a great reputation as a consequence of who they are and do. That allows them to focus on their goals, instead of living to defend their reputation (a time sink).

- **Develop a reputation-worthy character** and business, with matching behavior and processes
- **Leverage your high reputation to ignore petty attacks.** Strong reputation from impeccable character allows you not to have to 'defend at all costs'. You can't and shouldn't please everyone
- **Focus on good work** to attract more positive voices, rather than defending against all negative ones. Ignore haters

Law 6: Stand Out For Alpha Status & Marketing, Win & Disappear For Sigma Lifestyle

✕ Court Attention at All Costs ➡ Diva behavior isn't masculine. Conquerors pursue goals and results, which in turn get visibility, without them needing to chase 'attention'

Conquerors receive enough attention by simply pursuing their ambitious goals.
So be remarkable by substance, not noise. And for 'sigma types', silent success away from public view provides the highest life quality.

- Pursue attention if you need branding
- Disappear once you're successful

Law 7: Share Credit to Build Loyalty & Attract Top Performers

✕ Take Credit from Others ➡ Scarcity mindset & loyalty killer. May work short-term, but backfires for long term and with top performers

First of all, winners trust they can get enough credit for their own work. Giving credit to others only reinforces their success with a high-honor frame.
Second, top leaders amplify their teams' work to achieve more than they could get on their own, or that the team members could get by themselves. Recognition breeds more loyalty and more performance, a virtuous cycle that takes you to the top.

- **Give public praise to contributors**
- **Shine as the leader of top performers**: as the leader, your recognition is automatic

Law 8: Approach, Display Value, Then Turn The Tables

✕ Make people come to you, use bait if necessary ➡ Valid maxim, but too passive for life conquerors who actively pursue opportunities

Design opportunities where others approach you, but when not possible, approach first. The advanced game is approaching, displaying value, and maintaining power. Then, after you have leverage, others will come to you naturally.

Learn more:

- Cold approach power dynamics and strategies

Law 9: Win With Actions *And* Arguments

✕ Win Through Your Actions, Never Through Argument ➡ Ignores useful persuasion. Top 0.1% men are highly competent at *both*: execution *and* communication.

Focus on actions first, but complement it with good PR and marketing.
And remember that persuasion is power.

Law 10: Help Struggling But Quality Bros: They'll Become The Best Allies

✕ Avoid the Unhappy and Unlucky ➡ It ignores that all self-made men were once poor and unlucky and anyone can have a bad moment

Audit relationships and help for effort and ROI, not on the receiver's happiness/unhappiness.

- Avoid *eternally* unhappy and unlucky people
- Help the *momentarily* unhappy and unlucky back on their feet: they will owe you big

Law 11: Be Self-Sufficient, Make Others Prove They're Worth Your Time

✕ Make Others Dependent on You ➡ Dependence affords control, but signals neediness. Conquerors are self-sufficient, they don't need dependants

Top 0.1% conquerors don't need the psychological validation of having others dependent. **Dependent people are a cost**. Instead, they want other top, independent players.

Law 12: Be an Honorable Winner

✕ Use Selective Honesty and Generosity to Disarm Your Victim ➡ Mindset of sneaky manipulator and takers. May work short-term, but not for close relationships and long-term

Honesty can be costly, which is why low-power chronic cheaters disproportionately rely on it. **Top winners can afford to be honorable** because they don't strictly need anyone else to like them or help them.
Be that type of winner.

Law 13: Provide Self-Interest, Appeal to Higher Values

✕ Appeal to Self-Interest, Never to Mercy ➡ Provide Self-Interest, But Appeal to Higher Values

Instead of attracting cynics, appeal to higher ideals and you'll work with driven missionaries who tend to have better character and output than overly cynical ones.

Law 14: Observe Deeply, Gain Intel, Act Accordingly

✕ Pose as a Friend, Work as a Spy ➡ Winners don't 'work as a spy'. At most, they *send* spies

Law 15: Crush Totally Or Offer Good Peace Deals: Prevent Revenge-Seeking

✕ Crush Your Enemy Totally ➡ Valid reminder of not stoking angry revenge-seeking, but generic. In many cases, a (figurative) slap or small-scale attack can win you status and respect

Total 'crushing' can cost a lot of resources and is often risky in real life.
If you can offer a peace deal after a display of force, that's often the best scenario (ie, USA and the Marshall Plan).

Law 16: Be Busy: Make Others Fight & Earn Your Time

✕ Use Absence to Increase Respect and Honor ➡ A law for men who need others, but play games to hide it. Conquerors are truly busy and naturally absent

Using presence and absence strategically is a valid concept. But once you're busy conquering it just isn't your main focus.

- Be on your mission
- Assign a high value to your time
- Ensure others value you and your time

Law 17: Use Emotional Intensity to Remind People Who's In Charge

✕ Cultivate an Air of Unpredictability ➡ Erratic behavior isn't good leadership. And it makes you look unstable, a sign of cognitive malfunction, rather than power

Instilling fear may occasionally be helpful for a leader. But instead of 'an air of unpredictability', use bursts of high-intensity emotions, potentially even raising your voice. It's more aligned with masculine power.

Law 18: Build Fortresses, While Being Comfortable Outside of Them

✕ Do Not Build Fortresses to Protect Yourself ➡ Fortresses are good to have

Fortresses aren't just literal walls, but strategies to protect your assets, businesses, and mental well-being.

- Diversify investments, keep some funds hidden
- Own a secure survival retreat
- Set up fallback options in case (business) partners betray

Law 19: Read People Accurately, Know Who You're Dealing With

✕ Know Who You're Dealing With — Do Not Offend the Wrong Person ➡ Fear-based 'law'. Conquerors don't think with fear in mind

The empowered frame for this law would be 'do not offend those who deserve your respect'.

Law 20: Stay Independent — Even When You Commit

✕ Do Not Commit to Anyone ➡ Valid in some cases, but some top players commit to a partner, a business partner, a family… Or a cause.

Top players may commit; the only difference is that they never become *dependent*. They're mentally prepared for things to potentially fall out, and materially ready for easy disengagement.

Law 21: Play Dumber to Make Others Underestimate You. Then Conquer

✕ Play a Sucker to Catch a Sucker ➡ Good principle in the right contexts, but must be calibrated. Sometimes an early display of power is superior

- Hide core capabilities until decisive moments
- Make your enemies underestimate you
- Pretend to be 'nice' and disinterested in self-advancement with your colleagues

> **Lucio**: I played dumber to get the deal and get in. Then, I joined the coalition to kick them out

---

Law 22: Enter Peace Talks With Leverage

✕ Use the Surrender Tactic ➡ Conquerors don't talk about 'surrendering', but about negotiation or peace talks.

Don't wait until the bitter end when a surrender leaves you with zero negotiation leverage. Instead, begin talks when you still have some muscle and power.

Law 23: Concentrate Your Forces to Conquer Faster

✓ Concentrate Your Forces ➡ Valid principle, but contextual. A reserve unleashed later at a key juncture can win the battle

In life, focus on selected pursuits to become an expert. But travel the world, and gain experiences from disparate sources, people, women, and places.
Remember: women and family men stay put; life conquerors set out to own the world.

Law 24: Be The Greatest King & Conqueror

✕ Play the Perfect Courtier ➡ A law for jesters and company men who gossip and play politics. Conquerors build empires to be *kings*, not courtiers

- Build your own court instead of playing to other men's tune
- Carve your own path, free of political shackles

Law 25: Find Your Inner Conqueror & Live It With Pride

✕ Re-Create Yourself ➡ A law for those without a strong personality to be proud of. Or for people with a string of failures they need to move away from

---

Inside of you, there is a man who aches for more.
For more power, for more honor, and for more life experience. Find that man, embrace him with pride.

Law 26: Display You're Not Afraid of Dirty Work

✅ Keep Your Hands Clean ➡ It's a valid principle in business and civil society. But in more primal settings ensure the troops know you can do the dirty work better than they can

- **Limit 'dirty work' in favor of honorable behavior**: fallback men may crack, and the more dirt, the higher the odds of being found out for a cheat
- Gain a reputation for fearlessness and power before delegating, or delegating dirty work to tough guys may signal softness

---

Law 27: Create a Following of High-Value Men & Women

❌ Play on People's Need to Believe to Create a Cultlike Following ➡ A law for leaders of losers: no winner would even join a cult

'Creating a cultlike following' affords power indeed, but top 0.1% men conquerors don't want simple-minded and disempowered followers—**alone with your great self is better than in the company of losers**.
Conquerors want other conquerors in their tribe.

Law 28: Act Boldly, With Calculation

✅ Enter Action with Boldness ➡ Valid, whenever bold action is beneficial

---

Law 29: Plan the End, But Start At Once. You'll Find A Way

❌ Plan All the Way to the End ➡ Valid, but conquerors know that most conquests don't go according to plan. They trust themselves to still find a way

Conquerors plan, without over-planning. They have high confidence, and trust themselves to adapt and change plans on the way to victory.

Law 30: Focus on Accomplishments, Not On The Effort

❌ Make Your Accomplishments Seem Effortless ➡ A law for appearing, rather than winning. Conquerors focus on *results* that *are* impressive, independent of how much work it took

Conquering is a mindset that goes hand-in-hand with dedication and focused work. If winning were easy, chances are they'll busy themselves with new goals.

Law 31: Let Them Choose: People Always Choose Winners Anyway

✕ Control the Options ➡ A law for average folks who fear other people's free choice. Top options know that others will always choose them

This is the biggest secret of life that the top 0.1% men all know: **top catches *welcome* people's free choice** because it benefits them.
Lower-value men play games and mate guard. High-value men enjoy being freely chosen.

- Be the best option. Then let others freely choose you

Law 32: Be The Reality of Average Men's Fantasies

✕ Play to People's Fantasies ➡ If you need to *play* people's fantasies, you're not living your best life

Top men need little play to offer a fantasy because, to normies, their confidence, life, and results already seem fantastical.

- Make your life your dream life, and your norm is normie's fantasy

---

Law 33: Master Psychology & Human Nature

✕ Discover Each Man's Thumbscrew ➡ A law for sneaky passive passive-aggressives and manipulators.

Interdependent people focus on others. Conquerors focus more on themselves and their goals.

- **Understand the deeper commonalities of all men and women**. Deep down, everyone wants the same basic things. And they're all more foundational than individual foibles

---

Law 34: Be a King, And Get Treated As One

✕ Act Like a King to be Treated Like One ➡ Conquerors *are* kings, no need to 'act'

Royal posture without competence is entitlement, and can rub many people the wrong way. Especially the high value ones who see through posturers.

Law 35: Adopt a 'Positive Sense of Urgency' to Make Things Happen

✕ Master the Art of Timing ➡ What's your priority, 'trying to look unharried', or exploring the world and fulfilling your mission? Life's short, hurry up!

Law 36: Achieve Everything You Want

✕ Disdain Things You Cannot Have ➡ A law for men who are poor financially and mentally

Conquerors believe in their ability to move ahead in life, and they work on the things they want, rather than disdaining them

- Replacing longing with action plans
- Focus on what matters in life. It may not be toys and cars

Law 37: Live A Life Worthy Of History

✕ Create Compelling Spectacles ➡ A law for posers.

Conquerors live lives that end up in history books. Or that's so exciting that it would *sell* books.

Law 38: Think As You Like, Behave As You Like

✕ Think as You Like but Behave Like Others ➡ Another law for sheep

Any man with a winner's mindset knows this law doesn't speak to him.

Law 39: Display Your Cool When Everyone Loses Theirs

⍰♂ Stir Up Waters to Catch Fish ➡ It can work in some situations, but it's too narrow to qualify as a timeless power principle.

People naturally react strongly to high-value men. Alpha male partners are also constantly monitoring them, wary that they may lose interest.

Law 40: Price Your Time High: Freebies Don't Conquer

✕ Despise the Free Lunch ➡ A good reminder of value-exchange dynamics, but mostly for poor men with a poor men's mindset, and cooperators rather than takers

Go-getters aren't swayed by the 'free' tag. They think with ROI in mind, and whether it moves them towards their goal or not. And if it doesn't, they could care less it's 'free'.

- ⚠ Don't count on people to repay your free lunch: the social exchange is based on moral obligations. Takers and entitled men will take without giving back
- Evaluate offers based ROI, not stigma

Law 41: Surpass Past Legends: It's Your Duty For Human Progress

✕ Avoid Stepping into a Great Man's Shoes ➡ Another defensive law for men who act with fear in mind

Conquerors step in great men's shoes, respect other great men from the past, and take it upon themselves to carry further ahead.

- Respect past greats as part of every great man's legacy
- ⍰ Think of carrying the torch from great men before you as a generational duty, the best way to pay homage to our forefathers

- Use past greatness as a yardstick to beat, not as records to fear

---

Law 42: Take Our Your Opponent's Source of Power

✅ Strike the Shepherd and the Sheep will Scatter ➡ This law is valid. Our caveat is context. You may also create a martyr if the followers are motivated and have a replacement.

Law 44: Win With Superior Competence & Dominance

❌ Disarm and Infuriate with the Mirror Effect ➡ Mirroring others is reactive and follower-like. Plus, it feels more like classroom play, than a conqueror's strategy

Alpha males rarely pick fights because they're already on top. If they must compete, direct and open competition often beats indirect games in displaying confidence and positive dominance.

- Never copy a competitor or you follow their lead and descend to their level

---

Law 45: Do Whatever Needed to Achieve Your Goals

❌ Preach Change, But Never Reform Too Much at Once ➡ Generic maxim, doesn't apply across contexts. Sometimes you preach continuity, other times you reform fast

- Analyze the situation and do what's best to achieve your goals

---

Law 46: Be Perfect, Never Diminish Yourself

❌ Never Appear Too Perfect ➡ Fear-based, defending from the possibility of triggering average men's insecurities

Conquerors don't worry about making other men insecure — that's *their* problem.
Normies don't get jealous of top winners anyway because they don't even think they're in the same league. Play at that higher league where people are just grateful to be in your presence.

- Combine power with warmth to be positively relatable

Read more:

- Why most 'vulnerability' is weak

> How to Be Vulnerable As A Man, Without Looking Weak

Law 47: Advance Until You Conquer It All

❌ Do Not Go Past the Mark You Aimed For ➡ Timid law for small-time conquerors.

- Decide based on ROI: if advancing further is beneficial, keep going

- Lock in gains, build strongholds, then advance further

Law 48: Stay Adaptable

✖ Assume Formlessness ➡ Adaptability and calibration are crucial, but conquerors maintain their core because it works, and they like themselves

Alpha males don't like this frame because it reeks of spineless and unmasculine fickleness.
Conquerors maintain a core they stay true to because it works. And because they love who they are.

- Be fluid because achieving goals is the only goal
- Stay true to a few core principles whenever possible
- Do you as your preferred default approach. It worked

Ready to conquer?

Power University trains top men to turn principles into real-world outcomes: status in groups, respect from men and women alike, and attraction from women.

If you want to move beyond tricks and create real-life results, this is the program that delivers it.

- Proven frameworks for power, status, and influence
- Templates to build reputation
- Proven results for status, respect, attraction, and confidence

Modern Dating and Reproductive Strategy for High-Value Men

Lucio Buffalmano · 19 January 2026 · Archived copy · Original

For most of human history, dating and reproduction came together.
You couldn't have one without the other. If you wanted children, you needed a partner; if you wanted a stable family, you needed commitment.

That is no longer true.

For the first time in human history, **reproduction does not require dating or relationships.**
This technological and social revolution has created strategic options that most people never consider—yet some men and women will benefit from far more than others.

For most of human history, dating and reproduction came together, and you couldn't have one, without the other.

This article breaks down those options and their implications for power, freedom, and long-term success.

Contents

- 1. Sperm Donation
- 2. Surrogate Mothers
- 3. Polygyny and Multiple Long-Term Partners
- 4. Alternative Relationship Structures
- 5. Deliberate Non-Dating/Reproduction
  - Non-Genetic Impact on Future Generations
- Women's Strategic Reproductive Options
- Ethical, Social, & Mindset Considerations
  - The Fatherhood Question: Be Precise, Not Ideological
  - Child Welfare With Surrogacy For Men
  - Is Replacing Old Relationships Good?
  - A Better Frame: Wanting Instead of Needing

- The Future of High-Power Men: Freedom, Power, & Happiness

1. Sperm Donation

For some men, including high-power, ambitious, and high-agency men, traditional relationships are a poor strategic fit.

These are often men who are:

- **Highly independent** and mission-driven
- **Have avoidant tendencies** or a strong player psychology
- **Prioritize achievement** and freedom over communion/relationships

Some of these men may also not want to spend too much time dating.
However, they may still have an evolutionary drive towards reproduction and genetic legacy.
Sperm donation offers a rarely discussed alternative.

It allows a man to:

- Fulfill the evolutionary drive to reproduce
- Avoid long-term relational entanglements
- Help others build families

When handled correctly, this can be a genuine win-win-win.

P.S.: The 'Real' Sperm Wars Happen In Labs

Evolutionary psychologists recently focused on 'sperm competition' (Buss, 2024; Workman and Reader, 2021; Baker, 1996; Gallup and Platek, 2022 in *The Cambridge Handbook on Sexual Psychology*; DeLecce, 2022 in*The Cambridge Handbook of Evolutionary Perspectives*).

Traditional sperm-competition theory assumes men's sperm compete inside a vagina only.
That model, while probably still most prevalent globally, is becoming increasingly obsolete.

Today, reproductive selection increasingly happens in sperm banks, not bedrooms.
Men who pass donor screening can produce dozens of genetic heirs, without sex or competing over sexual access over a woman.
That's an order of magnitude larger than the man who wins the sexual sperm competition—or more.

---

2. Surrogate Mothers

In this model, a man commissions a woman to deliver a child only, never becoming a mother figure or a legal parent.

Contrary to sperm donors who often have little in children, surrogacy *boosts* fatherhood because the man is often the sole guardian and parent.

There are two common forms of surrogacy:

1. **Traditional surrogate**: the pregnant woman is also the genetic mother
2. **Gestational surrogate** (carrier): the pregnant woman gestates an embryo created from another woman's egg

While this may sound extreme to some readers, it is becoming more common for high-status and high-resource individuals.
For example, footballer Cristian Ronald may have had two children with surrogacy.

3. Polygyny and Multiple Long-Term Partners

Polygyny means having several partners at once.

It's not a new model as it's been practiced over evolutionary time by many different societies. Some authors even consider it 'the normal baseline' when power dynamics and economic activities allow some men to gain higher status and more resources.

Polygyny has been suppressed or even forbidden across most Western societies, but as they're becoming less religious, less marriage-based, and more libertine, polygyny has resurged.
Today, it may now be a valid option for some high-status men.

🤔Lucio's Take: **Polygyny is not as masculine and high power as many believe**

Lucio:
First off, highly agentic men seek more time for themselves and their craft, and they want *less* relationship drag, not more.
For these men, adding more relationships doesn't make life better or easier, it makes it worse.

Second, from a dating success point of view, polygyny is not always the peak dating it's sometimes portrayed to be. Peak dating for men is endless optionality, which ambitious and high-value men can achieve in most large cities. Why would these top men decide to have relationships with anyone, even if it's several of them?

Exceptions apply, of course, and for relationship-minded men who truly like several women and can manage to keep them without drama, this can be a good option.

4. Alternative Relationship Structures

Traditional monogamous relationships are only one type of relationship.
High-value and strategic men have plenty of options, and with the cultural shifts, they also become increasingly accepted and palatable to women.

Some options include:

- **Co-parenting** without romance, which can also be negotiated and even legally ratified as a transaction that best serves one's interests
- **Lifetime player**, dating as an 'eternal single', mostly for short-term. The challenge is that short-term dating may become more challenging for aging men who prefer younger women (especially in the West)
- **Rotations** of women happy to meet for intimacy, but without commitment to any
- **Consensual non-monogamy** <—⍰⍰♂ **Lucio's note:** I don't see it as a strong and appealing option for high-power men
  - **One-sided non-monogamy**, meeting and dating several women, some of whom are exclusive to you <—⍰⍰♂ **Lucio's note:** This happens naturally to high-power and cool men, without you openly requiring it (much higher power, and my favorite option)
- **Time-limited relationship**, including time-limited for a specific goal. For example, raising children together and then reassessing or splitting
  - Serial monogamy, which some high-status men fall into without pre-planning

These structures are not inherently better than traditional monogamy, of course.
But they are valid options that may better serve a man's needs, and optionality is freedom and power.

5. Deliberate Non-Dating/Reproduction

Men who have no need or interest in a genetic child also have less of a need for relationships.

Their sexual drives, if present, can be fulfilled with dating only, or with pay-per-play options. Not something we'd advise or endorse here for most, but it's an option for some.

Some manosphere movements overlap with this approach, including:

- **MGTOW**, the most aligned to deliberate non-dating, and once a large movement paralleling the red pill in popularity
- **Sigma male** ideology, the man who walks his own path without social groups, and potentially without dating as well
- **Monk mode**, or focusing on improving one's life, often linked to self-development goals like getting rid of bad habits, acquiring better habits, and mental health
- **Grindset** movements, focusing on business and resource accumulation

This approach can be combined with a lifestyle of choice.
Non-dating can make for a freeing, adventurous, or simple life and must not necessarily be replaced with self-development or hard work. While a man could decide for a life of hedonism, another could simply enjoy a stress-free life.

Non-Genetic Impact on Future Generations

It's also worth reminding that 'going one's own way' doesn't necessarily mean having any less impact on younger men and women, or future generations.

Genetic legacy is only a tiny aspect of legacy.
Genetic legacy also decays faster than most other legacies, losing 50% of one's own unique contribution with each new generation.
From an investment point of view, that would be a disastrous investment.

Men can positively impact future generations with their work, influencing policy, creating content, mentoring, or developing tools and businesses that help humanity as a whole.

Women's Strategic Reproductive Options

While we mostly focus on men here,

Modern reproductive technology has given women a wide strategic landscape.

While this article focuses primarily on men, it is important to understand parallel female options—because they directly shape dating markets.

Sperm Purchase

Sperm donation or purchase also allows women to entirely bypass dating, with some important advantages:

- **Avoid the risk of a poor partner** who may turn controlling
- **Avoid STD risks**, with pre-screened and tested donors
- **Increase optionality and selection ROI**: scrolling through an online catalog of data and pictures is immensely faster and more effective than dating. The perfect donor could be found with a few hours, without even dressing up and going out
- **Select high-quality donors**, who all come pre-screened as healthy and with high sperm parameters

With assisted reproduction, women can also run deeper health screening and checkups on embryos, increasing the odds of a healthy child. And that is a win for all, including for society.

Women beware: private donors may not pass sperm bank screening
Many men offer 'help' in various private groups. Be careful selecting random men. While plenty of private donors are good men, it's prudent to wonder about donors' motives and character. Some claim they prefer private donations over 'cold and expensive' sperm banks. The truth is that sperm banks have stringent requirements that many wouldn't pass.

Egg Freezing + Surrogacy

Egg freezing allows women to prioritize career and development when young, and reduce the 'biological clock' pressures.

Combining egg freezing plus surrogacy further extends the benefits, no need for 'time off' during pregnancy, and no more biological clock.
Egg freezing and surrogacy completely bypass the biological clock, allowing women to have children later than men can: women live longer, and frozen eggs outlast men's sperm decline.

Women today can finally have their cake and eat it too.

Ethical, Social, & Mindset Considerations

All these options involve major consequences for a man's life.

In all the dating and reproductive strategies, there are also others' lives involved, including future children that don't have a voice to ensure their welfare is protected. And there is society that doesn't always have a voice as the politics and policy take time to catch-up (if they ever do).

This means that it's the honorable man's task to ensure everyone gains (or, at least, nobody pays for his choices).

Let's review some common issues and questions:

The Fatherhood Question: Be Precise, Not Ideological

Research shows that boys without active father involvement face higher risks for behavioral issues.
These behavior issues include externalizing behavior, such as anti-sociality, with everyone paying a price.

However, most negative outcomes cluster around associated factors such as:

- Poverty
- Family instability
- Neighborhood effects

There remains a residual effect of father absence—but it is smaller than commonly portrayed.
Also, some jurisdictions allow to choose the child's sex, and having daughters may further mitigate the risks of single parenting. Finally, a father figure may also replace the biological father.

This is not to say there are zero consequences, but precision matters when shaping policy.

Child Welfare With Surrogacy For Men

Men shouldn't choose surrogacy to 'save time on relationships' if they don't have the time to be good fathers either.

If there is no mother present, the father should spend *more* time with the child, not less. He must provide emotional presence, not just play time and resources.

Just as for women, men can also consider a female mother figure who is not the biological mother. This may also be long-time nurses for wealthy men, although it's an open question of how well it can replace a mother.

Is Replacing Old Relationships Good?

There is always some resistance to innovations.
Plus, some people resist what they perceive to be risks to their current dating strategy, rather than what's good or bad in general.
And some others reject what they can't have for themselves.

In truth, labeling complex reproductive and social changes as 'good' or 'bad' is reductive and simplistic, and there are both pros and cons.
But I see more room for optimism, with increasing opportunities and benefits.

First off, dating and relationships were never meant to be the temple of love some portray them to be.
The ideal of the loving mother and father raising children is just that: an ideal that only reflects a tiny percentage of households.

Instead, by evolutionary logic, men and women didn't evolve to be nice to each other. Evolutionary logic suggests instead that it's more likely that **men and women evolved to better control each other** (see 'female relationship control'). That's not the premise for a 'loving relationship'.
And when things go south, broken homes don't make for better environments to raise children than single parents, and often make for *worse* environments.

With these new options, people *choose* to be parents. They have proven love to give, and likely best choose the timing when they can *best* provide and protect.

The Honor Rule: Make It Win-Win, & Everything Works

Here's a simple rule of thumb we like:

⚖ **As long as you make it win-win, it's good**

For example, for polygyny, don't be the sneaky guy who hides a second family and relationship. Be the honorable high power man who assertively sets it as a condition, and women freely decide to go with it.

You can make almost anything work honorably and well for all.
So there is no excuse to be a sneaky liar who makes the world worse off, rather than better off.

A Better Frame: Wanting Instead of Needing

> Quality relationships are based on choice—rather than need.

You hear these often in the manosphere or equivalent female dating strategies:

- You don't need a man
- A woman adds little value to a man's life

While these may be true, they often reveal more about the speaker's *attitude*, than their alleged unnediness.
It's sometimes an attitude of resentment. And it often betrays a defector strategy to relationships. Not the type of people you wanted in the first place for a relationship.

Instead, the healthy way of looking at it is that a lack of need frees people to pursue what they *want*. And what genuinely improves their life. Desire replaces needs.
People entering relationships out of *choice* are often better partners and better parents.

The Future of High-Power Men: Freedom, Power, & Happiness

These options are all great news for smart men who think strategically.

It empowers them to get more of what they want, for less.
It's a new era of even more freedom and empowerment, now extending even more deeply into to the dating and reproduction arena.

These are exactly the outcomes we provide at The Power Moves.

For the complete system—dating, power dynamics, agency, and life strategy—we share our best material inside **Power University**.

Antifragile Grandiosity: How ‘Humble Grandiosity’ Makes You Powerful

Lucio Buffalmano · 26 January 2026 · Archived copy · Original

Most people either think too little of themselves and sell themselves short, fail to maximize their potential, and live subpar lives.

Grandiose men, on the other hand, are slaves of their own grandiosity: they think highly of themselves, but are terrified of being proven otherwise. Internally, they are psychologically guarded and defensive. Externally, they constantly chase validation from others.

Empowered men move past this with Antifragile Grandiosity™, TPM’s model of *effective grandiosity*: the empowering aspects of grandiose self-belief without ego fragility or defensive behavior.”

Antifragile Grandiosity™ — A TPM Framework by Lucio Buffalmano
Antifragile Grandiosity is a conceptual framework developed by Lucio Buffalmano for The Power Moves (TPM). It synthesizes the high-agency benefits of grandiose narcissism—such as unmitigated confidence and visionary drive—while replacing ego fragility, negative entitlement, and defensive reactivity with the psychological resilience of an antifragile ego.

Important and aware of one’s importance, yet accepting human limitations

Contents

- Intro
  - Benefits of Grandiosity
  - Downsides of Grandiosity
  - Benefits of Antifragile Grandiosity
- How to Adopt Antifragile Grandiosity
  - 1. Remove Fragile Grandiosity With Positive Nihilism

- 2. Get Disgusted By Exaggerated 'Me Me Me' Self-Centeredness
- 3. Acquire Positive Humbleness: Awe, Mindfulness, Perspective-Taking & Accepting Death & Loss
- 4. Develop A Stronger Base: Trade Fragile Identities For Antifragile Ones
- 5. Rebuild An Adaptive Sense of Self-Importance
- 6. Embrace Your Importance Among Humans, With Humanity's Limitations
- 7. Focus On Action, Not Self
- 8. Make Your Goals Bigger Than You
- 9. Move to Antifragile Humble Grandiosity For Maximum Impact

Intro

First, let's define the terms:

- **Sense of self-importance is an internal evaluation**, based on how much weight you assign to yourself, your needs, your goals
- **Grandiosity is expressed and socially enacted**

Think of self-importance as the psychological substrate of grandiosity. And grandiosity is self-importance made externally visible. We use 'grandiosity' for our table for simplicity and recognition:

Fragile Grandiosity	Antifragile Grandiosity
Requires **external validation**	**Validates from within**: own thoughts and actions
Socially needy: may look aloof or superior, but needs flattery/attention	**Self-sufficient**, sense of self-importance isn't based on others
Psychologically defensive: must uphold an image of importance	**Psychologically resilient**: has no image to defend
Based on **fragile ego** and self-identities	Based on **antifragile ego** and self-identities
Strong until self-defenses hold, then **collapses under greater stress**	**Resilient through adversity**

Fragile grandiosity parallels vulnerable narcissism: feeling important and 'high value', but resenting not being treated as such.
Antifragile grandiosity is closer to grandiose narcissism, but healthier. It preserves the empowering mental benefits and fixes the maladaptive aspects with strategic humility, antifragility, and realism.

A balanced and antifragile sense of importance is empowering. Socially calibrated, it's also a leadership booster and attractive in dating.
But overdone it becomes a liability: it repels people, especially high-quality people, and it makes you fragile.
So let's learn how to do it right.

To get the benefits without the downsides, we must work on optimal balance of grandiosity and humility, calibration to the situation, and antifragility to withstand crises and difficulties.

Benefits of Grandiosity

A healthy sense of self-importance can support empowering traits like agentic pursuit of goals, approach-orientation, assertiveness, and tenacity.
Mentally, it can also support optimism, an internal locus of control, and a can-do attitude.
These are highly empowering traits that we want to preserve and even increase.

Self-importance, in its externalized grandiosity, also provides many social benefits.
People also to treat us in the way we portray ourselves, so **people who act important tend to be treated better and advance faster.**

This is crucial for agentic and ambitious men.
As a matter of fact, **the upsides of grandiosity are a necessity for highly ambitious men**.

It's men who thought of themselves as important, acted as important, who became important and successful

Calibrated Grandiosity For Top-0.1% Tactics

Calibration is crucial for more advanced applications, because extreme but well-calibrated grandiosity unlock top-0.1% results.

For example, grandiosity bordering into arrogance can be attractive in dating because it displays **unmitigated confidence**.
See for example the 'good asshole paradigm' and the 'arrogant brag technique'.

Unwavering belief in the importance of one's missions and goals also provides the energy and drive to push hard, and can motivate teams and attract followers. Steve Jobs for example seemed to act from a strong sense of importance in his mission at Apple.

However, I must repeat again this requires advanced calibration, or it can repel instead of attracting.

Downsides of Grandiosity

When you think of yourself as important, you tend to become entitled. And when that self-importance is fragile, people also become defensive, and fragile:

- ✕ **Entitlement**, a trait widely regarded as maladaptive and associated with negative affect such as aggression, hostility, heightened sensitivity, and envy (Hermann, Brunell, Foster, 2018)
- ✕ **Needy and risk-averse** (avoidance-oriented), because you stick to circles that validate you. You avoid 'risking' new groups or approaching new people

  - Tentative, anxious, and fearful to 'lose' status (see 'social status trap')
- ✕ **Fragility**: when things go south and you cannot get external validation, you fall apart right when you need resilience the most. That's when narcissists show up in therapy
  - ✕ Fixed mindset & thin skin: Self-importance often comes with fixed mindset-like psychology because you focus more on proving and defending importance, rather than learning and improving. And you overreact to any slight that chinks the image of self-importance
- ✕ **Poorer long-term relationships**: some are attracted to hubris initially. But it's mostly people who *lack* confidence. More dominant and power-aware people are repelled *right away*, and most relationships deteriorate when men cannot rein in their grandiosity

Benefits of Antifragile Grandiosity

When you stop needing to be important, you gain the freedom to be and live the real you.
What *you* really want, instead of upholding an image of who you should be.

You gain:

- ✓ **Higher mental resilience** because being ignored and starting low status don't threaten your ego. You're stronger during setbacks and can better endure adversities
  - Higher manipulation resistance, since much manipulation is based on flattery (several dating books for women offer women this advice to control the man by stroking his ego)
- ✓ **No-BS, goal-focused attitude** (approach-orienation) because instead of proving importance, you focus on reaching goals
  - Higher masculine agency, less about looking important, more about doing
- ✓ **Higher effectiveness** in life. Less needy = more empowered to do what's most effective

🧑‍♂️Lucio's Take: **My experience from self-important, to goal-focus**

Lucio:
I used to be more conceited, defensive, touchier, and socially guarded. Not always on the surface because I could

play a good game, but definitely underneath.

This was a stage of weaker and more fragile narcissism.

My brother, in contrast, was more open, honest, and relaxed. He never thought of himself as 'important'. He always thought of himself as just another guy. He didn't have an image to maintain or a reputation to constantly uphold. He was more likable and, overall, a better human being.

With the benefit of years of self-development, I understand that the main issue was that I was too egocentric and self-important.
With self-development, also thanks to the 'antifragile grandiosity' approach, I moved towards a more empowering and 'healthier self-importance'.

How to Adopt Antifragile Grandiosity

We'll first start 'destroying fragile grandiosity' with positive nihilism, and then we'll rebuild it with antifragility.

1. Remove Fragile Grandiosity With Positive Nihilism

No matter how 'important' you become, it will be gone in time.

Alexander the Great thought he was the son of a god. He conquered everything. And yet, you probably had to Google him. And he was just a few generations back.

Even the most 'important' men become a small footnote in history in just a few generations.
Then try 300,000 years into the future. Then 1 million. Then 1 billion. Nothing is left by then.

1.2. Realize Humanity's Inherent Transience

In 5 billion years the sun will explode, and by then, it's either we'll be gone, or we'll be a very different universe-faring species.

If still around, humans will have evolved into a different species.
They will view us like we view amoebas right now.

And eventually, probably, humanity's lineage will also disappear.
Freeman Dyson once thought life could outlive the stars. He changed his mind after discovering the universe is expanding.

Also see:

- Healthy nihilism

2. Get Disgusted By Exaggerated 'Me Me Me' Self-Centeredness

Exaggerated self-centeredness is immature and non-masculine. Grow disgusted by it, and it will help you move past it.

⁉️♂️ **Lucio's experience**: I largely managed this, and it helped me. It also helped socially: whenever I spot a 'me me me' attitude from others, I know how to handle it (and I know that they're not the best people to be close with).

3. Acquire Positive Humbleness: Awe, Mindfulness, Perspective-Taking & Accepting Death & Loss

Several approaches have been shown to at least temporarily reduce narcissistic grandiosity, self-centeredness and self-importance, including:

- The experiences of awe, like standing under a clear night full of stars (Campbell, 2020).
- Psychedelics, but it's something that we caution against: don't do it unsupervised (van Mulukom et al., 2020)
- Communal and empathic partners (Finkel et al., 2009)
- Empathic values affirmations and values journaling (Kopp & Jordan, 2013; Thomaes et al., 2009)
- Perspective-taking helps improve empathy, potentially lowering self-centeredness (Davis et al., 1996)

Humbleness helps moderate exaggerated grandiosity, striking the optimum balance of benefits, without the downsides (Foster, Shiverdecker, & Turner, 2016)

⁉️♂ **Lucio's experience**: I had good results even with just watching videos about the universe.

3.2. Accept Death, Aging, & The Possibility of Failure to Avoid Defensiveness & Psychological Collapse

Narcissists must work hard to maintain their sense of superiority in the face of negative feedback from the world.

What people mistakenly refer to as a 'weak core' that must be defended, it's probably more like superiority that must be maintained.
And while that system often works for successful narcissists, it's a vulnerability. The 'superiority-maintaining mechanism' can be overwhelmed by prolonged struggle or by tragedies.

The best approach to overcome this vulnerability is to accept the possibility of failure, and be at peace with it. Whenever you do that, you lose any reason to be defensive. And **you keep your high self-esteem and mental power under any conditions.**

Similarly, accept aging, loss of strength, body decay, and fading looks.

Also see:

- **Leveraging your mortality**

4. Develop A Stronger Base: Trade Fragile Identities For Antifragile Ones

> 'Be like water'

Being like water applies well to self-identities.
Quit over-defining yourself in constrictive and fragile terms. Define yourself in the loosest possible terms to become more resilient.
For example:

- I'm an entity that pursues goals
- I'm a resourceful guy who finds a way
- I'm just a guy who never stops doing his best, we'll see where that will take me

When it comes to self-importance and grandiosity, here are good mindsets:

- **I am most important to myself, that's what matters most, and I don't need others to validate it**
- I can be or become important to at least some people and new people I meet, and I likely will
- My work can be important

Also read this seminal article:

- **Antifragile ego and self-identities**

5. Rebuild An Adaptive Sense of Self-Importance

Not anymore an egotistic 'being important', 'recognized', or 'remembered'. But more grounded in reality.
Better mindsets include:

1. **You still matter**. You matter to some people, you matter for the positive impact you can have. And you certainly matter to yourself
2. **Your positive impact matters**, or the impact you *could* have. Focus on that. No matter how small, it can still be large for at least some
3. **Switch from what you want, to what's expected of you**: Viktor Frankl says we should not ask what you want—but what life wants from you. At TPM, we prefer an agentic-honorable life calling:
   - If you can add value, you must: it's your duty and your greatest call in life
4. **Adopt an 'immortal-mortal mindset'**: whatever you do, it will always remain true in the time and place you've done it. Hence, it's important to leave good marks on that university ('etched in the universe' philosophy)

6. Embrace Your Importance Among Humans, With Humanity's Limitations

A highly effective mix for the best of both worlds is this:

1. **Embrace your power and importance as a man among men**, including potentially feeling like a top man among men
2. **Embrace the limitations inherent to human nature**, including mortality, transience, and the 'greater power of odds', including the always-present possibility of failure

This allows you to feel great among men, reap all the mental and social benefits, while also acquiring the mental resilience of humbleness.

Display grandiosity or fatalism strategically for maximum benefits
Lean into grandiosity for motivation and value-display. In other settings, display fatalism to signal supreme inner peace. This makes you look wise, worldly, and emotionally grounded. Very attractive to many women.

7. Focus On Action, Not Self

The empowered agentic man focuses not on the self, but on action and results.
Take ego out of the equation. Focus on achieving goals and having a positive impact.

All the most effective men in the world took massive action

A good spin on grandiosity here is this:

> I have great potential, and I'm not second to anybody— now it's on ME to put that potential to work and do something with.

This channels the grandiosity into work

7.2. Stay Balanced: Avoid 'Internal Tyrant' With Action-Based Neediness

Switching from external validation to validation through action is often a step forward, but some men do it wrong.

They replace an external master with an even worse, judgmental internal one. Call it an 'internal tyrant'.
They become their own worst enemies. They *say* they work out or run every single day for health or mental strength, but in truth, they're addicted and feel bad if they don't.

Research backs this up: narcissists exercise more, but have also higher rates of *compulsive* exercise, bulimia, and disordered eating thoughts and behaviors (Lichtenstein et al., 2017; Gordon & Dombeck, 2010; Dakanalis et al., 2015).

Avoid these types of influencers. Strike a balance based on effective action, including time for recovery and mental well-being.

8. Make Your Goals Bigger Than You

It's not about you. It's about your *character* and who you *become*, shown through your actions, and the positive impact you can have.

⍰⍰♂ **Lucio's experience**: This was extremely helpful for me. It allowed me to move grandiosity from the self, to my goals. It improved my mental health and relationships, and made me more effective and ambitious in my work

9. Move to Antifragile Humble Grandiosity For Maximum Impact

You can be unique, special, and important while accepting that you're not.
This is the advanced level: both are true. Which one is which depends on the level at which you look at it.

Here are some identities of antifragile grandiosity:

- I'm important, but it's not about me: I'm a conduit for bigger goals
- I'm not at the center of the universe, but I'm at the center of *my* universe
- I'm important not because of who I am, but for the character I develop, what I can do with it, and the value I can add

As you make your goals bigger than you, think of yourself as merely a conduit for those bigger goals.
There may be a life calling for you. It may be as simple as being a great father, setting the example, or being an upstanding man throughout your life. Or it can be bigger.

Whatever it is, it requires you to be confident, competent, resilient… And a little bit grandiose to achieve it

---

Antifragile Grandiosity is a crucial piece of the empowered mind's 'full puzzle'. For the full picture plus the strategic toolkit to apply it in the real world, see:

The Social Investment Model: A Unified Theory of Value, Investment, and Power

Lucio Buffalmano · 2 February 2026 · Archived copy · Original

At The Power Moves, we've spent years studying the hidden rules of power in dating, leadership, and high-value social networks.

Our research, informed by psychology, evolutionary science, and real-world observation, produced the Social Investment Model™—the framework that explains how investment signals determine why some individuals effortlessly command status, respect, and attraction, while others overcompensate just to be noticed.

This guide shows you how to strategically invest your time, attention, and resources to maximize influence and power in any context.

Social Investment Model™

The Social Investment Model™ postulates that people trade investment and value in social exchanges, with the direction and returns shaped largely by personal value, comparative value, resource availability, and strategic refinement.

Investment and value are two different but intertwined concepts in this model:

1. **Personal Social Value (PSV)** → *who you are*
   Traits, status, competence, personality, attractiveness, intelligence, reputation, etc. More linked to 'genetic' value as well. It creates 'intrinsic attraction' (Blau, 1964) or 'genuine desire' in dating
   AKA: 'personal value'
2. **Exchange Value (EV)** → *what you give/take*
   Favors, time, help, money, effort, support, opportunities, introductions, etc.
   AKA: Give-and-take, investment

Although investment dynamics tend to cover more of the latter, they're interwined.
Investment of exchange value is necessary to form and maintain many relationships and to transact 'above one's level' of personal value.

For example, investing men date more attractive women, as exemplified by Brown et al. in *The Cambridge Handbook on Sexual Psychology*:

> This desirability of **provisioning becomes an especially important attraction strategy for unattractive men** (…), with men demonstrating greater beneficence toward women as a compensatory strategy for their own lack of attractiveness (Buss & Greiling, 1999; Takahashi et al., 2006).

This is logical since personal value + investment's value = larger total value than personal value alone.

Our studies confirm and complement these dynamics: the extra investment of lower-value individuals also makes up for a lack of smart strategies and mental empowerment.
An early TPM chart described these dynamics:

Courtship can be seen as a compensatory strategy: men display value and provisioning to the sex with higher obligatory parental investment (Trivers, 1972)

Key Terms

- **Investment** = resources allocated toward another
- **Effort** = visible investment and cost of investment
  - High effort = lots of work and/or high cost of investment
  - Low effort = little work and/or low cost of investment (ie.: high abundance)
- **Returns** = benefits received
- **Value** = anything that makes or can make people better off (value-positive)
  - **Total Value** = personal value + exchange value (traits and assets)
- **Power** = control over others and outcomes
- **Status** = social perception of power and value

The Power Exchange Equation

At the core of social dominance lies a deceptively simple equation:

Power=Returns receivedInvestment madePower = \frac{\text{Returns received}}{\text{Investment made}}
The result is your Social ROI, the metric that determines your baseline social power.

This equation is the naked truth of social dynamics: over-invest and your ratio tanks, signaling lower value and giving power away. Keep it high with smart investment and *getting* investment back, and you become the sought-after 'prize'.

Core Mechanisms

Two important concepts are:

- **Investment is the cost to access value** and to offset value imbalances
  - Investment signals people's value
- **Visibility and effort amplify investment's significance**: more costly and effortful investments send stronger social signals (and vice versa)

Despite these computations are largely unconscious, they're powerful and pervasive.
Let's dig deeper:

1. The Compensatory Investment Principle™ (Investment for Value)

The Compensatory Investment Principle™ states that in relationships marked by unequal personal value, **the lower-value party invests more to compensate for the imbalance**, while the higher-value party can invest less without jeopardizing the relationship.

In simple terms, the lower-value person invests more to make up the difference**.**
Compensatory investment is necessary to establish value-unequal relationships. Without it, higher value people would reject the 'bid for association'.

Lower-value people are thus motivated to invest more to secure or maintain access. For example, in romantic relationships, lower mate value partners engage in more mate retention behavior (Conroy-Beam et al., 2016).

Some more common examples of investment for value include:

Personal value	Investment
Skills/Knowledge	Pay for coaching
Looks	Invite to VIP table
Status	Walk up to him, be kind, carry the conversation

The larger the value differential, the larger the compensation required.
This leads to a crucially important principle:

⚖️ **The more you invest, the more you signal lower personal value (and vice versa)**

The net investment imbalance (their investment vs. yours) signals the perceived value difference between parties.

Note though that even though we talk about 'perceived', that is no less 'real'. People correctly consider investment a reliable indicator of social value. Since everyone's incentive is to seek higher value while saving resources, costly investments are reliable signals of investors' interest and receivers' higher value (costly signaling theory, Zahavi, 1975).
This is why investment dynamics are the most powerful cues of value and interpersonal leverage.

Exceptions always apply, but this principle applies across much of socialization.
Some examples:

1. You fill in silences on a date ⇒ you're framed as **needier for connection**
2. Someone walks across the room to say hi ⇒ you're framed as **higher status**

Over-Investing Danger: Entitlement & Relationship Harm

Investment flows are such powerful signals that they can also override more objective measures of personal value.

Thus, even over-investing higher-value men can turn their partners into the relationship prize.

It doesn't matter who's king: if he treats her like she's the relationship king, she's the relationship prize

Investment dynamics also impact emotions, behaviors, and expectations.
For example, over-investing may even turn well-meaning receivers into entitled takers, expecting investment, without feeling indebted to give back.

Compensatory investment in dating can undermine attraction
While sometimes needed and a smart strategy, poorly executed compensatory investment can undermine genuine personal and physical attraction by signaling lower personal value. Smartly executed compensatory investment instead can mitigate, or even turn these dynamics around.

Counterintuitive as it may sound, the safest approach for many is to ensure a balance of giving and taking.

2. Investment Visibility Model

Investment Visibility Model™ postulates that **social and status dynamics are largely shaped by *visible* investment**, based on perceived investment and perceived effort.
As a result, strategic actors manage both the amount and the visibility of their own and others' investments depending on context and goals.

Machiavelli observed that appearances often trump reality. The same principle applies to social value and investment. Factual assets and power matter. But interpersonally, value and investment only matter to the extent that others see and know about them ('opacity principle').
Therefore, **strategic signaling of value, investment, and effort is crucial for social success.**

Read more in:

- **Value-signaling**, our primer on signaling value
- Value Visibility Model™, same concept, applied to value in social exchanges

High Investment Signaling

Increasing investment's visibility can serve to:

- Display **resource-abundance** (ie, inviting to a luxury restaurant)
- **Virtue-signal** (ie, pro-social giving like charity, blood donation, etc.). Belief in one's prosociality has been associated with narcissism
- **Inflate *others*' investment to inflate their interest**
  ⍰ Example: '*It's so kind of you to say that, how did you notice*' <— Strategically 'thread expands' the time spent on extolling his virtues

Manipulative Signaling

Among the many examples of manipulation in investment signaling:

- **Inflating one's own contribution to increase people's debt** (social scalping™)
- **Early investment to signal prosociality but turning selfish** once commitment is secured (trust scalping™). Buss suggests this dynamic may explain why most marriages end early on

Read more in:

- Manipulation tactics

Low Investment Signaling

Low-investment signaling can be used to:

- Signal **lower interest** to **display self-sufficiency** and un-neediness
- **Lower your perceived executional effort** when executing tasks for others
- **Lower the perceived effort of your giving** to defend against compensatory frames and power moves

For example:

> **Her**: Ohhh thank you for driving all the way here and inviting me for dinner <— Dangerous frame of high effort just to be with her
> **You**: My pleasure, I was around the area anyway and wanted to try this restaurant. I hope you're hungry <— Reframes it as low effort and moves to connection-talk

Social ROI™: The Measurement Layer

Social ROI™ measures returns on investment, with a high ratio signaling high power, and a low ratio signaling low power.

There are two overlapping but distinct types of Social ROI:

1. Factual ROI (Power)

Real returns relative to real investment and effort.
→ Determines **outcomes and true structural power**, especially in formal organizations

- Independent of others: achieves outcomes and persists independent of others' awareness
- Example: CEO. He sets the priorities and is higher power even when looking higher effort than others

2. Perceived Social ROI (Status)

Social Effort Model™
Individuals who appear to expend minimal visible effort while others invest more toward them are perceived as

more powerful (**Law of Least Social Effort™**). Conversely, those who over-invest in others tend to signal lower value and power (**Law of Most Social Effort™**).

Perceived returns relative to perceived investment, inferred from visible effort.
→ Determines **status, attraction, and relational positioning** in unstructured groups.

- Others-based: *looks* powerful, but only exists in relation to others. It disappears outside of social dynamics
- Example: An average man gets an attraction boost when seen with an attractive woman, but reverts to average for everyone else

The two influence each other. For example, looking powerful boosts status, facilitating practical outcomes. And factual power boosts respect and attractiveness once signaled.

The Effort-Return Matrix

Social ROI matrix™

1. Low-Effort High-Returns = Looks Highest Power

- **Archetypes**: King
- **Dynamics**: Others expend more effort to associate with you, or contribute their work and time towards your goals

Popular focus on perceived effort may create some confusion (ie.: Castiglione's 'sprezzatura', later echoed by Robert Greene, the '**law of least effort**', and our own work ↗).
But remember that *leverage* is the key power multiplier, and **what matters most is whether you achieve your goals, independent of the amount of effort**.
A hard-working, high-energy executive expends lots of effort, but he's high-power and successful.

2. High-Effort High-Returns = High Power

- **Archetypes**: Social Butterfly

- **Dynamics**: High effort, moves around, but well-received

It's powerful because your results scale with controllable effort.

3. Low-Effort Low-Returns = Unknown Power

- **Archetypes**: Wallflower, Loners
- **Dynamics**: Sits alone, ignored, but doesn't even try

It's a poor quadrant if you seek outcomes or if you must still grow.
But it's a great spot if you're self-sufficient and enjoy your own company.

4. High-Effort Low-Returns = Low Power

- **Archetypes**: Jester, Flunky
- **Dynamics**: Tries hard, but only gets superficial acknowledgment

As per the Power Exchange Equation, this is textbook low-power and low-value.

⁉ **N.B.**: the difference between factual and perceived ROI. Some high-energy people get lots of *reactions*, high perceived returns, but they get little respect and attraction, so they're factually low power (all smoke, no sizzle).

⚠ **Compensatory trap: over-investing can move you here**
As per Law of Compensatory Investment, this quadrant signals low-value and *also* low power awareness and self-respect, undermining respect and attraction.

Investment Currencies Layer

These currencies vary in cost/effort, visibility, and ROI potential: choose wisely.

1. Material

- Money
- Goods
- Access to assets or infrastructure

Power Logic

> Smart use of material resources is the difference between 'simping', and a magnate's harem.

Material giving disempowers when scarce and traded for affection, but it's tremendously empowering when smartly deployed.

Strategy

If you give, **give like it's nothing to you** to signal low effort and abundance. Act like their service is never a necessity to signal optionality.

⁉ **Pro tip**: think of access to a better lifestyle as a large give in itself.

Strategy: start as low investment as you can get away with, because it becomes the expected baseline

2. Temporal

- Time
- Availability
- Presence
- Priority access

Power logic

> Your value is your time's value

Time is the most precious currency of the high-value agentic man, and he prices it accordingly.

Strategy:

Frame yourself as busy and your time as in your control, but scarce.

⁉️ **Pro tip**: chilling and 'me time' are investment in yourself, to be guarded as valuable as work time.

3. Psychological

Which can be divided into emotional, including attachment, and attentional.

Emotional includes:

- **Care**, or hoping for their well-being
- **Thinking** of someone
- **Fear** of losing someone
- **Empathy**

- **Vulnerability-sharing**

Attentional includes:

- **Listening**
- **Remembering** details
- **Timely replies**
- **Compliments**
- **Physical presence**
- **Executional efforts** (gifts, booking, planning).

Power logic

Principle:

⚖ **The higher the emotional investment, the higher the neediness** (and the lower the power)

Emotional investment signals high communion, while lower investment signals higher agency, more associated with masculinity.

In dating, visible motivational effort is what's referred to as '**chasing**', signaling higher neediness and potentially lower value.

Psychological investment is only visible if signaled, but it often 'leaks' from many behavioral, verbal, and nonverbal cues

Strategy

Focus on agentic goals.
Use attention early on: bonding facilitates seduction and emotional investment.
Restrict your later attention for quality time, and withhold it when undeserved.

4. Cognitive & Informational

Transfer of knowledge, skills, or perspective.

Includes:

- Advice
- Mentorship and teaching
- Sense-making

Power logic

It's high leverage giving, costs little, and adds a ton of value. It can also empower the giver thanks to teacher-pupil dynamics.

Strategy

Knowledge transfer can be priceless, but easily discounted at the price of hot air. Keep the most advanced insights for allies and worthy recipients.

5. Social Capital

Use of one's social status, reputation, or connections to benefit another.

Includes:

- Introductions
- Endorsements
- Access to groups/places
- Reputation/status-building
- Coalition-building

Power logic

Social capital investment can yield high returns, and some men acquire good status and power as 'connectors'. But it's an investment fraught with risks. Social investment is easy to give, valuable to others, but easy to forget.

Social Investment	Low ROI Risks
Introductions	Feels like stock socializing, and your intros soon feel like their own connections
Access to your circle	Feels like 'bringing a +1' and framing it as a give makes you look petty ('social bean counting™)
Endorsements	Feels like earned reputation if they do well, while you get the costs if they screw up

Strategy

A safe approach is to **keep your best contacts like poker cards**: close to you, but inaccessible to others. Exceptions are for allies and worthy recipients, not unproven folks.

6. Commitment

Binding oneself to future action.

Includes:

- Promises

- Exclusivity
- Public commitments
- Marriage
- Provisioning/protection

Power logic

> The higher one's value, the higher the resistance to commitment

There are eceptions to this rule, but **selectivity must increase with your increasing value**.

Binding commitments, including marriage, are costly but often under-appreciated.
High value men give a lot with marriage, but to most it feels like a normal step, rather than a large give (⍰ see video analysis ↗).
Be careful.

Strategy

Become a high-value, high self-sufficiency man. **Let others worry about earning your commitment**—it's their job to prove they're worthy.

⍰⍰ **Pro tip**: Avoid verbal commitments in dating. They signal neediness and dishonor, while largely failing to convince because they're easily faked.

7. Physical

- Bodily labor (e.g., helping move, carry stuff)
- Touch
- Sex/intimacy
- Protection

Power logic

It's high effort, yet it can be empowering when framed as prosociality or 'gallant'.
Often the higher cost of physical help is the associated time or emotional investment.

Strategy

Help with small everyday stuff to signal prosociality. But ensure you're never seen as dumb and low-value muscle.

In sexual escalation, never show desperation during 'last-minute resistance' or it lowers your perceived mate value.
Advanced escalation is making her *want* to do it.

Smart Investing: Strategic Layer

Social investing is crucial to succeed in life. It's the first step that moves you from 'random stranger' to a valuable connection, a friend, or an attractive partner.
Mutual investment also *keeps* relationships healthy (see 'win-win dating for women').

Over-investment undermines respect. But withholding investment prevents you from entering relationships with higher-value individuals.
So the key is to *smart investment*, a complex endeavour that few properly learn.

Social strategy 101: move to the side, don't lean in, quit gesturing. And potentially reconsider your friends

Effective Social Investing

A general principle is:

⚖ **Maximize your personal value signaling first, and then display and strategically invest the difference**

Strategic players work on themselves to:

- **Increase actual value** with self-development (ie.: strategic dominance, looks, and body language)
- **'Market' your value effectively**, for example, with strategic value display
- **Calibrate your investment** and signals. The optimum balance varies by individual, context, and their interest
- **Get investment back,** task others, 'thread expand' their effort to self-frame as 'the prize'

Learn more:

- **Power intelligence**, and learn effective calculation
- **Escape naive self-help**, look into positive Machiavellianism
- **Smart cooperator**

Social ROI Strategies

Downplay effort to signal high-genetic value

Make it seem like good results come naturally to you ('sprezzatura').

Work for results, while minimizing visible effort

For example, to approach a woman far away, play it like you're going there for another reason.

Some exceptions apply
For example, with sustained courtships that may work to win a woman over for provider-types, going for a provider

strategy.

Pay the Entry Price: Apprenticeship & Entry Tickets

Trying to be the 'king' or alpha type as a beginner is a trap. Remember that power beats status.

In your learning phase, focus on hard skills that grow factual power, rather than *looking* powerful.
Initial high-effort to learn from a master or 'buy into' a higher-value circle is not low-value, it's smart Capital Expenditure (CapEx).

Power tip for your learning curve:

- **Fail privately, win publicly**: private high-effort for growing skills, public display of skills

Advanced calibration

This article gives you the foundations.

Geomaxxing Explained: The Power Dynamics Most Men Miss

Lucio Buffalmano · 9 February 2026 · Archived copy · Original

If you're a Western man thinking about geomaxxing, or moving where dating is easier, listen closely.

Geomaxxing works.
The attraction boost is real. I've lived it for years.

But it ALSO comes with hidden risks — including a crucial one: **infidelity**.

Not because women are "worse" anywhere.
But because **power dynamics shift**, and most men don't understand what that shift does to relationships.

So let's break down the benefits—and the real dangers—of geomaxxing.

Contents

- Geomaxxing: Intro
  - Issue #1: Poorer Environment = Higher Odds of Expedient Behavior
  - Issue #2: Power differentials push problems from "in your face" to "behind your back"
  - Issue #3: Power differentials make genuine bonding harder
  - Issue #4: Submissive to You = Submissive to Everyone
  - Issue #5: Dominance Can Promote Revenge-Seeking. Culture Won't Help
- Solutions For Effective Geomaxxing
  - 1. Be Smart With Your Money
  - 2: Pick Right
  - 3: Bond With Her
  - 4: Teach Her to Speak Up
  - 5: Have a Good Relationship — Or None
  - 6: Become An Empowered Man

Geomaxxing: Intro

Geomaxxing is a ‘dating hack‘ consisting of moving to locations that offer better dating opportunities, given the peculiarities of the local sexual marketplace dynamics.
For example, it may include a favorable gender ratio, lower income compared to the foreigner, or a preference for the foreigner’s skin color.

I’ve been geomaxxing all my life before it even had a name. I’ve moved for personal growth, lifestyle, income… and yes, to experience dating all around the world.

Cumulatively, **I have spent years across the most popular “geomaxxing locations”**: Southeast Asia, Eastern Europe, South America, and even Sub-Saharan Africa.

The dating advantages of geomaxxing are real and strong, and we consider it a top dating strategy here at TPM.
I’ve seen a few dating coaches downplay its effectiveness, and I’ve often thought it was either a lack of experience or potentially manipulative behavior to protect their business.
Take my example: I’m not a model — yet I’ve been approached, asked for pictures, and pursued. One girl once rushed to leave an event with me. And another one found me on Facebook and complained that I didn’t have time to meet her.

Things that almost never happen in the West.

But here’s the part most men overlook:

The same power dynamics that give you huge advantages… also introduce hidden risks you MUST understand and mitigate.

Let’s start.

Issue #1: Poorer Environment = Higher Odds of Expedient Behavior

I don’t want to be misquoted on this, so please remember that this is a general theory and people differ. Great people exist everywhere.

That said, the principle is:

⚖️ **The closer someone is to survival needs, the less room they have for higher values.**

Similar to Maslow’s hierarchy.
When basic needs aren’t secure, you do what you must to survive.

Not because you're a worse person, of course — and in some aspects, harsher childhoods provide benefits. For example, people who struggled tend to be less entitled and potentially less narcissistic.

But neediness shifts priorities.
Honor isn't a priority. Getting resources is.

Some men miss these dynamics because they're not 'in your face obvious'.
Chances are you're not dating the poorest women alive. But neediness exists on a spectrum; different people sit at different levels on the curve, and different societies produce different averages.

Potential For Faster Life Strategies

Epigenetics suggests that a person's environment can influence gene expression (Adhya, 2020).

Specifically, life history theory suggests that **harsher environments cue people towards a faster life strategy, which is more associated with unrestricted sociosexuality** and dark-triad traits (Belsky, Steinberg & Draper, 1991).
Fast life strategies may also relate to the cooperation/cheat approaches, promoting more opportunistic behavior (Workman and Reader, 2021).

Many men moving to less affluent regions don't realize that **the local bell curve of life strategies has shifted towards a faster life strategy**.
And with faster life strategies comes **short-term thinking** and a higher risk of:

- **using you** for resources, passport, or status-hiking
- **security-seeking motives**, not love
- **fast consumption** and no savings (⚠ tip: ensure it's not your money being drained and that you're not the emergency fund)
- **STD risks** as unprotected sex may be more widespread
- **"side options"** and back-up mates
- **concealed partners**

Or a host of small or large lies, games, and power moves to secure one's future or the family's future.

Plenty of expats and passport bros found this out *too late*.
And that's still better than never finding out at all.

⚠ **As a wealthier foreigner, you're a *target* for scammers**
Because you're pre-framed as being wealthier, and potentially naive for being 'pampered' by safer Western standards. This also applies to everyday small scams like inflated checks: even good people can be quick to justify the scam with the frame of 'he can afford it'

Issue #2: Power differentials push problems from "in your face" to "behind your back"

The reason why men are more successful in certain locations boils down to power.
Whether it's attractiveness, uniqueness, higher dominance, status, or money… these are all aspects of dating power dynamics.

While higher power for you is good, lower power for her means less assertiveness and less power to speak up, communicate issues, and have her needs met. Plus, higher neediness means more 'caution' out of fear of upsetting you and maybe losing you.
That can lead to hiding issues, and unaddressed issues don't disappear — **hidden issues move from "to your face" to "behind your back."**

This isn't about character being bad, of course. It's about the general dynamics that change the context. And context can change behavior.

In comparison, an empowered woman who thinks of herself as having the same value as any man will speak up to your face.
Some guys may not like that, but when everyone's needs are met, the relationship is stronger.

P.S.: High power is a precondition of honorable behavior
These dynamics also mean that personal power is the foundation of honor and values. Higher values are the prerogative of those who are well-fed, well-off, and NOT needy of others.

Example

A girl I was seeing would not contact me much because she was worried that she would bother me.

That may seem the dream relationship for an avoidant-attachment and high-agency type of man.
But the truth was that she was suffering with little contact, didn't speak up about her needs, and that undermined the relationship.

Disengaged men can push women into emotional affairs
Situations like these also introduce infidelity risks because women may look for company and companionship with someone. And an emotional affair can easily transition into a sexual one.

Issue #3: Power differentials make genuine bonding harder

It's harder to connect with a woman who is — or *thinks* she is — too far below you.

And if she needs you much, as we've already said, she presents her best version instead of her full self.

Problem for you is: **hiding her true self undermines the premise of a genuine, honest, and win-win relationship.**
You can ONLY have a genuine relationship with partners who show up with their true and full self.

In comparison, an empowered woman who thinks well of herself has no need to hide any part of her personality.

Example

I never felt connected to the girl mentioned before like I felt with other women — that's the truth.

She didn't present her true self and didn't communicate clearly like I wanted. Over time, it made me less attracted, less trusting, and even having less respect.

Once the relationship ended, it was also a very different feeling. The relationship with past women with whom I bonded meant something.
With her, much less. Once it ended, it was more like the song *"just somebody I used to know"*, and '*I'm glad that it was over*'.

⍰♂Lucio's Take: **I don't trust lower-power people**

Lucio:
Not because they're untrustworthy, but because they don't have the personal power and confidence to speak their minds and show their true selves.
And it's simple logic: **how can you truly trust someone who's not showing his full self**?

And if they're lower value and need you, they have an *incentive* to present their best self, and hide their full self.

This is interpersonal power dynamics 101: you can only trust affection and love from above, not below.

Issue #4: Submissive to You = Submissive to Everyone

Most men prefer a more submissive partner than a 'stronger' one.

But here's the mistake they confuse *"submissive to me"* with *"submissive as a trait"*, and **confuse submissiveness for relationship safety and faithfulness.**

A submissive woman is submissive to **everyone** — not just you.

All it takes is:

1. a confident guy
2. who makes a smooth move
3. who spots her interest
4. and takes her hand, leading

And she follows.
I didn't read that in a book…

In contrast, a more empowered woman may say 'no thank you' first, before the approcher has a chance to make inroads. And she may resist anyone taking her hand or leading a bit too dominantly because she is more power aware and not as submissive.
It's not a guarantee, mind you, but it's an important line of defense.

Issue #5: Dominance Can Promote Revenge-Seeking. Culture Won't Help

Some think leaving the West means escaping "hookup culture" and finding more faithful societies.

Sometimes that belief is strengthened by more conservative cultures and religious faith.
We agree that culture is important and does indeed shape personalities and behavior. However, **human nature runs deeper than culture.**

And here's another potential issue with power differential: **over-dominance without warmth and connection creates protest behavior.**
Such as, she goes along with his choices because she's passive and wants the lifestyle. But since she loses out and since he usually gets it his way, small things add up. Result: she resents the dominant man, and cheating isn't only 'fair game', but something she may *relish*.

We can see possible protest behavior in this power-imbalanced relationship lacking warmth. I wouldn't exclude this move was revenge

If you don't build:

- a bond
- trust
- and a win-win relationship

Infidelity becomes more likely, despite or even *because* of your higher power.
Your increased "status" abroad gives you a false sense of security.

Example: Status & Looks Failed Him

I approached a girl at a mall, and it went like this:

> **Her**: I'm waiting for my boyfriend
> **Me**: Let's exchange contact quickly then
> **Her**: (looks around furtively, pulls out her phone, and gives me her contact)

Right after that, I went up on the second floor to observe (I do what I do because I'm interested in people and social dynamics).

Her boyfriend arrived shortly after. He was a Western guy.
Tall. Handsome. Fit. Stylish. A true 'alpha' and a total winner.

As much as I think well of myself, on paper, this guy was higher sexual market value. Yet, the next day she came straight to my place.
That guy had a poor relationship, and high SMV didn't save him.

P.S.: This is why I've never been too into the red pill
and why this website is more advanced. Sure, principles like 'alpha fucks, beta bucks' describe valid general principles. But principles describe *averages*. Experience the exceptions enough times, and your mindset starts to shift. This is why we write for exceptional men here, who can achieve exceptional dating results.

Solutions For Effective Geomaxxing

Focusing on the basics:

1. Be Smart With Your Money

Whenever possible, **never lead with money first**.

If you start with money, the whole dynamic and relationship change.
It's worse than being a provider in the West; if the income gap is large, it's more like you being a *sponsor*.

However, the truth is that different men have different 'value currencies' to offer. And using money may be a fair approach for some.
But if you rely on money, ensure you control the purse. And I also recommend avoiding supporting the needs of her extended family.

Also see:

- Self-defense strategies

> Self-Protection in Love and Business, Without Losing Trust

⍰⍰ N.B.: higher-status & wealthier women are more loyal!

This may seem counterintuitive to some men, but it aligns with our analyses, and it's confirmed by research.
From the authoritative *Oxford Handbook of Infidelity*:

> For women, those who are economically dependent on their partner are more likely to engage in infidelity than either women who provide all the income in a household (i.e., the breadwinners) or women who are in an economically equal relationship (Munsch, 2015).

2: Pick Right

We talked about general trends.
But people differ enormously:

- values
- character
- personality
- compatibility with you

Of course, if you're not doing relationships, this matters less to you.
But still, pick good enough to stay safe and healthy!

3: Bond With Her

Get to know the real her and connect at a deeper level.

Lead the conversation, but don't *dominate* the conversation in the sense that you crowd her out.
Don't talk *at* her. Talk *with* her.

A woman who doesn't feel bonded also doesn't feel bad about cheating.
On the contrary, a woman who is bonded to you *values* that bond, wants the best for you, and feels bad about harming you.

Also read:

- How to bond with women and people

4: Teach Her to Speak Up

Don't fall for:

"I like what you like."
or
"I'm OK with anything."

Don't worry, she doesn't need to be ultra-assertive.
But she must share:

- preferences
- needs
- opinions

Otherwise, you're dating a mask, not a person.

5: Have a Good Relationship — Or None

A good relationship itself adds **positive incentives** to remain loyal.

This isn't about making someone a saint; it's about her own self-interest and self-preservation instincts. **When you have something good, you're positively worried about losing it.**
It's a natural desire not to break something valuable (and you don't even need to mate guard!).

This is the uplifting approach to *positive* control that we champion here.
Making people *want*, instead of coercing and controlling. Quality men have this option, use it! It's also the most honorable.

Example

From personal experience, the relationship I felt safest in, loyalty-wise, was with a higher-status Western woman.

Why?
Well, it helped that it was an early relationship and we were more like equals. But also:

1. **I knew she'd speak up** if something was wrong
2. **She wasn't needy**, so no incentive to entertain several men
3. **She grew up well-off**, prime for slow life strategies and cooperation
4. **She presented her true full self**, no masks, no liking everything I liked
5. **Relationship quality created a strong** bond that betrayal would destroy

6: Become An Empowered Man

At the end of the day:

Geomaxxing is powerful.
But the biggest “maxxing” isn’t geography — it’s becoming a high-value and power-aware man.

Because if you have power with warmth, some ‘game’, and relationship skills… You can meet good women anywhere.

And if you don’t…
A passport enslaves you instead of freeing you.

We teach the ins and outs of power dynamics in **Power University**.
And for dating specifically, **Seduction University** takes you from “passport bro” to a global, top-1% man who succeeds anywhere.

Effective Calculativeness: How Strategic Giving Builds Power and Honor

Lucio Buffalmano · 16 February 2026 · Archived copy · Original

Many people approach generosity as an unquestioned virtue.
At The Power Moves, we've studied decades of real-world social dynamics, psychological research, and strategic interactions to understand how giving functions in practice.

Our conclusion shows that giving without strategy, what we call '**naive giving**', often backfires. Misallocating limited resources slows or halts personal advancement, undermines status and respect, and harms society.

In this article, we break down the principles of **effective calculativeness**: how to invest your time, energy, and resources strategically, maximize returns, and maintain strong relationships—without turning cold.
Let's dive in.

Effective calculativeness is a core component of strategic thinking

Contents

  - How Manipulators Confuse You
- 7 Rules of Effective Calculativeness
  - 1. Increase Your Value, & Signal It Strategically
  - 2. Ask "What's In It For Me?" (WIIFM)
  - 3. Analyze Alternatives
  - 4. If the ROI is Good, Give Back to Lock Win-Win
  - 5. If ROI is Poor, Don't Engage, or Cut Losses

- 6. Be Strategic: Calculate, But Act Like You're Not
- 7. Add the 'Honorable Approach' For Best of Both Worlds
- Bonus: Gain the Edge by Reading People (Advanced Systems)

Effective Calculativeness™

Effective Calculativeness™ means evaluating where your limited time, energy, and resources produce the highest strategic return, and investing accordingly.

Calculativeness supports 'social accounting', is a foundational component of **strategic thinking**, and is related to power intelligence. Together, they boost your odds of achieving goals and climbing upward. As such, calculativeness doesn't make you 'selfish', **calculativeness makes you an effective man**.

Calculativeness alone, though, doesn't guarantee success. As with most traits, **calculativeness must be calibrated** to be effective.
This is a universal principle whereby advanced results depend not on 'laws', but on calibration and balance.
If calculativeness is overdone and misplaced, for example, within win-win relationships, it can undermine communion, attachment, and potentially attraction.

- **Social Investment Model™**: the starting point for social investment dynamics
- How to be positively Machiavellian and Machiavellianism, a personality trait high in calculativeness and strategic thinking

Honorable Calculativeness™

Honorable Calculativeness™ pursues agentic goals, but with a preference for win-win, a distaste for being a burden, and the goal of creating net positive value with one's work and life

Honor requires calculativeness.

Coupled with an 'honorable man' approach, **calculativeness is the skill that allows you to be a net contributor to society** and to the world.

🧔♂Lucio's Story: **Calculative honor vs. 'unculculative dishonor'**

Lucio:
Years ago, while backpacking, I went out with hostel travelers. Some got drinks, but I didn't because I was on a budget.

A guy who few seemed to like started telling me aloud that 'where he comes from, everyone chips in money in a common pool, independently of who has it, and they all drink'.
He was trying to gang up with me to shame the drinkers into sharing.

I thought it was cheap guilt-tripping. Uncalculativeness was convenient for him, but I didn't want any part in that. No interest in being the scrounger.

Calculative Allocation of Resources Moves Humanity Forward

> Humanity and the world advance with the smart allocation of investment.

In financial investment, good investors are givers because they provide capital to good companies that make better products, for everyone's benefit.
Poor investors harm the system by wasting resources on inefficient companies. Everyone pays the price.

Interpersonal investment works the same way.
When generosity is non-selective, social investment is misallocated. Resources are diverted from contributors to takers. This keeps taker-strategies viable which may instead disappear when 'starved'.
Misallocation may also further corrupt the receivers, who can grow entitled and learn to scrounge instead of working.

Over time, productive reciprocity networks weaken while exploitative strategies keep draining the system. At scale, this makes society worse off.

Invest in quality people instead, and humanity improves. Seen from this point of view, honorable calculativeness may as well be a moral duty.

Why Naive Giving Fails

> Every minute spent on a “taker” is a minute stolen from a “giver” or a worthy cause.

Naive giving is a vulnerability ready to be exploited. As Machiavelli said, ‘Any man who tries to be good all the time is bound to come to ruin among the great number who are not good’.

Social interactions operate under exchange principles, where individuals evaluate costs, benefits, and alternatives (Thibaut & Kelley, 1959; Blau, 1964; Becker, 1976).

Even without considering predation, a lack of sophisticated social accounting is bound to be a strategic disadvantage.
Indiscriminate giving always fails agentic men looking to advance and achieve goals. To advance and achieve goals, you need return on investment.
Psychologist Adam Grant’s research into give and take supports this conclusion: naive givers lose out, while *strategic* givers advance.

Learn more:

- Effective cooperator: cooperate and give *smart*, without being naive
- Effective cynicism: the optimum balance between naïve cooperation and chronic suspicion

Naive giving undermines respect
Investing without returns signals lower value, undiscerning naivete, and makes you the sucker in the sucker’s trade. Nobody respects the sucker. Bad for success, respect, and self-respect.

How Manipulators Confuse You

First off, notice a double standard:

- Calculativeness in business = good
- Calculativeness in life = ‘bad’

Calculativeness in business is called due diligence, common sense, and dumb to skip. Yet, in our personal lives, you're discouraged from doing the same with your time and effort.
This shaming is a form of social manipulation. It functions on two levels:

- **Virtue signal** "uncalculativeness" to project an image of goodness
- **Handicap the competition** that falls for it and wastes resources

The only beneficiaries are the takers. And the tragedy is that **this double standard dupes the best men—**the generous, moral men who genuinely want to do good.

7 Rules of Effective Calculativeness

Here's how to become an effective and honorable calculator:

1. Increase Your Value, & Signal It Strategically

Value is the starting point.

Calculative before value protects you from takers, but it does not empower you with you quantity and quality of options.

Instead, work on yourself to become an attractive exchange partners. **Value is how you attract people and opportunities** to you, be in socialization, work, or dating.
As you grow your value, you want to progress into how to market it effectively. Also see:

- How to be a high-value man
- Signal value: show value in dating, (covertly) brag, and display competence
- **Power University**: The ultimate guide to becoming high value

1.2. Be High Power & High Warmth

Warmth invites others to you by signaling that win-win is possible, while power discourages and thwarts all types of

takers.

See:

- Power with warmth
- Effective social dominance

2. Ask "What's In It For Me?" (WIIFM)

All your investments should have a return.

The return that matters varies depending on context and goals, and isn't always and necessarily material. Returns may be emotional support, networking, or simply having a good time socializing.

3. Analyze Alternatives

Returns are relative, not absolute. A "good" investment is poor if a better alternative exists.

This is especially more relevant as your optionality increases with your value. This means that **the importance of effective calculativeness grows in tandem with your personal growth**.

Some golden principles:

- **Shop around**: The bigger the investment, the more deeply you test the market
- **Test & assess the recipients**: Are they grateful or entitled? Supporting you when you're in need?
- **Ask if you'd be better off on your own**: Do you really need an employer? Or a wife? You may also be by yourself <— This strategy has become more feasible for men in recent decades

Also read:

- Empowered individualism for an individual-centric mindset

4. If the ROI is Good, Give Back to Lock Win-Win

Once you've engaged a high-value partner or friend, give back to maintain the win-win.

While from an amoral point of view 'take as much as possible' may provide the largest returns, it's also a risky approach. Notably, most people are matchers and will avoid takers (*especially* the ambitious ones).
Two, former naive players can wise up, and may turn on you (and for good reasons).

In the end, when it comes to high-value and high-quality people, win-win relationships tend to outperform. Evolutionary biology supports this principle: people preferentially invest in relationships where returns are likely, making win-win the strongest relationships (Trivers, 1971).

Game theory of a good reputation: inviting more bids, at lower transactional costs
A reputation for someone who pays back invites more bids for cooperation and lowers the transaction costs of future deals because people trust you (Sylwester and Roberts, 2010).

5. If ROI is Poor, Don't Engage, or Cut Losses

Don't lend. Don't listen to their 3-hour vents. Don't meet for "coffee" to give free advice.

If you struggle saying no, you're in 'too nice guy' territory. Work on assertiveness, rejection tactics, or start with 'how to be a good asshole' before graduating to honorable man.
If you must maintain a working relationship, use the 'arms' length approach'.

⍰⍰ PRO Tip: think about ALL returns
Giving and taking apply across *any* form of value. Just to name a few, givers can raise your status with friends, boost your reputation at work, or simply listen. Takers can be low-level hostile with micro-aggression or covert power moves, publicly social climb on you, use relational aggression to undermine you, or 'simply' emotionally drain you.

6. Be Strategic: Calculate, But Act Like You're Not

In many everyday situations and first impressions, the sweetspot is to be calculative, but look like you're chill.

Remember that everyone engages in 'impression management' (Goffman, 1959). If you're the only one who doesn't, you may look overly Machiavellian or selfish. In a world where everyone virtue-signals, avoid being the odd one who 'doesn't get it'.

Some tips:

- **Pay attention to small stuff** because it previews the larger ones (ie, who pays a round, who gorges on the free buffet, etc.)
- **Act like you don't care about small stuff**

Avoid Social Bean Counting™
Social bean-counting™ is the over-preoccupation with tracking interpersonal credits and debts, especially over trivial matters or in contexts where connection or shared experience is the primary objective rather than exchange optimization.
Nobody likes this guy. Don't be one.

Also see:

Strategic thinking case studies: 3 real-life examples of strategic thinking to land a job, an attractive woman, and the life of your dream

7. Add the 'Honorable Approach' For Best of Both Worlds

Here's how:

1. **Prefer win-win** over win-lose
2. **Dislike being a taker**
3. **Always remember a 'give'**, keep a mental 'social credit'
4. **Always pay back a previous give**
5. **Relax calculativeness in established win-win relationships**
6. **Make 'adding value' your life's ultimate goal**

More often than not, honorable calculativeness outperforms pure calculativeness for life quality. Honorable calculativeness is better placed to deliver both self-advancement and great relationships.

Reminder: Communal relationships must be earned. And protect your downsides anyway
Only move from 'Exchange' to 'Communal' with worthy partners who have *proven* reciprocity. But keep a laxer 'background calculation' to ensure relationships *remain* win-win. And deploy self-defense strategies to ensure that you'll always land on your feet.

And the advanced step:

Bonus: Gain the Edge by Reading People (Advanced Systems)

Reading people is a crucial life skill.
It allows you to invest in the right people, without having to waste weeks, months or even years investing in the wrong people.

It's just like financial investment again. Poor investors who fail to assess companies lose money. Good investors get rich.
Some resources to get you started:

Why The 48 Laws of Power Doesn't Work: 5 Systemic Flaws

Lucio Buffalmano · 23 February 2026 · Archived copy · Original

Many men read *The 48 Laws of Power* to become more effective in life, learning about manipulation, strategies, and dark psychology.

However, despite being potentially eye-opening, **many find little practical improvement in their lives** — because the 48 Laws of Power often don't work in the modern world.

Some of our readers noted that the real difference came from foundational frameworks, mindsets, and calibration that turn tactical maxims into strategies, skills, and mindsets that deliver results.

This article fixes these issues for ambitious men who want real influence — not 'edginess' for its own sake.

⍰⍰ For the overview, see the main 48 Laws of Power guide

Contents

- Intro: The 5 Systemic Flaws
  - 1. Low Power (Laws 38, 24, 46, etc.)
  - 2. Over-cynicism & Paranoia (Laws 2, 12, 18, 20, 40)
  - 3. Defection Over Cooperation (laws 7, 12, 14, 33, 44)
  - 4. Coercion Over Conversion (Laws 11, 17)
  - 5. Maxims Don't Map to Real Power Principles
  - Bonus: Image Over Substance (laws 6, 30, 34, 37).
  - FAQs
- Laws of Power That Work

Intro: The 5 Systemic Flaws

We summarize the reason why The 48 Laws of Power doesn't work in this table:

Pattern	Example	Why it Fails
Low power mindsets	*'Behave like others'*	Subordinating individual sovereignty to the collective weakens an ambitious man's potential
Over-cynicism	*Despise the Free Lunch*	It mentally predisposes to defection and mistrust, undermining the long-term benefits of win-win
Defection over cooperation	*Pose as a friend, work as a spy*	Defection underperforms smart cooperation long-term
Coercion over conversion	*Keep others in suspended terror*	Value-taking as default underperforms smart value-exchanging as default
Sub-optimal 'laws'	*Say Less Than Necessary*	Maxims seldom describe deeper power principles, are contradicted by research, & backfire without calibration

Let's review better:

1. Low Power (Laws 38, 24, 46, etc.)

Advice that promotes behaviors and mindsets of submissive, unassertive, and unconfident men

Many ask: "is *The 48 Laws of Power* actually effective at gaining power?" The truth is that despite its name, many laws disempower, sub-communicating a lack of agency and self-trust.

Some laws at odds with an empowered man's mindset and behavior are:

Law	⍰ Low Power Sub-commmunication
Think as You Like but Behave Like Others (Law 38)	⍰⍰ Comply with the group, or you'll be punished
Never Outshine the Master (Law 1)	⍰⍰ Play small because without the master/job you're screwed
Play the Perfect Courtier (Law 24)	⍰⍰ Be yielding to stay in the court because outside of it you can't succeed
Avoid Stepping into a Great Man's Shoes (41)	⍰⍰ You cannot compare to previous greats
Never Appear too Perfect (Law 46)	⍰⍰ You must average yourself down because I need others to like me

Behaviorally, 'playing the perfect courtier' invites readers to be yielding and indirect, both associate with submissiveness, passive aggression, and sneakiness.

Mentally, 'Never Appear Too Perfect', 'Never Outshine the Master', and 'Behave Like Others' predispose you towards a defensive, others-oriented mindset to protect the status quo instead of a more empowered self-advancement orientation.

Reality check: would a top-0.1% man (think Donald Trump, Steve Jobs) worry about 'never outshining the master'?
Do you think that a grandiose, confident, high agency man would be too worried about 'behaving like others', 'never outshining his boss', or 'not appearing too perfect'? Probably not. These men are busy becoming masters of their world and changing the laws to what *they* prefer.

Group-Focus Disempowers You as an Individual

> The more you focus on ohers, the less you can focus on yourself

Laws that orient you towards fitting in the group disempower you as an individual. This is what we refer to as 'collective psychology' over an empowered individual psychology. **Collectively-oriented men fail to live their best lives because they put others above themselves.**

Read more here:

- **Empowered individualism**: the psychology of high-power individualism

🧍♂️Lucio's Experience: **My best life outshining masters**

Lucio:
In my first job as a 'talent graduate rotational programme', my immediate bosses had limited power over me because my mentor was a senior manager and my HR contact was a partner.

In my last job, my boss didn't mind that I'd outshine him because he had shares in the company. My outshining helped me secure a better position, salary, and equity package of my own after I had quit to travel the world (see the story here).

And my best life came when I stopped worrying about bosses altogether to work on The Power Moves. Today, 'Never Outshine the Master' feels like a small-timer mindset to me.

Defensive Logic to Support the Laws

Many 'laws' that on paper could apply to some circumstances are supported by defensive logic.
For example, in 'Say Less Than Necessary', Greene says that '*The more you say, the more likely you are to emit something foolish*', which sub-communicates a lack of confidence and self-trust.

Between the law titles and initial descriptions, Greene also uses 'always' ten times, but *sixteen* times the word 'never', highlighting a tendency towards threat-avoidance.

Low-Power Masked as Cynical Power

Several coercive and manipulative laws sound amorally Machiavellian, but inadvertently signal and nudge towards low-power mindsets.

For example, 'Discover Each Man's Thumbscrew' and 'Keep Others Dependent' betray a *lack* of self-sufficiency because high-value men don't need dependents.

Even 'Let Others Do the Work, but Always Take the Credit' can put you in a scarcity mindset of having to rely on others' work, instead of trusting that you can get enough recognition for your own.

These mindsets can sidetrack you into low-power, sneaky approaches instead of higher leverage self-empowerment.

Read more in:

- **Law of Power for Life Conquerors**, laws rewritten for top-1% men

2. Over-cynicism & Paranoia (Laws 2, 12, 18, 20, 40)

Over-cynicism is the mental source of 'defection over cooperation', and it transpires across the full book.

Over-cynicism	Positive Cynicism
Don't trust your friends, make some enemies	Don't over-trust anyone, but proven friends > enemies
Despise the Free Lunch	Be wary of social exchange manipulators, but accept free lunches as first-cooperative moves, and to access your higher value

Over-cynicism can limit practical outcomes because it can lose win-win opportunities. And it can also have *psychological* costs
For example, research found that Machiavellians are more dissatisfied with work and everyday life, and they tend to be alienated (Bereczkei, 2021).

Learn more:

- **Positive cynicism**: to balance the defensive benefits of cynicism, with the upsides of cooperation
- **Effective calculativeness**, the enabler of self-interest
- **How to be more Machiavellian**, in a winning way

3. Defection Over Cooperation (laws 7, 12, 14, 33, 44)

A behavioral orientation towards value-taking, manipulation, and defection, rather than attracting through high value and the possibility of win-win

Over-cynicism is the upstream mindset; defection-first behavior is its downstream expression.
And many of Greene's laws point towards defensive or aggressive short-term value-taking, rather than longer-term win-win.

Examples include:

- *Use Selective Honesty and Generosity to Disarm Your Victims* (law 12) <— Feigning cooperation to set up a con
- *Discover Each Man's Thumbscrew* (Law 33) <— Focus on negative information for emotional manipulation and blackmail
- *Disarm and Infuriate with the Mirror Effect* (Law 33) <— Focus on small-time mind games

While we embrace and advocate for learning more about defection, the goal shouldn't be to stick to defection only. **Cooperation strategies with high-value associates outperform exploitative ones** over the long-term.

For example, in *The Evolution of Cooperation*, Robert Axelrod showed that 'tit-for-tat', starting cooperative and retaliating only after defection, consistently outperformed purely defective strategies in long-term competitive environments.

A 'taker' approach may also be more damaging for leaders, who gain the most from a cooperative and engaged team.

For example, despite Greene's law on 'taking credit', studies link credit-stealing to employees' anger, lower work outcomes, and increased turnover (Cohen-Charash and Spector, 2001).

Read more:

- **Smart cooperator**: how to cooperate with power-intelligence
- **Self-defense strategies**: how to insulate yourself against possible defection

4. Coercion Over Conversion (Laws 11, 17)

An approach to coerce and constrain (push), rather than convert and attract (pull)

These two different approaches have been studied in several fields, including negotiation, status, and leadership. And, in general, the 'pull' approach of making others want to engage, trade, or follow you, is superior (especially in the modern world).

This is not to say that coercion doens't work. It does. And enforcement tools are crucial to lead effectively. But coercion tends to backfire when it's the *main* approach, as it is in Greene's 48 Laws.

For example, as explored by researcher Leon Haslam, **leadership based on coercion and control underperforms because it must spend resources on controlling and monitoring**. Leadership based on buy-in instead increases influence and engagement while *decreasing* the costs of control.

Coercive leadership requires constant control of antagonistic and demotivated subordinates

Learn better:

- **Leadership 101**
- Transformational leadership: how to inspire people
- How to become a good leader

5. Maxims Don't Map to Real Power Principles

'Laws' are memorable, but less precise and less effective.
Actual power principles are more precise and effective, but require calibration and are far less memorable.

Law (memorable)	Principle (truth)	Calibration (Hard)
Say Less Than Necessary	Speaking time correlates with leadership and social influence	Speak up during group formation, for visibility, and to influence the narrative; Listen more as an established authority and to bond
Use Absence to Increase Respect and Honor	Presence creates power; absence may amplify pre-existing power	Build leverage with high-power presence; selectively use scarcity when you know you will be missed
Appeal to Self-Interest	Self-interest is the foundation, but turns relationships transactional if it stands alone	Always cover self-interest, but play it down in relationships and appeal to higher ideals in leadership

In some passages, the advice can be not just uncalibrated but generally subpar.
For example, in the law's initial descriptions, Greene advises:

- *"Uncover something in your request, or in your alliance with him, that will benefit him, and emphasize it out of all proportion"* <— Feels manipulative, makes others feel venal, and likely underperforms
- *"You have more to fear from friends than from enemies. If you have no enemies, find a way to make them"* <— Making enemies is bad advice, even for simplistic prose

Some other laws are plainly less effective in most everyday scenarios. For example, research found that talking time correlates so robustly with leadership emergence that the 'babble hypothesis of leadership' showed that talking quantity affords leadership *independent* of quality (MacLaren et al., 2020).

Learn better:

- **Social calibration**
- **48 Laws of Power Scientific Analysis**: For a granular, law-by-law breakdown of the scientific errors in Greene's maxims, see our

⍰ Real-Life Example of Blindly Following the 'Laws'

Warning against over-trusting anyone is solid advice; it's power intelligence 101.
Everybody should know that relationships can sour and loyalties can change depending on context, character, and incentives.

However, law #2 becomes weirdly extreme when Greene literally advises to hire enemies over friends, and 'finding a way to make enemies'.
Unfortunately, some readers may believe and apply this advice, as seen in this example from Reddit:

Source: original removed here, recovered thread here

Bonus: Image Over Substance (laws 6, 30, 34, 37).

Several 'laws' are focused on appearance without nearly as much attention to substance.
Appearances are crucial. But so are the competences, skills, and results that allow you to 'look good'.

Readers who over-focus on appearances may overlook the foundations of power. And they use appearances to *compensate* for a lack of personal power (another case of low power behavior).

- **Foundations of self-development**

FAQs

Does The 48 Laws of Power actually work?

While The 48 Laws of Power can be entertaining and instructive, it **may not deliver consistent real-world results** for ambitious men without additional context and calibration.
Many laws promote defensive thinking, low-power mindsets, or over-cynicism, which **undermine long-term influence and goal achievement**. Simply following Greene's maxims without understanding the underlying principles often leads to **short-term manipulation at the cost of long-term power, deeper confidence, and relationships**.

Why does The 48 Laws of Power fail in real life?

The 48 Laws fail because they **prioritize appearance, coercion, and defensiveness over substance, value creation, and cooperation**. Many laws encourage low-power behaviors like playing small, small-timer manipulation, or fitting in instead of finding one's own path—all strategies that underperform for high-value men in modern social and professional environments.

What works better than The 48 Laws of Power?

For men who want actual results—respect, status, attraction, and success— the "Smart Win-Win" framework is significantly more effective. While The 48 Laws focuses on defensive maneuvers and value-taking tactics, the TPM approach emphasizes power-related skills, practical frameworks to guide behavior, and high-power behavioral cues, blending high-value cooperation with strategic Machiavellianism. Survey results from Power University suggest that becoming a high-agency, high-power individual—rather than a "courtier"—is an effective path for modern men.

Laws of Power That Work

An effective approach that worked for many of our readers and students is:

1. **Learn truly effective strategies** based on tested frameworks and scientific power principles
2. **Be strategically Machiavellian whenever needed**, like in competitions and with shadier characters
3. **Be honorable with high-quality people** to get the best of both worlds: winning and achieving goals, and positive relationships

Cynical self-help like *The 48 Laws* performs better than naive self-help but undermines your relationships. Smart win-win uses Machiavellianism to win, plus genuine relationships for higher life quality

Power University is built on this model and has delivered real-life results in terms of respect, status, influence, and attraction to thousands of men. Check it out here:

Social Skills vs Power Skills: Why Likability Alone Won't Get You Ahead

Lucio Buffalmano · 2 March 2026 · Archived copy · Original

If you want respect, status, and women's attraction, mastering social skills alone won't get you there. Power skills will.

Social skills are for getting along. Power skills are for getting ahead.

At The Power Moves we've spent years decoding the science of power and we've taught thousands of ambitious men how to get ahead and achieve goals.

In this article, we'll show you why you need *power* skills more than social skills.

Intro: Social Skills vs. Power Skills

Social skills and power skills cater to different people, suit different goals, and require different training.

Social Skills	Power Skills
Harmony: be liked and accepted	**Impact:** influence, respect, status
Agreeable communication, validating, and supportive	**Assertive/Strategic communication**, display value, frame control
Date as friends first, see if you connect	**Date for attraction,** lead, and achieve your goal

One is not necessarily superior to the other, and which one is superior depends on personality, goals, and context.

Social skills are perfectly adequate for spending time with long-time friends when there is an established foundation of mutual respect.
And power skills are required for achieving outcomes, and for competitive environments when you don't want to be passed over, or pushed lower.

Social Skills

Typical social skills include:

- Smooth conversations
- Graceful exits
- Making friends and 'how to keep in touch with them'

Advanced social skills make people think: *"He is polished."*
Social skills without power skills make you likable, but they don't give you status, respect, and influence.

Power Skills

Power skills include:

- Climbing hierarchies
- Being respected
- Influencing decisions
- Making *high-value* friends, networking
- Getting women's attraction

Advanced power skills make people think: *"Oh, he is high value."* And high-value men consistently get more out of life.
Power skills without social skills can make you come across as 'rough around the edges' or brusque, less of a good fit for a family dinner or a good gala.

You Can Have Both

Power and social skills are not mutually exclusive and the best is to have *both*, and both at *high levels*.
Advanced social skills to be smooth and charming, and effective power skills to gain respect, status, and attraction.
And of course, the calibration to know when to lean more towards one or the other.

That said, we argue that f**or agentic men it's best to prioritize power** (keep reading).

You can have both. But prioritize power

The Overlap Between The Two

There is an important overlap that both must cover for advanced outcomes.

For example, despite bonding being more communion, it supports the end goal of both intimacy and long-term, quality relationships.
So good power skills also include bonding and connection.

Similarly, group social dynamics like entering social groups, taking turns and respecting others is covered by social skills, but also support social status and popularity.
So good power skills cover it.

This is why our Power University alumni increased their social skills manyfold, despite Power University focusing more on power.
It's because students improved their social skills through the power skills.

Also see:

- **Should I start with Power University?**

> Should Beginners Start With Lucio's Power University?

But Most Social Skills Training Do *Not* Include Power

Unfortunately, since they lean more communion, **many social skills coaches over-teach communion and under-teach power.**
Plus, power skills are often more complex and nuanced, and not everyone has a good grasp of them.

This means that many social skills books and courses, even the advanced ones, may not teach the power that agentic

men need to achieve the results they want.
We also argue here that this naive self-help also fails less ambitious men, because everyone needs some knowledge of power and manipulation dynamics for self-defense.

Fortunately, the opposite is not true. For several reasons, power skills tend to better cover social skills.
In part, this is because those who learned or naturally understood power can more easily pick up the simpler and more widespread social skills. And they can, in turn, teach them together with power skills.

The Psychology of Success: Agency vs. Communion

The difference between these two paths is rooted in personality psychology.
Power skills are associated with **agency**, and social skills are more associated with **communion**.

Agency and power are associated with masculinity, communion and social skills with femininity

The Communion Pole (Getting Along)

Social skills are for people who prioritize “fitting in” and harmony. This is the **feminine pole** of socialization. It’s about warmth and connection. While useful for maintaining friendships, it does not build status.

The Agency Pole (Getting Ahead)

Power skills are for men who prioritize goals, progress, and outcomes. It’s more associated with **masculinity**. It’s about competence, impact, and results.
These are the men who get promoted, lead groups, and attract high-quality women.

The Communion/Agency Clash

You can sometimes most clearly see these different approaches by the reaction people have towards communion or agentic information.

For example, communion types may comment on our power dynamics analysis, ‘why does it even matter’ or ‘why

not just be yourself'.
A real-life example:

> **High-communion**: God it must be exhausting to only view relationships as power and subservience. Y'all ever heard of genuinely loving someone, compromises, coming to an understanding?

Conversely, a high-agency man wonders "why would anyone even ask 'how to keep a conversation going' if there is no goal".

In truth, they're both often better off understanding the other side.
The high communion man in our example could better appreciate that initiating a relationship requires a minimum display of agentic value and leadership, and *maintaining* a good relationship also requires keeping a minimum level of attraction and respect.

The Two Orientations: From Beginner to Advanced

Power skills can be seen as more advanced since they deliver more sought-after results.
However, the orientation towards agency or communion has more to do with personality psychology than with levels of sophistication.

And any man can lean more towards communion or agency, independently of their level of skills.

For example:

- A **communion-focused beginner** asks: *"How do I keep a conversation going?"*
- An **agentic beginner** asks: *"How do I get my classmates to respect me?"* or *"How do I get this girl to like me?"*

Advanced communion may instead want to learn how to better support a sad friend, while an advanced agentic man may wonder how to best navigate the boardroom power struggle.

Why Common Social Skills Advice Can Cost You Power

Good social skills teachers are perfectly competent to teach socialization, holding conversations, and making friends.

But if you're an agentic man, likability without respect, harmony without status, and good conversations without attraction are not exactly your best outcomes.

Worse yet, some social skills advice can even actively disempower you.

For example, a popular social skills teacher advises texting a friend: *"I thought of you."*
That is perfect for her personality, her friends, and the type of relationships she enjoys (notice she's a woman).
But if you're an agentic man, my agentic knee-jerk reaction: *"Who the f*ck does that?"*
I'd think the sender of that text is 'nice', but I also instantly see him as a low-power, too-nice guy. I may even worry if he'll get clingy or if we're both heterosexual.
It's not about being harsh — it's how an agentic mind works.

And since most people at the top are high agency, **high-communion advice can undermine your progress** socially, and professionally.

Successful Dating Is Power-First

Women are, on average, higher communion than men. But it doesn't mean they want high communion guys.

Sure, many women appreciate a high communion guy during the relationship, which is why we also encourage learning that side. It's a great plus. But the strongest *requirement* is power.

Women may be more communal themselves, but they want agentic, high-power men.

Communion Requires Power

Many men who first stumble on The Power Moves tend to believe that friendship or love stands in contrast to power.
But it couldn't be further from the truth because not only do the two go hand-in-hand, but **both friendships and love rest power**.

Already from inception, people have limited time and bandwidth and they want to select whoever gives them the best returns.
So becoming friends or lovers with someone is also a competition. To first establish that bond, you have to 'win' that competition by being valuable enough to form an association.

This is also a point made in Blau's seminal text *Exchange and Power in Social Life*:

> although men may want to associate together exclusively for the sake of sociable fellowship and have no interest in deriving any extrinsic advantage from their social relations, they must prove themselves attractive to each other by demonstrating qualities that make them preferable to other possible associates, qualities that must be comparable and that consequently are, in a relative sense, extrinsic.

Hence, don't fall for that naive, too-nice-guy dichotomy. Or, worse, don't fall for that manipulative virtue-signaling that 'love' doesn't require power or value.

Ambitious Men Better Start With Power

Ambitious men are often better off starting with power dynamics because they provide the fastest and largest returns, while also covering a good chunk of foundational social skills.

🧔♂️Lucio's Take: **My agency-first approach delivered the life I wanted**

Lucio:
I'm a good example of how power-first can work for some men.

I'm just *okay* at conversations, not great. And I don't even socialize much.
But I am much stronger at power-related outcomes, and that's allowed me to live the life I want.

I can:

- Join new groups and reliably gain status
- Come across as a valuable friend
- Get consistent results with women

And as I improved my power intelligence and skills, my friendships and relationships also substantially improved.

Starting power-first also benefits from the 'from hardest to easier' effect.
To make a comparison: power dynamics first is like mastering a race car to also cover city driving.

- The two aren't the exact same
- But if you learn racing first, you learn faster, achieve goals faster, and slow city driving feels easy

Power is car racing. Social skills are city driving.

Too Nice Guys Better Start With Power

Too nice guys are often not lacking social skills, but power.

Even more so for men than for women, power is a crucial element for a happy, successful, and even healthy life.

The truth is that **to enjoy communion, you must first learn power.**
All good relationships start with at least some display of power. This is especially true in dating and relationships, where sexual market value, leadership, and positive dominance are crucial to even start a relationship.

Next Steps

Why is The 48 Laws of Power So Popular? The Psychology of the Hype

Lucio Buffalmano · 9 March 2026 · Archived copy · Original

Why is *The 48 Laws of Power* so popular—and why has it stayed famous for decades, despite its flaws?

While the book is an undeniable masterpiece of storytelling and provides a necessary wake-up call to the reality of power, it also suffers from questionable morality, weak evidence, and limited real-world effectiveness.

In this guide, I break down the real psychological, marketing, and audience-fit reasons behind the book's massive success. We'll look beyond the hype to understand what actually drives the popularity of *The 48 Laws of Power*.

Let's dive in.

⁉⁉ For our broad overview on the book, see: 48 Laws of Power guide

  - 3. From Niche Appeal to Mass Market: Power Signaling
  - 4. Cognitive Targeting: The 'IQ Sweetspot' (Best-Seller Quality Tradeoff™)
- FAQs
- Moving Beyond the 'Laws'

Intro

Some time ago, I was asked why The 48 Laws of Power is so popular in The Power Moves community:

@Lucio Buffalmano

I've had a read of that forum before and I thought it was interesting to see how people there seem to find the idea of using some special tactics that "regular people" don't know about more motivating than the idea of actually solving their real-life problem.

I'm curious what would be your take on why people hype this book so much? You can find many people, including celebrities, praising this book. But everyone here is probably familiar with how impractical it is in terms of real life implementation.

The only real life value I can think that any average person can get from it (average as in starting where most people start, social skills-wise), is the general acknowledgement that there are hidden dynamics behind what people say and do that aren't obvious. And the acknowledgement that people act in their own self-interest most of the time (surprise?).

But since it's not clear how to apply that knowledge to real-life contexts just from reading 48 laws, I wouldn't expect many, if any, to be claiming that this book was life changing. Yet more than I would expect do.

Jump to latest comment

Is it simply peo[illegible]any-high they get from

> **Asker**: Why do people hype this book so much (despite) how impractical it is in terms of real-life implementation

It's a great question.

To be fair, as the asker also acknowledges, *The 48 Laws* is one of the best 'gateway' books ever written. It shatters the 'nice guy' delusion like few other books do, which is a mandatory first step for any high achiever.

Yet, it's not nearly as effective in delivering skills, mindsets, and real-life outcomes.
Why is it so popular, then?

This is why *The 48 Laws* became and remained so popular:

1. Authority-Hijacking: Messianic Laws, Dogmatic Absolutes, & Historical Name Dropping

Robert Greene is a brilliant writer, and the 48 Laws of Power is as captivating as it is **engineered for signaling authority** with:

- Messianic 'laws'
- Dogmatic absolutes
- Categorical imperatives
- Historical name-dropping
- Aesthetics of book cover & content

Let's review them:

Laws Format Signal Highest, Quasy-Divine Authority

The "laws" format is memorable and psychologically effective for signaling unquestionable authority, similar to inescapable physics laws like 'law of gravity'.

There may also be an element of the human psyche tapped by the format of 'lists of laws', similar to religious commandments: sacred, immutable… And a clear path to salvation.

Also read:

- Teacher frames
- Authority signaling: Andrew Huberman case study

Categorical Imperatives

Categorical imperatives support the 'laws format' to signal the highest confidence.
High confidence can enhance credibility in certain audiences because **people assume competence from confidence** (Schnaubert et al., 2021; Cialdini, 1984).

In the book, just between the laws' titles and the initial descriptions, the words 'always' and 'never' appear twenty-six times.

This is illusion of certainty can come at the cost of accuracy. Despite often being less correct, simplistic dogmas often outsell more nuanced but more correct principles:

Dogma (what sells)	Principles, models & calibration (what's true)
Say less than necessary	**Babble hypothesis**: Speaking time correlates with leadership emergence and social influence (MacLaren, 2020), but if you have leverage you can use silence to signal power

Dogma (what sells)	Principles, models & calibration (what's true)
Never Appear Too Perfect	**Pratfall effect**: a mistake can increase liking (Aronson, 1966) and prevent 'frenemies', but appearing perfect can awe followers and discourage opponents
Let Others Do the Work, but Always Take the Credit	**Social Exchange Theory**: Credit stealing may work with powerless followers or in short-term contexts, but as a 'take' it costs in engagement, talent retention, and long-term output

The 'real' principles are not catchy and memorable. On the upside, once understood, they allow for more effective calibration and yield better results.

Historical Name Dropping

TACITUS, C.55–120 A.D.

Your enemies, on the other hand, are an untapped gold mine that you must learn to exploit. When Talleyrand, Napoleon's Foreign Minister, decided in 1807 that his boss

Ancient quotes and references of people you've never heard of are powerful 'persuasion power moves'.
They serve as:

- **Authority-borrowing** from arcane ancient thinkers
- **Frame the author as higher authority than the reader** whenever the readers never heard of the source (covert power move, ie. 'I know more than you')

When readers tacitly accept that frame, they will automatically trust the 'more knowledgeable source'.

Of course, quoting ancient Roman authors is unrelated to expertise in advanced social and power dynamics—but few make that connection.

2. Marketing Positioning: Dark Psychology Manual on "How to Be Bad (& Win)"

Most self-help ignores power dynamics and provided the book with the perfect backdrop of 'politically correct but weak half-truths'.

Of the few books that dealt with power dynamics, none ever used an offensive-only perspective.

That provided a blue-ocean market for a **bold contrarian play** that positions itself as a power-focused, politically *in*correct, 'harsh but true' manual on 'how to be bad (and win)'.
Greene delivered it.

Read more:

- Dark psychology: what it truly is (and what isn't)
- Naive self-help

> Naive Self-Help: Why Self Help Is Failing You

The ‘Anti Too-Nice-Guy’ Positioning

The 48 Laws is the polar opposite, and cure, of men’s fear: the ‘too nice guy’ that’s taken advantage of, and fails in life.

Where the nice guy is powerless, *The 48 Laws* promises a guide for unapologetic dominance—’bad’ but effective (or so suggests the marketing positioning).

Greene followed his law of ‘Enter Action with Boldness’ and went all in with a purely offensive manual.
With great prose, valid insights, and the authority-building tactics above, it was a shark-level entrance that conquered this new market.

Note: marketing positioning ≠ ‘truth’ and ≠ results
The book was a needed ‘over-correction’ from standard self-help, providing a much-needed rupture and wake-up call.
Yet, some ‘laws’ are scientifically disproven. And offensive tactics alone under-deliver in a social species where personal value and smart cooperation are foundational to success.

More Evil, More Sales: Antifragile Against Criticism

Given the positioning as ‘evil but true’, critics pointing to the amorality of the laws only *helped* its sales.

The critics self-framed as ‘too nice guy’, and the wannabe power-players flocked to buy and proselytize.
This is why people hype it up. Praise sub-communicates high power, and criticism sub-communicates low-power ‘too nice guy’.

Public review	⍰ Sub-communication
⍰ *The 48 Laws of Power is amazing*	⍰ ⍰ *I’m a power player, I deal with reality to achieve goals*
⍰ *The 48 Laws of Power sucks*	⍰ ⍰ *I’m a too nice guy, I can’t stomach reality*

This dynamic may have discouraged some critics from speaking up — a pattern consistent with the spiral of silence described in sociology (Noelle-Neumann, 1974).

The Prison Ban Marketing Hack

No book is as far from being ‘banned’ as a best-seller available at your local bookstore.

Yet, *The 48 Laws of Power* marketing benefited from some US state prisons banning it, gaining extra reputation as a ‘dangerous’ book, an offensive weapon to keep hidden from predators.

Although some laws may handicap an unsophisticated reader as much as they could help, that was the best marketing gift it could get. It cemented its position as a **forbidden fruit**. And forbidden fruits are supremely seductive, as Greene himself would have written.

3. From Niche Appeal to Mass Market: Power Signaling

As per Moore’s take (1991) on the Diffusion of Innovations Theory, to ‘cross the chasm’ from early adopters to mass market, one has to dominate a niche first, and then move to the majority with a well-rounded product.

That’s what *The 48 Laws of Power* did.

In certain environments, value signaling isn’t about projecting “goodness,” but about projecting ruthlessness,

cunning, and dominance to gain status. This is why rap culture, in particular, embraced Greene's work—the biggest dominant force in the contrarian space of 'book for bad guys'.

It wasn't necessarily as an endorsement of how well it worked, but a Machiavellian signal.

🤔Lucio's Take: **Feminist power-signaling parallel**

Lucio:
Similarly, I've seen women conspicuously display a copy of *'Why Men Love Bitches*', a book advocating for women's empowered dating.
The book doesn't necessarily help them date better, and it may even *decrease* the odds of finding a high-quality partner, but it serves as power-signaling (and self-signaling).

In my experience, at least for women, it's sometimes hurt people who swing to the more dominant/antagonist side. That signals neediness and relationship failure, rather than power and independence.

Tipping Point & Social Proof

The antifragile marketing and a product designed for easy consumption (point #4) pushed the book past the tipping point of the mass market, where many uncritically 'join the social bandwagon' (Leibenstein, 1950).

4. Cognitive Targeting: The 'IQ Sweetspot' (Best-Seller Quality Tradeoff™)

The Best-Seller Quality Tradeoff™ is the phenomenon where achieving mass-market success forces authors to simplify, generalize, or entertain at the expense of depth, nuance, and calibration. It posits a necessary trade-off between realistic complexity and the narrative simplicity required to appeal to the majority (the 'fat portion' of the distribution curve).

The 48 Laws is both masterfully written and written to be a best-seller.

Why The 48 Laws of Power Became Popular — Audience Fit Model

The 48 Laws' ease of consumption well satisfies the larger middle of the bell curve.

For example:

Captivating Storytelling

The stories are certainly useful to understand the concept, but they prioritize entertainment value over analytical soundness.

Memorability Over Applicability

The laws seldom map onto deeper underlying power principles, but they're memorable.

Same for the advice: it's at times insightful for many, yet simple, prioritizing memorability over applicability (some may even say it's *simplistic*).

Scannability

The page layouts are approachable and easy to scan, with different fonts, colors, and large spaces:

LAW

2

NEVER PUT TOO MUCH TRUST IN FRIENDS, LEARN HOW TO USE ENEMIES

JUDGMENT

Be wary of friends – they will betray you more quickly, for they are easily aroused to envy. They also become spoiled and tyrannical. But hire a former enemy and he will be more loyal than a friend, because he has more to prove. In fact you have more to fear from friends than from enemies. If you have no enemies, find a way to make them.

PROFITING BY OUR ENEMIES

King Hiero chanced upon a time, speaking with one of his enemies, to be told ... that he had stinking breath. Whereupon the good king, being somewhat dismayed in himself, as soon as he returned home chided his wife, "How does it happen that you never

The layout is approachable even to those who don't read much

Law of Power #49: Target average folks to 'Create a Cult-like Following'
While *The 48 Laws* is incredibly helpful to awaken many readers to power dynamics, it takes a further step of sophistication to realize that *the book itself* is a series of 'persuasion power moves' (the 'quality-popularity tradeoff™').

Conquering Market Entrance: Dark Psychology & 'Hacks' Appeal

It's most profitable to sell to beginners because **few reach mastery, but everyone starts.**

That's what *The 48 Laws* does.
This younger crowd often starts with more approachable resources that require less cognitive investment, and *The 48 Laws of Power* provides the perfect book-level entry point. A 'real' book, yet simple and entertaining enough to read (or at least start).

Sometimes this demographic is also swayed by a 'hack approach' to 'dark psychology'. And Greene's laws deliver.

Simplistic offense	Strategic nuance
Crush Your Enemies Totally	Historically, leaders who crushed enemies removed a competitor, while some of those who wounded fostered revenge-seeking. However, crushing can be more costly than wounding, and ruthless-signaling may isolate, so the best strategy is contextual
Keep Others in Suspended Terror: Cultivate an Air of Unpredictability	Terror can boost compliance with disempowered followers. It works less well with more empowered followers, boosting the chances of brain drain and organized rebellion. Choose accordingly

FAQs

Why is *The 48 Laws of Power* so popular?

The book's popularity stems from its bold **contrarian positioning**, some valid insights, and entertaining narrative. By framing itself as an "evil but true" manual, it appeals to people tired of "politically correct" self-help. It uses a**uthority-hijacking**—through the format of "laws" and historical anecdotes—to create an illusion of absolute certainty in the more nuanced world of social and power dynamics.

Why is *The 48 Laws of Power* still popular after so many years?

It has benefited from the **Lindy Effect**: the longer something stays relevant, the longer it is likely to stay relevant. It has become a classic and almost a "cultural rite of passage" for many young men interested in personal success, goal achievement, and strategic power dynamics.

Why do people follow 48 Laws of Power?

Few people consistently follow the laws; it is difficult to apply them verbatim in most modern social contexts while remaining an effective operator.
More often, readers who were initially too naive find it beneficial as a first revelation of power dynamics they were not consciously aware of—a useful first step toward higher power awareness.
A few more cynical readers instead may follow it more closely because it validates their overly cynical worldview.
Finally, some people who promote it publicly use it to signal their Machiavellian persona. For them, it is less a guide to follow and more a brand that signals their personality.

Why is *The 48 Laws of Power* controversial?

The 48 Laws of Power is controversial because it takes a contrarian approach to self-help, focusing narrowly on power and offering tactics that are reputationally and relationally high-risk and often perceived as predatory.
Controversy has been a major driver of the book's marketing success: after gaining cult niche status and word-of-mouth promotion, it became one of the first mainstream guides to openly advocate manipulation, turning moral outrage into a powerful growth engine.

Moving Beyond the 'Laws'

Despite our critical approach, *The 48 Laws of Power* is a compelling introduction to the 'dark side' of human nature. Its popularity is well-earned as a cultural reset against "too-nice-guy" self-help.

We greatly respect Robert Greene and his work—TPM aligns philosophically with his work and with many of his insights, and we generally applaud and endorse his work.

At the same time, as we've seen, its "dogmatic laws" often underdeliver for smart and ambitious men who seek more empirically grounded and advanced resources.
If you prefer books, you can explore our "books better than *The 48 Laws of Power*" or the "best books on power" list.

And if you want to go straight to a deeper training ground that delivers status, respect, and attraction, Power University builds on these principles with an advanced, multimedia, and calibrated approach to power dynamics.

Psychopathy: Traits, Causes, Models, and Adaptive Potential

Lucio Buffalmano · 16 March 2026 · Archived copy · Original

Psychopathy is one of the most studied personality constructs in psychology and forensic psychiatry, with implications for societal functioning, personal effectiveness, and safety.

This article, continuously updated with the latest findings, reviews the full scientific literature on psychopathy from multiple angles, with special attention to adaptive and successful trait combinations. It then introduces Lucio's synthesis, examining psychopathic traits through an evolutionary lens and their potential for personal empowerment.

Part 1 — Scientific Foundations

What Psychopathy Is

Psychopathy is a multifaceted, dimensional personality construct characterized by a pattern of traits that often include low empathy, shallow affect, and impaired behavioral control.

Rather than a binary 'all-or-nothing' diagnosis or a fixed set of traits, contemporary research views psychopathy as a spectrum, where traits such as boldness, meanness, and disinhibition combine in varying ways to shape an individual's psychological and social functioning.

Common traits associated with psychopathy:

- Superficial charm and social dominance
- Low empathy and shallow emotional responses
- Manipulativeness and instrumental aggression
- Reduced fear and punishment sensitivity
- Impulsivity and poor behavioral control (more associated with factor 2)

But note that **psychopathy is not a static list of symptoms**. Researchers increasingly view psychopathy as a heterogeneous constellation of traits, and different combinations of traits can produce different psychopathic patterns.

🤔Lucio's Take: **The messy history of psychopathy research**

Lucio:
Psychopathy research is a young science seeking a clearer path after a complex start.

After Cleckley's initial accounts largely referred to factor 1, Robert Hare assumed psychopathy includes antisociality and is a 'classical syndrome'—meaning, a cluster of features that reliably co-occur and covary.

Later research undermined the co-variance (Blonigen et al., 2010; Marcus et al., 2013), suggesting that **psychopathy is a configuration of largely independent traits**. Lilienfeld (2018) even questioned the validity of a unitary psychopathy construct in itself.

Then Patrick's Triarchic model delivered ad-hoc, 'factorially pure indices', but today many researchers claim that Triarchic's boldness' shouldn't be a core component of psychopathy.

Finally, DSM's 'antisocial personality disorder' (ASPD) adds yet another construct, leaving us with many different and overlapping labels and constructs and several open questions.

Diagnostic & Assessment

The main assessment tools for psychopathy to date are:

- **PCL-R (Psychopathy Checklist—Revised)**: Clinician-rated 20-item assessment (Hare, 2003)
  - PCL:SV (Screening Version): Shorter, semi-structured version for quick triage (Hart et al., 1995)
- **PPI-R (Psychopathic Personality Inventory—Revised)**: Self-report tool for both offender and community samples (Lilienfeld & Widows, 2005)
- **TriPM (Triarchic Psychopathy Measure)**: Self-report scale indexing Boldness, Meanness, and Disinhibition. (Brislin et al., 2015)
  Take the test ↗
- **Inventory of Callous-Unemotional Traits (ICU)** to assess psychopathic traits, referred to as Callous-Unemotional (CU) in youth. (Kimonis et al., 2008)
- **LSRP (Levenson Self-Report Psychopathy scale)**: Brief self-report (Levenson et al., 1995)
  Take the test ↗

Notes: PCL-R became the gold standard for forensic work, but self-report measures (PPI-R, TriPM, LSRP) addressed the PCL-R's reliance on criminal history. Use validated versions and follow publisher guidance for administration and scoring.

Factor 1 & 2

PCL-R-based frameworks such as the three-factor model (Cooke & Michie, 2001) and the four-factor model (Neumann, Hare, & Pardini, 2015) have been proposed as alternative structures. In research, the four-factor model is widely used because it separates interpersonal, affective, lifestyle, and antisocial facets.

However, the simpler two-factor model remains common for quick overviews and broadly aligns with the PPI's two-factor structure:

1. **Factor 1 (AKA 'primary')**: Covers shallow emotionality and attachment, and the interpersonal 'mask'
2. **Factor 2 (AKA 'secondar')**: Reflects impulsivity, disregulation, and antisocial behavior, and it's closer to antisocial personality disorder (ASPD)

In general, factor 1 primary psychopathy can be more adaptive.

Factors 1 and 2 derive from **PCL-R**, and are similar to the PPI-I Fearless Dominance (FD) & PPI-II Impulsive Antisociality (SCI)

Factor 1	Factor 2
Low fear: deficit in startle potentiation, brain's failure to "prime" for threat	**Normal or hyperactivated defenses**
Positive affect and emotional resilience. Low fear, anxiety, and depression	**Negative Affect**: anger, alienation, distress, stress reaction, dysphoria, suicidal ideation, neuroticism
Correlates with **narcissism**	Correlates with **borderline personality disorder**, **ADHD**, and other conditions
Low externalizing: largely uncorrelated to substance abuse and conscientiousness	**Antisocial**: aggression, externalizing proneness, substance abuse, impulsivity, low conscientiousness
High social power: achievement, interpersonal assertiveness, dominance, high extraversion	**Low social skills**: poor assertiveness, social anxiety, withdrawal, immaturity, susceptibility to peer pressure

Factor 1	Factor 2
Instrumental aggression: premeditated, unprovoked	**Reactive aggression**
Strong heritable component	Heritable; amplified by environmental deprivation and low SES

Research Base: This table integrates findings from the major academic reference works on psychopathy, along with the core empirical literature

 Examples: James Fallon and M.E. Thomas may be closer to factor 1. Mark Renton from the movie *Trainspotting* could be close to factor 2.

Affective Deficits

Affective deficits are a core component of factor 1, and this table helps you understand beyond vague umbrella descriptions such as 'lack of conscience':

Affective Components	Description & manifestations
Low Empathy/ Callousness	Blunted emotional response to others' suffering. But cognitive empathy, or understanding others' emotions may remain intact
Lack of Remorse	Failure to feel regret after harming others, even when understanding the causal link. Remorse = regret for harm caused
Lack of Guilt	Weak self-condemnation after moral violations. Guilt = negative self-evaluation after wrongdoing
Shallow Affect	Limited emotional depth: reduced intensity, restricted range, and rapid emotional shifts
Emotional Detachment	Weak emotional bonding and attachment, often resulting in shallow relationships, disposability, and low loyalty

Biology

Key findings from psychopathy research include:

Genetic influences

Psychopathy is **moderately to highly heritable**, with genetics explaining roughly **40–60%** of trait variance (Blonigen et al., 2005; Viding et al., 2005).

- **Both factor 1 and 2 are heritable:** Factor 1's heritability may be marginally higher (Bezdjian et al., 2011), but factor 2's underlying disorders such as externalizing proneness and ADHD are highly heritable (Andershed & Lichtenstein, 2006).
- **Stability is also partially explained by genetic factors** (Loney et al., 2007; Lynam et al., 2007; Forsman et al., 2008)
- **Polygenic & Interactive Genetics:** Psychopathic traits arise from many small-effect genes acting additively and interactively, with both additive (32%) and non-additive (9%) influences contributing (Rhee & Waldman, 2002)

Additive effect of candidate gene polymorphisms on psychopathy. The more high-risk genes, the higher the chances of psychopathic traits.
Recreated by Lucio Buffalmano, based on Hoenicka et al. 2007

Hormonal Correlates

Overall, the evidence for hormonal effects is weaker:

- **Testosterone and cortisol seem weak markers**: Despite the theoretical correlation, the few studies that tested the hypothesis show inconsistent results (Glenn and Raine, 2014)
- **Testosterone-to-cortisol ratio *may*** relate to psychopathic traits (Glenn et al., 2011)

Neurobiological & Psychophysiological Systems

- **Amygdala-Prefrontal Dysfunction:** Reduced amygdala, ventromedial, and orbitofrontal cortex volume and responsiveness impair empathy, moral reasoning, and emotional integration into decision-making (Yang et al., 2005; Marsh et al., 2008; Glenn et al., 2009).
- **Impaired Paralimbic Connectivity:** Weakened white matter and functional links between emotional centers (limbic system) and executive control regions (PFC) prevent emotions from effectively guiding or restraining behavior (Heinz et al., 2005; Pezawas et al., 2005).
- **Blunted Physiological Fear & Stress Responses:** Low resting heart rate, reduced skin conductance, lower startle potentiation, and weaker autonomic reactions during fear conditioning, contributing to Boldness (Lykken, 1957; Patrick et al., 1993).
- **Reward-Focused Attention & Learning Deficits:** Attention bias toward rewards over threats and impaired punishment/fear learning, reducing sensitivity to cues that discourage harmful behavior (Blair et al., 2006; Newman & Kosson, 1986).

Neurobiology of psychopathy: reduced amygdala emotional signaling ("bottom-up") combined with varying levels of prefrontal executive control ("top-down") produces impulsive antisocial behavior or controlled instrumental psychopathy (Buffalmano, 2026)

Biosocial & Epigenetic Interaction

Both genes and environment matter, and they interact: epigenetic research shows stressors like childhood maltreatment can activate or silence genes, altering brain biology without changing DNA.

- **Gene-environment potentiating effect**: genetic risk combined with childhood maltreatment significantly increases the likelihood of antisocial outcomes (Caspi et al., 2002)
- **Parenting matters:** Harsh vs warm parenting can increase/decrease antisocial behavior and CU traits (Waller et al., 2013; Pardini et al., 2007; Pasalich et al., 2016);
- **Delinquent peers predict antisocial acts**, and psychopathic youth influence more than they are influenced; group settings increase risk-taking (Kerr et al., 2012; Goldweber et al., 2011; Steinberg, 2009)
- **Urbanization boosts criminality**, and high-crime neighborhoods particularly (Elliott et al., 1989; Foster & Brooks-Gunn, 2013)

Bottom line: There is no single cause of psychopathy, but it emerges from an interaction of genes, neurobiological differences, and environmental experiences, and each individual will have a different mix of 'causes'.

Dark Triad (Mach & Narcissism)

The recently proposed 'D-factor' claims that the shared core relates to **maximizing one's individual returns**, even at others' expense (Moshagen, Hilbig, and Zettler, 2018).

Here at TPM, we'd also add that both narcissism and psychopathy have a 'weaker' side (respectively, vulnerable narcissism and factor 2), and a 'stronger' one more associated with social dominance, independence, and agentic goal-pursuit.

Trait	Motivation & Tools	Vulnerability
Narcissism	Admiration with self-promotion	Validation-seeking
Machiavellianism	Goal-achievement with strategic calculativeness	Over-cynicism

Psychopathy	Reward-seeking with bold or disinhibited action	Long-term instability

Pros & Costs of Psychopathy

We focus on factor 1 as the more adaptive facet:

Advantages

- **Social power**: Can gain early status, and glibness can seem charismatic for positive first impressions (IF basic social skills are acquired)
- **Career / Performance:** Low anxiety and fearlessness help in masculine and high-stakes environments
- **Psychological health:** Low anxiety, stress, and depression; high emotional resilience; no 'heartbreaks'
- **Strategic advantages of low empathy:** Ruthless and amoral decision-making can facilitate goal-achievement
- **More sexual partners**, due to dominance, boldness, and high short-term mating efforts
- **High power in dating & relationships**: Low attachment = low neediness; partners often invest more

Disadvantages / Potential Risks

- **Long-term underperformance:** Too much fearlessness without enough self-regulation is the #1 for psychopathy
- **Shallow relationships:** Emotional detachment often weakens bonds
- **Alliances risk**: Overly instrumental attitudes undermine reputation, trust, and cooperation, including in leadership
- **Criminal risks:** Especially when paired with disinhibition
- **Lower long-term social efficacy:** Low empathy and emotional depth = 'unnatural', sometimes even in brief interactions

Part 2 — Scientific Debates

Some of the most asked, debated, and misunderstood topics in psychopathy include:

Does Psychopathy Include Antisociality/Criminality?

Whether psychopathy inherently includes antisociality and criminality is debated, with recent models increasingly seeing them as possible outcomes rather than defining traits.

Robert Hare's PCL-R has been criticized for including criminality as a constituent trait of psychopathy (Cooke and Michie, 2001; Cooke et al., 2004).
Hare's approach also biases towards *convicted* psychopaths, or "blue-collar" criminals, underestimating non-criminals and more successful 'white-collar' psychopaths.

That being said, while psychopathy may not necessarily lead to antisociality, **psychopathic traits may lower the bar for antisociality**, criminality, or violence.
For example, callousness, weak moral internalization, and lack of behavioral restraint can all increase the odds of antisocial behavior.
Plus, some psychopaths may *enjoy* inflicting harm:

A Problematic Link Between Psychopathy & Sadism

Psychopathy is associated with several measures and outcomes related to sadism, including:

- Sadistic fantasies and paraphilias (e.g., Woodworth et al., 2013)
- Deviant sexual arousal (Barbaree et al.,1994; Quinsey et al., 1995; Serin et al.,1994)
- Higher levels of gratuitous and sadistic violence in homicides (Porter et al., 2003)
- Schadenfreude (Porter et al., 2014).
- 'Inverted' social rewards, with cruelty enjoyable and kindness not (Foulkes et al., 2014)

Even among violent offenders, psychopathic individuals had higher sadistic traits that non-psychpathic ones (Holt et al., 1999).
Sexual deviancy and sadism may increase the odds of antisocial and criminal behavior, especially when in conjunction with disinhibition.

Technical note: Sadism was more correlated to facet 1 and 4 in Robertson and Knight, 2014 and facet 2 in Mokros et al., 2011.

Is Psychopathy Always Impulsive?

Psychopathy as a whole, and factor 2 in particular, are related to impulsivity via several different paths, but not all individuals high in psychopathic traits are always and necessarily impulsive.

These elements that increase the odds of impulsivity, and can compound when they co-exist:

1. **Executive control deficit (Prefrontal Cortex, PFC)** <– The main 'missing brake', strongly implicated in factor 2 and ADHD
2. **Low fear and low Behavioral Inhibition System (BIS)** <– Removes the 'brake' of punishment anticipation (more associated with factor 1)
3. **Emotional dysregulation / threat reactivity** <– Can trigger emotion-driven impulsivity (more related to factor 2)
4. **High reward approach (high BAS)** <– The 'moving towards accelerator'

Not directly tied to impulsivity, but can contribute to interpersonal aggression:

- **Low empathy & attachment** <– Removes the 'empathy & caring brakes' on harming others

Technical note: triarchic model issue
Knight and Guay (2018) note the issue of clustering two different types of impulsivity: Reward-driven / goal-focused, more related to factor 1, CU-traits, and hypersexuality; and Emotion-driven, more sensitive to threats, emotional reactance, and loss of control, more related to factor 2.

Can Psychopathy Be Cured?

While for decades the dominant view was that psychopathy was untreatable, more recent research paints a more nuanced picture and provides evidence for modest treatment effects (Polaschek and Skeem, 2018).

Psychopathy itself is difficult to change, but modern interventions can reduce antisocial behavior and criminal recidivism, with promising evidence for the Risk-Need-Responsivity (RNR) model (Andrews et al., 1990).

The reductions in reconviction risk are modest but meaningful, with effect sizes around 0.15–0.34 (Andrews & Bonta, 2010). A program with an effect around 0.15 could reduce a 50% reconviction rate to roughly 35%.

Treatment is also helpful with high risk individuals and can be beneficial despite challenges to the therapy environment (Lipsey et al., 2009; Lipsey, Wilson, & Cothern, 2000).

Experimental findings also suggest that simple attentional cues can help recognize fear in others, a deficiency that has been linked to interpersonal aggression.

Popular FAQs

How is psychopathy different from sociopathy

Psychopathy is a well-studied personality construct, while sociopathy is not a formal clinical diagnosis and is used inconsistently outside of academic circles. Sociopathy is often used informally to describe individuals with antisocial behavior shaped more by environment or upbringing, a claim that may also be misleading since genetic influences matter for both factor 1 and factor 2.
For accuracy, the term psychopathy is preferred.

What's the difference between psychopathy and antisocial personality disorder

Antisocial Personality Disorder (ASPD) is a clinical diagnosis defined in the Diagnostic and Statistical Manual of Mental Disorders (DSM). It focuses mainly on persistent antisocial and rule-breaking behavior, overlapping more with psychoapthy factor 2 than factor 1.
Psychopathy is a broader personality construct that includes interpersonal and emotional deficiencies (e.g., callousness, lack of remorse).
As a result, many individuals with psychopathy meet criteria for ASPD, but not all people with ASPD are psychopaths.

Are all psychopaths narcissists?

No. Psychopathy and Narcissistic Personality Disorder may share some traits, such as grandiosity and lack of empathy, but they are distinct constructs. Narcissism in psychopaths may also express differently, with equal grandiosity but lower motivation for admiration (Ronningstam, 1998).
And while psychopathy factor 1 is associated with narcissism, factor 2 is not.

Are psychopaths only men?

No, although psychopathy is more frequent in men, and men tend to score higher on psychopathy measures, it occurs in both men and women.
Women may show somewhat different patterns of expression, including more emotional disregulation in factor 2, more internalizing and self-direct harm (overlapping with borderline personality disorder and histrionic personality disorder), more relational aggression, but lower risk of criminal and violent outcomes.

How common is psychopathy?

Psychopathy is relatively rare in the general population. Estimates typically place the prevalence around 1%, although higher rates are observed in prisons and forensic samples. Some research suggests that subclinical psychopathic traits may be more common and can appear in competitive environments such as business, politics, and high-risk professions (Hare and Babiak, 2006).

For a quick differentiation between these commonly misunderstood constructs:

Construct	Status	Focus & Traits
Psychopathy	Research personality construct	Interpersonal + emotional deficits (factor 1) and poor behavioral control (factor 2)
ASPD	Clinical diagnosis in Diagnostic and Statistical Manual of Mental Disorders (DSM)	Persistent rule-breaking behavior (closer to factor 2)
Sociopathy	Informal term	Inconsistent use

Part 3 — Models of Functionality

Triarchic Model

The triarchic model (Patrick, Fowles, and Krueger, 2009) subdivides psychopathy into three dispositional tendencies:

- **Boldness:** Social dominance, emotional stability/resilience, and venturesomeness (most adaptive).
- **Meanness:** Deficient empathy (callousness), selfishness, and aggressive exploitation of others (facilitates manipulative or coercive strategies)
- **Disinhibition:** Lack of behavioral restraint, irresponsibility, and emotional volatility (contributes to risk-taking, externalizing behavior, and sometimes maladaptive outcomes)

Boldness and Disinhibition are relatively independent, whereas Meanness shows a small to medium association with Boldness and a medium to large association with Disinhibition (Hicks and Drislane, 2018).

Component	Maps to PCL-R	Why
Boldness	Factor 1 (interpersonal)	Adaptive charm & social dominance, low fear
Meanness	Factor 1 (affective) + some Factor 2 aggression	Callousness, cruelty, lack of cooperativeness
Disinhibition	Factor 2 / externalizing liability	Impulsivity, poor self-control, antisociality

Schematic depiction of the hypothesized relative contributions of Boldness, Meanness, and Disinhibition to different conceptual models of psychopathy (adapted with color adjustments from Hicks and Drislane, 2018)

Adaptiveness of Triarchic Domains

Boldness by itself may support effective functioning.
In contrast, disinhibition—closely aligned with the externalizing spectrum—appears to be the primary driver of persistent antisocial behavior and life dysfunction.

That said, at TPM we also like to look at adaptiveness *in context*:

Component	Adaptive	Maladaptive
Boldness	**Leadership**, status, crisis management. 'Pro-social psychopathy'	**Recklessness** at extremes: can ignore real dangers
Meanness	**Ruthless execution**: to achieve (selfish) goals without guilt	**Isolation:** Destroys social capital and alliances required for long-term power; can foster mutinies
Disinhibition	**Opportunistic Speed:** Prevents "analysis paralysis"; seizes rewards in unstable environments	**Self-Sabotage**: stupid risks, substance abuse, and explosive outbursts ('car without breaks')

The Adaptiveness of Boldness & Fearless Dominance

Technical Note: Triachic boldness is similar to 'Fearless Dominance' from PPI-I. Sometimes authors treat them interchangeably.

Looking at the literature, **boldness may be the most adaptive aspect of psychopathy** (Skeem et al., 2011; Beinning et al., 2018), including healthy psychological adjustment and inverse correlation with emotional distress (Lilienfeld, 2018).

Boldness may be the primary differentiator between psychopathy and antisocial personality disorder (Venables et al., 2014; Wall et al., 2015)
Conversely, extremely low levels of boldness are tied to elevated risk for internalizing disorders (e.g., Lynam & Miller, 2012).

We can't yet say for sure whether boldness follows the inverted U-curve of the 'law of balance' and becomes maladaptive at extremely high levels. However, we can venture that it may be better to be in the upper range than in the very low range.

Real-life evidence for the adaptiveness of boldness

- **More leadership positions held** (Lilienfeld et al., 2014)
- **Higher representation in challenging occupations**, like special military teams (Kjærgaard, 2013) and North Pole expeditions (though discussed in terms of poor outcomes, Leon & Venables, 2015).
- **Strong leadership performance** with higher subordinate satisfaction (and lower for meannes & disinhibition, Sanecka, 2013), US presidents' performance (Lilienfeld et al., 2012), and positive leadership style (Lilienfeld, 2018).
- **More profitable decisions in economic games** (Yamagishi et al., 2014)
- **Higher incomes** (Benning et al., 2003) and ranks in financial occupations (Howe et al., 2014).

Boldness may be heroically prosocial

Fearless dominance is higher among first-responders and is positively, albeit weakly to moderately, associated with heroism and altruism toward strangers (Smith et al., 2013; Patton et al., 2018)

These findings provide some evidence for Lykken's controversial statement that 'the hero and the psychopath may be twigs on the same genetic branch'.
Deeper dive on this topic: are psychopaths and heroes the same?

🤵♂️Lucio's Take: **'Good psychopath' (pop-)psychology refers to boldness**

Lucio:
Boldness explains most accounts of ‘good’ or ‘prosocial’ psychopaths (ie.: Lykken, 1995; Dutton, 2012).

When referring to psychopathic heroes, soldiers, and neurosurgeons, most are referring to the effect of boldness, with little disinhibition and little or no meanness.

Technical Note: It’s debated whether boldness should even be a core psychopathic trait.
Researchers such as Lynam and Miller view Meanness (Antagonism) and Disinhibition (Low Conscientiousness) as core psychopathic traits, and boldness as more of a specifier

Not All Peace & Love: The Grey Side of Boldness

Benning (2018) and Lilienfeld state that boldness is associated with:

- Low empathy (Benning et al., 2005; Mullins-Nelson et al., 2006)
- Adult antisocial behavior (Benning et al., 2003)
- Nonverbal disciplinary infractions in prison (Patrick et al., 2006)
- High levels of narcissism (Lilienfeld, 2018)
- Self-interest pursuit of rewards and thrill-seeking, potentially mildly callous (Fowles, 2018)

However, referring to the first three, Benning also adds that ‘these relatively mild deleterious effects would be unlikely to prevent a person from attaining success.’
And we’d also add that grandiose narcissism tends to be adaptive and some healthy self-interest and calculativeness often support personal success, without requiring antisociality.

Boldness may require good parenting to not turn into meanness

Fearless temperament is a risk factor for meanness (Fowles, 2018; Pardini, 2006; Hicks et al., 2013). Fortunately, studies suggest that parenting and socialization may be more impactful for children high in interpersonal features.

Kochanska’s studies show that while gentler discipline is often sufficient to develop conscience in more sensitive and fearful children, fearless ones benefit more secure attachment and positive child-mother relationship

(Kochanska, 1995, 1997; Kochanska et al., 2007). The author speculates this is a reward-based pathway that doesn't require anxiety and fear of punishment.

Balanced, rule-based discipline seems the optimal middle ground. While permissiveness allows antisociality to flourish, over-correction triggers reactive aggression (Patterson et al., 1998 and 2000; Kochanska and Kim, 2013). Conversely, consistent, predictable consequences help bridge the empathy gap, fostering guilt and internal regulation even in fearless children (Cornell and Frick, 2007).

Caveat: Boldness is adaptive *if alone*

Boldness is most adaptive if on its own.
For example, Lilienfeld says:

> Boldness (…) becomes malignant in the presence of other traits, especially SCI. (…) when boldness is conjoined with poor executive functioning, it may be channeled into ill-conceived risk taking, giving rise to the "poor judgment"

Prosociality follows the same logic. When paired with SCI, Fearless Dominance is more related to predatory aggression (Smith et al., 2013), sexual risk-taking (Kastner & Sellbom, 2012), and negative affect (e.g., guilt, shame) afterward (Fulton et al., 2010).

For an overview of how they may interact:

Combination	Behavioral Results
Boldness	Facilitate success in occupations that call for bravery and emotional resilience, or leadership and persuasiveness
Meanness	Associated with low empathy, low social closeness, instrumental aggression, and antagonism
Dishinibition	Relates strongly to criterion measures indexing impulsivity, negative emotionality, substance use, delinquent/antisocial tendencies, and suicidal behavior, close to factor 2
Boldness + disinhibition	Like Cleckley's masked pathology: seemingly well adjusted and socially adept but reckless and irresponsible. Short-term rewards, disregarding the consequences. High antisocial deviance possible ('externalizing supergroup', Hicks and Drislane, 2018)
Boldness + meanness	Can be expected to express their social and emotional poise in exploitative–antagonistic ways (example: Bernard Madoff)
Meanness + Dishibition	Impulsive antisociality: severely aggressive externalizing behavior, ranging from psychological pressure or physical force to achieve selfish goals to sadistic acts of violence

Table based on Benning, Venables, and Hall (2018)

3 Scientific Models of Successful Psychopathy

Models 2 and 3 may have the strongest support, and they can be complementary.

1. Subclinical Psychopathy Model

⍰⍰ Successful psychopaths are milder versions of clinical psychopaths

Inverted-U representation of the Subclinical Psychopathy Model (chart adapted by Buffalmano, 2026).
While somewhat intuitive, attenuation alone appears insufficient.
Research shows that individuals considered “successful” often display specific traits combined with compensatory adaptive characteristics, rather than mere ‘milder psychopathy’ (Lilienfeld et al., 2015a; Lilienfeld et al., 2016).

2. Moderated Psychopathy Model

⍰⍰ Environmental and individual moderators shape life outcomes

Different moderators have been proposed with strong but uneven support:

Moderators	Evidence & Effect
Executive functioning	**Strong**
Parenting & SES	**Small to moderate**, smaller than lay theories assume
Age	**Lower for psychopathic traits, high for antisocial behavior** which declines across adulthood
Physiological traits	**Strong**. Successful psychopaths are more similar to healthy controls for prefrontal cortex gray matter (Yang et al., 2005), orbitofrontal cortex and amygdala volume (Yang et al., 2010), hippocampus symmetry (Raine et al., 2004). Particularly important for PFC/executive functioning
Intelligence	**Mixed** (IQ lowers antisociality: Heilbrun, 1982; Heilbrun and Heilbrun, 1985; Watts et al., 2016); (No link: Walsh et al., 2004); (IQ boosts antisociality: Johansson & Kerr, 2005; Hampton et al., 2014). IQ = lower convictions (Ishikawa, 2001).

Not included by researchers, but power and status can also be powerful shields.

⍰⍰♂ **Technical Note: Buffalmano’s ‘Exchange Model’**
The Exchange Model suggests that high social and mate value psychopaths use less coercion because they can use the more effective social exchange

3. Multiprocess Model (Dual-Process / Triarchic)

⁉ Psychopathy is adaptive with the right mix of underlying facets

Psychopathy is not unitary, but the composition of its underlying facets can yield adaptive or maladaptive functioning.

The triarchic model is a multiprocess model building on the conceptually close "two-process model" and "dual pathway theory" (Patrick & Bernat, 2009; Fowles & Dindo, 2009):

- **Defensive fear system deficit** underlying interpersonal–affective features (largely related to factor 1), and
- **Executive control deficit** underlying impulsive–antisocial features (largely related to factor 2, and externalizing proneness)

In this model, successful outcomes are more likely with less cognitive–executive dysfunction and more dispositional fearlessness (ie.: in triarchic terms, less disinhibition and higher boldness).

Strategic Interpretations (TPM)

Despite a tendency to equate maladaptive with antisocial, **adaptive fitness is amoral**.
Evolutionarily, adaptive means higher odds of survival and reproduction. In humans, it may also boost the odds of achieving goals. Either way, it's independent of pro-social or anti-social orientation.

While we do not like or endorse antisociality at TPM and always prefer achieving goals with win-win, we also believe that to understand these dynamics it's important to keep the two separated.

Predatory Strategy

Several scholars suggested that short-term fast consumption, cheating, and coercion can be adaptive. These approaches overlap with a 'predation strategy' to life.

From a social exchange point of view, **predatory strategies are based on taking without giving**.
This is what makes someone a 'taker' and Robert Hare wrote about psychopaths that 'they all take more than they give'.

Defecting From Cooperation

Mealey proposed a sociobiological model of psychopathy of frequency-dependent social cheater strategy.

Indeed, psychopathic traits are associated with defection against coparticipants in the Prisoner's Dilemma game (Rilling et al., 2007), particularly against people who are viewed as low in value (Gervais et al., 2013), which may suggest a particularly calculative approach to exchanges.
Possible supporting evidence comes from frequent moving, aliases use, and preference for larger cities, since they can all faciliate escaping arrest, or escaping poor reputations (Robins, 1996; Jonason, 2018; Zuo et al., 2023).

Manipulation

Manipulativeness is a core trait of psychopathy, and multiple structural equation models suggested that manipulation and callousness are the common 'core' of the dark triad.

In relationships, David Buss notes that dark triad men engage in more cost-inflicting and 'game playing' strategies (e.g., evoking jealousy).

Suggesting a possible genetic component, interpersonal manipulativeness is related to aggression and reduced

prosocial behavior in young children (Pauletti, Menon, Menon, Tobin, and Perry, 2012)

Coercion

Coercion is a form of 'taking by force', related to aggression and criminal behavior.

Suggesting a link between psychopathy and coercive strategies, psychopaths are notoriously over-represented in prisons and more likely to violently recidivate (Kiehl, 2011), with important links to sexual coercion as well (Harris et al., 2007).
Reviewing the literature on sexual coercion, Knight and Guay (2018) claim that rape is part of a broader propensity of antisociality (Lussier et al., 2005; Smallbone et al., 2003).

Technical note: intimate partner violence may be the exception
Douglas (2018) notes that, contrary to factor 2, factor 1's affective deficits might ironically prevent intimate partner violence because they may not care enough, and studies show this trend (Hilton et al., 2008; Rock et al., 2013)

Sexual Strategy: Coercion, Short-Term, & Abandonment

Some scholars argue that unrestricted socio-sexual orientation and low parental investment, may form a **reproduction strategy based on quantity of offspring** (r-selected, Pianka, 1970).

There are several lines of evidence supporting this hypothesis.
For example, psychopaths have:

- Higher socio-sexuality, meaning more open to uncommitted sex (White et al., 2025)
- More sexual partners with less condom use (Reynolds et al., 2020)
- Higher sexuality ('hypersexuality', Kastner and Selbom, 2012)
- Higher likelihood to sexually coerce ('three-path model', Knight and Sims-Knight, 2003)
- In relationships: cheat more (Jones and Weiser, 2014), higher dissatisfaction (Weiss et al., 2016), seek make poaching (Craib et al., 2024)
- Fewer child support payments (Braver et al., 1997).

Behavioral evidence also suggests a higher mating effort, being less attractive in unadorned conditions but *more* attractive in adorned conditions.
Finally, neurobiological dysfunctions in emotional and moral processing may facilitate the pursuit of a more predatory strategy (Glenn & Raine, 2009).

Priming Psychopathic Sexual Strategy: Life History Strategy & Environment

Related to epigenetics, the life history strategy hypothesis (Ellis, 2009) suggests that environmental cues 'prime' psychopathic traits and behaviors to accelerate reproduction in harsher environments.

For example, children who grow up in harsher environments, such as high-stress or low-resource:

- Reach biological maturity earlier (Belsky et al., 1991; Harris et al., 2007)
- Have their first child at a younger age (Moore et al., 1993)
- Are more likely to have children outside of stable, long-term partnerships (Karney, 2020)

Furthermore, reminders of mortality bias individuals with low-SES backgrounds for short-term rewards over long-term investment (Griskevicius et al., 2011), suggesting that **impulsivity may be an evolved tactic to seize short-term opportunities.**

See more on this:

- ⍰ Investigative case study of a psychopath's sexual strategy

Does It Work? A *Flawed* Predator...

While "predator" is associated with dominance, it does not guarantee success—in nature, predators are also preyed upon, maimed, and face higher extinction risks than their prey.

When it comes to psychopathy, dishibition and poor planning often undermine a predatory strategy.
Write Porter, Woodworth, and Black (2018):

> (…) On one hand, psychopathic individuals engage in strategic, premeditated acts (…) on the other, they can react in impulsive (…) ways (…) that contribute to detection, arrest, and incarceration.
> In this light, individuals of this sort can be seen as "flawed predators," frequently preying on others but unable to reliably control their behavior.

The authors also explain that premeditation can co-exist with costly impulsive aggression, the latter undermining the possible adaptiveness of the former.

Crucially, effectiveness isn't a given in reproductive strategies either.
The few studies available provided no empirical evidence for higher reproduction, or even suggested otherwise (Marcus et al., 2011; Carter, Lyons, & Brewer, 2018).
However, the evidence is sparse for any conclusions, and different expressions of psychopathy may enjoy higher success (for a case study, see Buffalmano, 2020).

Calibration Model of Effective Psychopathy™

Effective Psychopathy™ refers not to promoting antisocial behavior, but to an adaptive profile of certain traits associated with psychopathy that boost fitness. It incorporates and calibrates functional strengths—boldness, effective grandiosity, emotional coolness, etc.—while removing maladaptive tendencies like short-term reward-seeking, criminal propensity, and externalizing tendencies.

The Calibration Model (Buffalmano, 2026) posits that since almost any trait can be adaptive or maladaptive depending on context and goals, **the most functional psychopaths calibrate behavior based on the situation and their end goal.**

Contextual and social calibration are central aspects of TPM's approach. Here are some examples of how adaptiveness changes in relation to context:

Trait	Maladaptive For...	Adaptive For...
Grandiosity	Reliable planning & prioritization	Interpersonal charisma and psychological resilience
Disinhibition	Substances & sustained success	First-movers advantages, & when rewards disappear
Lying	Long-term reputation & alliances	Social engineering & low-detectability scenarios
Callousness	Long-term cooperation & close bonds	Whenever selfish gains outweigh cooperation's gains

The effective psychopath may think grandiosely but turn more realistic when planning and executing.
Or he may be more ruthless and detached at work, but 'switch off' and be more empathic and warm to nurture cooperative alliances. If he values close relationships, he will also be kind to family and friends.

Researcher Keith Campbell proposed this approach to narcissism when he advised 'use it publicly, not privately' (Campbell, 2020).

As a fictional example, Vito Corleone in *The Godfather* maintained a loving family and strong bonds while running his organization. His son Michael tried the same by compartmentalizing work and life.

⚠ **Important reminder: psychopathy as a whole is often maladaptive, antisocial, and immoral**

Psychopathic profiles are often maladaptive and associated with unsuccessful lifestyles. The TPM approach focuses on isolating and cultivating the few functional traits that can be beneficial when properly regulated. We do not endorse or recommend its predatory aspects.

Strategic Psychopathy: Developing Helpful Traits

Strategic Psychopathy™ refers to developing a collection of adaptive traits sometimes associated with psychopathy, and learning how and when to use them.

There is no one-size-fits-all because **what you need depends on your goals** and your starting point.
But, some general guidelines for many can be:

1. **Increase boldness**
2. **Boost self-control**: remove dishibition, dopamine addictions, plan and work hard (conscientiousness)
3. **Calibrate** to situation and people for top-0.1% effectiveness

And for combining goal-achievement with life quality:

- **Be honorable**, especially with other quality people and close relationships

Honorable Psychopathy™

Honorable Psychopathy™ places **strategic honor™** and a preference for win–win as the baseline, while still incorporating effective psychopathy for goal achievement and self-advancement

We focus on the practical 'how to' in our flagship course:

Malcolm Gladwell Review: Books and Pop-Psychology

Lucio Buffalmano · 20 March 2026 · Archived copy · Original

Malcolm Gladwell is a journalist and bestselling author known for turning complex psychological and social phenomena into engaging, story-driven narratives.

His books are highly readable and popular. But they often sit in the space between **insightful storytelling and pop psychology**.

At TPM, we break down his key ideas—and more importantly, where **they fall short for smart men who want realistic and evidence-based analyses** that deliver status, respect, attraction, and real-world results.

Contents

- INTRO
  - 1. Blink (2005)
  - 2. Outliers (2008)
  - 3. The Tipping Point (2000)
  - 4. David and Goliath (2013)
  - 5. Talking to Strangers (2019)
- Gladwell's Books: Core Limitations
  - 1. Storytelling Over Science
  - 2. Cherry-Picked Data
  - 3. Correlation Mistaken For Causation
  - 4. Sensationalism Over Truth (Pop-psych Thriller)
  - 5. Lack of Actionable Strategy
- Gladwell's Secret: 'Better Than the Rest Effect™'
- Final Verdict

- Best-Seller Quality Tradeoff™

INTRO

At TPM, we categorize much of Gladwell's work as pop-psychology and naive self-help.

Much of it falls for "narrative fallacy": the tendency to favor a good story over scientific rigor or tactical utility. For a man seeking power, Gladwell is an excellent study in *persuasion*, captivating writing, and *book marketing*. But a poorer choice for smart men who want deep, nuances and realistic analyses—including using those analyses for strategies that deliver results.

Note: we removed our past standalone reviews of Gladwell's books to focus on higher-ROI resources

1. Blink (2005)

Quick Overview: *Blink* investigates human cognition and explains how snap, subconscious decisions can be extremely accurate—provided they are made by experts "thin-slicing" relevant data.

⍰ Pros

- **The Theory of Thin Slices:** Correctly identifies that experts can see significant patterns in small samples.

⍰ Cons

- **Poor Science:** Heavily cites "priming" studies that raised questions during the replication crisis in psychology.
- **Mistaking Intuition for Strategy:** Gladwell celebrates "thinking without thinking," which is a death sentence for a novice in a high-stakes social environment.
- **Bending Narratives:** Pits snap decisions against deliberate ones as if they are antithetical, rather than tools that require different contexts.

TPM Review

Blink probably remains Gladwell's best work, though still limited from a practical perspective.

While intuition works for chess masters and anyone who has thoroughly learned the ins and outs of a discipline, it fails for those navigating novel situations.

The real takeaway is not to trust snap judgments blindly, but to:

- Understand **when they work**
- And more importantly, **when they don't**

---

2. Outliers (2008)

Quick Overview: Gladwell argues that success is primarily a matter of luck, timing, and external "circuitous" circumstances rather than raw talent alone.

⍰ Pros

- **The Humility Lesson:** Puts individual success in a wider context of timing and environment.
- **Emphasis on Consistency:** Regardless of the "10,000-hour" debate, it correctly highlights that volume of effort is a prerequisite for greatness.

- **Practical Intelligence:** Correct distinguishes between IQ and “knowing what to say to whom,” which aligns with TPM’s focus on Social Calibration.

⍰ Cons

- **The Passive Success Myth:** By over-indexing on luck, it encourages a “wait and see” attitude rather than a proactive “build and take” mindset.
- **The 10,000-Hour Myth:** Simplistically and erroneously reduces expertise to a flat number, ignoring the quality of practice and innate biological floors/ceilings. The researcher Gladwell quotes in his book had to correct this myth in his own subsequent book (Ericsson, 2016)
- **Shallow Cultural Analysis:** Draws tenuous links between “rice cultures” and math ability that lack rigorous scientific backing.

TPM Review

Outliers is an entertaining read—but lacking in rigor and practicality.

Captivating anecdotes and thought-provoking rethorical questions, but not for intelligent men looking for rigorous science or practical insights to achieve goals. It fails to serve those who want to *build* power rather than wait for a stroke of luck.

---

3. The Tipping Point (2000)

Quick Overview: Analyzes how localized trends go viral and “tip” into massive social movements.

⍰ Pros

- **The Law of the Few:** Correctly identifies the roles of Connectors, Mavens, and Salespeople in social engineering.
- **Social Power Moves:** Provides a rare “gem” regarding conversation rhythm—the person who makes the other to adapt to their speaking tempo usually holds the upper hand.
- **Cover over content:** Validates that *how* information is packaged is often more important than the information itself (Gladwell knows that very well)

⍰ Cons

- **Tautological Logic**, like ‘it worked because influencers spread it’, which provides little explanation of the true underlying dynamics and little predictive value for future campaigns.
- **Light Evidence:** Relies on plausible stories (like the Broken Windows theory) that faced valid criticism for oversimplifying crime reduction and, potentially, for not working at all
- **Lack of How-To:** It describes the *what* but fails to provide a manual for the *how*.

TPM Review

The Tipping Point is a pleasant read and introduces useful concepts—but stops at surface-level explanations.

Practical applications are also lacking. Saying “target influencers” is not a strategy. Everyone does that.
The real questions are:

- Why did *this* idea spread and others didn’t?
- What mechanisms drove adoption?

- What made it stick under competition?

The book doesn't answer those.

It's a good mental model—but incomplete for anyone serious about influence, marketing, or power dynamics.

---

4. David and Goliath (2013)

Quick Overview: Argues that underdogs can find strength in their disadvantages and that "giants" often have hidden weaknesses.

⍰ Pros

- **The Disagreeable Entrepreneur:** Excellent insight into how successful leaders are often high on "disagreeableness" and willing to take social risks.
- **The U-Curve of Advantage:** Validates that beyond a certain threshold, wealth and resources can actually become a disadvantage for character building.

⍰ Cons

- **Historical Revisionism:** The attempt to frame Goliath as a "weak" underdog due to giantism is strategically nonsensical and ignores the military context of the time.
- **Overplays the Power of the Underdog:** Overplays the power of "unconventional tactics" to almost guarantee a win, ignoring that most underdogs who fight like David lose.
- **Disjointed Themes:** Forces unrelated stories about dyslexia, crime, and warfare into a single, tenuous "underdog" frame.
- **Platitudes Over Strategy**: That disadvantages can become strengths is an obvious platitude that adds little tactical value

TPM Review

This is Gladwell at his most "inspirational pop-psych."

The core idea—that disadvantages can become strengths—is valid. But the execution often stretches reality to fit the message.

In real life:

- Not all disadvantages are assets
- Not all underdogs win
- And strategy requires **precision, not inspiration**

Useful as a mindset shift. Weak as a strategic guide.

---

5. Talking to Strangers (2019)

The weakest of the bunch, and he went too deep into his common approach to writing a best-seller:

- Pick a famous or attention-grabbing story
- Make it sound exciting

- Twist the story to make it sound like everyone always got it wrong
- Find an unexpected lesson learned

But he went too far with this one and we couldn't even recommend it for an easy fund read.

Gladwell's Books: Core Limitations

Across Gladwell's books, similar bupatterns emerge:

1. Storytelling Over Science

Gladwell is a master storyteller.

But stories are not evidence.

He often builds compelling narratives first—and then fits selective research around them. This creates explanations that **feel true**, even when they're incomplete or misleading.

2. Cherry-Picked Data

Many examples focus only on **successful cases to prove and provide a narrative.**

This is not an investigative approach; it's a storyteller approach.
What's missing:

- The failures
- The base rates
- Critical analysis

Without those, one is more likely to mislead than to provide valid analyses.

3. Correlation Mistaken For Causation

A recurring issue:

- X and Y happen together → therefore X caused Y

But real-world systems are more complex.

This leads to **oversimplified conclusions** that don't hold under scrutiny.

4. Sensationalism Over Truth (Pop-psych Thriller)

Gladwell provides sensationalism over truths. That may sell better, but it comes at the cost of truth and effectiveness.

Gladwell's books often follow the same format. He starts with a story, leads towards the most plausible interpretation… But then veers to the more counterintuitive take. It's a **'pop-psychology thriller' format that captivates but misinforms.**

5. Lack of Actionable Strategy

This is the biggest issue for the ambitious and smart men we serve.
Gladwell explains:

- What happens
- Sometimes why

But rarely how to apply it in real life. For men who want results, this is a critical gap.

Gladwell's Secret: 'Better Than the Rest Effect™'

The better-than-the-rest effect™ describes the psychological boost people get when they feel intellectually superior to others, often resulting in appreciation for the source of the psychological boost

> Some books make you smarter, while some others make you think you're smarter

As Machiavelli said, what appears often beats what is, and it applies to feelings over truths as well.

Gladwell's readers feel smarter because **Gladwell frames his takes as revelations that beat consensus**. While 'everyone else', including experts, think X, the 'real Gladwellian reason' is Y. This is the structure underpinning many of Gladwell's stories.
And Gladwell's readers get to become part of an intellectual elite that 'sees the truth', in contrast to all those other blind sheep.

This may be the same appeal that conspiracy theories offer: **everyone else is stupid and we are smarter**.
This format, in a way, sells the benefits of narcissistic grandiosity: a confidence-boosting sense of superiority over everyone else.

Final Verdict

Malcolm Gladwell at his best writes excellent introductions to complex ideas, but often provides misleading takes based on sensationalism over truth.

His books are engaging, thought-provoking, and easy to read, but they are also **insufficient for a deeper understanding of the same dynamics he tackles**, and at times even potentially misleading (ie.: the 10.000 hour magic number).
Use them to:

- Expand your thinking (including critical thinking)
- Understand how the "masses" think
- Learn the art of high-level storytelling

But don't rely on them for a deeper understanding of human psychology/the world, decision-making, or real-world execution.

For that, you need deeper, research-based, and more actionable frameworks.

Best-Seller Quality Tradeoff™

The Best-Seller Quality Tradeoff™ is the phenomenon where mass-market success necessitates simplifying, generalizing, or entertaining at the expense of depth, nuance, and calibration.

Malcolm Gladwell is one of many examples of the Best-Seller Quality Tradeoff™. To hit the bestseller list, an author almost always has to trade depth for accessibility.

The highest-quality work is inherently more complex—requiring careful nuance, detailed evidence, and sophisticated reasoning. But complexity has limited appeal: it can't reach the 'fat middle' of the IQ distribution curve—the majority of readers who prefer stories that are simple, entertaining, and immediately digestible.

The result is that mass-market success often comes at the cost of rigor and tactical usefulness.

This is why I stopped reading popular books and focused instead on handbooks. They provide infinitely better source material for our theoretical work at TPM and to provide the best practical strategies in Power University.

John Gottman Relationship Research Review

Lucio Buffalmano · 22 March 2026 · Archived copy · Original

John Gottman is a renowned relationship scientist whose decades of laboratory studies (the “Love Lab”) have distilled empirical principles of interpersonal bonding. His work focuses on relationships but also offers practical, research-backed insights into general trust, communication, and conflict. Gottman’s findings are based on observation of thousands of couples, making his methods highly credible.

TPM Top-1% Angle: Gottman’s is for standard monogamous relationships.
Gottman largely skips crucial concepts like mate value, mating exchange dynamics, and dating and relationship games/manipulation.
He does not cover more ‘elite’ options available to higher value men like uncommitted dating, multiple partners, functional relationships, one-sided commitment, or men going their own way. That said, these principles are valid for committed and 1:1 relationships.

Contents

- Key Insights In Gottman’s Research
- Book-by-Book Reference
  - 1. The Seven Principles for Making Marriage Work
  - 2. The Man’s Guide to Women
  - 3. The Relationship Cure
  - 4. The Science of Trust
  - 5. Why Marriages Succeed or Fail
  - 6. Ten Lessons to Transform Your Marriage
- TPM’s Analysis
  - Pros: Evidence-Based & Actionable
  - Cons: ‘Middle-Class’ Focus (“Blue-Pill”)

- Applying Gottman's Insights

Key Insights In Gottman's Research

Key concepts and insights in Gottman's research include:

- **Breakup predictors** (four horsemen of the apocalypse): can predict a breakup with over 90% accuracy. They are:
  - **Contempt**: disrespect, mockery, or superiority; it matters because it is one of the strongest predictors of relationship collapse and kills admiration.
  - **Criticism**: attacking the person instead of the behavior; it matters because it turns ordinary complaints into character judgments and starts escalation.
  - **Stonewalling**: shutting down, withdrawing, or going emotionally dead; more likely to be from men than women. It matters because it kills repair and makes problems impossible to solve.
  - **Defensiveness**: self-protection, counterattacking, or refusing responsibility. It matters because it blocks accountability and prevents real resolution.
- **Covert Request for Emotional Attunement ("Bids for Connection")**: Are 'covert cues' for attention or affection.
  Responding to them (turning towards) is important to improve the relationship. Ignoring or reacting negatively (turning away) depletes relational trust, while turning toward builds it.
- **Knowing Your Partner** ("**Love Maps**"): Knowing your partner's inner world, preferences, stresses, goals, and history. It matters because accuracy and familiarity make connection easier and prevent emotional drift.
- **Shared Meaning**: Shared values, rituals, goals, and a common sense of what the relationship is for. It matters because strong relationships are not only about feeling good together, but also building a common life direction.
- **Conflict Management Without Nastiness**: Handling disagreements with respect, accepting influence, and compromising
  - Unsolvable Problems: Accept that some problems are unsolvable due to inherent differences. Don't aim to "resolve" these issues or you'll be fighting over the same unsolvable problem over and over
- **Vicious Cycles:** Negative interaction loops where one partner's move triggers the other's worse reaction, creating a self-reinforcing spiral. It matters because breaking the pattern is often more important than "winning" the argument.
  Read more here
- **Mutual Influence**: Accepting influence strengthens loyalty and cooperation; refusing influence is a top predictor of failure. High-value men can leverage influence without ceding control.
  Read more here
- **Positive perspective:** To generally think well of your partner, and the ability to give your partner the benefit of the doubt and assume good intentions.
  - Positive ratio: High-performing relationships feature a high ratio of positive-to-negative interactions. It matters because positivity creates resilience, makes repairs land better, and keeps small conflicts from becoming relationship-threatening.
    Read more here

Book-by-Book Reference

For a quick overview of the books we personally analyzed from John Gottman to improve our own work and strategies:

1. The Seven Principles for Making Marriage Work

- **Key Concept:** The “Sound Relationship House”—building friendship, managing conflict, and creating shared meaning.
- ⍰ **Pros:** The most comprehensive “operating manual” for long-term relationships.
- ✕ **Limitations:** Occasionally leans into “middle-class” social expectations that may feel overly domestic for high-power men

Full Analysis: The Seven Principles Summary

2. The Man’s Guide to Women

- **Key Concept:** “The Hero vs. The Zero”—understanding that a woman’s primary need is emotional safety and attunement.
- ⍰ **Pros:** Directly addresses female biology (ovulation cycles, stress responses) and provides a tactical “field guide” for men (although still geared for providers)
- ✕ **Limitations:** Can sometimes border on “provider-heavy” advice; men must balance this with maintaining relationship attraction and “lover” edge.

Full Analysis: The Man’s Guide to Women

3. The Relationship Cure

- **Key Concept:** The mechanics of “Bids for Connection.”
- ⍰ **Pros:** Applicable beyond romance—these strategies matters for most relationships, especially with more emotional and ‘communal’ types
- ✕ **Limitations:** The advice on “turning toward” can be misinterpreted as “always being available,” which can inadvertently lower your perceived status if not balanced with your ‘me time’ and mission-focus

Note: We removed it as a standalone review after we incorporated the best insights in our work to focus on the highest ROI work from Gottman.

4. The Science of Trust

- **Key Concept:** Using math and game theory to deconstruct how trust is built and betrayed. Found that ‘relationship cynics die earlier’ (important con to over-Machiavellianism).
- Note: Gottman reported a disturbing finding from his interviews: multiple women in high-conflict relationships cited their most intense sexual experiences occurred in the immediate aftermath of domestic violence or physical aggression. This highlights but does not condone complex dynamics related to dating dominance
- ⍰ **Pros:** High-level analyses; provides a framework for “Sliding Door” moments (the small choices that lead to loyalty or betrayal).
- ✕ **Limitations:** More academic and less applicable

Note: we removed the full stand-alone review to focus on Gottman’s higher ROI work (but we incorporated all his best takeaways in our frameworks).

5. Why Marriages Succeed or Fail

- **Key Concept:** Categorizing couples into “Validating,” “Volatile,” and “Avoidant” styles.
- 5:1 Positive Ratio: Gottman introduces the often misunderstood ‘5:1 ratio’. It’s not about having 5 “I love yous” for every 1 fight, but about positive sentiment (humor, touch, empathy, active listening) *while* arguing. If the

ratio drops to 1:1 during an argument, Gottman's data showed a 90% chance of eventual divorce.

- ⍰ **Pros:** Proves that there is no "one right way" to be a couple, as long as the 5:1 ratio is maintained.
- ✕ **Limitations:** Older research that focuses heavily on the "marriage" label rather than the broader "strategic alliance" of modern dating.

Note: full standalone review removed because his *The Seven Principles* includes most of the insights, with higher ROI.

6. Ten Lessons to Transform Your Marriage

- **Key Concept:** Practical application of the "Love Lab" findings through specific case studies.
- ⍰ **Pros:** Excellent for troubleshooting specific, recurring arguments (the "perpetual problems").
- ✕ **Limitations:** Focuses heavily on "repair," which may lead some men to stay in "sunk-cost" relationships that are fundamentally low-value.

Note: We removed this as a standalone summary after we extracted the best insights because it's less suited for our readership.

TPM's Analysis

Pros: Evidence-Based & Actionable

1. **Research-Backed & Empirical –** Thousands of couples observed in the "Love Lab," longitudinal studies, and statistically validated frameworks. This is high-authority content that's credible.
2. **Predictive Power –** Beyond popular claims of 'over 90% accuracy', these constructs align with known principles of power dynamics to predict, at the very least, loss of respect and attraction
3. **Actionable Frameworks –** Love Maps, Bids for Connection, and the Sound Relationship House provide concrete steps to improve communication, trust, and influence.
4. **Cross-Relationship Utility –** Many of Gottman's insights (turning toward bids, managing conflict) apply outside romance: friendships, networking, professional interactions.

Cons: 'Middle-Class' Focus ("Blue-Pill")

- **'Average Man's Frame':** Gottman's tends to be framed for middle-class, monogamous marriages.
- **High-Communion Preframe (Not For Top-1% Agentic Men)**: The hidden covert frame is that the goal is to "be happy" which can lead a man to adopt a "Happy Wife, Happy Life" mindset—a low-agency frame that may kill sexual attraction and respect.
- **Ignoring Several Power-Dynamics Realities:** Gottman treats relationships as closed systems. He ignores external realities and SMV-related realities. In truth, status, high-power behavior and optionality heavily impact these dynamics (and may even reduce the need for Gottman's own suggestions).
- **Lacks 'Optimum Balance' & Calibration Elements**: He suggests "accepting influence" (which is good for cooperation) but fails to warn that if a man accepts *too much* influence he becomes a "Zero" in his partner's eyes.
- **Over-Focuses on "Repair":** Gottman sometimes speaks as a relationship therapist, with the goal of "saving" things. Sometimes the best move isn't "repairing", but moving on (potentially, to a high-quality partner).
- **Ignores the 'Dark Side of Attraction':** In *The Man's Guide to Women*, Gottman pushes the "Hero" archetype as an attuned, protective provider. While effective for stability, it fails to mention that power, self-sufficiency, and potentially even some 'dark triad traits' can be attractive

Applying Gottman's Insights

- **Ensure you keep respect**: Gottman never calls it 'respect', but the truth is that contempt and criticism both point to a *lack* of respect
- **Uncover unsolvable problems, move on if compromise is costly**: If you two have irreconcilable differences, such as one wanting children and the other not, or one wanting his parents at home and the other not, you're not cut for each other
  - ⍰ **TPM Take**: Not compromising on anything is abusive, but giving up on what matters most for you is weak
- **Be *also* a friend (on top of lover and provider/protector):** Deep knowledge of your partner's world builds trust and influence.
  - ⍰⍰♂ **Lucio's Take**: This is one of the approaches that made me stand out in some of my dating
- **Spot and respond to *some* bids for but tell her to speak as well':** Boost your emotional intelligence because some dynamics will always be unspoken. But also expect and tell your partner to speak up clearly on what's important to her
  Read about bids here
- **Remember that influence is a two-way street:** Dominant men may tend to overly deny influence, which erodes trust and bonding. But weak men are overly influenced and emotionally react to women's 'judge power'. Smart men instead influence on what matters most to them and gain loyalty and cooperation by accepting influence strategically.
  Learn how some women control relationships
- **Like your partner or don't be in a relationship with her**: If you cannot be positive about your partner, consider ending it for both of you

Learn more:

- Phases of relationships power dynamics
- **Maintain attraction in relationships**

Positive Psychology & Power: The Strategic Guide to What Actually Works

Lucio Buffalmano · 23 March 2026 · Archived copy · Original

Positive psychology is the scientific study of what makes life most worth living. Before the late 1990s, psychology was almost entirely focused on pathology—fixing what was broken (depression, anxiety, trauma). Positive psychology, spearheaded by figures like Martin Seligman, flipped the script to focus on “thriving.”

Intro

For the agentic man, positive psychology is helpful with several mental foundations, yet not enough on its own.

On one hand, the mental resilience of a can-do, optimistic attitude coupled with the tools to control one’s state are foundational to mental empowerment (emotional sovereignty).

On the other hand, mainstream positive psychology is not a complete discipline. It misses some important aspects of mental empowerment. And when extending to external outcomes, it often devolves into naive self-help because it doesn’t properly cover its own achievement pillar.

For example, even health and mental-health-related achievements are often tied to power dynamics and interpersonal power dynamics because research has shown that social status is crucial to a man’s health and mental health (Wang and Geng, 2019; Demakakos et al., 2008).

Even when promoting relationships, it often assumes that good, win-win, and supportive relationships with well-intentioned others are easily reachable. But in truth, **good relationships are a hard-won achievement** that requires power awareness. You must know how to read characters, how to setup *smart* win-wins, and also how to protect your downsides in case of fall-outs.

This guide distills the science of well-being through the lens of power, stripping away the fluff to leave you with the actionable intelligence that actually works.

Core Concepts of Positive Psychology

Before diving into the literature, these are the foundational models of positive psychology that provide the highest strategic utility:

1. PERMA Model (Well-Being Framework)

Seligman’s updated model for well-being, standing for:

- **Positive Emotion**: Breaks down ‘positive well-being’ into various emotional components and practices such as hope, interest, joy, love, compassion, and gratitude.
  - Practical takeaway: “savoring” the present moment and maintaining an optimistic outlook on the past and future.
- **Engagement**: Reaching a state of “flow” by being fully absorbed in challenging tasks.
  - Practical takeaway: Train and work at a level where work is challenging but achievable.
- **Relationships**: Building deep, supportive connections because “other people matter.”
  - TPM Takeaway: It’s a two-way street, give to givers and bond with honorable men and quality women
- **Meaning**: Serving a purpose or cause that feels bigger than your own life.
  - Practical takeaway: Find a sense of purpose by belonging to and serving something greater than the self (family, work, community service, or spirituality)
- **Accomplishment**: Pursuing mastery and achieving goals for the sake of personal growth.
  - Practical takeaway: Work on your self-development, improve your competence in your chosen areas of expertise, set some goals and strive to achieve them

Meaning-Purpose Alignment

Pursuing goals aligned with values and contributing beyond oneself. This echoes the 'mission focus' of some manosphere content but, again, it's grounded in research.

2. Cognitive Behavioral Techniques (CBT)

Changing thoughts to change emotions and behaviors.

It provides the scientific foundation of many pop-psychology texts based on 'positive thinking', adding better and more effective approaches for managing and improving one's state.

Albert Ellis is one of its originators with Rational Emotive Behavior Therapy. It posits that events don't cause emotional distress; your *beliefs* about the events do.

3. Flow

Deep immersion in challenging and meaningful activities, boosting both well-being and productivity.

4. Strengths-Based Development

Identifying and leveraging personal strengths to decide what to focus on (rather than focusing only on weaknesses).

This approach of looking at one's strength to decide what to focus on and what to pursue in life and work is far superior to typical 'motivational' self-help based on 'you can do anything you want'.
It's both more persuasive for intelligent and critical thinking men, and it's **far more effective than motivation-only self-help** (see Lucio's video here).

5. Psychology of Optimism

Optimists and pessimists think differently along 3 crucial variables:

1. **Time / Permanence:** optimists see loss and rejection as temporary; pessimists see them as permanent
2. **Specificity / Pervasiveness:** optimists see loss and rejection as specific; pessimists see them as universal and as big general rejection to their whole work or personality
3. **Personal / External** optimists see loss and rejection as a consequence of the circumstances; pessimists take the blame on themselves and sees loss or rejection as a rejection of the self

Learned Helplessness vs. Learned Optimism

Helplessness is the ultimate state of pessimism, and it's the belief that no matter what you do, it will be useless. People in a state of helplessness become apathetic and take no action, including in situations in which they could change their environment.

Humans and animals can "learn" to give up after repeated unavoidable trauma. Learned optimism is the strategic counter-measure: training your brain to view setbacks as temporary, specific, and external rather than permanent, pervasive, and personal.

TPM Library: Positive Psychology Books Reviewed

Here is our curated breakdown of the most prominent books in the field, evaluated strictly for their real-world utility.

The Happiness Hypothesis

Jonathan Haidt explores ancient wisdom through the lens of modern psychology, introducing the famous “Elephant and Rider” metaphor.

- ✅ **PROS:** Valid breakdown of how human intuition and emotion work. It provides a realistic look at why humans are hypocritical and status-driven.
- ❌ **CONS:** It is academic and philosophical, lacking step-by-step actionable frameworks

Note: we incorporated the best findings in our frameworks and removed full review to focus on more actionable takeaways

The Happiness Advantage

Shawn Achor is not a researcher himself but did an excellent job at compiling the available research. He argues that happiness is the precursor to success, not the result.

- ✅ **PROS:** Good insights into how priming your brain for positive outcomes can increase cognitive bandwidth and problem-solving speed.
- ❌ **CONS:** Dangerously close to corporate “toxic positivity.” It ignores the reality that in highly competitive environments, strategic ruthlessness often outperforms a “happy disposition”

Note: we incorporated the best findings in our frameworks and removed full review to focus on more actionable takeaways

Authentic Happiness

Seligman’s book that launched the positive psychology movement, focusing on identifying and utilizing your “signature strengths.”

- **Incantations have no effect**: Seligman dyspels this major self-help myth here
- **Freud was unscientific**: Seligman provides a strong takedown of many of Freud’s foundational claims

- ✅ **PROS:** Good for establishing a psychological baseline and moving away from a victim mindset. Emphasizes leveraging what you are naturally good at. Strong
- ❌ **CONS:** The focus on “pleasantness” is outdated and largely abandoned even by the author in his later works. It lacks an edge for ambitious men.

Note: we incorporated the best findings in our frameworks and removed full review to focus on more actionable takeaways

Quote:

> This means that the promissory note that Freud and his followers wrote about childhood events determining the course of adult lives is worthless.
> I stress all this because I believe that many of my readers are unduly embittered about their past, and unduly passive about their future, because they believe that untoward events in their personal history have imprisoned them.
> (…)
> **Merely to know the surprising facts here—that early past events, in fact, exert little or no influence on adult lives—is liberating**

Flourish

Seligman's update to his own theory, moving away from "happiness" (which he admits is essentially "happiology") toward the broader concept of well-being (the PERMA model).

- ✅ **PROS:** A more realistic and mature model. The inclusion of "Accomplishment" validates the drive of high-achievers who seek mastery, not just a good mood.
- ❌ **CONS:** Still operates in a vacuum of "fair play," largely ignoring the dark triad traits that often inhabit the upper echelons of accomplishment.

Note: we incorporated the best findings in our frameworks and removed full review to focus on more actionable takeaways

Stumbling on Happiness

Daniel Gilbert provides a popular psychology overview, exploring why humans are poor at predicting what will make them happy and introducing the concept of "affective forecasting errors."

- **Focus on experiences**: Money won't buy happiness and you regret what you don't do
- **Put things in perspective**: We have adjustment mechanisms for major issues but not small one. Meaning, we might be more bothered by a scratch on our new car than by our house burning down.

- ✅ **PROS:** Strong research-backed insights on how we mispredict future happiness. Useful for avoiding major life decision mistakes and overestimating emotional outcomes.
- ❌ **CONS:** Lacks a clear framework or actionable system. More a collection of interesting psychological findings rather than a practical guide.

Note: we incorporated the best findings in our frameworks and removed full review to focus on more actionable takeaways

Learned Optimism

Martin Seligman's best book on positive psychology because it provides the best overview and presents a more mature framework.
It's also actionable. The theory on explanatory styles and resilience lends itself well to cognitive restructuring, and the author provides tips on how to reprogram a pessimistic brain.

- **Explanatory styles**: expands on the "Internal Locus" of control as an engine for resilience. If you believe the cause of a failure is "External" and "Specific" (rather than "Internal" and "Pervasive"), you maintain the agency to try again. This is the scientific basis for learned industriousness.

- ✅ **PROS:** A foundational text for mental anti-fragility. The ability to reframe setbacks from "I am a failure" to "This specific strategy failed today" is foundational for an empowered mind
- ❌ **CONS:** The book can be dry and relies heavily on lengthy academic questionnaires to prove its points.

Read the full TPM review of Learned Optimism

Forerunners: Albert Ellis, Aaron Beck

Ellis (and Aaron Beck) helped shift away from psychoanalysis toward more active intervention and self-intervention.

Decades before positive psychology, Ellis developed REBT, showing that beliefs—not events—create emotional

outcomes. Alongside Beck's work, this led to the development of cognitive-behavioral approaches (CBT). Positive psychology later adopted and expanded these ideas in frameworks like learned optimism and emotional regulation.

How to Stubbornly Refuse to Make Yourself Miserable

A masterclass in Rational Emotive Behavior Therapy (REBT), teaching you how to destroy the irrational beliefs that cause anxiety and depression.

- ✅ **PROS:** Extremely actionable. Ellis is blunt, realistic, and highly effective. This is internal frame control at its finest.
- ✕ **CONS:** The writing style is repetitive, and the core message could be condensed into a much shorter framework.

Read the full TPM review of How to Stubbornly Refuse to Make Yourself Miserable

How to Keep People from Pushing Your Buttons by Albert Ellis

This is highly relevant for us because Ellis applies REBT specifically to social dynamics, showing how to prevent others from manipulating your emotional state.

- ✅ **PROS:** A top-tier resource for handling manipulation. It teaches you how to deny toxic people the emotional reactions they crave, neutralizing their power entirely.
- ✕ **CONS:** Doesn't provide the socially offensive and defensive strategies needed to tackle these people in real life to maintain power, status, and reputation.
  TPM Note: Some examples on 'sharing vulnerability', including with a partner, are not what we'd advise

Read the full TPM review of How to Keep People from Pushing Your Buttons (for alumni)

TPM Analysis: The Good, The Bad, and The Naive

Positive psychology offers many empowering tools that are foundational to an ambitious man.
To combine 'mental health' with mental power and real-life outcomes, men must combine it with realism and strategy.

⍰ Good: Mental-Health & Mental Empowerment

- **Mental frameworks matter:** Thought patterns influence outcomes (frame control).
- **Emotional control is power:** Managing one's own emotions and feelings protects against emotional manipulation and 'judge dynamics', and puts control back into the sovereign individual
- **Positive emotions can boost performance:** Positive affect improves creativity, resilience, and persistence (though a high-power man must learn to act also when he doesn't feel like)
- **Resilience is trainable:** Techniques like CBT and optimism work when applied correctly.
- **Meaning drives long-term success and well-being:** Purpose sustains motivation beyond short-term rewards. This is also helpful for Machiavellianism and a healthier 'dark-triad edge'
- **Provides scientific backing for self-help**

Positive Psychology-related research confirmed or dispelled several findings. Says Seligman in *Authentic Happiness*, for example:

> Positive thinking often involves trying to believe upbeat statements such as "Every day, in every way, I'm getting better and better" in the absence of evidence, or even in the face of contrary evidence. (…) Many educated people, trained in skeptical thinking, cannot manage this kind of boosterism. Learned optimism, in

> contrast, is about accuracy.

⍰ Danger: The “Happy Sucker” Paradigm

Lucio’s primary criticism across this entire genre is the naive approach to achievement and social relationships. Mainstream positive psychology assumes a “fair world” where everyone is operating in good faith. It is dangerous naiveté.

- **Ignores power dynamics:** Real-world success depends on power dynamics and not just mindset
  - Ignores the darker side of socialization, such as manipulation, status games, and hidden agendas
- **Overemphasis on positivity:** Emotions often associated with negativity, including anger and shame have their place. They’re powerful fuel for motivation and can be a catalyst for change and power
- **Not entirely new:** Many ‘positive psychology’ ideas (emotional control, reframing, acceptance) were already present in Stoic philosophy, raising questions about how much is innovation vs. scientific validation.

These can undermine a man’s achievement:

- **Sub-par for career progression**: the ‘Happiness Advantage’ in a competitive corporate environment without understanding office politics is a *dis*advantage. Your positive attitude will simply make you a “happy sucker” who gets exploited by Machiavellian colleagues.
- **Exploitation risk**: happiness without effective calculativeness is a *dis*advantage.
- **Men also need power to find love**: happiness without understanding dating power dynamics and effective seduction frameworks will not land you a quality woman.

As a whole, ‘happiness’ without power is just compliance, submissiveness, and failure to meet your potential disguised as wellness.

TPM Verdict: Pursue Foundational Mental Resilience + Power, Not ‘Happiness’

Do not pursue happiness directly: as Viktor Frankl suggests, happiness *ensues*.

Swap ‘happiness’ for ‘baseline of contentedness’ about who you are and what you stand for. This is not a ‘peak emotion’, which is good because peaks often come crashing down—but it’s a high-well-being baseline you always get to peak with you.
And **reach it as a byproduct of developing foundational values and mental traits** such as honor, competence, self-love, self-esteem, and power-aware win-win relationships with quality people.

For agentic men, **happiness may not even matter that much**. Smart self-development will automatically give you a good baseline of self-esteem and ‘general contentedness’. It becomes a natural consequence of who you become-and, in part, achieve.
Chasing ‘happiness’ may sometimes betray a lack of foundations.

⍰♂Lucio’s Take: **The happiest man is the one who doesn’t need happiness. Focus on foundational mental empowerment**

Lucio:
Over years of studying and coaching, I've noticed a pattern: people chasing 'happiness' often lack foundational self-love and self-sufficiency.

Exceptions always apply, but consider this:

Chasing happiness from others betrays a lack of self-sufficiency, chasing happiness with material possessions betrays a lack of inner contentedness, and chasing happiness in a state of unhappiness betrays a lack of mental empowerment.

Someone said 'the richest man is not the one who has more, but the one who needs less'. It applies to happiness, too.

P.S.
Chasing happiness is not associated with agentic masculinity and undermines your social power.
See this reel.

TPM Takeaways for Ambitious Men

- **Keep**: emotional control, positive reframes, (learned) optimism and meaning (mission)
- **Add**: power awareness, social power, strategy, competence and everything we teach here and in **Power University**
- **Avoid**: 'chasing happiness', being 'happy but unaccomplished'

Build the pyramid of success from the ground up:

Positive Psychology helps with the lower and mid-level of the pyramid.

In our public articles we've focused more on the competence side. If you need help with the mental side, consider:

The Entrepreneurial Power Model: A Master Guide to Leverage & Influence

Lucio Buffalmano · 26 March 2026 · Archived copy · Original

Entrepreneurship is an economic, relational, and production system for gaining power, disproportionate value capture, and affecting change at scale.

From a self-empowerment perspective, entrepreneurship offers the largest leverage and **control over resources, decision-making, and time**. And insulates you from the vulnerabilities of being at someone else's mercy, a replaceable node in someone else's hierarchy.

This guide breaks down the power dynamics of entrepreneurship while providing ambitious men with tools and strategies for leverage and durable influence.

The Power-Exchange Model of Entrepreneurship™

The Power Exchange Model of Entrepreneurship™ states that to get high value from high-value individuals within voluntary exchanges, entrepreneurs must give back high value (extrinsic or intrinsic), exert personal influence (leadership, charisma), or strategically manipulate the exchange.

Value pertains to classical social exchange model (Blau, 1964), to which we add personal influence, and strategic persuasion/manipulation.
This model applies to all entrepreneurial relationships, from investors to business partners, to the general public and employees.

Core Problem: 'Value-Control Tradeoff Model™'

The value–control tradeoff™ states that the more value a person holds—ie., competence, capital, network, etc.—the more value they can provide, but the less controllable and more demanding they become. Entrepreneurs win by increasing their ability to exchange or extract performance from high-value, low-control individuals.

Lower value individuals tend to be less power aware and have fewer options, making them easier to control, but with lower added value.
Conversely, competent individuals add more value but are less manipulable, increasing entrepreneurs' costs.

Since not all forms of value are the same, entrepreneurs perform best when saving extrinsic resources, meaning that the topmost entrepreneurs may self-select to be high-IQ Machiavellians, hypercharismatic believers, or high-quality men that others genuinely look up to.

Entrepreneurs' competence allows for greater value extraction, boosting margins and business success

Let's explore their secrets to ensure you're more of the latter.

Solution 1: Entrepreneur's Personal Power

Personal power, which some refer to as 'charisma', 'character', or 'leadership', is a person's social value to others. And the more valuable the entrepreneur becomes, the more he can cooperate with high-value others.

In leadership, Maxwell called this the 'law of the lid', with the entrepreneur's level of leadership being the 'lid' to his effectiveness. Higher value entrepreneurs , can attract, retain, and influence top performers.

TPM Note: It's one of the most win-win and honorable approaches
While personal power can be abused, when it includes character and prestige, it tends to be win-win, lower risk, and stable. This is soft power per excellence, and the entrepreneur's equivalent of high mate value in dating.

1.2. Mindsets

Mental empowerment is a foundation of personal power, and key mindsets include:

Non-entrepreneur	Entrepreneur
Threat-focus, seeks safety and moves away (avoidance-oriented)	**Opportunity-focus**, seizes and moves towards (approach-oriented)
Consumer: Wants to buy	**Producer:** Wants to create and sell
Seeks entertainment	**Seeks knowledge & skills:** Uses media to extract mental models and promote
Passive: Waits for permission	**Hyper-agency** and action-taking
Follower: Comfortable in existing hierarchies.	**Leader/disruptor:** Driven to command
Naive nice guy: believes in the 'fairness of the system' and that giving is always rewarded	**Power aware**: sees power dynamics and trusts power above 'fairness'

Producer Mindset

Consumers look at a new cool gadget, want it, and ask 'how much does it cost'. Producers ask how it can help them create and sell better.

Entertainment vs. Education (Information Intake)

Consumers used media as escapism from their lives. Producers use it for informational acquisition, or customer acquisition.

High agency

Sense of control, the belief in one's ability to effect change.

Strategic Thinking

Strategic thinking helps across the full spectrum of entrepreneurship, from prioritizing opportunity, to social strategy.

Good entrepreneurs are also effectively calculative. As high-value men, they must protect themselves against the many takers who seek their time, employment, or companionship.

Time = Most Precious Resource

Entrepreneurs constantly assess what's the highest ROI on their time, and constantly protect it against takers and time-wasters.

Employees sell time for money, while entrepreneurs leverage *other* people's time.

Risk-taking

Employees seek stability, while entrepreneurs take bets.

Seeking Permission vs. Hyper-Agency

- The employee waits for approval, turning to those with the title, certifications, or degrees to be told what to do. Entrepreneurs have a bias for results and fast action.

Realism & Pragmatism

Realism is a necessary tool for anyone who seeks to enact change in the world.
Ray Dalio is a good example. Dalio enjoyed philosophical discussions, but he made 'hyperrealism' a key principle at work.

1.3 Power Awareness

Non-entrepreneur	Entrepreneur
Naive nice guy: misses power moves & status negotiations	**Power aware**: sees power dynamics
Trusts fairness and 'karma'; 'give and you will get'	**Trusts power** above 'fairness'

Effective entrepreneurs are power aware.
Rao's interesting 'Gervais Principle' posits that entrepreneurs capture the lion's share of employees' added value because they're power aware, and employees are clueless.

Power awareness and skills are crucial through the 'entrepreneurship value chain' (networking, VC pitching, partner selection, selling, hiring and retaining, etc.).

Some key articles on power-awareness:

- Power intelligence
- Social investment model, and how it relates to interpersonal power dynamics
- Naive self-help, covering what's missing in most entrepreneurship resources

1.4. Social Power

Positive dominance and a minimum of masculinity are important to gain respect, especially with other men.
This is the power component of our power and warmth framework, without which a man may pass too much for a 'nice guy', but fail to gain the respect he needs to lead.
Read more:

- **High power behavior**
- How to gain respect

1.5. Character

With a reputation for competence, fairness, and honor.
This is the equivalent of prestige-based social status.

Read more:

- **How to be an honorable man**

Solution 2: Power Asymmetry (Greater Power-Greater Value Capture™)

This principle states that the greater the Power Gap between entrepreneurs and employees, the more value the entrepreneur can, and often does, capture

Can often turn into *does* because most living organisms seek maximum returns. It's a law of nature, and returns maximization can turn coercive with absolute power.

However, the greater value capture must not necessarily be win-lose.
In free markets, value capture often remains win-win, and both are better off. Plus, entrepreneurs could re-invest the larger share into the business, and grow it for everyone.

But alas, it's best to never have to hope in someone's magnanimity.
Extreme power gaps can push value capturing to extremes that some may consider unethical. This is why government regulations setting a floor on value capture can be effective.

One example from the book '*Shoe Dog*':

High power = small capture	Low power = extreme capture
Phil Knight took pride in treating sponsored athletes well, and made many wealthy	Many considered Nike's sweatshop working conditions appalling

Thus, entrepreneurs may use several strategies to keep others lower power, including:

- Geo-arbitrage, outsouring to poorer countries
- Automations
- Scripts and manuals to systematize and diffuse best M.O.

Solution 3: Strategic Exchange (& Manipulation)

Rational players are incentivized to give the least and take the most, without breaking the active cooperation.

However, note that in free exchanges ,**even strategic and calculative exchanges often remain win-win.**
For example, giving what's less valuable to you but more valuable to someone else is not underhanded, but smart.

However, there can be an element of manipulation.

Social Exchange Manipulation

One may inflate one's giving, while deflating others' giving ('social exchange scalping').

Often, entrepreneurs' 'gives' are framed as out love, towards 'members of the tribe', without mentioning the self-serving motive.
Some examples from the resources we studied:

Strategic Give	Strategic Take
Sam Walton called employees 'associates' and started a revenue-sharing scheme, aligning incentives and long-term cooperation	Long-term employees gained, but had to commit their working lives to Walton while still on minimum wage
Howard Schulz called baristas 'partners' and provided revenue share.	Baristas were blocked from joining unions and were first to be fired during downturns

Strategic exchanges are give-and-take with plenty of grey area framings
Cynics focus on the right side, and naives only see the left side. Smart cooperator look at the bottom line: if both stay in the exchange, it's fair to conclude it's win-win

Solution 4: Influence (& Manipulation)

Good entrepreneurs tap into intrinsic motivation to inspire others, boost their sense of belonging, and move them from a natural self-focus, to team players.

This is the true essence of leadership, maximizing output and minimizing costs, while also boosting morale.
For an overview on these topics see:

- **How smart leaders inspire**
- How to be a leader

Manipulative Dynamics

The line between good persuasion and manipulation is often blurred, but given people's incentive to maximize returns, it is crossed more often than people wish to admit.

For example, genuine pro-social missions tend to attract believers who work hard for less. But they may also be used as covers to maximize value capture.
Some examples of superficially persuasive but potentially manipulative attempts:

Manipulation	Effect
Share the 'tough journey' of entrepreneurship	**Discourage entrepreneurship**. More employees = more bargaining power
'Change the world' missions framed as prosocial	**Attract believers** who work harder and ask less
Teamwork as a value, which is 'good' and prosocial	**Shames calculativeness**, pursuing individual credit, and strong salary negotiation

Manipulative attempts don't need to be mean-spirited or calculated. Often, they work best when they're subconscious.
Indeed, sociobiologist Trivers theorized that self-duping is the highest form of manipulation.

Read more in:

Corporate manipulation, a list of common business-to-employee manipulation

The Bigger the Sacrifice, the Bigger the Manipulation

A principle of manipulation dynamics is that manipulation festers in the areas of diverging interests, and that the more obviously interests diverge, the greater the manipulation must be.

See more in:

- Great leadership is great manipulation: Ultimate sacrifices call for ultimate manipulation

Manipulation... Or Team's & Mission Win? Perspectives Matter

If one believes the ultimate goal is good, or the good of the company supersedes that of the individual ('collectivist psychology'), then he would see entrepreneurs' manipulation as positive persuasion.

Solution 5: Execution

This is the only part that entrepreneurship resources focus on, largely ignoring all preceding aspects.
Across the resources we've analyzed, the following are recurring key concepts:

1. **Define a problem**, instead of starting from 'great idea'
2. **Build the offer**: Alex Hormozi proposes that value = dream outcome x odds of success / time delay x sacrifice. Make your offer good & proven, and fast & simple
3. **Define the avatar**, your ideal customer, and pitch to him (see example below)
4. **Systematize and automate:** Sources like Gerbner's *The E-Myth Revisited* suggest switching from working *in* the business and working *on* the business to scale and gain independence
5. **Hire slow and fire fast**, hire based on experience or you'll be offering free training paid by you. Consider the 'No asshole rule', or they'll drive away any other competent person
6. **Scale**: dominate one single channel, market, and product first, and only later expand (example: Amazon first dominated books, then everything else).

Worked Example: Power University's Avatar

Max is 32.
He is intelligent, disciplined, and ambitious.
But he feels he could operate at a higher level—strategically, socially, and professionally—but he lacks a unifying framework.

His main constraints are blind spots in power, strategies, and attraction.

Max could read on his own all TPM's articles and figure it out. But Power University or coaching saves him time, and gives him invaluable extra insights not publicly available.

Learning Entrepreneurship: Literature Overview

Most entrepreneurship literature focuses on execution and mindset, while largely ignoring power dynamics, incentives, and value extraction.

- **The Millionaire Fastlane & Unscripted** The 'anti rat-race manifesto' <—🤔 **Lucio's note**: a favorite
  - ✅ Pros: Power-aware, takedown of 'compound interest myth' and 'paradox of practice'
  - ❌ Cons: Dismissive of employment, which can be by choice or strategy
- **Zero to One**. Monopoly = maximum power asymmetry → maximum value capture. But focused on VC and lacks how-to
- **The Lean Startup**: A classic that introduced the 'Build-Measure-Learn' feedback loop and 'Minimum Viable Product' approach
- **$100M Offers**
  - ✅ Pros: A hyper-practical, tactical manual
  - ❌ Cons: The 'price high' is a generalization that won't apply to everyone
- **The E-Myth Revisited**
  - ✅ Pros: The main reference to transition from self-employed labor to systems engineering.
  - ❌ Cons: Simple concept, 'how to' is simplistic
- **Rich Dad Poor Dad**: Entry-level with foundational mindset shifts, but too simplistic for our audience
- **Biographies**
  - ✅ Pros: First-hand experience
  - ❌ Cons: Inherently biased. Reputation management, self-promotion, and potentially marketing
- **Principles**
  - ✅ Pros: Organizational engineering.
  - ❌ Cons: For big and stable businesses only. Potentially impression management (see our 'Machiavellian principles' take)
- **Start With Why**: Deep-sounding, but speculation based on survivorship bias. Apple's success may also come down to Jobs' personality, as per our model

Courses & Limitations of Practicality

Most courses I've analyzed were too basic or too generic to significantly move the needle for TPM. Common issues:

- **Motivation over practicality**
- **Passion over marketability**, but nobody buys your passion if it doesn't add value
- **Naivete**, skipping the power dynamics (predatory partners, manipulative negotiations, and manipulation)
- **Marketers without experience**: Most courses' sellers are marketers; their only business is selling those courses

Dark Triad Traits & Entrepreneurship

> Here's to the crazy ones. The misfits. The rebels. The troublemakers
>
> *Apple's ad*

While many popular texts highlight positive entrepreneurs, the truth is that there are also 'darker' traits associated with it.

And a 2021 meta-analysis shows that **all 3 dark triad traits are associated with entrepreneurial intentions**.

Dark triads may be driven towards a shortcut to status and power, and moving away from positions of low power. While Apple's quote is inspirational, one may 'rebel' against starting at the bottom. And a 'misfit' may not fit because of high antagonism, or lack of inhibitory controls.

Calculativeness

More selfish and calculative individuals are more likely to resent and reject an entrepreneur's greater value capture. They'd rather do the greater capturing than be at its receiving end.

Selfishness & Motivation

The research literature on narcissism suggests that narcissists are less motivated in positions of followership, and more concerned about their interests when they're project resources rather than project managers (Benson, Jordan, & Christie, 2016).

Entrepreneurship, with its high returns and visibility, may be their only path to thrive.

Grandiosity

Grandiosity, a trait associated with narcissism and factor 1 psychopathy, may be one source of the (over)-optimism required for entrepreneurial risks.

Several entrepreneurial slogans of 'changing the world', 'disrupting' and 'denting the universe' may suggest grandiose thinking.
For example, Diamandis' rules in *Bold* read:

- If you think it is impossible, then it is for you.
- Start at the top, then work your way up.
- The best way to predict the future is to create it yourself!

Learn more here:

- **Antifragile grandiosity**: getting the grandiose boost, without the downsides

Spectacular Cases

Among the entrepreneurs that some suggested may have dark triad traits:

- Sam Bankman-Fried
- Elizabeth Holmes
- Bernard Madoff, mentioned in *The Handbook of Psychopathy* as a possible example of 'successful psychopaths' (until he got caught).

Elizabeth Holmes created and leveraged her status and fame to recruit an A-list board of directors and secure billions from top VC firms. She also allegedly, and likely, lowered her voice, a cue of authority and social power.

The Entrepreneurial Tetrad Hypothesis™

The Entrepreneurial Tetrad Hypothesis™ proposes that four personality dimensions—grandiose narcissism, Machiavellianism, Factor 1 psychopathy (boldness), and autistic traits—may be disproportionately associated with entrepreneurship for the advantages provided in ambition, will to power, strategic thinking, risk tolerance, and systemization.

Looking at the history of entrepreneurship, especially including modern successes, it seems that, besides the dark triad, autism may also provide some advantages.

Autism may have become more relevant with the rise of technology, science, and the digital age.
And although it may be a potential limiter in pure social power and leadership skills, it may provide the drive to tireless work in scientific and technical domains that may bore more neurotypical men.

Trait	Entrepreneurial advantage
Grandiose narcissism	Ambition, status drive, belief in one's exceptional destiny
Machiavellianism	Strategic thinking, political skill, goal-focus
Factor 1 psychopathy	Fearlessness, stress resistance, willingness to take risks
Autism	Systemization, obsessive focus, deep specialization

Looking at some examples:

- **Jobs** → narcissism + psychopathic boldness
- **Zuckerberg** → autistic traits + Machiavellian strategic thinking
- **Musk** → autistic traits + grandiosity
- **Holmes** → grandiosity + factor 1

Different Solution: Solopreneurship

Solopreneurship may skip this game, appealing to more freedom-loving, independent, and potentially less extroverted men (a 'sigma type' in popular talk).
Resources for solopreneurs include *The 4-Hour Workweek*, Sivers' *Anything You Want*, and *The $100 Startup*.

There are two types of solopreneurs:

Missionary/artist	High Power
Loves his job	**Doesn't love** or even dislikes his job
Stays on his mission and systematizes the rest (admin, support, etc.)	**Systematizes** everything to stop working

But they share in common:

- **Sovereignity over 'scaling':** Personal autonomy and mobility over scaling to maintain full control over one's time and mobility
- **Independence over status**, living outside of status hierarchies

TPM's Contribution to Entrepreneurs

Most entrepreneurship advice focuses on tools.
But entrepreneurship is not only about ideas or execution, but also swaying exchanges, incentives, and power asymmetries in your favor.

Entrepreneurs are net value-givers. They move society forward, and we're happy to help them.
Our alumni entrepreneurs found Power University helped them expand their influence and achieve their goals:

Spirituality, Agency & Power: What Works, What Doesn't

Lucio Buffalmano · 2 April 2026 · Archived copy · Original

Most high-agency and rational men hear the word 'spirituality' and think of woo-woo 'vibrations' and passive losers waiting for 'manifestations'.

They aren't entirely wrong. A massive portion of the spiritual self-help industry is manipulative gurus and naive self-help. From the "Law of Attraction" to "give and you will get," these concepts may be more likely to harm than to help.

However, to dismiss spirituality entirely is a massive strategic blunder.
Stripped of the pseudo-science, **spirituality can be tremendously empowering** and form the foundation of antifragility and unnediness.

In this guide, we strip away the "woo-woo" to reveal the core mechanism of spiritual power.

Contents

- Spirituality for High-Value Men: TPM's Integrated Model

What's 'Spirituality'

Spirituality refers to the transcendence of materialism and physicality to embrace something larger than oneself, including inexplicable forces, a 'greater power' or God.

In truth, spirituality is a loosely utilized term that can refer to the search for meaning, purpose, transcendence, connectedness, and a relationship to what people consider sacred, or inexplicable by science.
Spirituality is also linked to the related concepts of 'awakening', 'awareness', and 'enlightenment'.

It overlaps and may include religion, but it's larger and can also exist without religion. Religion can be thought of as more organized, dogmatic, and ritualistic. Spirituality is broader, more personal, and often less tied to doctrine. However, spirituality is closer to Eastern religions, including Buddhism, Taoism, and Hinduism.

Spirituality in more practically-oriented self-help is also often linked to practices of **meditation and mindfulness**.

Effective Spirituality™

Effective spirituality™ combines emotional resilience and unneediness while maintaining the drive, ambition, and effectiveness of an agentic approach to life

Traits	Empowering Outcomes
Detachment (Mental Separation)	**Outcome Independence:** Focus execution, stay resilient independent of results. **Growth Mindset:** Failure is just data, not an emotional collapse.
Non-Neediness (Internal Value)	**High Self-Sufficiency:** Your value isn't dependent on others' validation or ownership. **Social Freedom:** Immune to typical social and emotional manipulation.
Strategic Acceptance (Amor Fati)	**Emotional Resilience:** You don't resist reality; you adapt immediately.
Present Moment Awareness	**Focus and Clarity:** Deep concentration on current tasks, reducing noise and anxiety. **Enhanced Observation:** Reading power dynamics, tells, and cues in real-time.
Connection to Purpose	**Unhindered Persistence:** Deep conviction fuels grit that standard motivation cannot match. **Charismatic Leadership:** People follow the internally guided.
Transcending Ego	**Antifragility:** Criticisms and reversals don't shatter your identity; they reinforce it. **Strategic Decision Making:** Actions are based on effectiveness, not validating the self.

Spirituality is valuable for **resilience, stability, and unnediness.** But it becomes harmful when it turns into naivete, loss of agency to 'the universe' or 'karma', and when it replaces action with thoughts only.

Our approach to men's empowerment aligns with 'effective spirituality', and places the mind at the center stage of a man's power.
You can read more in our antifragility articles, or our main training on this:

- **Confidence University**

The Core Mechanism: Detachment as Mental Power

The core useful mechanism in spirituality is **detachment**, especially detachment from life events and material possessions.

In practical terms, this means being **less reactive and more unfazed** by inner thoughts, fears, and cravings, and by external social reactions and events.
Mindfulness research describes this as nonjudgmental, purposeful awareness of the present moment, and modern studies show that meditation and mindfulness can help reduce stress, anxiety, depression, insomnia, and related distress.

TPM adds an important layer: pure spirituality and **full detachment alone can blunt your edge.**
It can make you less ambitious and less effective, lowering your status, respect, and attraction. While a spiritual man would reply 'so what', we serve men who also want to achieve goals here. So we prefer a more integrated approach for the best of both worlds (read below).

Bottom line: Spirituality is useful when it increases internal freedom, emotional stability, and clarity of action. It becomes harmful when it replaces agency with hope or strategy with belief.

The Upside: Emotional Control, Antifragility, and Inner Freedom

Non-spiritual	Positively Spiritual
Reactive: Everything is a personal threat or a "big deal."	**Emotionally Cool:** Detached from the drama; nothing is a big deal.
Materialistic: Identity is tied to ownership and status.	**Unneedy:** Value is internal; possessions are tools, not identity.
External Worth: Measures value by what others think/have.	**Internal Frame:** Judges character and personal integrity.
Hedonic Treadmill: Chasing dopamine spikes; crashing back to "lack."	**High Baseline:** Constant contentment and stable well-being.

Non-spiritual	Positively Spiritual
Fragile Ego: Shattered by failure or social rejection.	**Antifragile Ego:** Welcomes challenges; failures provide data, not pain.
Victim Mentality: “Why is this happening to me?”	**Amor Fati:** Do the best with whatever happens, and if you cannot, accept it: ‘it’s OK’

Some more agentic and rational men may wrongly downgrade spirituality to non-rationality, woo-woo, or ‘hippy culture’. In truth, spirituality can be a foundational pillar of mental health and power.

Unneediness, Self-Sufficiency, & Resilience to Losses

Spirituality reduces neediness towards things and, often, also from people.
This is important because while spirituality is often associated with the feminine pole, **higher self-sufficiency is supremely masculine**.

⍰♂Lucio’s Take: **Be bigger than any-*thing*. Material transcendence = mental power**

Lucio:
What you own, owns you. The more you attach to things and material possessions, the more they will control your mind.
Just like a mate-guarding partner, you become mentally invested and defensive, fearing the loss. And if you lose it, you lose psychological well-being with it.

This is a pattern I’ve noticed when people get attached to things. This is why I prefer a minimalist approach, with fewer things, and looking at them as instrumental tools. I feel much freer and more empowered transcending materialism.

The same goes for any possessions and people.
Attachment to partners can be good, but too much can make you overly dependent.

Transcending money: do what you love

I'd very much appreciate it if one million magically appeared in my bank account, of course. Yet, I would also keep doing the exact same things.
This is why increases or decreases in earnings don't have as big an impact on me. That doesn't make me the best entrepreneur to maximize returns. But it's tremendously empowering.

Psychological & Emotional Resilience

Effective spirituality can give you emotional control without emotional numbness. You do not need to suppress pain or to be overwhelmed by feelings, either. You can acknowledge it, feel it, and not be ruled by it.

Once your identity is less attached to praise, failure, or status, **you stop collapsing when life pushes back.**

By transcending failures, spirituality can be an essential pillar of antifragility, both 'antifragile grandiosity' and antifragile ego.

Social Resilience & Manipulation Resistance

Emotional control also lowers the desperate urge to be validated by others. That makes you less emotionally manipulable and more independent of judges' authority.
This directly supports social power.

Fearlessness From Loss & Death Acceptance

Surprisingly, spirituality's greater comfort with the possibility of loss, physical frailty, and death can make you more fearless.

Contededness

Finally, spirituality can be more effective than positive psychology in achieving 'happiness'.
It can produce a higher and more stable baseline of contentment instead of a fragile dependence on outcomes, or wider swings based on acquiring material possessions.

All in all, **positive transcendence may as well be the ultimate power move in life**: need nothing, depend on nothing, and always be content.
Contrary to being 'soft', this approach to spirituality may be the closest thing to 'successful psychopathy', taking the positives from psychopathy, without the meanness and antisociality.

The Dark Side of Spirituality (Naivete, Power Loss)

Bad Spirituality (low power)	TPM Spirituality (high power)
Underachieving: A warped approach to "non-striving" as an excuse for laziness.	**Ambitious:** High-striving for goals, but detached from non-essential social validation.
Naive: Believing others are equally "spiritual" or good-natured.	**Power Aware:** Realistically assesses others' darker drives while remaining open to genuine "light."
Low Self-Esteem: Uses "ego dissolution" to hide a weak sense of self.	**Antifragile Grandiosity:** strong self-belief, but with a larger, malleable, & antifragile identity
Over-Giving: Indiscriminate giving to takers and toxic social parasites.	**Strategic Generosity:** Invests value into high-quality people and close relationships (Effective calculativeness)
Anti-Science: Rejects logic in favor of "vibrations" and pseudo-science.	**Rational Realism:** Critical-thinking approach that accepts the limits of science without falling for scams.
Total Surrender: Passive "letting go" even when action is required or revenge is called for	**Strategic Grit:** Dogged goal pursuit, evening the scores, but letting go of what's outside one's control.
Law of Attraction: "Think and attract" (The Sucker's Strategy).	**Internal Locus of Control:** Mindset is the foundation, but massive action is the engine of results.

The dark side of spirituality may be smaller than the upsides, but it's more common because it's over-represented in self-help.
Even besides the most obvious woo-woo nonsense, even mild spirituality like 'trust the universe', 'give more' and 'acceptance' can turn harmful without power and strategy.

The emotional appeal is obvious. People want relief. They want a story that makes struggle feel meaningful-or make personal failures feel 'OK'.
That psychological need is exactly why **the market is crowded with snake oil salesmen**.

Some other common woo-woo, less useful, or potentially harmful concepts and associations to spirituality include:

- **Vibration**, the idea that all matter and energy—including thoughts and emotions—resonate at specific frequencies. Higher vibrations = love, joy, and enlightenment; lower rvibrations = fear and negativity
- **Law of attraction**, sometimes associated with not taking action because it would signal you 'don't trust the universe'
- **Karma**, absolving men of the responsibility to readdress wrongs
- **Simple solutions to complex problems** that won't always work (eg, 'letting go' for traumas)
- **Naive giving**, as 'give more to get more'
- **Using spirituality for material pursuits**, like giving more to get more or 'attracting riches'

Literature on Spirituality

Spirituality is potentially the largest-selling sub-genre of self-help.
Even many self-help 'gurus' or best-selling books that are not usually classified as 'spiritual' contain elements of spirituality, including Tony Robbins and *Think and Grow Rich*.

There is no clear "first book" or 'main book' on spirituality, but some of the main authors that shaped it include Norman Vincent Peale, Deepak Chopra, Eckhart Tolle, Anthony de Mello, Joe Dispenza, and David Hawkins.

An unfortunate **good chunk of spiritual self-help is predatory and manipulative.**
It panders to 'people's need to believe', as Robert Greene wrote in one of its 'laws'. Furthermore, as we have outlined in the 'best-seller quality tradeoff', most best-sellers must necessarily reduce in complexity, nuance, and often quality to appeal to the masses.

In simpler words, most **spirituality best-sellers are also lower-quality spirituality.**
Keep that in mind as we review these books:

- **The Seven Spiritual Laws of Success**: Unpalatable mix of law of attraction and ineffective spirituality for material gains
- **The Secret**: One of the most popular and one of the worst
- **Already Free**
  - ✅ Strong integration of acceptance and development; best bridge model.
  - ❌ Abstract in parts
- **The Power of Now**: Focus on mindfulness and presence in the present
- **As a Man Thinketh**: First book focusing on thoughts, an important aspect of mental health and power, but simplistic
- **The Go-Giver**: Naive giving, lacks any strategy
- **Letting Go**: Focuses on letting go to heal, but it offers nothing beyond that one solution
- **Awareness**: One of the most down-to-earth and best descriptions of 'enlightenment'
- **Self-Healing books and gurus**: Mixing thoughts and meditation with healing, or random practices to cure diseases (Steve Jobs opted for a diet of fruits to cuse his cancer)

The Biggest Lie: "Think & Things Will Manifest"

One of the weakest yet most popular concepts associated with spirituality is the 'law' of attraction/manifestation.

Thinking about your goals, sometimes associated with 'visualization' can help sometimes. It can focus on your goals and potentially deliver new ideas, and it may help internalize that achieving your goals is possible.

However, the second leg of the law of attraction is far more dubious for any critical thinkers.
The claim is that if you think the right thoughts strongly enough, the 'universe' will deliver it and reality will

reorganize around your desire.
This is unscientific and, we may say, lacking any logical connection.

Several ‘gurus’, for example Joe Dispenza, mix this old law with pseudoscience. For example, thoughts altering reality through metaphysics.
For believers, it is unfalsifiable: if it works, the belief is confirmed; if it fails, you “didn’t believe enough.”

Manifestation becomes actively harmful when it replaces action with hope and ‘thoughts’.
The result is predictable: delayed action, delayed competence, and higher odds of long-term failure masked as “spiritual growth.”

🤦♂️Lucio’s Experience: **My colleague ‘attracting’ losses**

Lucio:
I remember meeting a former female colleague and an otherwise high-power woman at a high-end shop in the city.

I was there to take a break from constant work on TPM and make some approaches. And she was there… Planning how to spend the money she would ‘attract’ and ‘manifest’.

Back then, it was the era of McGregor dominating UFC and endless videos done about him visualizing victories and attracting and manifesting victories.
My colleague had become a huge fan of McGregor, and her plan was… Quadrupling her money betting on his win against Mayweather.

Compare the two different approaches: one rationally working hard on his business. The other ‘attracting’.

And for the record, McGregor lost.

Spirituality for High-Value Men: TPM’s Integrated Model

The integrated model is simple: combine the resilience and unneediness of spirituality, reject the agency loss, and add agentic goal-achievement.

You act with full agency: strategize, work, compete, and achieve. But internally, you remain detached: outcomes do not define your worth, and losses do not devalue you as a person.

It's possible to use this approach to go all the way: obsessively ambitious, yet imperturbable. Become unbreakable while still acting aggressively in the world.
Or you may also add a middle path between passivity and obsession. Work hard, but take time off for relationships and spiritually-related pursuits.

You can also be religious while being ambitious, agentic, and practical.
You can be religious and still be practical. As the Italian saying goes, *"aiutati che Dio ti aiuta"* — help yourself and God will help you.

Finally, this approach is also effective in maintaining the upsides of Machiavellianism and 'dark-triad traits', while removing the downsides.

🤔Lucio's Take: **Transcendence via achievement**

Lucio:
Don't forget that one way to become more spiritual and non-needy is to… Achieve all your goals and needs.

Then you may naturally become less materialistic, chillier, and focus on giving back.

This integrated model aligns with TPM concepts like:

- **Healthy nihilism**
- **Leveraging death for life**
- **Antifragility**, antifragile ego, and antifragile grandiosity
- **Confidence University**, leveraging principles of spirituality, positive psychology, and even dark triad confidence tactics into a unified system for mental power

Handbook of Psychopahty: Summary & Review (2nd Edition)

Lucio Buffalmano · 6 April 2026 · Archived copy · Original

The *Handbook of Psychopathy* (2018), edited by leading scholars in the field, is the most comprehensive, research-based synthesis of modern psychopathy science.

Contents

- Notes
  - Chapter 1. Psychopathy as Masked Pathology
  - Chapter 2. Psychopathy, Sociopathy, and Antisocial Personality Disorder
  - Chapter 4. The Response Modulation Hypothesis
  - Chapter 5. Temperament Risk Factors for Psychopathy
  - PART II DISTINCT PHENOTYPIC FACETS OF PSYCHOPATHY
  - Chapter 6. Externalizing Proneness and Psychopathy
  - Chapter 7. Callous–Unemotional Traits
  - Chapter 8. Boldness: Conceptual and Methodological Issues
  - PART III ASSESSMENT AND DIAGNOSIS OF PSYCHOPATHY
  - Chapter 13. Variants (“Subtypes”) of Psychopathy
  - Factor 1 vs. Factor 2 Table
  - Chapter 14. Genetic and Environmental Influences
  - Chapter 15. Family Background and Psychopathy
  - Chapter 18. Cognitive and Emotional Processing in Psychopathy
  - PART V PSYCHOPATHY IN SPECIFIC SUBPOPULATIONS
  - Chapter 21. Psychopathy in Women: Assessment, Manifestations, and Etiology

Notes

About the Authors:
Each chapter is authored by different experts and researchers in the field of psychoapathy and edited by Christopher J. Patrick, PhD. Patrick is a leading authority in the field of psychopathy and Professor of Psychology at Florida State University.

⍰⍰♂ **Lucio's note**: I re-organize chapter for topical congruency and to keep the TOC manageable.

Chapter 1. Psychopathy as Masked Pathology

Author: Christopher J. Patrick

The opening chapter, explores psychopathy through the lens of Hervey Cleckley's classic clinical description in *The Mask of Sanity* (1941/1976). Cleckley's core proposition is a **masked pathology**—a severe, underlying deficit in behavioral and emotional regulation concealed by a credible outward appearance of psychological normality ('sanity').

Main Takeaways:

The field has progressed from viewing psychopathy as a discrete condition to a **dimensional** and **multifaceted** disorder, which better aligns with the complexity Cleckley observed. The **Triarchic Conceptualization** (Patrick, Fowles, & Krueger, 2009) is introduced as a framework to integrate findings, characterizing psychopathy by three biobehavioral dispositions: **Boldness** (the "mask" or fearless dominance), **Meanness** (callousness-unemotionality), and **Disinhibition** (externalizing proneness).

- **Cleckley's 16 Diagnostic Criteria:** These criteria are categorized into "Mask features" (e.g., Superficial charm, absence of delusions/nervousness, suicide rarely carried out) and "Behavioral deviance features" (e.g., Unreliability, inadequately motivated antisocial behavior, poor judgment).

Chapter 2. Psychopathy, Sociopathy, and Antisocial Personality Disorder

Author: David Lykken

The Lykken model of antisocial genotypes. Redrawn from Lykken (1995, p. 11). Copyright © 1995 Lawrence Erlbaum Associates, Inc.

This chapter was originally written by the late David T. Lykken and reprinted with William G. Iacono's commentary. It provides a historical and conceptual analysis of the terms psychopathy, sociopathy, and Antisocial Personality Disorder (ASPD).

Lykken highlights the importance of distinguishing between a predominantly genetically-influenced, temperament-based psychopathy (sometimes called "primary" psychopathy) and a form of antisocial behavior driven more by adverse social environment (sociopathy or "secondary" psychopathy).

- **Antisocial Personality Disorder (ASPD):** This official *DSM* diagnosis primarily focuses on overt behavioral deviance (e.g., impulsivity, irresponsibility, law-breaking), correlating strongly with the Disinhibition aspect of psychopathy but not as much the core affective-interpersonal deficits (Boldness and Meanness) central to Cleckley's psychopath.

Sociopathy vs. Psychopathy: Real-Life Examples

> If Mike's psychopathy is a result of one of the subtle brain malfunctions that are conjectured in later chapters, then even the most talented parents may be disappointed. But if Mike's "problem" is merely that he is relatively fearless, then those parents might produce a hero instead of a hoodlum.
> Some historical figures who, I believe, had the "talent" for psychopathy but who did not develop the full syndrome and achieved great worldly success include Winston Churchill (Carter, 1965; Manchester, 1986, 1988), the African explorer Sir Richard Burton (Farwell, 1963; Rice, 1990), and Chuck Yeager, the first man to fly faster than sound (Wolfe, 1979; Yeager, 1985).

And little later, Lykken includes IQ as a moderator for psychopathy, used to avoid petty crimes and instead to gain status in legitimate society. He says Lyndon Johnson exemplified this syndrome. Both Hitler and Stalin were relatively fearless, clever men, unconstrained by guilt or pity, whose ruthless rise to power would not have been possible had they felt normal degrees of caution or conscience.

⍰⍰♂ **Lucio's note**: This sounds appealing in its simplicity, but it also feels less convincing and authoritative.

Churchill may have been high in boldness, but low in meanness and factor 2, rather than 'talent for psychopathy' and 'not developing the full syndrome'.

⍰⍰♂ Lucio's Note: Little empirical evidence for parenting effects on factor 1, but valid for factor 2

From chapter 24:

> Though influential theories posit that effective parenting is important for engendering success in individuals with psychopathic traits (Lykken, 1995), the empirical evidence for this proposition is mixed. Children with high levels of callous–unemotional traits—which correspond most closely to the affective facet of adult psychopathy—show high levels of conduct problems (Andershed, Gustafson, Kerr, & Stattin, 2002; Wootton, Frick, Shelton, & Silverthorn, 1997) and reactive aggression (Yeh, Chen, Raine, Baker, & Jacobson, 2011), irrespective of the measured adequacy of their parenting.

However, there is stronger evidence for factor 2:

> However, for the interpersonal features of psychopathy, Lykken's original hypothesis may hold: Adolescents high in these features who are exposed to inconsistent parenting show more deviant behavior than those experiencing consistent parenting (Edens, Skopp, & Cahill, 2008).

⍰♂Lucio's Take: **A more subjective and opinionated chapter that I'd consider dropping**

Lucio:
While Lykken is an authoritative voice, I found the tone of this chapter more opinionated and subjective.

The differentiation between sociopathy and psychopathy and 'nature vs. nurture' also felt a bit too clear-cut, including when compared to successive chapters.

Leaving the original chapter and then adding refutations based on more recent studies may also tirp some learners, who may remember the original chapter more than the more recent findings.

Overall, I'd suggest the editor consider dropping this chapter or re-author it with updated takes and studies.

Chapter 4. The Response Modulation Hypothesis

Authors: Rachel Bencic Hamilton and Joseph P. Newman

> One of the most prominent cognitive models is the response modulation hypothesis (RMH). This perspective attributes the disinhibition seen in psychopathy to a failure to shift attention automatically from the implementation of ongoing goal-directed behavior to its evaluation (Newman, 1998; Patterson & Newman, 1993).

The Response Modulation Hypothesis (RMH) posits that the impulsive and problematic behavior characteristic of psychopathy stems from a **weakness in the capacity to process contextual cues** and redirect attention when focused on achieving a goal. Individuals high in psychopathy, when focused on a reward, fail to use peripheral or secondary information (like cues of potential punishment or danger) to modulate or adjust their ongoing behavior.

- **Core Deficit:** The deficit is not one of *knowing* right from wrong, but an attentional problem where goal-directed processing filters out contextual information that might otherwise inhibit a problematic response.
- **Time and Attention Deficits**: *the RMH suggests that psychopathic individuals' emotional deficits are moderated by attention. These findings suggest that the diminished reactivity to fear stimuli and affective cues seen in psychopathic individuals reflects idiosyncrasies in attention that limit the processing of information that is outside of the attentional spotlight (Newman et al., 2010).*
  - Enough time and attention could cure this: *when asked to turn their attention to processing and appraising the valence of emotion cues, and given enough time to do so, their performance is comparable to that of nonpsychopaths (Lorenz & Newman, 2002; see also Glass & Newman, 2009). Meffert, Gazzola, den Boer, Bartels, and Keysers (2013) presented evidence that higher-order cognitive processes moderate the empathic deficits of psychopathic individuals.*
- **Empathy may also be activated with directed attention & time**: *Meffert and colleagues suggested that when psychopathic individuals deliberately attend to empathy-related cues, they show normal empathy-related responses.*

It is only in situations in which the processing of empathy-related information is incidental that they show abnormalities. In our view, these findings provide evidence that the interpersonal and affective deficits characteristic of psychopathy are turned on or off depending on attentional focus (see also Ayame et al., 2014).

- **Mechanism underlying Disinhibition:** The RMH provides a mechanistic explanation for the Disinhibition facet of psychopathy, linking this biobehavioral trait to specific cognitive processing weaknesses.
- **Two Levels of Failure**: *failure to pause to evaluate the potential consequences of an action promotes impulsive action and prohibits the development of behavioral control, as well as a failure to devise a long-term life plan (Factor 2). (…) failure to reflect on the negative outcome of a maladaptive action encourages dysregulated and potentially asocial behavior*
- **Potentially underlying emotional deficits**: *The paradox of psychopathy is that psychopathic individuals show the capacity for intact reasoning and ostensibly genuine affect, but when they are engaged in goal-directed behavior, the information required for these activities is less accessible (Wallace, Schmitt, Vitale, & Newman, 2000). (…) decision making and emotional deficits seen in psychopathy can be viewed as being modulated by attentional focus.*

Chapter 16. Psychophysiology of Psychopathy: the Low-Fear Hypothesis

Authors: Adrian Raine (also author of '*Psychopathy, An Introduction to Biological Findings*'), Yaling Yang

This research stream has long sought to identify a core biological mechanism, often focusing on a fundamental deficit in the ability to experience fear or respond to threat and punishment cues. However, the data are complex, leading to an integration of multiple mechanisms: one related to the **Boldness**/fearlessness dimension and another related to the **Disinhibition**/impulsivity dimension.

- **Low-Fear Hypothesis:** Originally proposed by Lykken and others, this hypothesis suggests that psychopathic individuals' failure to learn from punishment or avoid danger stems from an innate, reduced emotional response (e.g., low skin conductance reactivity) to threat stimuli.
- **Deficit in Defensive Reactivity:** The chapter reviews evidence that high-psychopathy individuals, particularly those high in Boldness, exhibit reduced startle potentiation and other indicators of defensive (fear) reactivity.
- **Integration of Mechanisms:** Modern psychophysiology suggests a dual deficit: one pathway involves the low-fear temperament (affective/Boldness), and another involves deficits in inhibitory control (cognitive/Disinhibition).

Chapter 5. Temperament Risk Factors for Psychopathy

Author: Don C. Fowles

> Research on psychopathy in adults has strongly documented two somewhat independent dimensions that, to a significant extent, reflect different temperament risk factors. A temperament of low fear and anxiety contributes to the first dimension, whereas disinhibition due to deficient executive control combined with high negative emotionality— tendencies indicative of general proneness to externalizing problems—appears to contribute to the second.

These two dimensions map to both to the PCL-R facets:

> The two PCL-R factors are characterized as affective–interpersonal or "core features" of psychopathy (Factor 1), and impulsive–antisocial tendencies (Factor 2) (Benning, Patrick, Hicks, Blonigen, & Krueger, 2003; Hare, 1991, 2003; Harpur, Hare, & Hakstian, 1989). In personality terms, the correlation between the two factors is largely attributable to variance associated with Big Four or Big Five Antagonism (Lynam, Miller, & Derefinko, Chapter 11, this volume).

But PPI probably better captures this distinction:

> Validity studies indicate considerable parallelism between PPI Factors I and II and PCL- R Factors 1 and 2, despite their differing assessment formats (e.g., Poythress et al., 2010). However, the two psychopathy factors are more clearly differentiated in the PPI, with the PPI's Fearless Dominance factor in particular reflecting more of the positive psychological adjustment (i.e., "boldness") aspects of psychopathy seen in Cleckley's (1941/1976) concept of psychopathy, and less of the callous–unemotional or meanness component (see Patrick, Fowles, & Krueger, 2009, as discussed below).
> (…)
> Notably, in contrast with the correlated factors of the PCL-R, the two factors of the PPI are orthogonal.

Defining Temperament: Temperament is conceptualized as the heritable, early-emerging, biologically-basead and stable core of personality in affect and behavior that provides the foundation for psychopathic traits

- **Temperament and Psychopathy Facets:** The chapter reviews evidence for how different temperamental traits contribute to the psychopathy subdimensions:
  - **Boldness (Fearlessness):** This trait is linked to a lack of **fear sensitivity** or a low level of anxiety, which is a key temperamental factor.
  - **Disinhibition (Impulsivity):** This trait is linked to high levels of **impulsivity** and difficulty with emotional and cognitive control.
- **Low fear for factor 1**: *Importantly, the deficit in startle potentiation was specific to F1 of the PCL-R (Patrick et al., 1993), consistent with the idea that these core features of psychopathy reflect low fear (Lykken, 1995). In contrast, aversive startle potentiation was unrelated to F2.*
- **PPI vs. PCL-R**: *The Psychopathic Personality Inventory (PPI; Lilienfeld & Andrews, 1996; Lilienfeld & Fowler, 2006) was designed to assess psychopathy in noncriminal populations. Factor analyses of the PPI's eight subscales (e.g., Benning et al., 2003; Benning, Patrick, Salekin, & Leistico, 2005) have revealed two higher-order factors, alternatively labeled PPI-I or Fearless Dominance, and PPI-II or Impulsive Antisociality. Notably, in contrast with the correlated factors of the PCL-R, the two factors of the PPI are orthogonal.*
- **Different scales reflect these two broad factors** (MPQ personality profiles): a cluster analysis of MPQ for high scorers on PCL-R found two subgroups labeled "emotionally stable" and "aggressive" that paralleled the trait correlates of PCL-R F1 and F2 (Hicks, Markon, Patrick, Krueger, and Newman, 2004; Skeem, Johansson, Andershed, Kerr, and Louden, 2007)

Children With Fearless Temperament Benefit From Good Parenting & Secure Attachment

Maternal gentle discipline is enough to promote internalization of conscience in more fearful children by generating sufficient anxiety. But children with fearless temperament are harder to parent and socialize, influencing conscience development (Kochanska, 1993, 1995, 1997, 2002).
Securely attached, mutually positive mother–child relationships provide a reward-based pathway for fearless children, allowing conscience to develop without relying on anxiety (Kochanska, 1995, 1997).

Good parenting can channel a fearless child into a pro-social career.
But a fearless temperament could lead in different directions, and lack of empathy and attachment could instead produce skilled predation.
Or fearless insensitivity shaped in the directions of antagonism and callousness could give rise to high levels of meanness with extreme antisocial predation.

Externalizing Spectrum Model

> The externalizing spectrum model views disinhibition (rather than strong reward-approach motivation) as the core liability (e.g., Krueger et al., 2002, 2007; Krueger & Markon, 2006). Although weak inhibitory control is central to this formulation, the deficit is viewed more broadly as one of executive control processes, including poor emotion regulation. For example, disinhibition involves "a lack of planfulness and foresight, impaired regulation of affect and urges, insistence on immediate gratification, and deficient behavioral restraint" (Patrick, 2010, p. 31), presumably related to "frontal-brain based differences in the capacity to restrain behavior and regulate affect in the service of non-immediate goals" (Patrick & Drislane, 2015, p. 629).

PART II DISTINCT PHENOTYPIC FACETS OF PSYCHOPATHY

Chapter 6. Externalizing Proneness and Psychopathy

Authors: Lindsay D. Nelson and Jens Foell

> The construct of externalizing proneness, which encompasses tendencies toward impulse control problems of various types, along with affiliated traits
> (…)
> Externalizing proneness closely parallels the disinhibitory–behavioral (Factor 2) features of psychopathy as assessed by different instruments, which in turn relate to substance use problems. As externalizing proneness predominantly reflects behavioral disinhibition, it is distinguishable from the affective–interpersonal (Factor 1) features of psychopathy

- **ESI**: *Scores on the ESI general Disinhibition factor showed expected robust associations with (1) a composite index of externalizing disorder symptoms, (2) broad MPQ traits of constraint and negative emotionality, known to correlate with externalizing psychopathology (Krueger, 1999a; Krueger, Caspi, Moffitt, Silva, & McGee, 1996), and (3) impulsive–antisocial (Factor 2) symptoms of psychopathy*
- **Genetically heritable**: *Genetic modeling analyses indicated that externalizing proneness (behavioral disinhibition) was highly heritable (84%), implying that a range of adolescent problem behaviors may share a common genetic etiology.*
- **Overlap with Other Disorders:** Externalizing proneness shows substantial comorbidity with other impulse-control conditions, such as Substance Use Disorders, Conduct Disorder, and Attention-Deficit/Hyperactivity Disorder (ADHD), highlighting a shared underlying propensity for behavioral deregulation.
- **Biobehavioral Referents:** The chapter reviews neurobiological and cognitive processes associated with this trait, often relating to impaired reward-and-punishment sensitivity, executive function deficits, and brain systems involved in self-control.

Correlates of Externalizing Proneness

General externalizing proneness is a coherent, well-studied construct representing trait liability toward disinhibitory problems of varying kinds.
It shows broad, cross-domain associations:

Psychiatric correlates

- Strong links with **substance use disorders** (alcohol, cannabis, other drugs) (Nelson et al., 2016).
  - Related to cigarette smoking (Whalen et al., 2001), cannabis use (Korhonen et al., 2010), pathological gambling (Grant et al., 2016; Slutske et al., 2001), and suicidal behavior (Verona et al., 2004).
- Associated with pervasive **distress internalizing disorders** such as major depression, dysthymia, and generalized anxiety (Nelson et al., 2016).

- Connected to ADHD—especially hyperactive-impulsive and combined types, but not strongly to inattentive type (Barkley, 1997; Patrick et al., 2015).
- In PTSD, high externalizing predicts more antagonism, alcohol problems, and antisocial traits (Miller et al., 2003; Miller et al., 2004).

Personality trait correlates

- Negatively related to Constraint and Conscientiousness
  - Low conscientiousness predicts poorer health behaviors and life outcomes broadly (Israel & Moffitt, 2014; Moffitt et al., 2011).
- Positively related to Negative Emotionality, Neuroticism, Agreeableness deficits, and emotional instability (Griffith et al., 2010; Tackett et al., 2014).

Behavioral and cognitive correlates

The relationship between disinhibition and inhibitory control appears largely genetically mediated (Young et al., 2009).

- Linked to **maladaptive decision-making** and disadvantageous gambling choices (Fein et al., 2004).
- Associated with **deficient executive function and response inhibition** across tasks (Young et al., 2009).

Neurophysiological correlates

- Lower baseline autonomic activity but **heightened stress reactivity** (Lorber, 2004; Ortiz & Raine, 2004).
- Dysfunction in vagal regulation and increased striatal dopaminergic reactivity to rewards/amphetamine (Buckholtz et al., 2010a, 2010b).
- Reduced ERN amplitudes indicating poorer internal error monitoring (Hall et al., 2007).
- Most robust marker: reduced P300 amplitude across tasks, partly genetic in basis (Hicks et al., 2007; Yancey et al., 2013; Nelson et al., 2011).
- Intact processing of external feedback (FRN) but deficient elaborative processing of outcomes (Bernat et al., 2011).

Brain imaging findings

- Evidence for stimulus-driven processing style: reduced anticipatory activation and heightened amygdala reactivity to affective stimuli (Foell et al., 2016).
- Altered intrinsic connectivity involving the insula (Abram et al., 2015).
- Abnormal activation patterns during response inhibition tasks, suggesting dysfunctional reward–action coupling (Castellanos-Ryan et al., 2014).

Bottom line:
Externalizing proneness reflects a broad dispositional liability tied to poor inhibitory control, reward-driven behavior, substance problems, antagonistic outcomes, executive dysfunction, and identifiable autonomic and neural processing differences across multiple biological and behavioral systems.

Chapter 7. Callous–Unemotional Traits

Authors: Essi Viding and Eva R. Kimonis

Callous–Unemotional (CU) traits are the affective-interpersonal core of psychopathy measured in youth, characterized by lack of empathy, deficient guilt or remorse, and a general disregard for others' feelings or problems, and at high risk for developing full adult psychopathy.

They are similar to the **Meanness** dimension of psychopathy in the Triarchic model.

- **Core Components:** CU traits encompass:
  - **Lack of Empathy/Callousness:** Difficulty recognizing or sharing others' emotional states.
  - **Lack of Guilt or Remorse:** Failure to experience negative emotions following misconduct.
  - **Shallow Affect:** A limited range of emotional expression, especially warmth or positive feelings for others.
- **Relevance to Youth Diagnosis:** The inclusion of "with callous and unemotional traits" as a specifier for Conduct Disorder in the *DSM-5* underscores the clinical and prognostic importance of Meanness in developmental psychopathology.
- **CU Traits + Antisocial Factor 2 = Worst Outcomes**: *it is the combination of CU traits/affective dysfunction with the impulsive–antisocial behaviors captured by the Factor 2 dimension of psychopathy that designates the most severely antisocial group of youth.*
- **Etiological Distinction:** CU traits are linked to a distinct profile of neurobiological deficits, notably an impairment in the processing of distress cues (like fear and sadness faces), suggesting a unique etiological pathway involving the amygdala and other related brain structures.

Development of Callous-Unemotional Traits

CU traits emerge from **strong genetic liability interacting with the environment**. The most consistent profile is:

- fearless temperament
- blunted emotional and autonomic reactivity
- reduced amygdala and empathy-network response
- impaired sensitivity to punishment and distress cues

However, positive environmental inputs—especially warm, reinforcing parenting—can meaningfully buffer genetic risk.

Genetic factors

- **Moderate to strong heritability** in youth (≈ .45–.67) (Viding & McCrory, 2012).
- Elevated CU is highly heritable even without conduct problems (Larsson et al., 2008).
- Conduct problems + high CU are strongly genetic, whereas conduct problems + low CU are more environmentally driven (Viding et al., 2005, 2008).
- There is partial genetic overlap between CU and externalizing, but also CU-specific genetic influences (Bezdjian et al., 2011; Forsman et al., 2008; Viding et al., 2007).
- Stability of CU traits over time is largely genetically driven (Fontaine et al., 2010; Forsman et al., 2008).

Candidate genes and molecular findings

Key principle: there are no "genes for CU"; genes influence neurocognitive vulnerabilities that raise risk.

- Tentative links involve serotonin and oxytocin systems, but replication is needed (Beitchman et al., 2012; Dadds et al., 2013; Fowler et al., 2009; Malik et al., 2012; Moul et al., 2013).
- Gene effects likely depend on environmental context (gene–environment interplay).
  Example: serotonin transporter long allele linked to CU traits in low-SES youth (Sadeh et al., 2010).
- GWAS suggest many variants of very small effect; rare variants and interactions likely important (Viding et al., 2010, 2013; Trzaskowski et al., 2013).
- Epigenetic work links higher CU to increased oxytocin receptor methylation (Cecil et al., 2014; Dadds et al., 2014).

Environmental and parenting influences

- Harsh/negative parenting → higher CU (Waller et al., 2013).
- Warm parenting → lower CU (for a review, see Waller et al., 2013).
  - High levels of adoptive mothers' positive reinforcement were able to buffer the effects of heritable risk for CU behaviors (Hyde et al., 2016).
  - *High levels of parental warmth may buffer children with high CU traits from developing serious and persistent conduct problems (Kroneman, Hipwell, Loeber, Koot, & Pardini, 2011; Pasalich, Dadds, Hawes, & Brennan, 2011; Waller, Gardner, & Hyde, 2013).*
- Low affection, warmth, and positive reinforcement → increased risk for developing CU traits (Pardini, Lochman, & Powell, 2007; Pasalich, Witkiewitz, McMahon, Pinderhughes, & Conduct Problems Prevention Research Group, 2016).
- Genetic confounding likely explains part of parenting effects (Viding et al., 2009).
- Adoption study: positive reinforcement from adoptive mothers buffered genetic risk (Hyde et al., 2016).
- Children with high CU show less eye contact with mothers, suggesting child-driven effects on attachment (Dadds et al., 2011, 2012).
- Disorganized attachment is associated with CU (Bohlin, Eninger, Brocki, & Thorell, 2012; Pasalich, Dadds, Hawes, & Brennan, 2011).

Other developmental correlates

- Peer relations: more conflict and instability (Muñoz et al., 2008).
- Associate with delinquent peers (Kimonis, Frick, & Barry, 2004), but may be less influenced by them while they strongly influence others (Kerr et al., 2012).
- Possible modest negative association with IQ (Fontaine et al., 2008).
- Some links to low SES environments (Sadeh et al., 2010).
- Maternal psychopathology during/after pregnancy may be a risk factor (Barker et al., 2011).

Neurocognitive profile

Children with CU traits typically show:

- Marked lack of empathy and guilt (Frick & Viding, 2009).
- Proactive/instrumental aggression.
- Reduced attention to distress cues (fearful/sad faces) (Hodsoll et al., 2014; Marsh & Blair, 2008).
- Blunted empathy responses (Jones et al., 2010; Schwenck et al., 2012).
- Reduced eye gaze to attachment figures (Dadds et al., 2011).
- Slower behavioral change following punishment (Blair et al., 2001).

Neural correlates

Key brain findings in youth with conduct problems + CU:

- Reduced amygdala reactivity to fearful faces (Marsh et al., 2008; Viding et al., 2012).
- Low amygdala partly mediates proactive aggression (Lozier et al., 2014).
- Reduced activation in empathy network (insula, ACC, amygdala) when viewing others' pain (Cheng et al., 2012; Lockwood et al., 2013; Marsh et al., 2013; Michalska et al., 2016; Yoder et al., 2016).
- Atypical vmPFC/OFC responses to punishment and reward (Finger et al., 2008, 2011).
- Overall pattern: **low emotional responsiveness and poor reinforcement learning**.

Hormonal findings

- Mixed evidence for low cortisol; results inconsistent (Hawes et al., 2009).
- Cortisol alone is likely a weak biomarker.
- Hormone coupling (cortisol–DHEA) may be more informative (Johnson et al., 2014; Kimonis et al., 2017).

Physiological markers

- Reduced skin conductance and heart rate responses to others' distress (Blair, 1999; de Wied et al., 2012).
- Reduced autonomic reactivity during anticipation of aversive stimuli and provocation (Fung et al., 2005; Isen et al., 2010; Kimonis et al., 2008).
- Resting heart rate does **not** clearly differentiate CU (de Wied et al., 2012).

Early temperament

- Fearless, low-arousal temperament is a key early risk factor (Frick et al., 2014a).
- Fearlessness predicts later CU traits longitudinally (Barker et al., 2011).
- Linked to atypical development of empathy and guilt (Fowles & Kochanska, 2000).

Chapter 19. Psychopathy and Developmental Pathways to Antisocial Behavior in Youth

Authors: Paul J. Frick and Monica A. Marsee

Callous–Unemotional (CU) Traits related to psychopathy in youth and their presence identifies a severe, stable, and highly problematic subgroup of youth with conduct problems who are prone to proactive aggression and display an unperturbed, "cold" manner. Understanding the antecedents of CU traits is essential for early identification and targeted intervention.

Proactively aggressive	Reactively aggressive
do not show these problems in emotional regulation (Dodge et al., 1997; Vitaro, Brendgen, & Tremblay, 2002) and instead sometimes show reduced levels of emotional reactivity (Marsee & Frick, 2007; McAuliffe et al., 2007; Pitts, 1997; Xu, Raine, Yu, & Krieg, 2014).	Higher rates of anger and other problems related to emotional regulation (Marsee & Frick, 2007; McAuliffe, Hubbard, Rubin, Morrow, & Dearing, 2007)
/	Tendency to attribute **hostile intent** to ambiguous provocations by peers
/	Social skills problems: difficulty developing nonaggressive solutions to problems in social interactions (Crick & Dodge, 1996).
heart rate remained low among members of the reactive–proactive group in response to a simulated provocation from peers	heart rate increased significantly more for members of the reactive group compared to nonaggressive controls
Higher geneetic influences on childhood-onset conduct problems were considerably greater for those high in CU traits (81%) (Viding et al., 2005)	30% for those who showed normative levels of CU traits (30%) (Viding et al., 2005)

- **Antecedents and Early Markers:** The chapter reviews prospective studies that identify early markers of CU traits, such as blunted affect, reduced attention to eyes/fear cues (Dadds et al., 2006, 2008, 2011), and the early use of proactive, instrumental aggression (Salekin & Lynam, 2010).
- **Parents may be crucial to develop guilt/conscience in behaviorally disinhibited children**: behaviorally inhibited children, because they are temperamentally predisposed to develop appropriate levels of guilt, may need less optimal parenting than fearless and behaviorally uninhibited children.

In a sample of preschool children (ages 3–5), behaviorally inhibited children showed higher levels of guilt, irrespective of the consistency of parenting, while uninhibited children only with high parental consistency (Cornell and Frick, 2007)

- **Proactive vs. Reactive Aggression:** CU traits are selectively related to **proactive (instrumental)** aggression—aggression used deliberately to achieve a goal—rather than reactive aggression, which is impulsive and hostile.
- **Developmental Trajectory:** The stability of CU traits from early childhood into adolescence suggests they are a reliable, enduring marker of a psychopathic-like developmental pathway.

Chapter 8. Boldness: Conceptual and Methodological Issues

Authors: Scott O. Lilienfeld, Ashley L. Watts, Sarah Francis Smith, and Robert D. Latzman

Boldness, similar to fearless dominance, is a unique, often adaptive, trait characterized by social charm and confidence, low stress reactivity, a lack of fear, high self-assurance, and a tendency toward social dominance. It distinguishes individuals high in psychopathy who are "successful" (i.e., less prone to apprehension and incarceration) from those who are "unsuccessful" and is often negatively correlated with measures of anxiety and neuroticism.

- **Key Component Traits**: interpersonal potency, charisma, physical fearlessness, venturesomeness, and novelty seeking, along with calmness in the face of danger.
- **Brain's lower defensiveness**: *Although the etiology of boldness remains the subject of debate, Patrick and colleagues (2009) conjectured that it stems from individual differences in the sensitivity of the brain's defensive systems, including those rooted in the amygdala and other structures involved in threat processing (see LeDoux, 2015, for a discussion).*
  - *consistent with the hypothesis that boldness is associated with lower sensitivity to perceived danger. Taken together, these diverse findings point to a low level of responsiveness in the defensive system among individuals with elevated levels of boldness (see also Watts, Lilienfeld, DeMartino, & Sauvigné, 2015, for preliminary meta-analytic evidence).*
- **The "Successful Psychopath" Link:** Boldness is a key differentiator in the successful psychopathy literature (see Chapter 24), as it is hypothesized to confer resilience, intact executive function, and the ability to navigate complex social situations without the debilitating fear and anxiety that characterize others.
- **Behavioral Dishinhibition**: *Miller and Lynam (2012) reported that FD was associated primarily with (reversed) FFM Neuroticism (r,, = -.50), FFM Extraversion (r,, = .50), and, to a lesser extent, FFM Openness to Experience (r,, = .25); associations with FFM Agreeableness and Conscientiousness were negligible. Consistent with the conjectures of Fowles (1980) and Lykken (1995), FD was highly and negatively associated with measures of behavioral inhibition (r,, = —.57). Its associations with measures of behavioral activation were weaker but nonetheless positive and moderate positive in magnitude (rw = .35).*
- **Measurement and Correlates:** The chapter discusses the various ways Boldness is assessed (e.g., through the Triarchic Psychopathy Measure [TriPM] or the Psychopathic Personality Inventory [PPI]) and its contrasting correlates, noting that it often relates *negatively* to internalizing psychopathology like anxiety.
- **Methodological Challenges:** The authors address the complexities of separating Boldness from traits like Narcissism and examining its role in different populations.

Boldness and Interpersonal Behavior

Research increasingly links boldness (as assessed by Fearless Dominance, FD) to adaptive interpersonal traits such as leadership, heroism, and social influence.
Lilienfeld, Waldman, and colleagues (2012) found that higher FD predicted historians' ratings of leadership, communication, public persuasiveness, willingness to take risks, legislative initiative, landslide election wins, and

global stature, though it was also associated with assassination attempts.

In workplace and community samples, FD was positively associated with adaptive leadership styles, such as transformational leadership, and minimally related to counterproductive or domineering behaviors (Smith & Lilienfeld, 2012; Smith, Watts, & Lilienfeld, 2017). Across a large multinational sample, FD also predicted holding leadership and management positions, as well as risky occupations like police, fire, and military work (Lilienfeld, Latzman, Watts, Smith, & Dutton, 2014).

Consistent with Lykken's (1982, 1995) idea that heroes and fearless psychopaths share low dispositional fear, FD was positively associated with everyday heroism (e.g., helping strangers in risky situations) and altruism toward strangers in undergraduate and community samples (Smith, Lilienfeld, Coffey, & Dabbs, 2013). Similarly, presidential war heroism correlated with estimated FD scores, with leaders like Theodore Roosevelt and Zachary Taylor scoring high. Overall, these findings suggest that boldness relates to **prosocial behaviors that involve social or physical risk**, rather than prosocial behavior in general.

🤔Lucio's Take: **Is heroism only adaptive within a limited range?**

Lucio:
I wonder about the true extent of heroism' 'adaptiveness', at least in evolutionary psychology term of fitness (survival and reproduction).

Heroism is adaptive when it boosts a man's status, but if he pushes his 'heroic luck' too far, then… Dead heroes leave no offspring.

That makes me wonder if heroism may be on an inverted U of adaptiveness, and only fitness-enhancing within an optimum range and with strategic calibration (ie.: be heroic when the risks are not too high and it makes you look like a hero, but avoid too high risks).

Boldness Primarily Differentiates ASPD From Psychopathy

> As noted earlier, the results of two recent studies (Venables et al., 2014; Wall et al., 2015) demonstrate that boldness is a primary, if not the primary feature differentiating psychopathy, as measured by the PCL-R, from

> ASPD (see also Murphy, Lilienfeld, Skeem, & Edens, 2016).
> These findings dovetail with the longstanding historical view that psychopathy is more associated with adaptive functioning, including superficial charm, dominance, and psychologically healthy risk-taking, than is ASPD (Lilienfeld et al., 2015a).

The association between boldness and 11 non-PCL-based measures of psychopathy across 32 samples (N = 10,693) found a considerably high mean effect size (r = .38), and when the analyses were restricted to well-validated psychopathy measures, the mean effect size rose to r = .44 (Lilienfeld et al., 2016).

Lucio's note: This makes sense, so I had to wonder if it isn't also correct to say that the *broader* factor 1 differentiates them

Is Boldness a Core Feature of Psychopathy?

> the nature of boldness and its relevance to psychopathy have recently become flashpoints of intense scientific controversy (Lilienfeld, Patrick, et al., 2012; Lynam & Miller, 2013; Miller & Lynam, 2012; Patrick, Venables, & Drislane, 2013). In particular, experts in the field have debated whether boldness is an intrinsic feature of psychopathy, or is instead irrelevant or at best peripheral to it. Perhaps boldness is not part of psychopathy per se but only moderates its behavioral expression, predisposing individuals to "successful" or 179 "adaptive" psychopathy (Hall & Benning, 2006; see also Lynam & Miller, 2013; Widom, 1977).

Is Boldness Truly Adaptive?

> Moreover, the question of whether boldness is entirely psychologically adaptive or, like other features of psychopathy, it also has a dark side (Paulhus & Williams, 2002), remains a point of contention. Perhaps when dispositional boldness becomes too extreme or when it is coupled with certain unsavory personality traits, such as poor impulse control or antagonism, or certain cognitive traits, such as low intelligence or poor executive functioning, the right stuff can transmute into the wrong stuff, crossing the murky boundary that separates bravery from reckless risk taking.

The authors also argue that Boldness alone is usually not harmful. It tends to become maladaptive when combined with high SCI (Lilienfeld et al., 2015a; Lilienfeld, Watts, & Smith, 2016).

With intact executive control, boldness can produce the "right stuff" (Wolfe, 1979). But when paired with poor executive functioning, it is more likely to channel into poorly judged risk-taking (Frost, Ko, & James, 2007; James, 2008).

Empirical work supports this interaction: the combination of high FD and high SCI predicts outcomes such as predatory aggression (Smith, Edens, & McDermott, 2013), sexual risk taking (Kastner & Sellbom, 2012), and negative affect after risky sexual behavior (Fulton et al., 2014).

Boldness May Follow the Law of Optimum Balance

The authors conclude that very low levels of are tied to elevated risk for internalizing disorders, but we don't have enough data yet to say whether too much boldness becomes similarly maladaptive.
More data is needed to conclude whether boldness follows the law of balance.

FD and SCI Differences

> Taken together, these studies paint a picture of FD as being negatively associated with conditions marked by emotional distress, and positively associated with healthy adjustment.

Just like for factor 1 and 2 from the PCL-3, FD and SCI from the PPI displayed strikingly different psychopathological correlates.
that only SCI was significantly associated with substance and drug abuse, and consistently positively associated with a host of measures of childhood and adult antisocial behavior. In contrast, FD was essentially unrelated to childhood antisocial behavior, although it was slightly but significantly associated with interview-assessed adult antisocial behavior (r = .15).

PART III ASSESSMENT AND DIAGNOSIS OF PSYCHOPATHY

I move chapter 3 here for topical congruency

Chapter 3. The PCL-R Assessment of Psychopathy: Development, Properties, Debates, and New Directions

Authors: Robert D. Hare, Craig S. Neumann, and Andreas Mokros

The authors review the Psychopathy Checklist-Revised (PCL-R; Hare, 2003), which is considered the most established and empirically-supported measure of psychopathy for use with adult offenders. Its extensive use has led to a large body of research supporting the disorder's forensic utility.

The PCL-R's structure is multifaceted, yielding a two-factor, three-factor, or four-factor model of psychopathy. Associated versions have also been developed for adolescents, screening versions, and self-report instruments (e.g., PCL:YV).

- **PCL-R structure:** The PCL-R is an interview-based, file-reviewed measure that focuses on **criminal psychopathy** and is uniquely useful in offender samples due to its strong predictive validity for criminal behavior.
- **Multifactorial Structure:** The PCL-R structure is typically described by:
  - **Factor 1 (Interpersonal/Affective):** Captures the core personality traits (e.g., superficial charm, pathological lying, lack of empathy), aligning with the Boldness and Meanness aspects of the Triarchic model.
  - **Factor 2 (Lifestyle/Antisocial):** Captures the chronic behavioral instability and deviance (e.g., impulsivity, juvenile delinquency, criminal versatility), aligning with the Disinhibition aspect.

⍰⍰♂ Lucio's note: Hare and possible bias with PCL-R
while it may seem most befitting to have Robert Hare author this chapter, there may be downsides to it, including conflicts of interest, potential bias, and a less-than-truly representative chapter. I would have liked to see more about the issues around the PCL-R, including criminal behavior, but I was left hoping for more. See the notes below for more details

Chapter 9. Capturing Psychopathic Personality: Penetrating the Mask of Sanity through Clinical Interview

Authors: David J. Cooke and Caroline Logan

Due to the psychopathic individual's superficial charm, manipulative tendencies, and pathological deceitfulness, interview-based assessment must go beyond self-report to gather objective, observable information. The authors advocate for a comprehensive, information-based approach to assessment that integrates data from collateral sources and uses a structured conceptual model, such as the Comprehensive Assessment of Psychopathic Personality (CAPP), to ensure all facets of the construct are covered.

- **The "Mask" Challenge:** Psychopathy is a disorder that cannot be observed only in a clinical setting; the true pathology is revealed only when observing the individual's history of real-life activity in "the marketplace, the saloon… to church, and to their work" (Cleckley, 1976).

Chapter 10. The Self-Report Assessment of Psychopathy: Challenges, Pitfalls, and Promises

Authors: Martin Sellbom, Scott O. Lilienfeld, Katherine A. Fowler, and Kristen L. McCrary

While self-report measures are highly cost-effective and capture subjective experiences not easily observable (e.g., thoughts, emotions), they are vulnerable to the psychopathic traits of lying, deception, and impression management. However, modern self-report instruments are increasingly valuable for assessing specific facets, particularly the Boldness/Fearless Dominance factor, which often correlates negatively with anxiety and is captured well by an individual's self-perception of fearlessness and confidence.

- **Challenges:** The primary pitfall is the risk of **faking bad** (over-reporting negative traits) or **faking good** (under-reporting negative traits, especially the affective/interpersonal components) due to the manipulative nature of the psychopathic individual.
- **Mean and exploitative were worse at faking tests**: *those scoring high on the meanness (i.e., callous–unemotional, exploitative–aggressive) domain of psychopathy were worse at avoiding detection by scales designed to identify underreporting than those who scored low on this domain.*
- **Psychopathy is a configuration of largely independent traits**: *The interview-based PCL-R also includes separable factors, further divisible into facets (Hare, Neumann, & Mokros, Chapter 3, this volume) that show strongly divergent associations with criterion measures in self-report, clinical-diagnostic, behavioral, and physiological response domains. Rather than a classical syndrome, which, as noted earlier, comprises a constellation of covarying signs and symptoms (Kazdin, 1983), psychopathy may instead be a maladaptive configuration of largely independent dimensions.*
- **New may be needed for what seems a configural construct:** *This alternative view of psychopathy as a configural condition may call for alternative models of scoring and interpreting self-report psychopathy measures. Scholars may need to consider configural (multiplicative or interactive) models of scoring self-report psychopathy measures instead of, or at least in addition to, more traditional linear (additive) models that rely on merely summing scores on lower-order psychopathy dimensions.*
- **Meanness and antagonism as core components**: *A compelling argument can perhaps be made for the essentiality of meanness or antagonism in differing manifestations of psychopathy (Lynam, Miller, & Derefinko, Chapter 11, this volume; see also Crego & Widiger, 2015; Lynam & Miller, 2015).*
  - But boldness differentiates between ASPD and psychopathy: *However, there is evidence that the boldness domain, which maps onto many of the features of psychopathy described by Cleckley (1976; see Lilienfeld et al., Chapter 8, and Patrick, Chapter 1, this volume), differentiates psychopathy from DSM ASPD (Venables et al., 2014; Wall et al., 2015), and consistently distinguishes primary from secondary psychopathy in subtype studies (Hicks & Drislane, Chapter 13, this volume).*

Best quote

> The psychopath shows a remarkable disregard for truth and is to be trusted no more in his accounts of the past than in his promises for the future

Chapter 11. Psychopathy and Personality: Benefits of a Trait-Based Approach

Authors: Donald R. Lynam, Joshua D. Miller, and Karen J. Derefinko

Conceptualizing psychopathy in terms of broader personality dimensions, like the FFM (Neuroticism, Extraversion, Openness, Agreeableness, Conscientiousness), links psychopathy research to the massive existing research base in general personality science. This approach simplifies the construct by showing that psychopathy is primarily characterized by a severe lack of **Agreeableness** and **Conscientiousness**.

- **Five-Factor Model (FFM) Mapping:** The chapter demonstrates how the psychopathy traits align with the

FFM:
  - **Meanness/Antagonism** aligns with very low **Agreeableness**.
  - **Disinhibition** aligns with very low **Conscientiousness**.
  - **Boldness** is often linked to high **Extraversion** and low **Neuroticism** (fearlessness).
- **Benefits of Trait-Based Approach:** Using this framework allows researchers to study developmental change, cross-cultural differences, and basic psychological processes (e.g., those underlying Agreeableness) related to psychopathy using established methodologies.

🤔 **Lucio's note**: I agree with the author and it was an incredibly instructive chapter. My only note was that at times I felt the FFM-based approach may be stretched to fit certain facets or aspects of psychopathy. For example, referring to 'extraversion minus trust' is not describing FFM extraversion anymore, but something different. This is why other measures of psychopathy are equally relevant.

Chapter 12. Psychopathy and DSM-5 Psychopathology

Authors: Thomas A. Widiger and Cristina Crego

While the *DSM-5* maintains the behavioral-centric diagnosis of Antisocial Personality Disorder (ASPD) in its categorical section, it introduced an Alternative Model for Personality Disorders (AMPD) that better captures the full spectrum of psychopathic personality. The AMPD's trait-based approach, which includes the domain of Antagonism and the facet of Callousness, aligns more closely with the interpersonal and affective features (Meanness and Boldness) that are often missed by ASPD alone.

- **ASPD Limitations:** The established *DSM* criteria for ASPD are heavily skewed toward observable antisocial behaviors (Disinhibition), leading to a diagnosis that is broader than psychopathy and fails to distinguish between the primary (affective/interpersonal) and secondary (anxious/reactive) variants.
- **Dishibitory liability is the genetic foundation**: *psychopathy, ASPD, substance use disorder, and low Conscientiousness (or low constraint) may all reflect a common, underlying disinhibitory liability. Consistent with this, twin studies have suggested a common genetic basis to ASPD, substance use disorders, and low Conscientiousness (Sher & Slutske, 2003).*
- **There are more antisocials than psychopaths**: *Antisocial Personality Disorder There has been a considerable body of research on the diagnostic co-occurrence of psychopathy with antisocial personality disorder (ASPD). This research has generally suggested that most cases of psychopathy diagnosed within prison or other forensic settings would meet DSM-IV (APA, 2000) criteria for ASPD (which were carried forward into DSM-5; see below), but only about half of the cases of ASPD would meet criteria for psychopathy (Hare, 2003; Hare & Neumann, 2008).*
- **The AMPD Framework:** The Alternative Model is trait-based and organizes personality pathology along domains, where psychopathy is best represented by a high score on the **Antagonism** domain (corresponding to Meanness) and a low score on the **Conscientiousness** domain (corresponding to Disinhibition).
- **Youth Diagnosis:** The chapter also addresses the inclusion of the **"with callous and unemotional traits"** specifier for Conduct Disorder in the *DSM-5*, which helps to identify the high-risk, psychopathic variant of youth antisociality.

Criminal vs. Antisocial: Non-criminal ≠ 'Good'

An interesting distinction between 'criminal' vs 'antisocial' that's relevant to the discussion of 'adaptive vs. maladaptive' psychopathy

> Although it is not difficult to imagine a psychopathic person without a criminal record or even a criminal history, it is perhaps difficult to imagine a psychopathic person not having a history infused with unethical, predatory, and other disreputable acts. Skeem and Cooke (2010) made a distinction between criminal and antisocial behavior. "Criminal" behavior is sanctioned by the legal system, whereas "antisocial" behavior is

> more inclusive, involving “behavior that defeats the interests of the social order” (p. 435). “Snakes in suits” (i.e., psychopathic persons in business, law or other white-collar professions; Babiak & Hare, 2006; Babiak, Newmann, & Hare, 2010) may not in fact break many laws, but they significantly bend, massage, and work the rules to an unfair, self-serving advantage.

Chapter 13. Variants (“Subtypes”) of Psychopathy

Authors: Brian M. Hicks and Laura E. Drislane

The idea of psychopathy subtypes (e.g., Primary vs. Secondary, or variants based on the Triarchic factors) reflects growing evidence that different configurations of underlying traits exist, which have distinct etiological origins, personality correlates, and clinical implications. The primary distinction focuses on the role of anxiety/fear.

Factor 1 vs. Factor 2 Table

⁉️♂ **Lucio’s note**: this table is my own, compiling a collection of studies from this chapter, as well as other studies from other chapters

Factor 1	Factor 2
PCL-R F1 (Affective/Interpersonal) & **PPI-I** (Fearless Dominance)	**PCL-R F2** (Lifestyle/Antisocial) & **PPI-II** (Impulsive Antisociality)
Low fear: deficit in startle potentiation, signaling brain’s failure to “prime” in response to threat (Patrick et al., 1993; Lykken, 1995). Note: Because threat cues fail to activate the defensive system, individuals show reduced fear conditioning and diminished sensitivity to punishment, boosting fearless behavior	**Normal or hyperactivated defenses:** functioning or even hyper-reactive defensive motivational system.
reward-approach (agentic positive emotionality): Because threat cues fail to activate the defensive system, individuals show reduced fear conditioning and diminished sensitivity to punishment. This creates a lopsided **“reward-approach” orientation**, where the pursuit of gains is never checked by the anticipation of risk.	reward-approach because of executive control/disinhibitory deficit
Behavioral disinhibition: negatively associated with measures of behavioral inhibition (r,, = —.57) (Miller and Lynam, 2012), low fear of punishment Note: If fearlessness alone, impulsive tendencies reflect a willingness to take risks due to an absence of normal fear-based restraint (low BIS), and the behavior might be effective and adaptive (cold and fearless) (Fowles)	**Low impulse-control inhibition**: impulsive, low self-control, low constraint (Krueger, Caspi, Moffitt, Silva, & McGee, 1996) Note: the impulsivity associated with F2 is theorized to entail a broader, more severe lack of inhibitory control based not on lack of fear, but on Executive Functions dysfunction (“unconscientious disinhibition”) (hot and disregulated) (Fowles)
Positive affect and high well-being and correlates negatively with fear, anxiety, and depression components of Negative Emotionality (NEM) (Skeem, Polaschek, Patrick, & Lilienfeld, 2011).	**Negative Affect**: anger, alienation, distress, fear, and stress reaction, dysphoria and suicidal ideation, neuroticism (Fowles & Dindo, 2006; Skeem et al., 2011; Hicks & Patrick, 2006; Blonigen et al., 2010; Harpur et al., 1988; Patrick, 1994; Smith & Newman, 1990; Verona, Hicks, & Patrick, 2005; Verona, Patrick, & Joiner, 2001).

Factor 1	Factor 2
Narcissism: more associated with narcissism (Blackburn, 1975, 1987, 1998)	**Psychological maladjustment**: associated with borderline personality disorder (Falkenbach et al., 2014), symptoms of major mental disorders (Skeem, Johansson, Andershed, Kerr, & Eno Louden, 2007), and maladaptive coping strategies (Claes et al., 2014; Hicks et al., 2010). Associations with social skills deficits: poor assertiveness, social anxiety and withdrawal, immaturity, and susceptibility to peer pressure (Blackburn et al., 2008; Fanti et al., 2013; Kimonis et al., 2011; Skeem et al., 2007).
Low associations with substance abuse (r's = .07) (Miller and Lynam, 2012)	**Substance abuse** (Reardon, Lang, & Patrick, 2002; Smith & Newman, 1990)
Low associations with antisocial behavior (r's = .12) (Miller and Lynam, 2012)	**Antisocial**, aggression, impulsivity, and sensation seeking; symptoms of ASPD;
High social power: achievement, interpersonal assertiveness, dominance (Skeem, Polaschek, Patrick, & Lilienfeld, 2011); high FFM Extraversion (r,, = .50), and, to a lesser extent, FFM Openness to Experience (r,, = .25) (Miller and Lynam, 2012)	
associations with FFM Agreeableness and Conscientiousness were negligible (Miller and Lynam, 2012)	
Instrumental aggression: premeditated, unprovoked, instrumental aggression (Reidy, Zeichner, Miller, & Martinez, 2007; Reidy, Zeichner, & Seibert, 2011) PCL-R Facets 1 and 2 have been related to premeditated aggression. Psychopathy as a whole may be a protective factor against reactive violence (Reidy, Shelley-Tremblay, and Lilienfeld, 2011)	More highly correlated with **reactive violence** (Falkenbach, Poythress, & Creevy, 2008; Hecht, Berg, Lilienfeld, & Latzman, 2016; Reidy et al., 2007; Reidy, Zeichner, & Martinez, 2008), including for facets 3 and 4 (Declercq, Willemsen, Audenaert, & Verhaeghe, 2012; Flight & Forth, 2007; Snowden & Gray, 2011; Walsh, Swogger, & Kosson, 2009).
	Greater treatment motivation (Poythress et al., 2010) and treatment change (Olver, Sewall, Sarty, Lewis, & Wong, 2015), with higher likelihood of reporting receipt of mental health treatment or use of prescribed antidepressant medications (Hicks et al., 2010; Vaughn et al., 2009).
Genetic	More strongly associated with environmental deprivation and low SES
Lower intimate partner violence since affective–interpersonal deficits might ironically protect against this type of aggression (Hilton, Harris, Rice, Houghton, & Eke, 2008) (Rock, Sellbom, Ben-Porath, & Salekin, 2013)	Higher intimate partner violence (Hilton, Harris, Rice, Houghton, & Eke, 2008) (Rock, Sellbom, Ben-Porath, & Salekin, 2013)
Low Externalizing Proneness with nonsignificant negative correlation (r = –.16) (Patrick et al., 2005).	**High Externalizing Proneness:** essentially complete overlap (r = .94) between broad externalizing factor from the Externalizing Spectrum Inventory (ESI) and PCL-R F2 (Patrick et al., 2005). Note: Highly heritable, it accounts for the high comorbidity among antisocial behavior, substance use disorders, and disinhibited personality traits (Krueger et al., 2002).
lack of empathy	

Note: many of these associations are only clearly evident after controlling for the variance in Factor 1 that overlaps

with Factor 2 (Blonigen et al., 2010; Harpur et al., 1988; Hicks & Patrick, 2006; Patrick, 1994; Smith & Newman, 1990; Verona et al., 2001, 2005).

Factor 1 vs. Factor 2

- **Primary Psychopathy:** Characterized by high psychopathic features, low trait anxiousness, a "cold" and calculated behavioral style, and often aligns with the **Boldness** trait. This subtype is theorized to stem from a core affective deficit.
- **Secondary Psychopathy (Sociopathy):** Characterized by comparable levels of antisocial behavior but **higher trait anxiousness**, strong negative emotions, and a "hot" or reactive and impulsive behavioral style. This subtype is often linked to neurotic conflicts and severe environmental factors like child maltreatment.

PCL-R factor 1 and 2 have a correlation of .50, while the PPI's factors termed Fearless Dominance and Self-Centered Impulsivity (Lilienfeld & Widows, 2005; alternatively labeled Impulsive Antisociality [Benning et al., 2003]) do not.

However, their nomological networks are markedly similar when researchers control for their shared variance (Benning, Patrick, Blonigen, Hicks, & Iacono, 2005; Poythress et al., 2010).

> The largest difference between the primary and secondary subtypes on personality traits was for Neuroticism (d = 1.28), followed by Anger/Aggression (d = 0.75). Consistent with the notion of a severe subtype of ASPD or externalizing subtype, the secondary variant also scored higher on Disinhibition than the primary variant (d = 0.60). The primary subtype, however, was higher on Positive Emotionality/Extraversion (d = 0.70) than the secondary subtype, consistent with the conceptualization of good adjustment and greater social poise and engagement.

In general, factor 2 is messier and more problematic, with elevated levels of both internalizing and externalizing problems.
But **findings for the relationship between psychopathy subtypes and criminal behavior were mixed**.

- **No neurological subtypes yet**: *Ideally, the defining features of subtypes would be directly relevant to etiology, for example, features reflecting emotional or cognitive processes whose neurobiological pathways are well mapped. No such defining features have been established for psychopathy. Therefore, psychopathy subtypes are typically defined by differences on an array of traits and clinical features that we refer to here as 'personality structure'*
- **Triarchic Subtypes:** Patrick and colleagues (2009) proposed a triarchic model of psychopathy that seeks to synthesize multiple theoretical approaches and lines of empirical research proposing that different combinations of Boldness, Meanness, and Disinhibition can define distinct variants.
  evidenced by validation studies utilizing the TriPM (…) has substantial descriptive utility for comparing different conceptions of psychopathy based on how prominently Boldness, Disinhibition, and Meanness are represented.
- **Low boldness and high disinhibition had highest externalizing and psychological adjustment**: analyzing results from the Minnesota Twins, Hick's *intringuing findings suggest that individuals with high scores on Boldness and Disinhibition represent an extreme externalizing subgroup that lacks typically co-occurring internalizing problems. This lack of internalizing problems may in fact facilitate engagement in antisocial deviance. It is interesting to note that persons with high Boldness and low Disinhibition scores exhibited the lowest rates of psychopathology and highest levels of psychosocial adjustment (Hicks, 2014).*
  - Boldness + disinhibition is the issue: *boldness per se is not associated with psychopathology. Rather, Boldness appears to act as a moderator of disinhibitory tendencies, such that the combination of the two yields a distinct subsample that exhibits very high levels of antisocial deviance (i.e., an "externalizing supergroup"), while maintaining relatively stable emotional adjustment and competent interpersonal functioning.*

- **ASPD is low constraint and negative emotionality**: *the ASPD criteria do identify a relatively severe psychiatric condition that has strong personality correlates, most notably high negative emotionality (aggression, alienation, stress reactivity) and low constraint (Krueger, Caspi, Moffitt, Silva, & McGee, 1996). The personality profile associated with ASPD seems to be driven by the small group of people (nearly all men) within the general population whose antisocial behavior exhibits an early onset and persistent course.*

Chapter 14. Genetic and Environmental Influences

Authors: Irwin D. Waldman, Soo Hyun Rhee, Devon LoParo, and Yunsoo Park

Psychopathy and antisocial behavior are influenced by a complex interplay of heritable factors (genes) and specific environmental factors, often studied through twin and adoption studies. Crucially, the different facets of psychopathy show distinct heritability patterns, confirming the need to study psychopathy as a multifaceted construct with diverse etiological roots.

- **High Heritability:** The chapter details evidence suggesting that general antisocial behavior and personality traits underlying psychopathy (e.g., low empathy, fearlessness) have a significant heritable component.
- **Genes and non-shared environments account for the lion's share**: *Meta-Analysis Results The results of analyses of data from all of the samples meeting the inclusion criteria (N = 52 samples; 149 groups; 55,525 pairs of participants) are presented in Table 14.1. The full ACDE model fit best as compared with the other, more restrictive models, suggesting that additive genetic (32%), nonadditive genetic (9%), shared environmental (16%), and nonshared environmental influences (43%) have significant influences on antisocial behavior. Parameter estimates did not differ after excluding studies that examined psychopathy*
- **Environment still matters (from chapter 31):** *although identical twins exhibit increased similarity for levels of psychopathic features compared to fraternal twins, the concordance they show in absolute terms is moderate rather than high—indicating a substantial contribution of environmental influences (and their interplay with genomic makeup) to the emergence and expression of psychopathic symptoms across time.*
- **Facet-Specific Etiology:**
  - **Callous–Unemotional (Meanness) Traits:** Show a particularly strong heritable influence, suggesting a significant innate, biological vulnerability for the core affective deficits.
  - **Impulsivity/Disinhibition:** Also shows a strong genetic component but is more reactive to specific non-shared environmental influences.
- **Gene-Environment Interplay:** The authors explore the concepts of gene-environment correlation (where genetic predispositions influence the environments an individual seeks or is exposed to) and gene-environment interaction (where a genetic risk factor is only expressed under certain environmental conditions, such as early maltreatment).

Chapter 15. Family Background and Psychopathy

Authors: David P. Farrington

Adverse family and social environments, while not the sole cause, is an important exacerbating factor, especially for the behavioral and disinhibited aspects of psychopathy. Poor parenting, family disruption, and exposure to deviant models significantly increase the risk for an individual with a biological vulnerability (e.g., low fear, high impulsivity) to progress toward a psychopathic outcome.

- **Real but small effect sizes**: *Leschied, Chiodo, Nowicki, and Rodger (2008) conducted a comprehensive meta-analysis of 38 prospective longitudinal studies in which the focus was to establish which, if any, family factors were related to later criminality and antisocial behavior. Taken together, the family factors measured (e.g., parental discipline, substance and child abuse, and family separation) had an effect size (Cohen's d) of 0.25.*
  - Effects vary by developmental period: *effects of family predictors varied somewhat over time and across*

developmental periods. For example, family structure appeared to have a greater effect when measured in adolescence ($d = 0.67$, $p < .01$), whereas parental management assessed during mid-childhood ($d = 0.41$, $p < .001$) was most strongly predictive of adult antisociality. These latter findings suggest that the effects of some family factors may be specific to certain developmental periods, which could potentially account for weak relationships reported in other studies focusing on only one specific period of development (Leschied et al., 2008).

- **There are 7 family factors**: *family factors are grouped into seven categories: (1) childrearing problems (poor supervision, poor discipline, coldness and rejection, low parental involvement with the child); (2) abuse (physical or sexual) or neglect; (3) parental conflict and disrupted families; (4) large family size; (5) criminal or antisocial parents or siblings; (6) other characteristics of parents (young age, substance abuse, stress, anxiety/depression); and (7) socioeconomic factors (e.g., low income, poor housing).*
- **Keep an eye on your children**: *studies show that parents who do not know where their children are when they are out, and parents who let their children roam the streets unsupervised from an early age, tend to have delinquent children.*
- **Urbanization boosts criminality**: *boys living in urban areas are more violent than those living in rural ones (Derzon, 2010; Foster & Brooks-Gunn, 2013). In the U.S. National Youth Survey, the prevalence of self-reported assault and robbery was considerably higher among urban youth (Elliott et al., 1989). Within urban areas, boys living in high-crime neighborhoods are more violent than those living in low-crime neighborhoods.*
- **Key Risk Factors:** Several different factors affect outcomes
  - **Parental Antisociality/Criminality:** Transmission of deviance through both genetic and social learning mechanisms.
  - **Parenting Practices:** Factors like harsh, inconsistent, or neglectful parenting significantly contribute to externalizing behaviors.
  - **Family Disruption:** Socioeconomic deprivation, large family size, and family conflict are often associated with increased risk for youth conduct problems.
- **Environmental Impact on Subtypes:** Poor environmental factors are especially implicated in the development of **Secondary Psychopathy** (sociopathy), where anxiety and negative emotion are higher, often stemming from trauma or dysfunctional parenting.

Chapter 17. Psychopathy and Brain Function: Insights from Neuroimaging Research

Authors: Blair, Meffert, Hwang, and White

Neurobiological research has consistently pointed to structural and functional abnormalities in brain regions responsible for emotional processing, social cognition, and impulse control, offering insights into the biological underpinnings of psychopathic traits.

- **Amygdala Dysfunction:** The chapter highlights consistent evidence for functional and sometimes structural abnormalities in the **amygdala**, a region crucial for fear conditioning and processing distress cues. This dysfunction is strongly linked to the **Meanness** (Callous-Unemotional) trait.
- **Prefrontal Cortex (PFC) Abnormalities:** Deficits are often observed in the **ventromedial prefrontal cortex (vmPFC)** and **orbitofrontal cortex (OFC)**, which are involved in response reversal, inhibitory control, and evaluating consequences. These findings provide a neural basis for the **Disinhibition** and poor judgment aspects.
- **Integration with Mechanisms:** Neuroimaging provides a clear biological referent for understanding mechanisms like reduced empathy, impaired fear conditioning, and poor decision-making capacity.

Chapter 18. Cognitive and Emotional Processing in Psychopathy

Author: Christopher J. Patrick

> The triarchic model of psychopathy (Patrick et al., 2009) (…) encompasses three distinct dispositional tendencies that account for its observable symptoms and correlates: boldness, involving social dominance, emotional stability/resilience, and venturesomeness; meanness, entailing deficient empathy (callousness), selfishness, and aggressive exploitation of others; and disinhibition, involving lack of behavioral restraint, irresponsibility, and emotional volatility. The TriPM was developed to assess psychopathy in terms of these distinct dispositions.

The chapter ties together the different parts of the book by using three core psychological processes—**inhibitory control, defensive (fear) reactivity, and empathic sensitivity**—as conceptual anchors for the three Triarchic traits. This integrative perspective shows how specific deficits in these processes map directly onto the clinical manifestation of Boldness, Meanness, and Disinhibition.

- **Three Key Processes and Triarchic Links:**
  - **Inhibitory Control:** Deficits in this area (e.g., in executive function) are strongly linked to **Disinhibition**.
  - **Defensive (Fear) Reactivity:** Impaired or low reactivity to threat is the mechanism underlying **Boldness** (fearless dominance).
  - **Empathic Sensitivity:** Deficient processing of others' emotional states is the mechanism underlying **Meanness** (callousness-unemotionality).
- **Continuously varying dimensions**: *The empirical evidence for disinhibition, boldness, and meanness as continuously varying, polygenic dispositions lends credibility to the idea that liabilities for the three can occur in varying combinations.*
- **Dishibition = externalizing**: *the disinhibition construct of the triarchic model corresponds to the externalizing liability factor in the general psychopathology literature (Krueger et al., 2002, 2007), and it has well-established behavioral and neurophysiological correlates.*
- **Social attachment and empathy are linked:** *Decety (2011) drew attention to empirical evidence for a connection between social attachment and capacity for empathic concern, including evidence pointing to shared neural circuitry for these two processes. In doing so, he highlighted the role of neurochemical systems in the regulation of attachment behavior, with a particular emphasis on the neuropeptide oxytocin*
- **Continuous, not discrete:** *evidence strongly supports the view of psychopathy as continuous in nature (i.e., varying by degree across individuals) rather than discrete (i.e., either present or absent).*
- **Agentic disaffiliation = goal pursuit without empathy:** *standard attachment-style inventories are not well suited to indexing the weak social connectedness that characterizes classically "detached" psychopathic individuals, as distinguished from affectively dysregulated externalizing individuals (Hicks & Drislane, Chapter 13, this volume). The triarchic model characterizes the social deficit in psychopathy as active ("agentic") disaffiliation —involving pursuit of goals/resources without concern for the feelings or welfare of others (Patrick et al., 2009).*
- **Bridging Phenotype and Genotype:** The chapter demonstrates how these processes can be assessed behaviorally (phenotype) and linked to specific neurobiological systems (genotype), fulfilling the mandate of the NIMH Research Domain Criteria (RDoC) framework.

Affective Deficits + Low Control = Impulsive Disregard

> To the extent that individuals are deficient in control system function and lacking as well in fear of aversive outcomes, sensitivity to others' distress, or feelings of closeness/connectedness, their propensity to act in the moment without regard for consequences will be high. When affective deficits are present, only moderate levels of disinhibitory liability may be required to produce a reckless, unrestrained behavioral orientation. This

> may help to account for why many psychopathic individuals do not show impaired performance on behavioral tests of frontal executive function.

PART V PSYCHOPATHY IN SPECIFIC SUBPOPULATIONS

Chapter 20. Psychopathy in Children and Adolescents

Authors: Randall T. Salekin, Henrik Andershed, and Abby P. Clark

> Our review of the youth psychopathy literature indicates that the interpersonal, affective, and behavioral features of psychopathy are present and measurable quite early in life.
> (…) multidimensional psychopathy measures developed for use with children and adolescents do, for the most part, index a condition that appears similar to adult psychopathy, and that psychopathic tendencies identified early in life have a genetic basis and are relatively persistent across time.
> (…)
> available research indicates that psychopathic tendencies in youth are predictive of more severe antisocial–aggressive outcomes, but that psychological treatment has potential to ameliorate the condition early in its development.

- **Differences are evident from young age:** *research findings to date indicate that early on, pathological levels of these symptoms are also evident (Evans & Lee, 2013; Lewis, Stanger, & Sullivan, 1989; Parry, 2006; Peskin, 1992; Talwar & Crossman, 2011). Research has shown that even young children can dominate others excessively (Assary, Salekin, & Barker, 2015), tell strategic lies (Evans, Xu, & Lee, 2011; Fu, Evans, Xu, & Lee, 2012), and deliberately mislead others (Hsu & Cheung, 2013; Polak & Harris, 1999). Moreover, the differences between age-normative lying and more pathological forms of deceptiveness may emerge early in development (Waller et al., 2012). Past research has shown that even in preschoolers, a smaller subset of children can be identified and seen by others as chronic liars (Stouthamer-Loeber, 1986).*
- **Heightened risk-taking is visible early on**: *Although engagement in some risky behavior may be common among children (Sandseter & Kennair, 2012), emerging research on this topic suggests that variation in such behavior is possible to assess at a very young age, with certain youth being quite high in risk-taking and others being distinctly low (Morrongiello & Lasenby, 2006). For example, in a study that evaluated children ages 2–5 years for sensation-seeking tendencies, Morrongiello and colleagues (2012) found that very young "daredevils" could be reliably identified.*
- **Environment can channel psychopathic traits in very different directions:** *research has shown that parenting and other environmental factors may affect the manner in which impulsive/sensation-seeking tendencies are expressed. For instance, within affluent neighborhoods, high impulsivity or sensation seeking might lead to engagement in high-risk sports and adventuresome prosocial pursuits, whereas within less affluent neighborhoods, these same traits could give rise to delinquency, substance use, and other problems (Barker, Trentacosta, & Salekin, 2011).*
- **Extreme self-worth and beliefs of superiority predict proactive aggression and ringleader bullying** (e.g., Ang, Ong, Lim, & Lim, 2010; Barry et al., 2007; Bukowski, Schwartzman, Santo, Bagwell, & Adams, 2009; Kerig & Stellwagen, 2010; Stellwagen & Kerig, 2013; Washburn, McMahon, King, Reinecke, & Silver, 2004) and the interpersonal features of psychopathy were associated with better perspective taking and were more predictive of ringleader bullying than either CU traits or impulsivity.
- **Interpersonal manipulativeness is related to aggression and reduced prosocial behavior** in young children (Pauletti, Menon, Menon, Tobin, and Perry, 2012)

22. Cultural and Ethnic Variations in Psychopathy

Authors: Kostas A. Fanti, Alexandros Lordos, Elizabeth A. Sullivan, and David S. Kosson

> In summary, available research findings indicate that psychopathy is similar in many respects across cultures.

- **Slightly higher scores for African Americans?** Some studies pointed out to higher scores for African American in the US, but Skeem, Edens, Camp, and Colwell (2004) compared mean PCL-R scores for African American and European American participants across 21 studies and found a small but significant Cohen's d for PCL-R total scores (d = 0.11, SD = .23), and for scores on the Affective (d = 0.10, SD = .20) dimension of psychopathy. But didn't find differences for Factor 1, leading them to conclude that there is no strong evidence that African Americans have higher levels of the core psychopathic traits than European Americans. However, the heterogeneity and the variability in the range of differences in mean total PCL-R scores across ethnic groups (from +3.3 to –4.7) indicate substantial ambiguity.
  Verona and colleagues (2010) suggest that reported ethnic differences might actually be an artifact of SES.
- **Some differences among ethnicities exist**: *There do appear to be relatively consistent differences between African Americans and European Americans in relationships of psychopathy scores with some criterion variables, in particular with self- reported Impulsivity and Psychoticism, and responses in laboratory paradigms assessing cognitive and emotional processing. These differences raise the possibility of distinct mechanisms underlying psychopathy in African American as compared to European American prisoners.*
- **Correlates largely similar across countries:** *Our review of studies of adults (see Table 22.3) and youth (see Table 22.4) from different cultural and ethnic backgrounds provides evidence that the correlates of psychopathic traits are largely similar in different countries.*
- Cross-cultural PCL-R means lower in Europe/Asia. Societal factors of collectivism may suppress overt traits.

Chapter 21. Psychopathy in Women: Assessment, Manifestations, and Etiology

Authors: Edelyn Verona and Jennifer Vitale

Female psychopathy manifests with relational aggression and internalizing comorbidity, assessed via PCL-R showing lower prevalence but similar structure. Etiological factors include trauma and hormonal influences, with neurocognitive deficits paralleling males but moderated by gender.

- **Factor 2 is more emotionally disregulated:** *there is some evidence that psychopathy, at least the secondary subtype, is manifested in more emotionally dysregulated ways (e.g., BPD, suicidality) and within more intimate interpersonal contexts (e.g., domestic interactions, sexuality) among female compared to male offenders.*
- **More internalizing and self-directed harm:** *there is a growing body of work suggesting that psychopathic traits may not be protective for some types of internalizing problems, particularly suicidality and self-harm, in women compared to evidence for the protective role of these traits in men. In turn, these findings appear consistent with theorizing that impulsivity and aggression may be more likely manifested as self-directed violence and self-harm in women than in men (Forouzan & Cooke, 2005; Sadeh, Javdani, Finy, & Verona, 2011)*
- **Lower criminality and early conduct problems:** *less evidence of early behavior problems (Rutherford et al., 1998; Silverthorn & Frick, 1999), lower risk of criminal and violent recidivism (e.g., Edens et al., 2007),*
- **Manifestations**: higher histrionic, borderline overlaps.
- **Should we assess psychopathy differently for women?** *Assessment strategies may need to be modified for use with women. One approach may be to include other indicators of psychopathy that tap uniquely female expressions of antisocial–externalizing (Factor 2) tendencies, such as prostitution, sexual risk taking, IPV, self-directed aggression, and relational forms of aggression such as friendship betrayal and "backbiting." It is unclear whether the use of alternative indicators will further improve the validity of psychopathy assessments with women, or instead blur boundaries between psychopathy and other personality disorders in women*

Chapter 23. Deviance at Its Darkest: Serial Murder and Psychopathy

Authors: Eric W. Hickey, Bethany K. Walters, Laura E. Drislane, Isabella M. Palumbo, and Christopher J. Patrick

While psychopathy is a common characteristic among many serial murderers, the disorder is not solely defined by this crime, nor is it a necessary prerequisite for it. The association is driven less by the Disinhibition/Erratic Lifestyle factor and more by the core affective deficits (Meanness) that facilitate the violence.

- **The Affective Core:** Serial murder is predominantly linked to the **Meanness** (Affective) features of psychopathy, such as a lack of empathy and emotional coldness, which allow the perpetrator to commit heinous acts without remorse.
- **Compartmentalization:** many serial murderers can maintain an outwardly normal appearance (e.g., steady job, family life) while committing crimes in a highly secretive, compartmentalized manner, suggesting that high levels of Boldness and lower levels of Disinhibition may be present in some cases (e.g., John Gacy, Gary Ridgway).
- **Mass murderers are different than serial murderers:** *Mass murderers are also far more likely than serial murderers to meet diagnostic criteria for severe mental disorders such as schizophrenia or bipolar disorder, whereas serial murderers more often exhibit personality disorders (most typically antisocial personality), along with paraphilias in many cases (Douglas, Burgess, Burgess, & Ressler, 2013; Duwe, 2004; Hickey, 2015; White-Hamon, 2000).*
- **Typical psychopath vs. typical serial murderers**: *we hypothesize that only a small proportion of serial murderers are "true psychopaths"—that is, individuals with an essential psychopathic disposition who engage in serial homicide. As conceptualized classically (Cleckley, 1976), psychopathy involves a persistent pattern of reckless, irresponsible behavior that pervades the affected individual's life. By contrast, many serial murderers commit their crimes in a secretive, highly compartmentalized manner—maintaining an ostensibly normal pattern of behavior in other areas of life (e.g., residing in a permanent home, maintaining a steady job, being married and raising children).*
- **Fantasy-Driven Behavior:** serial murder is predominantly a fantasy-driven pattern of behavior, which can arise in individuals with different interpersonal styles, confirming that the psychopathic profile is not universally identical among all serial killers.
- **Most serial murderers are men:** it's not true that they're 'genius level IQ' or particularly low-IQ and it's not true they're mostly white. But it's true they're mostly men
- **Start older**: *In contrast with other homicidal offenders, serial murderers typically commence killing at older ages, beginning in their early 30s on average (Fox & Levin, 2015; Godwin, 2008; Hickey, 2015).*

PCL-R Ratings for Five Well-Known Serial Murderers

The authors examined five notorious serial murderers based on interviews, avaible history, and court documents, and then compared the scores to each other and clarified when they were different.

> Consistent with the idea of a systematic relationship between serial murder and psychopathy, all five of these perpetrators exhibited salient psychopathic symptoms. However, contrary to the view that most serial killers (including these specific ones; LaBrode, 2007) are clinically psychopathic, only one of the five (Ted Bundy) exceeded the PCL-R cutoff score of 30 out of 40 points required for a diagnosis of psychopathy (Hare, 2003).

The authors conclude that most serial killers do not meet the clinical 30-point threshold for psychopathy, suggesting that their crimes are often driven by specialized paraphilias or other mental disorders rather than a "core" psychopathic personality.

Name	Total	Factor 1	Factor 2	Interpersonal	Affective	Impulsive	Antisocial
Bundy	34	16	15.5	8	8	8	15
Gacy	27	16	9	8	8	3	6
Kemper	26	13	11	5	8	4	7
Dahmer	23	9	12	3	6	8	4
Ridgway	19	11	4.5	4	7	2	3

All credits to the authors: Hickey, Walters, Drislane, Palumbo, and J. Patrick

The authors state that the affective features of PCL-R psychopathy are most consistently present in serial murderers because of the very nature of the acts perpetrated by serial murderers, involving repeated fatal victimization of others:

> In summary, the data presented in Table 23.1, together with our ratings of other serial murder cases to date, suggest that the main basis for a systematic association between the phenomenon of serial homicide and the diagnosis of psychopathy lies in the callous–unemotional (meanness) features represented in the Affective facet of the PCL-R. Two potential bases for this systematic association are that (1) deficient remorse, lack of empathy, and rationalization are part and parcel of serial homicide offending, and (2) lack of social connectedness (disaffiliation) contributes to serial murder, as well as to callous–unemotional features of psychopathy.

Chapter 24. Successful Psychopathy

Authors: Stephen D. Benning, Noah C. Venables, and Jason R. Hall

The "successful psychopath", who manages to avoid negative outcomes at least and enjoy some levels of personal success, is distinguished from the "unsuccessful" variant by possessing higher levels of adaptive traits—primarily **Boldness**—which are hypothesized to confer greater cognitive ability and better emotional regulation.

- **It's an old concept**: *"Successful psychopathy" is a concept that has long captured the interest of researchers and clinicians alike (Smith, 1978; Widom, 1977). This seemingly paradoxical concept has its roots in Cleckley's (1976) landmark monograph, The Mask of Sanity. Others have argued that certain psychopathic traits (e.g., glibness/charm, fearlessness) may serve as valuable personal assets in certain professions, including law, politics, business, or emergency responding (Babiak & Hare, 2006; Lykken, 1995).*
- **But it's a difficult phenomenon to study**: *Despite long-standing interest in this topic, successful individuals with psychopathy have proven to be an elusive target for research. Efforts to systematically study high-functioning persons with psychopathy in the community have been impeded by methodological obstacles. In particular, identifying and recruiting individuals with high levels of psychopathic traits from the general population pose ongoing challenges given issues of definition (discussed below) and the low prevalence of individuals with extreme psychopathic tendencies in noninstitutional settings.*
- **Intact or even enhanced executive functioning are key** (e.g., planning, decision-making) and greater autonomic reactivity to emotional stressors compared to their unsuccessful counterparts, allowing them to navigate complex social/professional environments effectively.
- **Successful psychopaths' brains are closer to healthy controls**: *in terms of prefrontal cortex gray matter (Yang et al., 2005), along with orbitofrontal cortex and amygdala volume (Yang, Raine, Colletti, Toga, & Narr, 2010), and in terms of symmetry between the left and right anterior hippocampus (Raine et al., 2004). Raine and colleagues (2004) have interpreted the relatively intact autonomic physiology and neuroanatomy of successful individuals as factors protecting such individuals from committing crimes in obvious or easily detectable ways.*
- **Strategic defection**: psychopathic traits are associated with defection against coparticipants in the Prisoner's

Dilemma game (Rilling et al., 2007), particularly against people who are viewed as low in value (Gervais, Kline, Ludmer, George, & Manson, 2013). Indeed, Mealey (1995) proposed a sociobiological model of psychopathy that characterizes people with psychopathy as deceptive cheaters, whose proclivities for antisocial behavior are genetically determined.

Defining Success

The authors start with the lowest bar of success as **avoiding the worst outcomes**:

- **Incarceration**: *Among adjudicated offenders, high and intermediate levels of psychopathy are associated with a higher proportion of crimes going undetected than low levels of psychopathy (Aharoni & Kiehl, 2013), suggesting that higher psychopathy is associated with more effective evasion of legal contact. However, in absolute terms, higher psychopathy tends to be associated with earlier and more extensive criminal arrests/convictions.*
- **Psychopathology:** *psychopathy, particularly its impulsive– antisocial features, is systematically associated with problems such as alcohol and drug dependence, as well as with rule breaking and aggression (Patrick, Hicks, Krueger, & Lang, 2005). Better-functioning, successful psychopathic individuals are expected to show fewer problems of these types: Rule breaking, to the extent it occurs, is less apt to lead to legal problems, and substance use is more likely to be recreational than habitual.*

Then, they move to **Attaining Desirable Outcomes**:

- **Agency**: *there are conceptual and empirical reasons for hypothesizing that psychopathic traits may contribute to success in areas involving goal-oriented activity (agency), like socioecological niches that favor the ruthless pursuit of status (ie., dense, transient populations that encourage individual-level approaches to resource (Kinner, 2003). Modern could be an occupational niche that rewards psychopathic behavior (Wexler, 2008)—in particular with large size, rapid growth, or frequent restructurings that foster instability in employee relations and insulate against the interpersonal consequences of selfishness (Babiak, 1995). Workers in professional settings are more likely to come into contact with individuals with psychopathic traits than are clerical or other junior workers (Boddy, Ladyshewsky, & Galvin, 2010), and high psychopathic tendencies are 3.5 times more common at senior levels compared to the general population (Babiak & Hare, 2006).*
  - Heroism: *Heroism is another form of societal success that shows some association with the interpersonal–affective features of psychopathy. This association shows up most clearly when these features are indexed separately from the disinhibitory features of psychopathy. Fearless Dominance as indexed by the PPI and related measures (cf. Drislane, Patrick, & Arsal, 2014) is associated with everyday heroism (Smith, Lilienfeld, Coffey, & Dabbs, 2013), in which people provide aid to others at the risk of minor physical danger to themselves. Fearless Dominance is also associated with engagement in occupations involving high levels of physical risk (Lilienfeld, Latzman, Watts, Smith, & Dutton, 2014)*
  - Also read: Psychopaths & Machiavellians at the top (emotional intelligence lie)

- **Communion**: psychopathy is unrelated to deficits in theory of mind (i.e., ability to deduce the thoughts/motives of others), but negatively related to empathic concern for others (Blair, 2008; Mullins-Nelson, Salekin, & Leistico, 2006; Seara-Cardoso, Neumann, Roiser, McCrory, & Viding, 2012; Wai & Tiliopoulos, 2012). Psychopathic individuals are more likely to befriend others for instrumental than for affiliative reasons (Jonason & Schmitt, 2012), which may cause others to dislike interacting with such individuals in cooperative situations (Rauthmann, 2012).
  Communal success could mean having many (typically short-term) sexual partners (Hare, 2003; Jonason, Li, Webster, & Schmitt, 2009; Jonason, Valentine, Li, & Harbeson, 2011), though it's not empirically established whether it results in more offspring (Gladden, Figueredo, & Jacobs, 2009; Glenn, Kurzban, & Raine, 2011). Finally, if successful in poaching others' sexual partners, they also appear more vulnerable to having their own sexual partners poached (Jonason, Li, & Buss, 2010).

Success Must Be Assessed In All Life Areas, & Over Long-Term

I found it interesting that the authors picked Jordan Belfort as an example:

> a person can achieve a high level of professional success and still be unsuccessful in life as a whole. For instance, Jordan Belfort (known as "the Wolf of Wall Street"; Belfort, 2007) (…) conviction for offenses related to these activities required him to pay $110 million in restitution to his victims.
> This high-profile case highlights the fact that an individual with psychopathic traits who appears highly successful at one point in time may fail spectacularly at a later point and therefore no longer qualify as successful. Thus, the designation of an individual with psychopathic traits as successful should be considered provisional, subject to revision based on later biographical events.

In Belfort's case though, he still ended up successful thanks to the fame that the movie brought him (which by the way lends credibility to moderated psychopathy model, in this case moderated by IQ/strategic predisposition). The same can be said of some recent former mobsters who acquired a sizable following on social media (ie.: Michael Franzese and Salvatore 'Sammy the Bull' Gravano).

The 3 Models of Successful Psychopathy

Three main frameworks attempt to explain how some individuals high in psychopathic traits function adaptively in society, and they can be complementary:

1. Subclinical Psychopathy Model

The subclinical model proposes that successful psychopaths are simply milder versions of clinical psychopaths. The core traits are largely the same, but expressed at lower severity or without crossing the threshold into chronic criminality.

There is evidence for differences between the two, and also for differences between sub-clicanically high psychoapthy and non-psychopathy:

> The relationship between psychopathic tendencies and performance on tasks indexing risk taking and aggression appears to differ in nonclinical as compared to offender samples.
> (…)
> In undergraduates, subclinical psychopathy is associated with real-world cheating on classroom exams (Nathanson, Paulhus, & Williams, 2006b), proclivities toward body modification and tattoos (Nathanson, Paulhus, & Williams, 2006a), and preferences for antisocial forms of entertainment (Williams, Paulhus, & Hare, 2007).
> Psychopathy scores are higher on average for undergraduates who choose to study business as opposed to the arts or science (Wilson & McCarthy, 2011)
> (…)
> willingness to tolerate unethical practices mediates the relationship between psychopathy and publication rates for academic accountants (Bailey, 2015).

 Example: The authors mention 'The Godfather' Michael Corleone as an example of subclinical psychopathy.

However, research shows that individuals considered "successful" often display not just lower psychopathy, but different traits, including **higher conscientiousness, planfulness, and goal-directedness**. These traits not easily explained by mere attenuation of psychopathy. This suggests that success is not just "less psychopathy," but rather psychopathic traits combined with compensatory adaptive characteristics (Lilienfeld et al., 2015a; Lilienfeld et al., 2016).

One more empirical finding that struck me at odds with this model is that the crucial executive functioning doesn't

seem to be much higher in subclinical psychopaths:

> However, given that executive functioning, as measured by the Porteus Maze Test, is not enhanced in participants with subclinical psychopathy (Widom, 1977), the relationship between successful psychopathy and executive functioning may be limited to certain capacities (e.g., flexible responding as opposed to planning) or variable across samples.

In short, attenuation alone appears insufficient. Additional self-regulatory strengths are typically present.

---

2. Moderated Psychopathy Model

The moderated model argues that successful and unsuccessful psychopaths share largely similar core dispositions, but environmental and individual moderators shape life outcomes. Under this view, psychopathy is the same underlying liability, but its behavioral expression depends on buffering factors.

Proposed moderators have included intelligence, executive functioning, parenting quality, socioeconomic status, special talents, and physiological traits such as fear reactivity. Age is one of the more consistently supported moderators, given the well-established decline in antisocial behavior across adulthood.

Classic formulations, such as the fearlessness model, suggest that low fearfulness constitutes a core vulnerability that may lead either to antisocial outcomes under poor socialization or to adaptive high-risk roles under more favorable developmental conditions (Lykken, 1995).

Importantly, empirical support is uneven.

Intelligence shows weak and inconsistent moderating effects. <— ⍰⍰♂ **Lucio's note**: However, chapter 25 suggests otherwise, at least when it comes to violence. In a passage, the authors's state that *'subsequent studies have failed to detect a significant interaction between psychopathy and intelligence in predicting legal contacts, incarceration, or recidivism (Holland, Beckett, & Levi, 1981; Walsh, Swogger, & Kosson, 2004; Watts et al., 2016)*. But when I checked Watts' study, it suggested the opposite, saying '*we found some support for the hypothesis that intelligence served as a protective factor against antisocial behavior among individuals with high levels of psychopathy'*

Parenting effects, while present, are stronger for factor than factor 1.
As for SES, the few existing studies show it does not affect the development of conduct problems in youth with callous–unemotional traits (Barker, Oliver, Viding, Salekin, & Maughan, 2011), nor does it affect recidivism in individuals with psychopathic traits (Walsh & Kosson, 2007).

But executive functioning seems to matter a lot:

> Because executive function by itself does not appear to be associated with psychopathy (Dolan, 2012; Mol, Van Den Bos, Derks, & Egger, 2009), it may be a more promising moderator of success in psychopathy than intelligence.
> Indeed, unlike individuals who exhibit high levels of antisocial behavior (Morgan & Lilienfeld, 592 2000), successful individuals with psychopathy have superior executive functioning compared to controls, and unsuccessful individuals with psychopathy, as assessed by perseverative errors on the Wisconsin Card Sorting Test (Ishikawa et al., 2001; cf. Valliant, Freeston, Pottier, & Kosmyna, 2003).

---

3. Multiprocess (Dual-Process / Triarchic) Model

The most mechanistically precise account comes from multiprocess perspectives, which argue that psychopathy is not unitary but reflects partially independent dispositional systems.

Dual-process theory distinguishes between:

- a **defensive fear system deficit** underlying interpersonal–affective traits, and
- an **executive control deficit** underlying impulsive–antisocial traits.

Weak defensive (fear) reactivity contributes most directly to the interpersonal–affective features of psychopathy, including charm and manipulativeness, grandiosity, and emotional insensitivity with low empathy and nonanxiousness,

> From the standpoint of the two-process model, successful psychopathy can be seen as the product of a low fear disposition unaccompanied by significant cognitive–executive dysfunction. Such individuals would be expected to be highly self-confident, socially assertive, and persuasive, and lacking in sensitivity to the feelings of others due to reduced personal experiences of fear, anxiousness, and distress. Consistent with these suppositions, those high in fearless dominance are more likely to make selfishly profitable decisions in economic games (Yamagishi, Li, Takagishi, Matsumoto, & Kiyonari, 2014); they also have higher incomes (Benning, Patrick, Hicks, Blonigen, & Krueger, 2003) and ranks in financial occupations (Howe, Falkenbach, & Massey, 2014).

Conversely, unsuccessful psychopathy lacks executive control:

> From a two-process perspective, unsuccessful psychopathy (i.e., expressed as persistent criminal deviance leading to repeated convictions and periods of imprisonment) can be viewed as arising from salient cognitive–executive dysfunction (cf. Moffitt, 1993) and antisocial attitudes alloyed with low dispositional fear. Unsuccessful psychopathy is further likely if an individual experiences adverse events that engender social detachment, distrust, and hostility or even hatred toward others (Christian, Meltzer, Thede, & Kosson, 2017; Lynam, 1996; Patrick et al., 2009).

These two processes are theorized to underpin the two main psychopathy factors, and research has provided compelling support for this theoretical model, especially with the PPI factors that display stronger diverging associations (for reviews, see Patrick, 2007; Patrick & Bernat, 2009; Skeem, Polaschek, Patrick, & Lilienfeld, 2011).

The triarchic model formalizes this further by separating **boldness, meanness, and disinhibition** as partially independent trait domains (Patrick et al., 2009). Within this framework, boldness reflects adaptive tendencies, along with some aspects of maladaptive functioning (Skeem et al., 2011).
Boldness seems to generally adaptive, and especially so for certain niches:

> In the domain of work and business leadership, ratings of supervisors' boldness are positively associated with subordinates' satisfaction with supervisors and with their jobs; by contrast, meanness and disinhibition are negatively related to these variables (Sanecka, 2013). High levels of boldness have also been found in special military teams assigned to patrol remote regions of Greenland (Kjærgaard, Leon, Venables, & Fink, 2013) and to North Pole expeditions (Leon & Venables, 2015). These studies highlight the potential contribution of high boldness (or dispositional fearlessness) to success in the business world and to effective performance in extreme environments.

But Boldness + Meanness/Dishibition Is Problematic & Meanness + Dishibition is Worst

Individuals high in meanness and boldness can be expected to express their social and emotional poise in

exploitative–antagonistic ways, while boldness and disinhibition, could be similar Cleckley's conception of psychopathy as a "masked" pathology: seemingly emotionally well adjusted and socially adept but act out in reckless, irresponsible ways to gratify immediate desires, without regard for adverse consequences.

Disinhibition coupled with high meanness would be expected to manifest as severely aggressive externalizing behavior, ranging from psychological pressure or physical force to achieve selfish goals to sadistic acts of violence.

This structure provides the clearest modern explanation of "successful psychopathy": individuals high in boldness but relatively low in disinhibition are less likely to show chronic antisocial failure.

The authors' examples are Don Draper, Sonny from The Godfather, and Amy from Gone Girl.

🤔Lucio's 4th model: **Exchange Theory of Successful Psychopathy (Buffalmano, 2026)**

Lucio:
The Exchange Theory of successful psychopathy builds upon the Moderated Model, narrowing its focus on 'social and mate value' moderating traits, and linking it to the social exchange as a legal and socially-approved venue for selfish goal-achievement.

For example, an attractive, high-IQ, power-aware, strategically inclined and confident (potentially from narcissistic grandiosity) psychopathic individual can exchange his value and previously acquired resources to get what he wants, without having to resort to higher risk, win-lose coercion. Or, at least, he can 'limit himself' to more grey-area but rarely sanctioned forms of pressure tactics.
This doesn't make him any nicer, so it doesn't need to be 'less of a psychopath', as he can cooperate smartly and calculatively while being ruthlessly unempathic, but it makes him less likely to fall on the wrong side of the law.

An example may be Ashton Kutcher's character in the movie *Spread*, who lives off women's largesse thanks to his attractiveness, Machiavellianism, and seduction skills.

Basically, this says that **high-fitness psychopaths succeed because they can use the exchange game over the predatory game**, and gain even larger returns with lower risks. For certain traits such as attractiveness, this may be obvious, even if only subconsciously, also to lower IQ individuals.

This model probably works best in combination with the multiprocess theory, for individuals with intact executive

control, and is probably correlated with Machiavellianism.
That said, more ‘readily monetizable traits’ like looks, and especially for women, may lower the bar to the exchange game, even in the presence of higher disinhibition (ie.: exchange goods for sexual favors or companionship).

🤔Lucio’s 5th model: **Calibration Theory of Successful Psychopathy (Buffalmano, 2026)**

Lucio:
This model suggests that success is determined by the ability to **contextually regulate** psychopathic expressions.

The ‘calibrated’ psychopath uses **strategic compartmentalization**. He may apply ‘Meanness’ and ‘Boldness’ as tools in competitive environments, while switching to a simulated, functional, or even genuine ‘pro-social’ mode in cooperative environments (family/alliances) to protect his long-term interests and social support.

For example, they may be more ruthless at work, and be able to ‘switch off’ outside of it to improve intimate relationships and friendships.

As anecdotal example, even during tough divorce proceedings with first-wife Ivana, Trump once said he’d ‘never say anything bad about his wife because ‘she’s the mother of my children’. That preserved functional relationships with the ex-wife and his children, improving family ties and reputation.
But in another interview about his work approach, prodded about a vicious reputation, he asked if that was a compliment.
And while we may know little of Trump’s intimate relationships behind doors, that may at least signal the intention of two different modes.

Researcher Keith Campbell proposed something similar for the related trait of narcissism when he advised ‘use it publicly, not privately’ (Campbell, 2020).

Empirical Conclusions

Successful psychopathy is best understood not as a single coherent subtype, but as particular configurations of partially independent liabilities. Individuals combining fearlessness and social dominance with intact executive control are far less likely to follow the chronic antisocial pathway.

> Whether termed “fearless dominance,” “boldness,” or “weak defensive reactivity,” dispositional fearlessness in itself appears to be associated with a range of adaptive tendencies, as well as with certain deviant tendencies readily recognizable as psychopathic (e.g., narcissism, risk taking). As such, the presence of dispositional fearlessness in the absence of neurocognitive liability for externalizing problems is perhaps the clearest basis for successful psychopathy. Other combinations of bold, mean–callous, and disinhibitory tendencies may also be associated with successful, noncriminal outcomes—but further systematic research is needed to evaluate the ways in which these differing configurations of psychopathic attributes are expressed.

Disinhibition—closely aligned with the externalizing spectrum—appears to be the primary driver of persistent antisocial behavior and life dysfunction (Patrick et al., 2005; Skeem et al., 2011).

Finally, empirical research also points to several aspects that increase the odds of successful psychopathy including increased age, higher executive functioning, and physiological and neuroanatomical similarity to healthy controls as traits.

⍰♂Lucio’s Take: **Super useful chapter** ⍰⍰

Lucio:
From an applied perspective, this was one of the most insightful chapters.
I want to thank the authors first and foremost.

If I may offer one small suggestion: it could help to add a few more sentences clarifying how the field moved from the dual-process theory to the triarchic model. The connection may be obvious to researchers, and I was able to infer it and explore it further myself, but a bit more context—whether chronological or conceptual—could make the bridge clearer for non-research readers.

- **Effective psychopathy**, TPM’s take on ‘successful psychopathy’

PART VI CLINICAL AND APPLIED ISSUES IN PSYCHOPATHY

Chapter 25. Psychopathy and Aggression

Authors: Stephen Porter, Michael T. Woodworth, and Pamela J. Black

> CONCLUSION: Available research findings indicate a clear relationship between psychopathy and aggressive behavior. In fact, the case can be made that high-psychopathic individuals commit more nonsanctioned violence than any other members of society.

- **Proactive Aggression:** This form of aggression is selectively related to the **Meanness** (Callous-Unemotional) component of psychopathy, reflecting a lack of empathy and a willingness to exploit others.
- **Reactive Aggression:** While psychopathic individuals engage in reactive aggression, it is less central to the construct and is more strongly correlated with the **Disinhibition** and high-anxiety/secondary psychopathy subtypes.
- **Often it's a mix of reactive and proactive:** *some violent acts contain elements of both reactivity and instrumentality (Bushman & Anderson, 2001). For example, Barratt, Stanford, Dowdy, Liebman, and Kent (1999) found that only 20–25% of the aggressive acts coded in their sample could be classified as either strictly premeditated or impulsive. Therefore, researchers who study aggressive behavior must refine their operational definitions beyond simply "instrumental" or "reactive" in order to capture the complexities of motivations for violence.*
- **Factor 1 more premeditated, factor 2 more reactive:** *There is evidence that scores on Factor 1 of PCL-R psychopathy, reflecting emotional coldness and manipulativeness, are related to premeditated, unprovoked, instrumental aggression (Reidy, Zeichner, Miller, & Martinez, 2007; Reidy, Zeichner, & Seibert, 2011), whereas scores on Factor 2, reflecting impulsive–irresponsible tendencies and antisocial behaviors, are more highly correlated with reactive violence (Falkenbach, Poythress, & Creevy, 2008; Hecht, Berg, Lilienfeld, & Latzman, 2016; Reidy et al., 2007; Reidy, Zeichner, & Martinez, 2008).*
  - Same for sub-facets: *Furthermore, at the facet level, PCL-R Facets 1 and 2 have been related to premeditated aggression, and Facets 3 and 4 to impulsive aggression (Declercq, Willemsen, Audenaert, & Verhaeghe, 2012; Flight & Forth, 2007; Snowden & Gray, 2011; Walsh, Swogger, & Kosson, 2009). These findings are in line with the previously noted results indicating that instrumental violence is related to little, if any, emotional arousal during acts of aggression*
  - But factor 1 manipulates to appear more reactive: . *analyses from Porter and Woodworth (2007) revealed that the tendency to exaggerate the reactive quality of homicide offenses was strongly related to PCL- R Factor 1 scores, and unrelated to Factor 2 scores.*
- **Dishibition related to severe aggression:** *Marcus and Norris (2014) evaluated relations between subscales of the TriPM and sexual coercion using a vignette paradigm. They found that scores on all three TriPM scales (Boldness, Meanness, Disinhibition) predicted reported use of low-level sexually predatory tactics, and that Disinhibition was uniquely predictive of use of severe, potentially criminal coercive tactics.*
- **As a whole, psychopathy may protect against reactive aggression**: *the relationship between psychopathy and reactive violence is not as clear. It appears that total scores and Factor 2/SCI scores are often related to impulsive aggression, but to a lesser degree than Factor 1 scores correlate with instrumental aggression in an in-depth review of research on the relationship between psychopathy and reactive violence, Reidy, Shelley-Tremblay, and Lilienfeld (2011) concluded that existing evidence as a whole points to psychopathy as a protective factor against impulsive violence.*

- **Factor 2 more linked to criminal behavior, factor 1 to motivation**: *would appear that while Factor 2 behavioral features may have a more direct and obvious relationship with criminal offending and recidivism (e.g., Walters, 2003), the core emotional–interpersonal traits of psychopathy represented in Factor 1 may better help to explain the motivations that underlie the serious types of violent crimes that psychopathic offenders choose to commit (see also Skeem, Poythress, Edens, Lilienfeld,* 2011)
- **Psychopaths may enjoy aggression:** recent research indicates that psychopathic offenders may derive gratification or enjoyment from their violent behavior. Analyses of their sexual violence, in particular, suggest that both thrill- seeking and sadistic interests may play an important role in psychopathic crime. (⍰⍰♂ Lucio's note: I wasn't sure how thrill-seeking may have been at the same level of sadism alone or high meanness rather than being, for example, just a smaller added contributor)
- **Self-harm is mainly related to factor 2:** *existing research at this time suggests that self-harm is related mainly to impulsive–antisocial (Factor 2) features of psychopathy, as assessed by different inventories, it may be the case that offenders who exemplify the affective–interpersonal features of psychopathy engage in self-harmful behavior that is insincere and enacted to manipulate others*
- **Assessment in Different Populations:** The chapter reviews the manifestation of psychopathy-related aggression across various populations, including incarcerated adults and children with Conduct Problems.

Intelligence moderates violent expressions of psychopathy

The theory sounds logical:

> A potential moderator of the relationship between psychopathy and violence is intelligence; that is, more intelligent psychopathic individuals may be less inclined to act aggressively because they can use their cognitive resources to devise nonviolent means (e.g., conning and manipulation) to get what they want (Nijman, Merckelbach, & Cima, 2009; Vitacco, Neumann, & Wodushek, 2008).
> Less intelligent psychopathic individuals may resort to violence to compensate for their inferior abilities to manipulate others through language.

And the evidence seems to support it:

> As evidence for this, Heilbrun (1982) found that past violent offending in a sample of male prisoners was influenced by the interaction of intellectual level and self-reported psychopathic tendencies: Less intelligent offenders who scored high in psychopathy showed greater likelihood of having a history of impulsive violence than either more intelligent psychopathic offenders or less intelligent nonpsychopathic offenders.
> In line with this, Heilbrun and Heilbrun (1985) reported that the most dangerous individuals in a sample of offenders were those with the following characteristics: psychopathic, low IQ, socially withdrawn, and history of violence.

⍰⍰♂ **Lucio's note**: However, chapter 24, although more related to criminality rather than simply violence, seems to suggest otherwise

However, a confounding variable is that IQ may better allow individuals to avoid conviction, rather than outright engaging in less aggression or violent behavior:

> Ishikawa and colleagues (2001) tested a community sample of 16 "unsuccessful" and 13 "successful" psychopaths (classified based on their PCL-R scores and whether they had incurred criminal convictions) on laboratory measures of autonomic stress reactivity and executive functioning (referring to the capacity for initiation, planning, abstraction, and decision making). Although differing in conviction history, the two groups had engaged in substantial and similar amounts of self-reported criminal behavior, including violent acts. Results from the laboratory assessment indicated that participants in the successful psychopathy group

> exhibited greater autonomic reactivity to emotional stressors and stronger executive functioning than those in the unsuccessful psychopathy group. The implication is that psychopathic individuals who are able to avoid apprehension and adjudication for their violent acts are those who possess intact capacities for planning and decision making.

Language patterns: past tenses, filler words, cause-effect subordinating conjunctions, & material goods

> Hancock, Woodworth, and Porter (2013) used automated language analysis methods to explore the descriptions of homicides provided by these offenders (…) it was posited that many aspects of language use operate below the level of conscious control (…)
> Two systems, Linguistic Inquiry and Word Count (LIWC; Pennebaker, Booth, & Francis, 2011) and Wmatrix (Rayson, 2008), were used to code transcripts (…)
> high PCL-R offenders used more past-tense and fewer present-tense words in their narratives, as well more disfluencies (e.g., "uh" or "um") than low PCL-R offenders, suggesting both psychological distancing and an emotional detachment from their crimes. Furthermore, high-psychopathy offenders used more subordinating conjunctions (indicative of cause-and- effect thinking) such as "because," "since," and "so that," demonstrating that they provided more reasoning for their actions, consistent with greater instrumental motives. Tellingly, high psychopathic participants also were more likely to use language (even within the context of a murder narrative) reflective of material needs and gains, such as references to food, drink, and money.

Premeditation & instrumental vs. foolhardy: flawed predators

> Clinical and empirical observations suggest that some physically aggressive actions by high psychopathic individuals share these characteristics of premeditation and instrumentality (….) However, most of these psychopathic individuals have difficulty controlling themselves at times (…) in ways that contribute to detection, arrest, and incarceration (…) In this light, individuals of this sort can be seen as "flawed predators," frequently preying on others but unable to reliably control their behavior.

Psychopathy is linked with sexual deviancy and sadism

Sadism and psychopathy are different but correlated:

> Mokros and colleagues (2011) evaluated whether psychopathy as indexed by items of the PCL-R and sadism as indexed by diagnostic criteria from DSM-IV-TR (APA, 2000) and the 10th edition of the International Classification of Diseases (ICD-10; World Health Organization, 2004) share a sufficient number of defining features that they can be considered the same construct. Based on analyses of data for a sample of 100 male sex offenders (50% of whom were considered sadistic), they concluded that psychopathy and sadism are distinct constructs, and that specific features of PCL-R psychopathy, such as the deficient affect (Facet 2) features, are actually predictive of sadistic behavior.

Psychopathic offenders had higher sadism scores:

> Holt and colleagues (1999) found that such traits were more common among violent psychopathic offenders than violent nonpsychopathic offenders in a maximum security prison. Violent and sexually violent offenders did not differ in their level of sadistic personality traits, leading the authors to argue that the traits were not tied specifically to sexual pleasure.
> (…)
> Consistent with this, Woodworth, Freimuth, and colleagues (2013) reported that participants from a large

> sample of high-risk sexual offenders who showed elevated PCL-R psychopathy scores were significantly more likely to have a sadistic paraphilia than participants who exhibited either low or moderate psychopathy scores.

Sadism was associated with facets 1 and 4 of the PCL-R:

> Robertson and Knight (2014) examined the relationship between general measures of sadism and psychopathy at the facet level, and found that a variety of measures of sadism (e.g., self-report scales, file review of past crimes) correlated with total scores on the PCL-R and scores on Facets 1 and 4.

Psychopathy is also associated with deviant sexual arousal:

> *studies have found higher PCL-R scores to be associated with sexual arousal in response to deviant visual and auditory stimuli. Specifically, available data indicate a significant but modest correlation (.21-.28) between PCL-R total scores and deviant sexual arousal (Barbaree, Seto, Serin, Amos, & Preston, 1994; Knight, 2010; Quinsey et al., 1995; Serin, Malcolm, Khanna, & Barbaree, 1994).*

And empirical evidence from actual homicides support this, as analyzed by Porter and colleagues (2003)

> homicides committed by psychopathic offenders (n = 18) showed significantly higher level of both gratuitous and sadistic violence than those committed by nonpsychopathic offenders (n = 20). Most psychopathic offenders (82.4%) had committed sadistic acts against their victims, compared to 52.6% of the nonpsychopathic offenders.

Somewhat related, Porter, Bhanwer, Woodworth, and Black (2013) found that psychopaths also have higher levels of schadenfreude:

> Results indicated that higher psychopathy scores (as measured by Paulhus, Neumann, Hare, Williams, & Hemphill's [2016] Self-Report Psychopathy Scale) were related to increased self-reported schadenfreude across all conditions, even after being primed to feel empathy.

Chapter 26. Psychopathy and Substance Use Disorders

Authors: Jarrod M. Ellingson, Andrew K. Littlefield, Alvaro Vergés, and Kenneth J. Sher

There is a significant and complex overlap between psychopathy and Substance Use Disorders (SUDs), driven primarily by shared vulnerability factors related to poor self-control and high sensation-seeking. The relationship is strongest for the **Disinhibition** facet of psychopathy (e.g., impulsivity, irresponsibility).

> Most studies to date have found significant associations between psychopathy scores and measures of substance use and SUDs in a wide range of samples, including criminal, community, and clinical samples across development stages (adolescents and adults). Regarding subdimensions of psychopathy, there seems to be a robust association between the impulsive–antisocial factor and substance involvement, but less consistent or null associations for the affective–interpersonal factor. In studies employing the lower-level facets, associations are somewhat less robust, with the impulsive lifestyle and antisocial facets showing larger associations than the affective or interpersonal facets.

- **Shared Etiology:** Both psychopathy and SUDs are related to a broad underlying construct of **Behavioral Disinhibition** and **externalizing proneness.**
  - **Disinhibition**: facets of psychopathy within differing inventories that relate most closely to disinhibitory psychopathology—namely, those reflecting impulsive nonplanfulness and reckless irresponsibility—have

demonstrated particularly strong associations with SUDs.
  - **Externalizing proneness:** Recent theoretical and factor-analytic work has suggested that a dispositional factor of externalizing proneness, reflecting shared variance among different forms of disinhibitory psychopathology, contributes to both psychopathy and SUDs.
- **Dishinibitory liability as the root?** *Theoretical work across disciplines has suggested that a dispositional factor, sometimes labeled "disinhibitory liability" (Vanyukov et al., 2012), entails general deficits in inhibitory control and proclivities toward social deviance (e.g., rule breaking), and confers risk for all externalizing disorders, including psychopathy and SUDs (e.g., Gorenstein & Newman, 1980; Iacono, Carlson, Taylor, Elkins, & McGue, 1999; Sher & Trull, 1994; Yancey, Venables, Hicks, & Patrick, 2013).*
- **Heritable 'behavioral under-control' as another measure for disinhibition**: *Krueger and colleagues (2002) demonstrated that reverse-scored constraint (i.e., a broad-based measure of disinhibition assessed via the Multidimensional Personality Questionnaire; Tellegen, 1982; Tellegen & Waller, 2008) loaded on a general, highly heritable externalizing factor that also included measures of substance use and ASPD. This observation led to the conclusion that "personality and psychopathology are linked at an etiological level" (Krueger et al., 2002, p. 421). Consistent with this notion, evidence from the behavioral genetic literature suggests that the vast majority of the genetic correlation between alcohol dependence and conduct disorders is accounted for by variance in behavioral undercontrol, a broad- band measure of impulsivity (Slutske et al., 2002).*
- **SUDs are most associated with ASPD**: *The Epidemiologic Catchment Area study, which assessed DSM-III disorders, found that 83.6% of participants diagnosed with ASPD had a co-occurring lifetime SUD (Regier et al., 1990). In addition, rates of ASPD among participants diagnosed with lifetime SUDs ranged from 14.3% (alcohol) to 42.7% (cocaine).*
  - Impulsive-antisocial factor explains most of psychopathy's association with SUDs: *The most consistent finding has been a significant association of total psychopathy scores with SUDs that is entirely explained by the impulsive–antisocial factor (Blackburn & Coid, 1998; Blackburn, Logan, Donnelly, & Renwick, 2003; Hart, Forth, & Hare, 1991; Hemphill, Hart, & Hare, 1994; Reardon et al., 2002; Smith & Newman, 1990).*
  - Impulsive lifestyle stronger association: *Walsh and colleagues (2007) found a strong and robust association for PCL-R Factor 2 with substance dependence. However, the impulsive lifestyle facet of Factor 2 demonstrated stronger associations than the antisocial facet with lifetime symptoms of alcohol and illicit drug dependence in this male sample, and with substance use among female offenders in another study (Kennealy et al., 2007).*
- **Psychopathy and SUDs share common genetic & biology:** *converging evidence suggests that both are associated with common neural systems (e.g., PFC, ACC), biomarkers (e.g., P300, ERN), and genetic markers (e.g., MAOA, COMT, ANNK1, 5-HTT, CHMR2).*
- **Factor 1 less related**: *Regarding facets of Factor 1, the interpersonal facet was positively correlated with cocaine, but not other drug, dependence symptoms (Walsh et al., 2007). Furthermore, adjusting for the other PCL-R facets resulted in negative correlations between the affective facet and some (though not all) substance use measures in both studies (Kennealy et al., 2007; Walsh et al., 2007), consistent with negative association of this facet with participation in substance use treatment (Durbeej, Palmstierna, Berman, Kristiansson, & Gumpert, 2014).*
- **Peaks at 18-25YO and decreases later:** *Although some have highlighted the temporal stability of psychopathy, ASPD, and related personality constructs (e.g., Lynam & Gudonis, 2005), others have noted the sharp decline in antisocial behaviors as individuals transition from adolescence to adulthood (e.g., Blonigen, 2010). This so-called "age-crime curve" (Hirschi & Gottfredson, 1983) parallels the "maturing out" of substance-related pathology (Winick, 1962), which "appears to be primarily a disorder of late adolescence and young adulthood" (Sher & Gotham, 1999, p. 933). Thus, engagement in antisocial behaviors and addictive behaviors both appear to rise and fall during emerging adulthood (roughly ages 18–25; Arnett, 2000).*
  - **Decrease in novelty-seeking and increasing in reward-seeking**: *Blonigen, Littlefield, and colleagues (2010) demonstrated that, relative to individuals who persisted in antisocial behaviors, those who desisted from*

antisocial behaviors across ages 18–25 showed marked decreases in novelty seeking (a trait broadly related to impulsivity–behavioral undercontrol) and larger increases in reward dependence (a construct related to positive emotionality and negatively related to disinhibition).

- **Boldness:** Also contributes through sensation-seeking—a willingness to take risks and pursue novel, exciting experiences (including drug use).

Chapter 27. The Role of Psychopathy in Sexual Coercion against Women

Authors: Raymond A. Knight and Jean-Pierre Guay

Psychopathy is a robust predictor of sexual aggression and coercion, a relationship primarily driven by the affective and interpersonal features of the disorder. The lack of empathy and callous exploitation of others (Meanness) allows for the instrumental use of sexual violence without guilt, which is the defining characteristic of this link.

- **Rape is part of a general propensity towards antisociality and not 'specialized':** *These findings replicated prior research suggesting that the commission of rape can be characterized as part of a broader general propensity to act in an antisocial manner (Lussier, LeBlanc, & Proulx, 2005; Smallbone, Wheaton, & Hourigan, 2003). Likewise, the versatility of offense behavior found among rapists in these studies is consistent with the hypothesis that antisocial tendencies are pervasive among convicted rapists.*
  - Only child molesters 'specialize': *Examining the criminal records of 506 sex offenders being evaluated for sexual commitment, Harris, Smallbone, Dennison, and Knight (2009) found that sex offenders as a whole were versatile (criminal generalists), regardless of whether they were committed or determined not to be sexually dangerous and released back to prison to complete their sentences. Indeed, evidence for specialization was found only in the child molester subgroup.*
- **Sadism is part of psychopathic coercion:** *both the iterative, empirically driven revisions of the MTC rape typologies (Knight, 2010) and the generation of a SEM for the etiology of sexually coercive behavior against women (Knight & Sims- Knight, 2016) have yielded evidence across multiple samples for a covariation between facets of psychopathy and sadism in both archival ratings and self-report measures.*
  (…) the combined CM/Hypersexual trait showed substantial covariation with Sadistic fantasies (Knight, 2013; Sims-Knight, 2013).
  - Paraphilia and sadistic fantasies also linked: *recent studies that have examined the relation for psychopathy as a whole have continued to show evidence of covariation between total psychopathy scores and sadistic fantasies and paraphilias (e.g., Fischer, 2008; Hill, Habermann, Berner, & Briken, 2006; Woodworth et al., 2013).*
- **Sadism may be the 'upper end' of agonistic continuum:** s*upport for a reconceptualization of sadism as the extreme high pole of an agonistic continuum that extends from no sexually coercive fantasies or behaviors at the low end, through paraphilic coercive fantasies, to fantasies of controlling, bondage, and humiliation during sex, to fantasies of hurting a victim during sex, and finally to serious sadistic fantasies and behaviors (Knight, 2010; Knight, Sims-Knight, & Guay, 2013; Mokros, Schilling, Weiss, Nitschke, & Eher, 2014). The current exploration of only the extreme upper end of this continuum might mask important relations because of partial measurement and truncation of the full range of the construct. Indeed, some data suggest that different subdimensions of psychopathy may be differentially related to varying levels of the agonistic continuum (e.g., Liu, 2014; Sims-Knight, & Guay, 2011).*

Three lines of research highlight the link between psychopathy and

Three independent research-domains highlight that key symptomatic subdimensions of psychopathy play significant roles in rape:

> First, in the general criminal research literature, there were some indications of increased risk for sexual coercion among psychopathic criminals, and this risk was consistent with recent theoretical explanations of

> particular symptom subdimensions of psychopathy.
> Second, studies of incarcerated rapists revealed a high incidence of psychopathy, and the facets of psychopathy had emerged as critical elements in an empirically validated typological model that identified important individual differences among rapists. Moreover, psychopathy had been identified as an important predictor of sexual recidivism among convicted rapists.
> Third, in both offender and nonoffender samples, the symptomatic facets of psychopathy had been identified as traits that define critical paths in structural equation models of the etiology of sexual aggression against women.

Sexual coercion may be linked to short-term sexual strategies:

> evolutionary explanations for sexual coercion have also highlighted the importance of psychopathic tendencies. Most notably, it has been speculated that proclivities toward short-term relationships, high mating effort, and low parental investment on the part of psychopathic individuals (Quinsey & Lalumière, 1995), along with their use of short-term cheating strategies (Mealey, 1995), might coalesce into a high reproduction-rate (r-selection; Pianka, 1970) mating strategy that not only has some evolutionary advantages but also increases the probability of sexual aggression. Although the evidence for such theories remains tentative (Marcus, Sanford, Edens, Knight, & Walters, 2011), recent neurobiological research nonetheless supports the hypothesis that dysfunctions in brain regions that are key to emotional processing and morality judgments may allow psychopathic individuals to pursue this evolutionary strategy (Glenn & Raine, 2009). Moreover, such evolutionary speculation emphasizes the theoretical congruence between characteristics associated with psychopathy and those associated with rape.

- **Investigative case study of psychopaths' sexual strategy**

The 3-path model to coercion

Knight and colleagues' improved Malamuth's original two-path Confluence Model (1991) with:

1. **Callous–Manipulative** latent trait (replacing hypermasculinity, it's a latent trait not from PPI/PCL-R, but from MIDSA and related to factor 1)
2. **Antisocial** latent trait pathway (added)
3. **Hypersexuality** (maintained)

This three-path model (callous-manipulative traits, antisocial tendencies, and hypersexuality) significantly improved predictive power and was replicated across criminal and noncriminal samples, adolescent and adult samples (Knight & Sims-Knight, 2003, 2004, 2011, 2016).

Independent laboratories have similarly found that psychopathy dimensions—particularly callousness, manipulation, impulsivity, and antagonism—covary with impersonal sex attitudes, sexual dominance, unrestricted sociosexuality, and higher sexual drive (Harris et al., 2007; Visser et al., 2010; Kastner & Sellbom, 2012; LeBreton et al., 2013; Jonason et al., 2009; Baughman et al., 2014; Carter et al., 2014), and there is a **strong covariation between Callous–Manipulative (CM) traits and Hypersexuality** (Johnson & Knight, 1998; Knight & Sims-Knight, 1999; Graham & Knight, 2017). Combining the two improves model fit (Knight, 2013).

Conceptually, the unifying thread between CM traits and hypersexuality appears to be a **primary reward focus** and disregard for secondary information—others' needs, long-term consequences, or social norms. This aligns with Newman's response modulation hypothesis (Newman & Baskin-Sommers, 2011), which posits an attentional deficit in psychopathy: once goal-focused, individuals fail to process peripheral inhibitory cues. This mechanism is distinct

from general executive dysfunction associated with antisocial behavior.

Neurobiological evidence supports this linkage. High self-centered impulsive psychopathy (PPI-Scl) predicts heightened mesolimbic dopamine recruitment in response to rewards (Buckholtz et al., 2010; Bjork et al., 2012). Brain regions implicated in reward processing (ventral striatum, anterior cingulate cortex) overlap with circuitry involved in sexual motivation (Stoléru et al., 2012). Structural and functional abnormalities in these regions are also documented in psychopathy (Kiehl et al., 2001; Birbaumer et al., 2005; Glenn & Raine, 2009). This suggests shared neurocircuitry underlying CM traits and hypersexual motivation.

The data aligns with reward-driven, sensation-seeking impulsivity (linked to CM and hypersexuality; instrumental aggression; reduced threat sensitivity) rather than affectively dysregulated and impulsive antisocial aggression (linked to antisocial behavior, negative emotionality, and reactive aggression.

⍰⍰♂ **Lucio's note**: I wished for more of the source studies linking psychopathy to hypersexuality to be published. Some of them were papers presented at various conferences or unpublished manuscripts.

All 3 dark triads are related to sexual drive, and psychopathy is the highest

> Several studies have linked various measures of the Dark Triad traits (subclinical narcissism, Machiavellianism, and psychopathy; Paulhus & Williams, 2002) with a variety of measures of sexual behavior and fantasy. In a study of undergraduate students Jonason, Li, Webster, and Schmitt (2009) showed that the scores on the Dark Triad traits were positively related to having more sex partners, unrestricted sociosexuality, and a greater preference for short-term mates. In another study of college students, Baughman, Jonason, Veselka, and Vernon (2014) found that all three Dark Triad scales were related to sexual drive, with psychopathy showing the strongest relation. Testing an online sample recruited by a marketing company, Carter, Campbell, and Muncer (2014) found that scores on the Dark Triad correlated positively with both recreational sexual behavior and sexual desire for others for both males and females.

Different paths to impulsivity

There seem to be two different kinds of impulsivity:

1. **Reward-driven** ignoring secondary information when pursuing goals: It involves risk-taking, sensation-seeking, and focusing on getting what you want while ignoring consequences or other people's feelings.
2. **Emotion-driven**: It involves being sensitive to threats, getting overwhelmed by negative emotions, and losing control when upset.

The research suggests that hypersexuality and callous–manipulative/self-centered impulsive traits are linked more to the first type — the reward-driven, goal-focused impulsivity.

The authors argue that it's important to keep these two types separate, because they may explain different kinds of aggression. Psychopathy-related aggression may be more about the reward-driven, goal-focused type, while other aggression may be more about emotional dyscontrol.

They also criticize the triarchic model for mixing different kinds of impulsivity together under "disinhibition," and for separating manipulative traits into a different category. In their view, that blending hides important differences instead of clarifying them.

⍰♂Lucio's Take: **Interesting, I wished for more details on how they related to factors 1 and 2**

Lucio:
The two paths the authors suggest about impulsivity seem to relate to factor 1 and factor 2.

But then they say that both hypersexuality and Callous Manipulative (CM), more linked with factor 1, and Self-Centered Impulsivity (ScI), more linked with factor 2, appear to *both* covary both with the reward-driven impulsivity, while based on the previous chapters I expected ScI factor 2 to relate more with the emotion-driven impulsivity.

Maybe the use of CM is creating some confusion here as it may tap into both factor 1 and factor 2. Or factor 1 and/or factor 2 can share both types of impulsivity?

I'd welcome a clarification on this.

Chapter 28. Risk for Criminal Recidivism: The Role of Psychopathy

Authors: Kevin S. Douglas, Gina M. Vincent, and John F. Edens

> With some disclaimers, it is fair to state that psychopathy is an important and meaningful risk factor for subsequent antisocial behavior of many types, across many contexts, in many different types of people.

- **Moderate predictive validity for PCL-R***: in the "typical" settings (offenders, forensic patients, civil psychiatric patients) in which the PCL-R is used, there is support for a moderate-level association between psychopathy and recidivism, which is subject to moderating influences of differing types*
- **HCR-20 and LSI-R are better predictors of recidivism:** *in Gendreau and colleagues' (2002; see also Gendreau, Goggin, & Smith, 2003) meta-analysis, the LSI-R outperformed PCL measures substantially in predicting general recidivism, and modestly in predicting violent recidivism.*
  (…)
  Guy and colleagues showed similar bivariate effect sizes for the PCL-R/PCL:SV and HCR-20, but when both measures were included together in a regression model, the PCL-R/PCL:SV's predictive contribution dropped to near zero, whereas the HCR-20's contribution remained strong.

- **PPI also predicts recidivism despite not having criminal items:** *the items of the PPI are less strongly imbued with crime- and violence-specific content. Despite this, the pattern of associations for the PPI factors with recidivism parallel those for the PCL measures—with much stronger associations for its behavioral deviance (SCI) features than its interpersonal–affective (FD) features (see Marcus, Fulton, & Edens, 2013; Miller & Lynam, 2012).*
- **Boldness more unrelated to crime:** *Boldness (when operationalized as PPI-FD) tends not to be strongly related to antisocial behavior (Marcus et al., 2013; Miller & Lynam, 2012), although in one study it was found to interact with disinhibitory tendencies (as indexed by PPI-SCI) to predict predatory aggression (Smith, Edens, & McDermott, 2013).*

Factor 1 protects against IPV, factor 2 predicts it

> Conceptually, the two main factors of psychopathy might be expected to show opposing relations with some types of partner violence. Primary (affective–interpersonal) deficits might ironically protect against this type of aggression because of an absence of normal affectional ties, whereas the antisocial deviance component, which includes items reflecting impulsiveness and reactive aggression, would be expected to positively predict IPV. Studies of men in a correctional facility with a history of IPV (Hilton, Harris, Rice, Houghton, & Eke, 2008) or enrolled in treatment for domestic violence (Rock, Sellbom, Ben-Porath, & Salekin, 2013) have generally shown this to be the case.

Chapter 29. Treatment of Adults and Juveniles with Psychopathy

Authors: Devon L. L. Polaschek and Jennifer L. Skeem

The historic pessimism regarding the treatability of psychopathy (**therapeutic pessimism**) is not fully supported by empirical data, and high-quality, high-intensity interventions can demonstrate positive outcomes, especially for juveniles. The focus has shifted from "curing" the personality disorder to **managing the risk** and reducing antisocial behavior.

- **Challenging Therapeutic Pessimism:** *Before reviewing these findings, we contextualize work to be reviewed by noting that conclusions of "nothing works with psychopaths" echo broader conclusions reached prior to the late 1980s regarding the treatment of criminal offenders in general. Since that time, research by an influential group of Canadian psychologists has convincingly demonstrated that some treatments do indeed "work" to reduce risk for recidivism.*
- **Modest but important impact:** *In general, the more programs adhere to the RNR model's principles, the larger the reductions overall in reconviction risk. The impact on crime for those adhering to all three principles is modest but important, with reported effect sizes ranging from 0.15 to 0.34 (Andrews & Bonta, 2010). Even an effect size of 0.15 is notable. For example, if 50% of untreated offenders had been reconvicted at follow-up, the corresponding rate for treated offenders given a 0.15 effect would be 35%—a relative reduction of more than 30%.*
- **RNR 3 principles:** *treatment programs for offenders yield the largest reductions in criminal behavior when they (1) target relatively intensive services toward higher-risk offenders (the Risk principle), leaving lower-risk offenders with little or no therapeutic attention, (2) focus treatment services on changing empirically documented risk factors for crime (e.g., criminal attitudes, substance abuse, impulsivity), termed "criminogenic needs" (the Need principle), and (3) deliver interventions in a manner that maximizes offenders' engagement in the treatment process and ability to use the treatment services to make changes (the Responsivity principle; Andrews et al., 1990; Andrews & Bonta, 2010; Bonta & Andrews, 2016).*
- **Intervention seems to work even with higher risk juveniles:** *Although it tends to be assumed that high-risk youth represent "the most hardened and least likely to respond to treatment" (Lipsey, Wilson, & Cothern, 2000,*

p.6), there is little support for this assumption. In fact, as compelling evidence to the contrary, Lipsey (2009) concluded from a meta-analysis of 548 controlled studies of programs for adolescent offenders published before 2002 that "there was no indication that there were juveniles whose risk level was so high that they did not respond to effective interventions" (Lipsey, Howell, & Kelly, 2010, p. 23). Instead, meta-analytic evidence indicates that core principles of effective correctional services for antisocial behavior—including the risk principle—generalize to young people (for a review, see Skeem et al., 2014).

- **Poor behavior during treatment doesn't mean 'not effective':** *although research indicates that offenders with high PCL scores tend to challenge the treatment process, the extant evidence shows they still profit in general from that treatment, and there is no support for the view that psychopathic traits per se pose any unique problems for treatment beyond features generally associated with high criminal risk.*
- **Group dynamics make a large difference in youth:** *Adolescents are also more driven toward risk-taking when in the presence of peers than when alone (see Steinberg, 2009). Juveniles with psychopathic features are not immune to such influences. Youth with pronounced psychopathic features are likely to be integrated into delinquent peer groups (Kimonis, Frick, & Barry, 2004), commit crimes in groups (Goldweber, Dmitrieva, Cauffman, Piquero, & Steinberg, 2011), obtain low scores on measures of resistance to peer influence (Thornton, 2012), and engage in antisocial behavior that is significantly predicted by peer delinquency (if modestly less so than those with low-moderate psychopathic features; Kerr, Van Zalk, & Stattin, 2012).1 The point is that juvenile offenders with psychopathic features are—first and foremost—juveniles.*
- **Factor 2 psychopaths attend more, but results were similar:** *They found that offenders classified into a subgroup reflecting secondary psychopathy attended treatment more reliably and showed higher treatment motivation than offenders classified into a primary psychopathy subgroup, but no differences between these groups were found on disruptive behavior or skill mastery, or on the proportion of group members judged to be "treatment successes"* (Poythress and colleagues, 2010, p. 396).
- **Focus alone may also help reverse some psychopathic deficiencies:** *treatment innovation efforts may also benefit from findings of recent neuroscience-informed research. For example, Dadds and colleagues (2006) demonstrated that observed deficits in recognition of fearful facial expressions were reversed for children with callous–unemotional traits when they were told to "pay attention to the eyes." This finding suggests that recognition of others' distress can potentially be remedied using a basic behavioral manipulation.*

Chapter 30. Legal and Ethical Issues in the Assessment and Treatment of Psychopathy

Authors: John F. Edens, John Petrila, and Shannon E. Kelley

"Psychopathy" is a term frequently used in court, raising debates because it lies at the heart of fundamental legal questions concerning the restraint of liberty (e.g., civil commitment), the imposition of the death penalty, and the reliability of expert testimony. The central ethical concern is the potential for the diagnosis to be misused, leading to a presumption of incorrigibility and disproportionate sentencing.

Chapter 31. Understanding, Assessing, and Addressing Psychopathy: A Coordinated Agenda

Authors: Dustin B. Wygant, Dustin A. Pardini, Abigail A. Marsh, and Christopher J. Patrick

The future of psychopathy research must move beyond simply documenting associations to focus on clarifying underlying etiological influences, refining assessment methods through a dimensional lens (like the Triarchic model), and developing more effective, targeted interventions. The agenda emphasizes integrating neurobiological data with phenotypic traits to advance a deeper and more practically useful understanding of the disorder.

- **The RDoC Framework to replace DSM:** t*he National Institute of Mental Health's (NIMH) Research Domain Criteria (RDoC) project (Cuthbert & Kozak, 2013), which seeks to establish a new classification system for mental illness based on neuroscientific knowledge of behavior, to replace the current DSM system. Specifically, the RDoC*

> *project calls for psychopathology researchers to investigate transdiagnostic symptom dimensions rather than specific disorders, in terms of core biobehavioral processes (i.e., positive affect, negative affect, cognition, social interaction, arousal/bodily regulation) quantified using variables from multiple domains of assessment (e.g., genetic, molecular, neuroanatomic, physiological, behavioral, self-report).*

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Psychopaths go For Quantity Rather than Quality

> They tend to prize quantity over quality in intimate relationships, viewing romantic encounters as sources of fun (Jonason & Kavanagh, 2010) rather than as sources of commitment and intimacy (Ali & Chamorro-Premuzic, 2010).
> To the extent that psychopathy has been linked to communal success, it has mainly been in relation to having multitudinous (typically short-term) sexual partners (Hare, 2003; Jonason, Li, Webster, & Schmitt, 2009; Jonason, Valentine, Li, & Harbeson, 2011). Though this kind of sexuality may theoretically result in greater reproductive success (Nadelhoffer & Sinnott-Armstrong, 2010; Wiebe, 2004), it has yet to be established empirically whether this is actually the case (Gladden, Figueredo, & Jacobs, 2009; Glenn, Kurzban, & Raine, 2011). As successful as individuals with psychopathic traits may be in poaching others' sexual partners, they also appear more vulnerable to having their own sexual partners poached, yielding a net neutral effect on their reproductive fitness (Jonason, Li, & Buss, 2010).

- Psychopath's sexual strategy: a deep dive

> Psychopaths' Sexual Strategy: Marauders of Sex

Conscientiousness Differentiates Successful vs. Unsuccessful Psychopaths

From chapter 12.
Note that this is based on personal reflections based on personal experience, not measured or lab-tested, but logic and studies (quote right after) seem to back it up:

> Mullins-Sweatt, Glover, Derefinko, Miller, and Widiger (2010) surveyed clinical psychology professors, criminal attorneys, and forensic psychologists, asking them if they had ever personally known a psychopathic person who had been successful in his or her psychopathic endeavors—and if so, to characterize the person using trait descriptors. Persons so identified exhibited the antagonistic traits of deceitfulness, arrogance, manipulativeness, lack of remorse, callousness, and egocentricity, but they were high rather than low in Conscientiousness, which is associated with a number of positive life outcomes (Ozer & Benet-Martinez, 2006).

However, studies seem to back it up:

> Conversely, studies have also demonstrated a significant negative relationship between Conscientiousness and a history of arrests (e.g., Clower & Bothwell, 2002). The lack of deliberation, rashness, and incompetence that characterizes low Conscientiousness could very well contribute to an increased likelihood of being arrested and convicted for one's criminal behavior.

Primary Psychopathy as a Deception Strategy

> Mealey (1995) advanced an evolutionary psychology analysis of psychopathy in which primary psychopathy reflects a survival strategy that relies on cheating or defecting from groups after signaling cooperation. Based on Mealey's arguments, it follows that the mechanism for this survival strategy is conserved in the human genome and would occur at similar prevalence in all human populations. In contrast, secondary psychopathy reflects an adaption to environments with limited resources. In such situations, there will be a higher incidence of individuals employing a cheating strategy to gain an advantage when competing for resources, and such individuals would be situated disproportionately in the lower SES sector of society, where access to resources is limited.

Logarithmic Effects of Psychopathy?

Reviewed in chapter 15, *The Cambridge Study in Delinquent Development* shows large differences between those scoring 10 or more on the PCL:SV and the remainder of the study participants:

PCL:SV score / N.	Mean ASPD	Mean convictions	% convicted
0–2 (162)	0.21	0.29	20.5
3–5 (74)	1.05	1.68	56.8
6–9 (35)	2.14	3.83	65.7
10+ (33)	5.76	—	97.0

Lack of Conscience Alone Isn't 'Evil', But Facilitates it

From Lykken's chapter 2:

> Unlike the ordinary sociopath, the primary psychopath has failed to develop conscience and empathic feelings (…) This essential peculiarity of the psychopath is not in itself evil or vicious, but, combined with perverse appetites, or with an unusually hostile and aggressive temperament, this lack of normal constraints can result in an explosive and dangerous package.

Boldness Needs Two More Traits for Antisocial Behavior

From Fawles' chapter 5:

Boldness involves reward-seeking without fear, often linked to arrogance, defiance, emotional insensitivity, and excitement seeking. To explain antisocial and "mean" behaviors, at least two additional traits are needed: (1) lack of concern for others, reflecting poor attachments and low empathy, which can lead to exploitativeness, proactive aggression, guiltlessness, and mild callousness; and (2) antagonism, or active hostility toward others, promoting cruelty, destructive aggression, rebelliousness, and severe callousness.

However, fearlessness is a risk factor on its own:

> Pardini (2006) presented findings from a study of adjudicated juvenile males and females, indicating that fearlessness represents a risk factor for callousness and severe violence. A mediational model revealed

> evidence of a path from fearlessness to lack of punishment concern to callousness to severe violence. Thus, fearfulness contributed to callousness through its association with lack of concern for punishment, and callousness in turn was predictive of increased violent behavior. Findings from this study provide compelling evidence for fearless temperament as a risk factor for meanness.

Dishibition also plays a role:

Dishinhibition + Low Fear

With good parenting and attachment, normal Behavioral Inhibition System (BIS), and the emergence of empathy and conscience, fearlessness can look similar to boldness from the triarchic model.
However, boldness is still likely to include some degree of narcissism, thrill seeking, and lack of emotional sensitivity (Skeem et al., 2011, p. 106), with a tendency for self-interested, mildly callous pursuit of rewards.

Fearlessness accompanied by a weak BIS, and thus a lack of behavioral restraint, would make negative developmental trajectories much more likely.

Is Psychopathy Even a Unitary Construct?

From chapter 8, reflecting on the lack of correlation between factor 1 and factor 2 in the PPI (contrary to the PCL-R's stronger correlation):

> FD and SCI were largely orthogonal (uncorrelated) in Benning and colleagues' (2003) analyses, a finding buttressed by a subsequent meta-analysis (Marcus, Fulton, & Edens, 2013; see also Malterer, Lilienfeld, Neumann, & Newman, 2010). Given that many or most authors regard psychopathy as a classical syndrome, that is, as a set of covarying features, this surprising finding raises intriguing questions about the validity of the boldness construct and, perhaps more provocatively, the nature of the psychopathy construct itself.

And later, on how this concept surprised a field that believed in the syndromal nature of psychopathy:

> This assumption appears to be widely held in the psychopathy literature. For example, Hare (1993) wrote that "psychopathy is a syndrome—a cluster of related symptoms" (p. 34; emphasis added). Nevertheless, the assertion that psychopathy is syndromal is challenged by findings that (1) the lower-order and higher-order dimensions of several well-validated self-report psychopathy measures, including the PPI/PPI-R (Lilienfeld & Andrews, 1996) and at least one other self-report psychopathy measure, namely, the EPA (see Few et al., 2013), do not display a consistent pattern of positive manifold (i.e., uniformly positive interrelations among subscales); and (2) two major factors of the and PPI and PCL-R show opposing associations with measures of internalizing psychopathology.

The authors propose (Lilienfeld, 2013; Lilienfeld & Fowler, 2006) that psychopathy is a "compound variable," a constellation of largely independent subtraits that combine to form a meaningful trait complex (Berry, Sackett, & Wiemann, 2007), also called "emergent traits" (Hough & Schneider, 1996).

If this analysis is sound, they say, the answer to whether psychopathy is a true syndrome depends on how one defines psychopathy. When the term refers to ASPD and related models of largely "unsuccessful" psychopathy—highlighting disinhibition and strong affective detachment—psychopathy does appear syndromal. However, when referring to Cleckley's conception and similar models of largely "successful" psychopathy that emphasize boldness as central, psychopathy does not qualify as a classical syndrome, because boldness shows little relation to the other core psychopathy features (Marcus et al., 2013).

QUOTES

⍰⍰♂ Lucio's Analysis

Hare review of the PCL-R checklist

Hare has a financial interest in the Psychopathy Checklist-Revised (PCL-R), as he receives royalties from its use. A financial stake does not automatically imply bias, but it is a well-known source of potential bias, even if unconscious.

Past behavior, including responses to criticism and alleged attempts to block publication of critical research may even lend credibility to possible bias as they appear defensive of the PCL-R.

Cues to Hare's Defensiveness of PCL-R

I had first noticed some defensiveness in Hare's response to Ronson's book '*The Psychopath Test*'.

Then from chapter 28 of this handbook:

> in Gendreau and colleagues' (2002; see also Gendreau, Goggin, & Smith, 2003) meta-analysis, the LSI-R outperformed PCL measures substantially in predicting general recidivism, and modestly in predicting violent recidivism. **Hemphill and Hare (2004; see also Hare, 2003) sought to rebut these findings on methodological grounds**, and reanalyzed most of the studies from Gendreau and colleagues' meta-analysis that directly compared the LSI and the PCL. Although their reanalysis yielded markedly different results regarding the relative superiority of the LSI, neither meta-analysis reported statistical tests of incremental validity for the two measures.

And linked to potential bias, Hare also seems to actively promote the PCL-R efficacy.
Quoting from chapter 30:

> It is also asserted that "most clinicians who participate in this [in-house] training should have little difficulty in conducting reliable PCL-R assessments" (Hare, 2003, p. 18), although we are aware of no published research specifically examining the efficacy of any particular training program.

Many researchers avoid speaking with absolutes or sounding too self-assured, and would rather quote evidence to back up strong claims. It's noteworthy that Hare seems to express such strong confidence in his PCL-R without backing it up with credible research.

Criticism of PCL-R Only Appears In Other Chapters

For example, from chapter 13:

> Hare assumed a unitary model of psychopathy, so the process of pruning the initial item pool into the final PCL item set led to the exclusion of most of Cleckley's items related to positive adjustment (because they reduced internal consistency) and to the inclusion of items more explicitly related to criminal behavior (due to higher correlations with traits associated with social deviance; Patrick, 2006). As a consequence, there was some drift away from the Cleckley prototype, such that the PCL-R appears to index a construct more similar to the severe ASPD-subtype conception of psychopathy. For example, in prisoner samples, the prevalence "of ASPD is commonly 50%, whereas the prevalence of prisoners meeting the diagnostic cutoff for psychopathy using the PCL-R is often 25%, with nearly all of the PCL-R—defined psychopaths nested within those who meet criteria for ASPD (Hare, 1996, 2003).

Deprioritizing Cleckley's Accounts For More Empirical Evidence?

In some passages, I felt like Cleckley's original descriptions were used to justify or explain more modern theories, including providing a rationale for the concept of boldness in the triarchic model.
For example:

> boldness maps largely onto what Cleckley described as the "mask" of superficially healthy adjustment (but see Miller & Lynam, 2012, for a 183 dissenting view)
> (…) Moreover, noteworthy elements of boldness can be found in several of Cleckley's other criteria for psychopathy.

These notes are interesting and do add some value.
However, I worried that Cleckley's observations may not have too large an impact on modern theories, and that some concepts weren't also thought out to retrofit Cleckley's original accounts.
I'd rather the field move and rely on empirical findings alone, instead.

Suggestions for the Editor and Authors

Starting from a position of excellence, these are simply ideas that could make an already strong handbook even more to an audience such as myself:

Thematic consolidation by chapter-topic

Let me preface this that this book is already doing this well, and better than many other handbooks I've studied.

That said, there may be some extra room to make each chapter even tighter around a specific topic, and avoid repeating the same information in other chapters.

For example, chapter 7 on Callous-Unemotional traits could combine with chapters 19/20 on children and adolescents.
Various mentions to DSM could also be combined into Chapter 12 only.

And various mentions to Ckleckley and his pioneering work could be omitted from some places, epscially in light of the more recent findings available today.

This could tighten the book around stronger, core chapters, and free up enough space to then:

Cover some basics

- **A clear comparison between major diagnostic tools (ie.: PPI vs PCL-R)**, discussing the different items, forensic vs. non-forensic use, and why Factors 1 and 2 correlated in the PCL-R, but not in the PPI. Understanding this for example helped me evaluate whether antisociality is truly a core psychopathic feature rather than an artifact of PCL-R
- **Brief primers on commonly cited physiological markers** such as 'fear-potentiated startle' and skin conductance, explaining how they are measured and why they matter (at first I wondered why it's startle *potentiation* than matters, rather than simple startle response)

Provide a 'researcher-community' overview

Some of us non-researchers turn to handbooks for an integrated overview of the full literature in a single volume. And it would add immense value to know where the broad research community stands on certain open and debated issues.

For example, do most researchers today believe that antisociality is a core component of psychopathy? Do most researchers consider PPI a better measurement than PCL-R? Do most researchers prefer the triarchic model over

factor 1/factor 2 from PCL-R? Or do they regard the PPI's factors as better descriptors of psychopathy as a whole, not limited to prison populations?

I am aware there may not be an easy quantitative metric to capture field-wide consensus. However, even general impressions from well-positioned researchers, for example cautiously presented in a side box, would add substantial practical value for readers trying to understand where the field currently stands.

Clarify the role of IQ as a moderator for antisociality/violence

I was interested in this area of research and was first surprised by chapter 24's findings that IQ didn't seem to have a stronger moderator effect.

However, Chapter 25 then seemed to suggest a stronger role of IQ in moderating violent behavior, even as it ends by implying it may be due to better *evading* conviction rather than not engaging in it.

Chapter 24 instead seems to downplay the role of intelligence in moderating antisocial behavior for successful psychopathy (evidence for model 2 of successful psychopathy). Even if IQ helps evade conviction, from an amoral point of view, that would still boost the case for 'successful' psychopathy at least from an individual fitness point of view.

REVIEW

The *Handbook of Psychopathy* is one of the most comprehensive and rigorous syntheses of modern psychopathy research to date, and it provided an important empirical foundation for our articles and lessons on psychopathy.

I am grateful to the authors for their rigorous work and look forward to following their progress as they continue to move the field forward.

Is The 48 Laws of Power Evil? A Clinical Analysis

Lucio Buffalmano · 13 April 2026 · Archived copy · Original

Robert Greene's *The 48 Laws of Power* is often defended by fans as a neutral observation of history or a necessary defensive manual.

At The Power Moves, we don't stand for comfortable lies.
We've read Greene closely, analyzed the book's tone and structure, and taught power literacy to thousands who went on to achieve their goals while staying honorable. Short verdict first: **yes, The 48 Laws of Power contains highly manipulative elements and, by our definition, leans toward what we classify as 'evil'**. Below, we show why it is so.

Let's dive in.

This is a moral-free analysis, not a moral prescription
We provide evidence that the book is manipulative and skewed towards evil-making, without suggesting the book is 'bad' or that it should be 'good'.
⍰⍰ For the complete overview in one single place, see the main 48 Laws of Power guide

Is The 48 Laws of Power Manipulative?

The TPM Manipulation Model defines manipulation as:

> Manipulation is a form of influence that disguises objective truth for selfish ends, and can be costly to the receiver.

Based on this definition, it's clear that ***The 48 Laws* is manipulative** because Greene's recipe for power *revolves* around deception for selfish ends, aimed at creating win-lose exchanges, and with a high likelihood of harming the receiver.

Important elements that differentiate between persuasion and manipulation are also intention, such as if one manipulates in bad faith, and consideration towards the target, such as if one doesn't care about harm. *The 48 Laws of Power* shows no consideration for the targets and instructs in bad faith.

Take a few core laws as examples:

Law of Power	Why Manipulative
Conceal Your Intentions	a directive to lie systematically. If it wasn't clear enough from the title, Greene instructs: "*Keep people off-balance and in the dark, Guide them far enough down the wrong path, envelop them in enough smoke*"
Pose as a Friend, Work as a Spy	This is straight-up social engineering. And it's not even goal-based, as Greene seems to promote this as a baseline behavior when he writes, '*There is no occasion that is not an opportunity for artful spying.*'
Discover Each Man's Thumbscrew	Greene instructs to find insecurities because "*it is a thumbscrew you can turn to your advantage*". This is predatory, probably emotionally manipulative, and potentially even sadistic vexing of others

And these aren't outliers, either. The entire book is laced with imperatives like "Get others to do the work for you, but always take the credit" (Law 7) or 'Use selective honesty and generosity to disarm your victims'. If this isn't manipulation, then what is it?

Is The 48 Laws of Power Evil?

Let's first define 'evil' for a fair assessment:

> Evil is a selfish and predatory approach that sees others as means to an end, without a preference for win-win outcomes, and coupled with lack of empathy, care for others' well-being, guilt, and remorse

Now, based on this definition, ***The 48 Laws of Power* is evil because it prescribes an amorally selfish path to success while ignoring others' well-being**, without adding caveats for the human costs, and while ignoring potentially more effective win-win alternatives.

Greene's book is goal and power oriented, amoral, and without any compunction for others. If anything, *The 48 Laws of Power* may be more evil than a purely amoral approach because an amoral approach would include equally or potentially more effective genuine self-development and exchange; Greene's book lean more on win-lose and predation, instead.

This is also why *The 48 Laws* doesn't work that well in real life. It's because an effective approach would include self-development and smart cooperation.
These approaches are either underdeveloped or completely absent. Geeene himself suggested as much when he said that his follow-up book *Mastery* was to remediate this issue.

Evil is the Book's Main USP

The more it shocks, the more it sells

The book is popular in large part *because* the laws are framed as offensive and evil.

If you skip the "evil" frame, what's left? Valid but much blander advice like "Master the art of timing" (Law 35). Or purge the evil framing, and you get platitudes like 'consider your costs and returns before committing' (Law 20) or 'hire based on competence, not friendship'.

Is Robert Greene Evil?

No, Robert Greene is not evil. He *authored* a book that is inherently antisocial, but books do not necessarily represent an author's beliefs, values, or character.

Greene is on record saying that he wrote *The 48 Laws* because he was tired of the hypocrisy of naive self-help and wanted to call it out.

And his approach was sound. To correct cultural trends, it can be helpful to grab attention and go extreme in the other direction to rebalance things more quickly.
Greene went extreme into the dark side to 'average out' self-help total lack of 'darker side'. And the Messianic tone and marketing, he grabbed and diverted attention to a new course-correcting paradigm.

The need for 'correcting' general self-help is something we also share with Greene, and he did a masterful job at it.

⍰♂Lucio's Take: **Greene comes across as an ethical, values-driven individual**

Lucio:
In his interviews and videos, Greene often comes across as a thoughtful, ethical, and even openly vulnerable individual, including when discussing his stroke recovery and the importance of empathy.

In his criticism of other manosphere influencers, he also shows a preference for win-win, a distaste for dark-triad behavior, and a philosophy that rejects tribalism in favor of humanism—something I also largely agree with.

Read more:

- **Robert Greene review**: pros and cons of Greene as an author who is low in empirical evidence, but high in intuition
- **Naive self-help**: why it fails ambitious men

The Weakness of Denying

Denying that *The 48 Laws of Power* is manipulative is common, but unconvincing at best.

It's:

- **Weak critical thinking**, and failure to appreciate reality (funny, if someone claims to enjoy the book for its 'realness')
- **Manipulative denial**, including an unintended gaslighting effect and self-manipulation (funny, doing that on a book about manipulation)
- **Virtue-signaling**, out of concern for looking bad if they're reading, enjoying, or advocating for a manipulative book

To be clear, exceptions always apply. Some readers do extract defensive insights from the book, and they're truly well-meaning.

But some others may gain by confronting the more uncomfortable truth.
Greene may say the denial betrays their own shadow, the repressed cunning and ambition the book awakens.
But we prefer empirically supported psychology, and cognitive dissonance may be at play. Admitting the book is

manipulative forces people to face their own darkness. So instead, they rationalize and virtue-signal with 'it's history', 'it's defensive', or 'it's about how you apply' (implying they apply it 'well').

Let's now review some common 'denial of the obvious':

1. "But Greene is only describing history" — no, it's clearly *prescriptive*, not descriptive

You'll often see the line, including from the author: *the book is simply describing power dynamics.* That's false for three reasons:

1. **Prescriptive tone:** Greene doesn't write saying 'historically some leaders did X'. He writes with imperatives
2. **Structured as 'rules to follow':** The book presents its maxims as laws to follow for those seeking power. The book provides advice on how to apply the maxims, not merely how they appeared in history.
3. **Frame of effectiveness:** The examples emphasize effectiveness and mimicry, not critical context

Here's the difference if it's not immediately clear:

Prescriptive	Descriptive
Crush your enemies totally	Historically, leaders who attacked without scoring a dominant victory sometimes stoked revenge-seeking (ie.: WWI and Germany)
Conceal your intentions	Hiding intentions prevents competitors from undermining and out-strategizing you, but over-concealment in close relationships can undermine trust

2. "You can use the laws defensively" — the book is written as *purely offensive*

First off, readers can use the book for self-defense since knowledge of offense also empowers defense. However, **the book is written purely as an offensive guide.**

Here's the difference if not immediately obvious:

Actual 'laws'	Defensive framing
Keep others in suspended terror	Some despots try to instill fear to keep you subjugated
Conceal your intention	Don't always fully trust others in competitive settings: they have an incentive to lie and mislead you
Pose as a friend, work as a spy	Be careful of friends who ask personal information, but share little. Some of them may be looking for intel or leverage over you

3. It's about "understanding power" — no, it focuses on defection *only*

The book helps to understand *some* aspects of power. And thanks to its popularity and its anti-naive focus, it's the first step into power-awareness for many.

Here's the difference:

Promoting Defection	Understanding Power
Keep others in suspended terror	Suspended terror works with absolute power and disempowered followers who can't quit or organize revolts. It risks defection and revolts when these conditions aren't met
Crush your enemies totally	It's best not to wound vindictive and powerful foes who can inflict damage. But smaller attacks or power moves can signal dominance, instill fear, and divert their resources into defense
you have more to fear from friends than from enemies. If you have no enemies, find a way to make them.	Friends & allies are power multipliers. Look for cooperation opportunities, but be careful because the tighter the cooperation, the larger the defection risks. Always have contingency plans and fallback options.

An analytical treatment of power is broad, covering both pros and cons of different strategies. It would teach:

- **Costs and benefits of both cooperation and defection**, including how to create alliances while minimizing the risks
- **The benefits of honorable behavior (ie, credit-giving)**, a proven path to 'prestige-based status'. For example, giving credit retains and motivates talent
- **Psychological benefits of honorable behavior**, including higher self-esteem for many

The truth is that cooperation is a foundational aspect for any large accomplishment. Look around, all the greatest empires and accomplishments have been cooperative endeavors. Cooperation builds empires and alliances maintain them. But Greene includes none of that in *The 48 Laws*.

4. It's about psychology – no, it's about dark psychology

Applied dark psychology refers to psychological principles and dynamics to gain power and control over others, and it's heavily associated with manipulation dynamics.

In general, and unlike psychology, dark psychology focuses not on general human nature, but zooms in on the more competitive, selfish, and negative aspects, without considering the 'brighter' and more cooperative aspects.

Fans say that the book describes reality, but at most, it describes only one side of reality. The *dark* side.

Dark focus-only	Psyhcology
Self-interest runs the world	Living creatures are self-interested, but that self-interest can be expressed through cooperation. Humans also developed a sense for moral and ethics, often preferring to 'do the right thing'
Friends resent you and will betray	Many people are calculative, and the odds of betrayal increase with its benefits. However, people differ in their likelihood of betraying

With this distinction in mind, the book isn't about 'understanding psychology', which would include the evolution and psychology of cooperation, free-riding detection and punishment, and the evolution of morality.

Being charitable, one could say that *The 48 Laws* focuses on dark psychology only. But it doesn't present a broad overview of dark psychology either, so it's more like a selection of dark psychology tactics.

Own It, Quick Making Excuses

Quit the self-defense and untruthful claim. While it's tempting to rationalize the book's content to avoid the manipulator label, accepting the book for what it is—a manual on deceptive influence—is the first step toward true power literacy.

Its manipulativeness may as well be its strength, focusing on one thing only, ruffling feathers, and providing an important wake-up call for many too-naive men.

In Sum: 100% Manipulative, 80% Evil

Based on the TPM framework, the book scores as fully manipulative and highly evil.

It's not *fully* evil since the book's offensive mode is *instrumental*, in that it creates harm while seeking to achieve goals, but it doesn't harm for harming's sake.

FAQs

Is The 48 Laws of Power Evil?

The book is approximately 80% evil. Based on the TPM framework, "evil" is defined as a selfish, predatory approach that views others merely as means to an end, lacking empathy and concern for others.
The 48 Laws of Power qualifies as "evil" because it prescribes an amoral path to success that ignores human costs and omits equally effective, prosocial alternatives like cooperation and self-development. It is categorized as **instrumental evil**—harming others to achieve a goal—rather than sadistic evil (harming for pleasure).

Is The 48 Laws of Power Manipulative?

Yes. According to the TPM definition of manipulation, *The 48 Laws of Power* is **100% manipulative**. The book meets the clinical definition of manipulation because many of its laws instruct readers to disguise objective truths for selfish ends, often at a high cost to the receiver.

Is Robert Greene evil?

No. While Robert Greene authored an inherently antisocial book, he is not an evil person. Greene has stated that the book's extreme tone was a deliberate **course-correction** against 'naive self-help'.
Therefore, the book is a strategic tool for attention and paradigm-shifting rather than a reflection of the author's personal moral character.

Alternative: Effective Machiavellianism

Effective Machiavellianism combines manipulation know-how with cooperation and win-win because they're both important for different contexts and goals.

If your aim is results — money, influence, freedom —, Effective Machiavellianism adapts amoral strategies to competitive settings *and* appreciates the possibility of win-win and genuine relationships for a higher life quality.

Honorable Machiavellianism is similar, but adds the preference for win-win, distaste for cheating and lying, and the drive to add value.

Power University teaches both: ruthless effectiveness, and how to achieve everything you want while staying honorable.

Successful Psychopathy: A Strategy Guide for Ambitious Men

Lucio Buffalmano · 20 April 2026 · Archived copy · Original

The "Successful Psychopath" is often described as having stress immunity and fearless traits with high executive control to thrive in leadership, crisis, and competition.

However, that's a baseline, and at TPM we prefer a more systematic approach that maximizes personal power and the odds of success.

This article outlines TPM's *strategic psychopathy*: the maximization of traits and strategies to deliver *effective psychopathy*, a system for repeatable and sustained success.

Core principle: Effective Psychopathy is based on calibration to context
For many psychopaths, extreme or 'always-on' expressions often turn maladaptive. It's calibration + 'optimum balance' that unlocks higher levels of effectiveness.

Baseline 'successful psychopathy'	TPM Effective Psychopathy
Affective Detachment: undermines long-term bonds; eventually feels "robotic" or "off" to others.	**Strategic Empathy**: on and off switches and 'compartmentalization' gets the best of both worlds
Ruthlessness can be good in business but burns bridges and triggers retaliation	**Selective ruthlessness** and compartmentalization calibrate to context
Zero stress = less preparation and lack of 'clutch performance'	**Performance arousal**: Selective & balanced pressure provides hyper-focus
Fearless approach-orientation often ignores or underestimates risks	**Bold utilitarianism** for outcome-maximization planning + bold execution
Superficial charm works for first impressions but loses appeal over time	**Power + warmth** attracts (prestige) and earns for long-term social power
Grandiose confidence: miscalibrated + poor planning = lower results	**Calibrated confidence**: strong self-belief grounded in reality and feedback

Contents

- Phase I: Building The Engine
  - Develop Unshakable Self-Belief
  - Develop Boldness
  - Adopt Utilitarian Thinking (Bottom Line-Based Rationality)
  - Grow Strategic Detachment (Emotional Non-Reactivity)
  - Master 'Mission Mode' for Strategic Ruthlessness (Compartmentalization)
  - Use Strategic Extraversion ('Social Performance Mode')
- Phase II: Neutralizing the Liabilities
  - Control Disinhibition
  - Boost Conscientiousness
  - Develop a Long-Term Time Horizon
  - Optimize Decision-Making: Focus on Risks, Not Just Rewards
  - Build Your "Moral Anchor" (Self-Imposed Rules)
- Phase III: Sustained Power & Success
  - Use Power to Underwrite Cooperation, Not To Force It ('Pull Approach')
  - Calibrate Calm & Detachment: Welcome 'Performance Arousal'

  - Maintain Win-Win Utility: Long-Term Alliances
  - Find Meaning & a Mission: Legacy & Curing the Void
- Checking the Stats

Phase I: Building The Engine

This phase focuses on cultivating the more adaptive core psychological mechanisms of primary psychopathy (low fear, stress immunity, calculated charm) without maladaptive behavior.

Develop Unshakable Self-Belief

Power starts with the mind, and self-esteem and self-confidence are foundational to a man's power.

Primary psychopaths' high self-confidence offers several mental benefits. But it can border on the unrealistic, and doesn't always lead to results when it lacks proper planning and execution.

The effective psychopath instead must temper confidence with realism, plans, reality-based feedback, and tireless execution.
More on effective confidence:

- **Antifragile grandiosity**, for high confidence without fragility
- **Confidence University**, for the full guide on turning self-esteem into results

Effective confidence starts with the subconscious and must always provide the foundation for effective action

Develop Boldness

Boldness is one of the most consistently adaptive components of psychopathy in the literature, combining two foundational advantages: low anxiety/stress immunity, and bold action/acting under pressure (Lilienfeld, 2018).

Develop Fearless Calm (Physiological Control)

Primary psychopaths have lower stress reactivity and greater physiological calm under pressure. It can be a massive advantage in crisis, escalations, and conflict situations.

- **Meditate** (e.g., mindfulness, breath-focused attention): reduces physiological arousal and anxiety, improving emotional regulation (Chen et al., 2012)
- **Exposure therapy**: Increasingly more challenging experiences to expand your comfort zone. Join public speaking clubs, improv classes, etc.
- **Physiological Downregulation:** Slow breathing, relaxation techniques, and controlled body language directly reduce arousal and improve stress resilience.
- **Embrace mortality** to 'be at peace' with the worst scenario

Learn to Act Despite Discomfort (Fearless Dominance)

In terms of pure agency, fearlessness doesn't have to be 'absence of fear'. The ability to act *despite* fear is all that matters.

- **Decouple anxiety from action**: The physical sensation of anxiety (heart racing, shortness of breath) must not be obeyed with submission or inaction. Act *despite* the fear.
- **Quit overthinking** (bias for action): Become more pragmatic and focus more on action and results. Practicality > philosophy
- **The 3-Second Rule:** Act within three seconds before the emotional mind can generate a prohibitive narrative

🤔Lucio's Take: **Embrace competitiveness to overpower fear**

Lucio:
I remember a football coach telling my parents I was fearless on the pitch, 'going in' without a care.

While I score high in boldness, I never felt 'fearless'. I'm very calculative with risk/rewards, and I always felt performance pressure, especially with crowds. But I was very competitive and driven to show resolve and power to

the opposing players. They weren't going to waltz on 'my' goal.

Being physically unimposing only made me *more* fearless, *especially* towards larger players. Fearlessness was a necessary tool to turn the size gap around.

Adopt Utilitarian Thinking (Bottom Line-Based Rationality)

Utilitarian thinking seeks the best course of action based on what maximizes outcomes. It empowers you to make purely logical decisions, independent of moral considerations. That doesn't mean it's 'immoral'; it may even be *more* moral when maximizing personal and social well-being.

- **Adopt an outcome-based morality**. ⍰ 'What is good is what maximizes utility'
- **View problems as equations**, not narratives. Ask: "What provides maximum benefit for the system?"
- **Effective calculativeness**, investing only in what yields a return
  See **effective calculativeness ↗**

Grow Strategic Detachment (Emotional Non-Reactivity)

Strategic detachment enables outcome independence and emotional non-reactivity (non-neediness), maintaining focus on agentic goal-achievement.
Reduced emotional reactivity is associated with mental well-being, including lower rumination and distress. For example, psychopathy researcher Kent Kiehl notes:

> psychopaths don't get distressed by being in prison (…) they don't get bothered by much of anything. They don't ruminate and they don't get depressed.

- **Expose yourself online** with opinions or content creation. Use negative feedback to reduce emotional reactivity and build tolerance to social disapproval
- **Embrace Effective Spirituality**: Transcendence can boost non-neediness and self-sufficiency
- **Stoic 'amor fati'**: Accept what you cannot control and focus on what you can influence

Strategic detachment in intimate relationships
Emotional detachment may undermine pair bonding and facilitate a short-term sexual strategy (related to 'player psychology' and 'lover strategy').
However, while some psychopaths may be abusive out of power motives, positive expressions of detachment can be protective *against* heartbreak, controlling, and abusive tendencies (Douglas, 2018; Hilton et al., 2008; Rock et al., 2013).

Immunity to Social Disapproval

Social approval can be a valuable and sometimes fundamental resource, but needing it puts you at the mercy of others, including judge power moves.
The effective psychopath pursues approval when it's instrumentally effective, and ignores it when it's not.

- **Put yourself first in daily interactions:** e.g., disagreeing, asking a difficult question, walking away from social functions you don't enjoy.
  See how to be a good asshole ↗

Master 'Mission Mode' for Strategic Ruthlessness (Compartmentalization)

Compartmentalization selects 'modes' based on contextual effectiveness.
And while power+warmth is a strong behavioral baseline, too-nice men must understand that **meanness may be**

the most adaptive 'mode' in some contexts (despite often being labeled as 'maladaptive' in the literature).

A study asked psychology experts about the traits of successful psychopaths they knew, and their list featured deceitfulness, arrogance, manipulativeness, lack of remorse, callousness, and egocentricity.

- **Personality calibration**: Realize that people differ, and some cheat more. Keep your best self for the best people, and your strategic self for the rest
- **Remind yourself of your objective:** Tell yourself 'The goal is X' to switch back to mission mode

Love tip for nice guys: realize that love rests on power
Many women aren't programmed to love kind and weak, but kind, strong, and life-effective.

Empathize Strategically (Performance vs. Relationship Mode)

Empathy is what makes us human and supports genuine relationships, but it can also prevent effective action.

The Effective Psychopath can act ruthlessly when needed (low affective empathy), while still perfectly understanding others (cognitive empathy) to predict and manage behavior.

- **Discover needs:** Find out what people truly want and need. Tip: most people want the same things
- **Read people and characters**: Start by learning to read body language for cues of inner states. Graduate to predicting behavior based on character and context
- **Run the full 'empathy gamut' for maximum effectiveness**: Eg., empathic listening and caring in close relationships, dominant and talkative during group formation, and more ruthless in business
  - Empathize strategically: mirror and validate for social capital (e.g., "I can see why you would want that")

Be a Strategic Chameleon

Most environments are mixed.
Work is a mix of competition and teamwork, and most relationships are a mix of converging and diverging interests.

For mixed situations, anything that's 'pure kindness' or 'pure meanness' backfires.

What may work best at work is **an outer layer of teamwork, but a core of Machiavellian calculativeness.** And what may work best in relationships is to boost cooperation, while remaining vigilant and preparing for the possibility of defection.
See:

- The myth of emotional intelligence: Machiavellians at the top

Use Strategic Extraversion ('Social Performance Mode')

Social power, linked to extraversion, boldness, and grandiose narcissism, facilitates leadership emergence, social status, and group influence.

- **Learn to 'switch on' ('social performance mode'):** If you're not naturally extroverted, you can always *act* like one. The more you do it, the better you get (and you may learn to enjoy it)

🤔Lucio's Take: **I 'switch on' extraversion entering new groups**

Lucio:
Despite being high self-sufficiency and leaning towards introversion, I always switched on 'social performance mode' when entering new groups. I approached more, talked more, and sometimes read the room to move towards higher status members ('social climbing').

This approach made friends and gained status, even allowing me to coast in future interactions.

Phase II: Neutralizing the Liabilities

This phase focuses on building the external structures—the guardrails—that prevent disinhibition and meanness from causing chaos, unnecessary harm, and failure.

Control Disinhibition

You must put in place systems to suppress irresponsibility. The Effective Psychopath is self-controlled and resolute (at least for his agentic goals).

- **Control dopamine loops**: Consider a clean-slate start with a 'dopamine detox'.
  - Train delaying rewards: Only allow yourself the reward *after* the work
  - Schedule blocks of 'deep work', without distractions
- **Use pre-decisions and "if–then" rules**: eg., 'If I feel a reckless impulse, I must wait 10 minutes before acting'
- **Develop accountability systems:** Don't rely on motivation, use public commitments, contracts, habits with rewards/punishments
- **Force financial discipline:** Implement automated savings and investments to counter impulsive spending

Establish The "Boredom Management System"

Chronic need for stimulation can lead to impulsive, self-destructive behavior. Counter it with:

- **Channel stimulation-seeking into value-adding pursuits** like entrepreneurship, learning complex new skills, or structured competitions
- **Replace destructive or overly risky thrills** with extreme but controlled sports (mountaineering, structured racing)
  - Consider videogames for easy thrills with less risk and effort
- **Develop habits:** Create daily routines to stabilize life (morning exercise, work schedule, food breaks)

Boost Conscientiousness

Conscientiousness is associated with many positive life outcomes, but psychopaths tend to be low on multiple facets of conscientiousness (Ozer & Benet-Martinez, 2006; Miller et al., 2001).

Higher conscientiousness instead can counteract impulsivity while enabling sustained, goal-directed execution. It's an important trait to boost success for high psychopathy individuals (Benning et al., 2018).

- **Goal setting & plans:** Define actionable goals, with a schedule, and execution routines
- **Pursue meaningful goals** that matter to you
- **Reward yourself for following through**

Technical note: address one, improve everything else
Twin studies suggested there may be a common 'disinhibitory liability' among psychopathy, ASPD, substance use disorder, and low conscientiousness (or low constraint) (Sher & Slutske, 2003), so addressing one can help with the others.

🤦♂️Lucio's Take: **How I developed conscientiousness**

Lucio:
I boosted conscientiousness in 3 ways:

1. **Switching to goals I care about**, pursuing my mission with TPM and Power University
2. **Aligning incentives**, from employee to entrepreneur

3. **Linking execution to honor** and earning my own respect. Reward after execution feels great. Reward without following through feels like dishonorable slacking

Develop a Long-Term Time Horizon

Psychopathy researcher Robert Hare said that psychopaths' behavior makes sense only if you live in the now. But immediate gratification undermines ambitious men seeking long-term success.
Besides the systems and mindset we mentioned, consider this:

- **Visualize the trajectory** 5, 10, and 20 years in the future. Anchor your daily choices to your high-value future self

Optimize Decision-Making: Focus on Risks, Not Just Rewards

While pop literature on 'good psychopathy' stressed psychopaths' utilitarian thinking, psychopaths' decision-making is often sub-par because it loses sight of risks when rewards are salient.
This can cause personal and financial losses — and leave you open to exploitation.

- **Focus on risks more than on rewards**. Studies show that psychopathic individuals can avoid monetary punishment just as well when that's their sole goal (Newman and Kosson 1986)

Build Your "Moral Anchor" (Self-Imposed Rules)

Since psychopathic individuals can lack a conventional internal conscience, they must create a logical code of conduct to keep them on track.

- **Set key red lines** that tend to be high cost and low rewards (e.g., "Never do substances", "Never assault", etc.)
- **Manage Aggression**
  - Channel aggression into training, sports, competition
  - Learn the often larger benefits of *pull* approaches.
    See: Motivational leadership ↗; soft power ↗; prestige ↗
- **Adopt TPM's "honorable power" framework**, combining honor with effectiveness
  - Switch mindset: value taker = weak dishonor. Value giver = strong honor

See:

- **The honorable man's guide**: honor, without costs

> The Honorable Man's Guide: Power, Respect, and Success

Phase III: Sustained Power & Success

This phase ensures that fearlessness and detachment are used to build sustainable institutions and legacy.

Use Power to Underwrite Cooperation, Not To Force It ('Pull Approach')

Once you have the *capacity* to be ruthless, it's time to wield it effectively. How much to show and use depends on context. But in general, for most life situations in modern states, **use display of force as leverage while seeking to avoid its actual use.**
Carry the sword, and keep it sheathed unless needed.

Al Capone said ‘You can get much further with a kind word and a gun than you can with a kind word alone’. But Capone’s proclivity for leading with coercion delivered a series of attempted murders, and imprisonment at just 33 years old.
Roosevelt’s ‘Speak softly and carry a big stick’ instead leads with cooperation and **backs cooperation with credible power**. And it set the ground for a longer-lasting empire.

This approach minimizes betrayals and costly escalations, while enjoying the fruits of peaceful cooperation.
And it aligns with our foundational social strategies and with seminal game theory work on effective cooperation (Axelrod, 1984).

Lucio’s Take: **Be low average meanness, but scale it fast to match needs**

Lucio:
While I score low-ish on meanness, my despisal for uncalled-for meanness allows me to muster the indignation and power to at least match it back.

This is a good combo.
Low average meanness allows for greater long-term alliances while making fewer enemies.
But you can draw from the ‘reservoir well’ of meanness to match various social attacks, ‘power moves‘, or betrayal.
In game theory, this is ‘niceness’ + ‘provocability’.

Learn more:

- Strategic cooperation

Calibrate Calm & Detachment: Welcome ‘Performance Arousal’

Once you can detach enough, it’s time to calibrate it.

Detachment seems to follow an inverted U-curve of optimum balance and ‘performance mode’ may benefit with moderate arousal.
For example, research suggests that while successful psychopathic individuals show increased heart rate before and during a public speech, unsuccessful ones don’t.

Benning (2018) suggests a relation with self-monitoring and impression management, conceptually closer to narcissism (Gangestad & Snyder, 2000). Self-monitors aren't lower anxiety, but Clifton notes they are superior social chameleons and charmers, and date twice more than non self-monitors (Snyder & Simpson, 1984).

Maintain Win-Win Utility: Long-Term Alliances

Long-term cooperation boosts returns for all, including for agentic players focusing on their own goals (Axelrod, 1984).

Some psychopaths' tactics of relocation and aliases to escape burn reputations are weak, bottom-feeding chater stratetgies that undermine ambitious men.
A better baseline strategy instead is to do this:

- **Gain a strong reputation**, gaining status, respect, and prestige in your social circles
- **Focus on value**, being high-value, providing value, and then finding other value-givers and matchers

Learn more:

- Social exchange and social investment model, the foundations of exchanges
- Strategic cooperation

Find Meaning & a Mission: Legacy & Curing the Void

The final stage of mastery is giving the detached, fearless life a direction and long-term focus to counter the inherent meaninglessness of a purely detached existence.

- **Channel your drive beyond material gains**
- **Find a project that will outlive you**
- **Think in terms of legacy**

This 'pull' approach of a motivational mission is far superior to 'routines', 'habits', and strictures.

Honorable Psychopathy: Pursue Value-Adding Missions

Honorable psychopathy places **strategic honor** with a preference for win–win and value-adding pursuits as the

baseline.
With this approach, **the mission adds value to humanity and civilization.**

This is TPM's favorite approach.
For non-psychopathic men, it also delivers a better life quality, with genuine charismatic leadership, and genuine relationships.

Checking the Stats

The goal is not to become a psychopath.
It's to become a controlled, high-effectiveness operator who can access these traits when they boost results—and shut them off when they don't.

For a general baseline and a rough guideline, aim for these results in the Triarchic Psychopathy Measure:

- **40+ in Boldness**
- **20-30 in Meanness,** but you can keep it scalable to match challenges
- **Below 25 in Disinhibition** for control and long-term success

For a full framework on how to incorporate dark triad traits into an honorable and successful life, we built our full course Power University:

The Competence–Value Model: How Competence Drives Power

Lucio Buffalmano · 27 April 2026 · Archived copy · Original

Competence is the practical ability to produce reliable results in a domain, and it's one of the two main bedrocks of success.

At TPM, competence is a foundational pillar of men's empowerment because **competence strongly translates to leverage**, and competent men tend to gain respect, status, and attraction.

The Competence Loop: Competence is one of the foundations that boosts value, delivers outcomes, and boosts mental power with a positive 'outside-in' feedback loop

Contents

- Competence-Value Amplification Model™
  - The Limitations of 'Hacks-Seeking'
- The Science of Competence
- How to learn & become competent
  - How to Develop Skills
  - How to Learn
- Books on Learning: TPM Reviews
- TPM's Take: Key Competences In Life

Competence-Value Amplification Model™

The Competence–Value Amplification Model™ states that outcomes are largely determined by competence and personal value, while strategies serve to present, amplify, or at times misrepresent the underlying reality.

Strong fundamentals produce even stronger outcomes with good strategies and signaling; Amplying weak fundamentals instead undermines you.

Value, competence, and strategies are distinct, yet they overlap and reinforce each other.
Competence is technically a form of value, and can be offered and leveraged in social exchanges to demand value back, either in the form of financial compensation or status (and often both, see Blau, 1964). They're also connected in the sense that improving one usually improves all the others.
But to give you an idea, consider these three different examples:

Context	Strategies	Foundations (Competence & Value)
Entrepreneur seeking capital & team	Pitching, persuasion, social networking, negotiation tactics	Leadership competence; product or idea quality; execution ability; ownership/equity position
Dating, seeking a partner	Approach many, hide interest, signal value, plan the date	Dating competence (leadership, positive dominance, etc.); attractiveness; provisioning ability (his overall 'SMV')
Scializing, seeking friends	Mirror, relate, ask deeper questions	Power & social skills (power/warmth); confidence; status (job, income, etc.)

When we talk about value and competence being 'fundamental' and 'deeper', it doesn't mean that strategies 'matter less'. Value-signaling, self-promotion, and various social strategies are competencies in their own right, and are critical elements of the 'outcome chain'.
In fact, most men sell themselves short by failing to showcase their true value properly.

However, **strategic competence alone struggles to substitute underlying competence and value**, and especially so in the longer run.
Instead, the more objective levels of underlying competence and personal value can set a ceiling and constrain the effectiveness of any strategy. Especially so for men who prefer an honorable approach and don't want to lie and manipulate.

Instead, the higher your competence and more objective personal value, the more successful your strategies will be. Be competent and high-value enough, and even basic strategies will work

The Limitations of 'Hacks-Seeking'

This model clarifies a common misconception among many beginners who seek an edge, without addressing the foundations.

Some beginners are attracted to various tactics from 'dark psychology', showy 'power moves', or 'laws of power' that are often surface-level tactics, sometimes high manipulation and Machiavellianism (see 'why 48 Laws don't work'). But they still don't get results because they skip the foundations of personal value and social competence (including social power and positive dominance).
Beginners don't lose because of tactics. They lose because they lack value.

In truth, all the tactics in the world will at best build a castle in the sand if you don't back it up with competence and personal value. That castle will collapse as soon as it's stress-tested by life or others (P.S.: many men looking into 'how to pass shit tests' would also be better off working on competence and value. Tests only happen when value/competence are uncertain).

Strong leaders and 'alpha male types' don't rely on tricks. They're actually high-value, competent, and confident.

Power built on hacks, 'power moves', etc. collapses under stress. Power built on real competence and value delivers outcomes that last

The Science of Competence

Roughly listed from most important for real-life outcomes:

1. Real-Life Competence: The Ultimate Goal (Conscious Competence Matrix)

Real-life competence is what matters most to achieve most life and socially relevant goals. This is because gaining status, respect, and attraction requires effective and real-time behavior.

One of the most common questions we get is how to come up with the right response in real time.
What most don't realize is that by analyzing interactions, they are already one or two steps ahead of most men.

With continued analysis and exposure, real-time competence follows.

This framework is widely used in training and performance development and maps four stages of skill acquisition:

1. **Unconscious Incompetence:** You are clueless, and you don't even know it <— Where many men stand for power dynamics
2. **Conscious Incompetence:** You realize exactly how bad you are <— This is where the ego takes a hit, and many prefer denying instead of doubling down
3. **Conscious Competence:** You can understand or execute, but with cognitive load and focus <— At this level, you're not yet fully 'real-life effective' because the right move only becomes obvious later, upon reflection
4. **Subconscious Competence (Mastery):** The skill is fully myelinated and automatic <— You're 'real-time effective', gaining status, respect and attraction as a simple consequence of 'who you are'

TPM Takeaway: Embrace Incompetence as Opportunity and Consciously Work on 'Subconscious Mastery'
Once your hard skills are on autopilot, you read the room's power dynamics subconsciously, freeing up mental bandwidth to strategize and achieve goals, while looking confident and 'natural'

2. Competence = 'Rewiring' (Myelin and Neuroplasticity)

Your brain builds competence by creating and reinforcing neural patterns.
Each time you perform a behavior, the same circuits activate (or "fire"). With correct repetition, those circuits become faster and more efficient through processes like synaptic strengthening and, over time, increased myelination.
In simple terms: **the more you practice something correctly, the more your brain optimizes that pattern for speed and accuracy, and the more the skill becomes ingrained and automatic**.

TPM Takeaway: Learn From the Best, Use Deliberate Practice, and Coaching
The brain doesn't always reward effort—it reinforces patterns. Learn and repeat the wrong thing, and you get better at being wrong. Masters ensure the information you get works. Deliberate practice improves performance by targeting weaknesses and plateaus with expert feedback.

3. Focus on Experience to Learn Patterns (Cognitive Load Theory & “Schemas”)

Research shows that working memory has a very limited capacity and can only process a small amount of novel information at once.
To overcome this limitation, experts develop **schemas**—structured knowledge representations stored in long-term memory that compress and organize information into meaningful patterns. Schemas reduce cognitive load by allowing complex information to be processed as single units rather than many separate elements.

- **Real-time competence is pattern recognition that reduces cognitive load and enables fast, automatic decisions under pressure.**
  Expert performance is largely automated pattern recognition, not conscious reasoning.

TPM Takeaway: Train Experience-Based Recognition Looking For Outcomes
Outcomes are always the final objective, and sometimes you want performances on first attempts. However, whenever possible, try to get more reps first. People try to “perform well” too early. Experts first build pattern recognition speed.

🤔Lucio’s Take: **Mastery is in the experience that develops patterns**

Lucio:
Experience is a crucial pillar for TPM because experience builds patterns from real-life exposure and experience. Experts can select more effective strategies and spot red flags based on the patterns they’ve seen.

For example, if they know that kind and supportive women tend to do X, then Y behavior is a red flag even in the absence of an obvious red flag.
And they can advise for or against a certain approach based on

However, IQ and analysis remain foundational for mastery. IQ learns patterns faster and better connects the missing dots to develop more complex schemas (and avoid jumping to conclusions from limited exposure).
Analysis helps fix the inherent limits of repeated exposure (eg.: the rarity of certain events and contexts coupled with humans’ relatively short life span).

4. Competence = Confidence: Bandura's Self-Efficacy Theory

In psychology, **self-efficacy** is your belief in your own ability to succeed in specific situations. Bandura's work suggests the most powerful source of self-efficacy is **mastery experience**—overcoming challenges and succeeding.

TPM Takeaway: Build Confidence With Competence & Improving Results
Skip affirmations, pop-psychology, and self-help myths. Whenever possible, build confidence with competence. Over time, that evidence compounds into a stable internal belief: *"I got this."*

5. The Dunning-Kruger Reality Check

The Dunning–Kruger effect is a cognitive bias in which people with low ability tend to overestimate their competence, largely because they lack the skills needed to accurately evaluate their own performance.

TPM Takeaway: Judge Yourself Based on Results
If you can achieve your goals and gain respect, status, and attraction, you're at a good level. If not, you're not yet fully 'life competent', and you have room for growth

How to learn & become competent

The great news is that competence can be increased. As a matter of fact, while personal value is slightly more tied to genetics, **most people can massively boost their competence**. So in this section, we will review how to become more competent.

We differentiate here between more practical skills, and learning.
For both of them, we recommend:

1. **Pick something you're naturally good at** because genetic predisposition matters
2. **Pick something you enjoy** or something you would do anyway. It makes hard work much easier

How to Develop Skills

What to Do	Why It Works
Define the skill as performance, not knowledge	Forces measurable outputs and ties practice to real competence
Break the skill into trainable subunits	Isolating weak components improves the system faster than repeating the whole skill
Use deliberate practice loops with fast feedback cycles	Rapid feedback is one of the strongest accelerators of learning speed
Use retrieval practice	Strengthens durable competence more than passive review
Space practice over time	Improves long-term retention and consolidation (spaced repetition effect)
Interleave related skills	Improves transfer and adaptability across varied conditions
Respect cognitive and physical limits	Prevents overload; working memory limits require structured progression
Track performance, not effort	Only observable performance reflects real competence growth

1. Define the skill as performance, not knowledge

- ✕ Bad: "Learn dating"
- ✓ Good: "approach 3 girls I like, go on a new date a week"

Competence improves when practice is tied to real performance, not passive understanding.

2. Break the skill into trainable units

If a complex skill can be broken into sub-units, isolate and train weak subcomponents.

3. Use deliberate practice loops (core mechanism)

Practice must be structured as a loop:

- Attempt
- Feedback: get tight feedback loops with external expert feedback.
- Error tracking and correction
- Repetition with adjustment

You do not improve from repetition alone. You improve from corrected repetition.
Fast feedback compression is one of the strongest predictors of skill acceleration.

4. Space practice over time

- Short sessions across days outperform long cramming sessions
- Forgetting slightly before relearning improves retention

Spaced repetition effect is one of the most robust findings in learning science.

5. Interleave related skills

Mix different types of problems or situations instead of repeating the same type.

- A → B → C instead of AAAAA → BBBBB → CCCCC

This improves transfer and real-world adaptability, even if it feels harder during training.

6. Do one thing at a time, and don't overload (respect cognitive & physical limits)

Do not try to learn too many elements at once.

- Start simple
- Automate basics
- Then increase complexity

TPM's law of optimum balance fits competence well. Both too little and too much can slow progress down. Too much with too high intensity also boosts the risks of injury.
The goal is not maximal suffering, but the right amount of it.

7. Repeat core actions until they become automatic

You know you're there where you can execute automatically, fast, and well.

8. Track performance, not effort

Effort feels productive but is often misleading. Competence is visible in performance curves, not subjective feelings.

- Measure outputs
- Track errors

- Track speed and consistency

How to Learn

What to Do	Why It Works
Build a conceptual map	Structures knowledge
Apply immediately or 'mentally stress test it'	Deepens understanding
Space sessions	Improves retention
Interleave topics	Builds flexible knowledge
Mental model reconstruction	Strengthens memory
Teach others	Reveals gaps
Anchor to existing schemas	Organizes memory
Embrace confusion (to solve it)	Motivates deep diving

1) Build a conceptual map first

Learning science shows that understanding the *structure* of knowledge — how ideas relate — is crucial for deep learning. The *framework* is what allows you to *reason and transfer knowledge*.

- Sketch the *big ideas* of the discipline before you start
- Identify the *core concepts* and how they connect.

2) Do and challenge the theory, don't just consume it

Whenever possible, doing is the best way to learn deep theory. When first-hand practice is unfeasible, 'stress test it'.

- Don't wait until you feel "ready"
- Start working on real problems early, even if you don't fully understand the theory yet
- Stress-test ideas: think how it could work concretely, and how it could backfire

Learn more:

- Three Pillars of Knowledge: first-hand experience, scientific evidence, and critical analysis. Competence grows best when those three are combined.

3) Space and revisit complex ideas

Spacing out study sessions improves retention and understanding far more than cramming — even for theoretical knowledge. This is one of the strongest findings in learning science.

- Don't try to understand everything in one pass
- Make notes to revisit later
- Revisit the same concepts the next day, then again after a few days

4) Use *interleaved study*

Interleaving helps your brain learn to *discriminate* between concepts and apply them flexibly. Especially useful in fields where concepts often overlap.

- Mix topics instead of mastering one completely before moving on.
  - e.g., study Group Theory, then Quantum Mechanics, then revisit Group Theory

- e.g., learn social exchange, think how it applies in your life; then social investment model, think what you can change in your life thanks to it; then learn effective calculatinveness and compare it to naive self-help

5) Build and test your *mental models*

Learning science shows that retrieving and reconstructing knowledge strengthens the mental model, or the internal representation of the discipline, which is the core of deep understanding.

Do not reread or rewatch. Force recall from memory:

- Explain the concept without notes
- Reconstruct the solution from scratch
- Predict how it applies in a new situation
- Draw diagrams or flowcharts

This strengthens durable competence more than passive exposure.

6) Use feedback loops (external or self-generated)

Feedback corrects misconceptions early — preventing you from reinforcing errors in your internal model.

- Check solutions against authoritative sources
- Ask peers or mentors to critique your reasoning

7) Teach or explain to someone else

Teaching forces you to organize your understanding and reveal gaps you wouldn't notice otherwise.

- Explain a theoretical concept to a peer, or even to yourself aloud
- Encourage them to ask questions: their questions can highlight your blind spots

8) Link new knowledge to what you already know

Learning science finds that new knowledge is learned best when it's anchored to existing schemas, becoming more organized and usable.
AskL

- 'How does this connect to what I already understand?'
- 'What is similar? What is different?'

9) Embrace confusion and revise

Feeling lost is part of mastering theory. It gives you the drive to seek the deeper mechanics that differentiate between the beginner and the master.

- Expect confusion early
- When you feel lost, lean into it and dig deeper

Books on Learning: TPM Reviews

- **So Good They Can't Ignore You** — Seeks to debunk the 'follow your passion' script and argues that skill and value come first.
  - ✅ Some valid arguments against passion-first thinking
  - ❌ Not the most scientific (quotes Pink and Gladwell's 10.000 hours rule); goes too far denying the role of

passion

- **Make It Stick** — A practical book on how to learn and retain information better.
  - ✅ Practical and evidence-based.
  - ❌ Less focused on high-pressure social or professional execution.
- **Peak** — Anders Ericsson's classic expertise book.
  - ✅ Foundational and research-based. Debunks the flow's concept from positive psychology for competence building
  - ❌ Deliberate practice is important, but not the whole story.
- **Mastery** — Robert Greene's attempt to fix the '48 Laws of Power' focus on dark tactics by adding competence.
  - ✅ Covers some power dynamics as well
  - ❌ Not scientific, more anecdotal and opinion-based; also not a guide, over-relying on mentorship
- **Ultralearning** — A self-directed, intense approach to skill acquisition.
  - ✅ Actionable and good for rapid, focused skill acquisition.
  - ❌ Can lean too hard on intensity if not balanced well; Bit of a 'bio-hacking' approach on tactics, rather than a full framework

TPM's Take: Key Competences In Life

The three main pillars of competence are:

Domains	Why
Mental foundation (self-esteem, antifragile ego and grandiosity, effective spirituality, confidence, etc.)	Mental power supports learning and sustains effort to turn competence into outcomes
Social competence (assertiveness, interpersonal power, high-power behavior, nonverbals, etc.)	Gives you respect, status, influence, and boosts attraction. It protects against the 'hollow success' of 'wealthy but not respected'. See: billionaire disrespected by girlfriend ↗
Life & strategic competence (Strategic thinking, effective calculativeness, positive Machiavellianism, etc.)	This is the 'strategic competence' that maximizes the presentation and outcomes of value and all other competencies
Work competence (technical skills)	Crucial for resources and career. And provides a floor of in case entrepreneurial efforts, more based on leadership and social competence, fail

These domains are distinct but strongly interdependent. Strength in one tends to reinforce the others over time. For example, status also supports mental and physical health.

We focus more on mental resilience in Confidence University, but Power University provides an overview of foundational mental power, fully covers social and life confidence, and also provides competence-based confidence:

Check Power University

Dark Triad: Traits, Benefits & Strategy Guide

Lucio Buffalmano · 4 May 2026 · Archived copy · Original

The dark triad captures three related but distinct traits: **narcissism**, **Machiavellianism**, and **psychopathy**.

These traits can provide advantages in key markers of success, including leadership, dating, social status, and influence.
But they also come with serious risks, especially over the long term.

This article explains what the dark triad is, how it can boost or undermine success, and how smart, strategic men can use it without becoming destructive.

Dark triad archetypes: a narcissistic leader, a fearless warrior, and a cunning strategist

Contents

What the Dark Triad Is

The dark triad is a label coined by Paulhus and Williams in 2002 for three personality traits that are related, but not identical: narcissism, Machiavellianism, and psychopathy.
The traits showed overlap in common traits like selfishness and low agreeableness, while still being different constructs.

Interpersonally, dark triads tend to view relationships not as cooperative ventures, but as transactional exchanges.

The Three Traits at a Glance

Narcissism tends to be more linked to extraversion and self-importance, Machiavellianism to strategic manipulation, and psychopathy to callousness and antisocial tendencies (Furnham et al., 2013).

- **Narcissism**: Grandiosity, pride, and egotism. Narcissists crave validation and adulation, but their high self-belief often propels them into leadership roles.
- **Machiavellianism**: Manipulation, self-interest, and cynical materialism. Machiavellians are long-term strategists who view social interactions as a chessboard.
- **Psychopathy**: Lack of conscience and remorse, muted emotions, and potential for antisocial behavior, impulsivity, and instrumental aggression. It is the most linked to criminality.

Trait	Main edge	Main risk
Narc	Confidence, status seeking, self-promotion	Entitlement, fragility, need for admiration
Mach	Strategic thinking, patience, social calculation	Over-cynicism, alienation & life dissatisfaction, trust erosion
Psycho	Fearlessness, boldness, emotional detachment	Impulsivity, imprisonment, drug use, long-term failure

Dark Tetrad

In 2013 Buckles and colleagues showed that dark triads were more willing to harm an innocent victim (though only sadists worked to cause harm) and proposed the ‘dark tetrad’.

Sadism may be more related to psychopathy, but reactive aggression from perceived slights may be more related to narcissism and factor 2 psychopathy (ASPD).

The Shared Core: The Dark Factor of Personality

Different models isolate different traits or dispositions shared by the dark triad, including:

- **Antagonism/Low agreeableness** from the Big 5 perspective
- **Low honesty/humility** from the HEXACO, better covering behavioral aspects like manipulation (Muris et al., 2017)
- **Manipulation and callousness**, based on Multisample Structural Equation Models (Jones & Figueredo, 2013)
- **Unrestricted sociosexuality**, or a predisposition for short-term mating (Jonason et al., 2009, 2012)

Researchers also introduced a new shared '**Dark factor**' (or 'D factor')—the tendency to **maximize one's own benefit even at the expense of others**, while maintaining justifying beliefs (Moshagen, Hilbig, and Zettler, 2018 and 2020).

You can measure your D-factor with this validated assessment questionnaire (Moshagen et al., 2020): Measure your D-factor ↗

Why it Matters for Ambitious Men

The more positive and empowering aspects of the dark triad include:

- **Social power**, including social dominance, influence, and leadership. From Machiavellianism and grandiose narcissism, and potentially boldness factor 1 psychopathy (Christie and Geis, 1970; Brunell et al., 2008; Watts et al., 2013; Deluga, 2001; Lilienfeld et al., 2014)
- **Boldness** and social confidence, related to extraversion from grandiose narcissism and low fear from factor 1 psychopathy (Patrick et al., 2009)
- **Mental power**, with low neuroticism and emotional resilience, related to psychopathy factor 1's boldness and grandiose narcissism (Campbell et al., 2002; Rose, 2002; Watson et al., 1988; Lilienfeld, 2018).
- **Strategic predisposition** and a calculative, pragmatic and rational approach to maximize goal achievement and self-interest, from Machiavellianism (Christie and Geis, 1970; Pilch, 2008; Deak, 2017; Samson & Paulhus, 1992)

These traits and behavioral patterns lead to many coveted results, including:

- **High status**, including acquiring status in new groups
- **Respect** from others
- **Confidence** and self-esteem
- **More sexual partners**, especially psychopathy and often narcissism (Borráz-León and Rantala, 2021; Freyth and Jonason, 2023)
- **Leadership**

Pros & Cons

The dark triad traits are a double-edged sword. Research consistently links unchecked dark triad traits to counterproductive behavior, relationship damage, and legal risks—especially concerning psychopathy (Hampejs et al., 2025).

Think of them like always-on boosters on a racing car: great starts and speeds… But may crash you at the first curve.

Adaptive Upsides	Maladaptive Liabilities
Leadership: excels at first impressions, gaining status, and influencing decisions	**Reputation risk:** Driven by grandiosity, selfishness or a 'mask', risks long-term exclusion
Self-focus for goal-achievement takes care of 'number 1' and boosts the odds of success	**Self-absorption undermines alliances** and relationships
Strategic thinking: Highly effective in life, calculating best moves without emotional bias.	**Trust erosion:** people eventually feel used or uncared for, leading to burned bridges
Stress tolerance: boldness and low fear; effective in high-pressure environments.	**Legal & physical risk:** impulsivity, recklessness, and rule-breaking (psychopathy)
Self-promotion: gains visibility and networking opportunities	**Irritates others** when it turns into bragging and undermines bonds with 'me, me, me'
Short-term successful mating, independence, fewer heartbreaks	**Unstable long-term** relationships and lack of bonding and love
Competitive drive: intense self-focus to achieve goals	**Undermines cooperation** with 'fixed pie mindset', mistrust, and over-competitiveness

⚠ But Beware: The Vulnerable Dark Triad (VDT)

The vulnerable dark triad is a crucially important construct for TPM.
Most people often associate the dark triad with dominance and cunning agency. But in truth, they also have a 'weaker version' that Miller dubbed 'vulnerable dark triad' (VDT).

The dark triad 'low power shadow' is factor 2 psychopathy and vulnerable narcissism, both linked to BPD

Lyons in '*The Dark Triad of Personality*' says that besides the more adaptive factor 1 psychopathy and grandiose narcissism, the dark triad also includes their vulnerable versions: vulnerable narcissism, Factor 2 psychopathy, and features of Borderline Personality Disorder (BPD).

Both narcissism and psychopathy have a vulnerable expression, but not Machiavellianism (or, at least, it hasn't yet been identified by research).

The vulnerable triad is linked to:

- **Neuroticism** and mood swings <— Low masculinity
- **Insecure attachment** <— Related to neediness, chasing, and low-power emotional manipulation (eg, 'pity plays')
- **Negative emotionality** (shame, stress, envy, anxiety, anger) <— Related to unpleasant emotions that can decrease both effectiveness and life quality
- **Self-harming behavior**

Vulnerable Triad	Low-power Correlations
Vulnerable narcissism	Low and fragile self-esteem; Avoidance-oriented; Low perceived control; negative affect
Factor 2 psychopathy	Antisocial; reactive aggression; externalizing proneness, substance abuse; impulsivity; low conscientiousness

Read more in these tables:

- Factor 1 psychopathy vs. vulnerable psychopathy
- Grandiose narcissism vs vulnerable narcissism

Key Questions About Dark Triads

Are dark triads more attractive?

Dark triads are not more attractive unadorned, and some studies even find dark triad facial morphs to be less

attractive. However, things change and invert in real life, where higher mating effort, better presentation, strategic predisposition and confidence can all boost attraction, ultimately resulting in more sexual partners for narcissists and psychopaths.

Can you develop dark triad traits?

While some aspects are largely determined by genetics and early environment, you can develop the adaptive behaviors associated with the triad. For example, you can train yourself to be more high-agency, more strategic in your social maneuvers, and more emotionally detached in high-pressure negotiations. The smarter approach is to develop the useful edges while skipping the destructive ones.

Can you be a good dark triad?

Yes, if you adopt the edge and use it within an 'honorable man's approach' of seeking win-win.
But not in the stricter sense of clinical 'dark triad', since it's defined by traits that, at their core, involve using others or disregarding them. That part is inherently not "good."

How do you distinguish between an Adaptive and a Vulnerable Dark Triad?

Key differences lie in traits related to emotional regulation, mental power, and agency. The adaptive Dark Triad is characterized by higher emotional stability, stronger and stable self-esteem, and agentic persistence under pressure. The vulnerable Dark Triad, in contrast, is associated with neuroticism, emotional volatility, insecurity, and more reactive (rather than strategic) behavior and aggression.

Dark Triad Sexual Strategies

Sexual strategies are central to the dark triad construct and key to their success in the mating market.

In terms of unadorned looks, dark triads are no more attractive and potentially even *less* attractive. However, they're *more* attractive adorned, suggesting higher mating effort starting already with better clothes (Holtzman and Struber, 2012; Lyons and Simeonov, 2016).

Dating success though isn't just physical attractiveness, but also includes behavior and value-signaling.
And **dark triad traits can be polarizing and particularly attractive to (some) women** (Louis Carter et al., 2014; Brown, 2008). Higher attractiveness may start with a 'power motive', or a predisposition to strive for status and power. Swami and Furnham say that studies have shown that a power motive provides men with access to fertile women as well as making them more attractive to women.

Buss also says there are good reasons why dark triad men are more attractive, including:

1. **Social confidence** and charm, particularly effective when compared to shy, awkward guys who signal low power, passivity, and submissiveness (referred in popular culture as "beta males").
2. **Status**, gaining status, social prominence, and leadership, key qualities that boost sexual market value
3. **High-power**: They don't seem desperate, don't trip over themselves trying to be too nice, and display high-status body language

Dark Triad 'Game'

While mainstream dating advice focuses on consistency, provisioning, and attentiveness, dark triads operate on a fundamentally different frequency.
Dark triads focus on presentation, high value-signaling, power, and gaining leverage.

This approach can be seen in this movie scene, with the protagonist showing a highly Machiavellian approach to dating:

> **Him**: (approaches with high confidence and with the goal of gaining emotional leverage with sex, romance, and Mach 'game'. Then chills when she is hooked)

- **The Narcissist's "Peacocking":** Wendy Patrick states that narcissists are perceived as most attractive (Rauthmann and Kolar, 2013) (…) due to their flashy appearance, superficial charm, and self-assuredness
- **The Psychopath's "Closer Attitude":** Lacking approach anxiety and fear of rejection, they can be incredibly bold and decisive
- **The Machiavellian's "Game":** Views dating as a game to boost attraction, achieve intimacy, or gain emotional leverage. They can spot a woman's insecurities to build a fast, albeit artificial, sense of intimacy

Trait	Mating Strength	Mating Liability
Narc	Charisma and status signaling; entitlement to go after high-value women	Need for adulation can seem weak. Can fear approach out of ego & status considerations
Mach	Expert at "game", framing, and using power for seduction	May over-game & over-hide feelings when sharing them could assuage fears and boost attraction
Psycho	High boldness; zero approach anxiety	High psychopathy lacks the social feel for smooth charm, a major con for the top women

Exploitation, Coercion, & Mate Guarding

Research suggests that Dark Triad traits are related to exploitative short-term mating strategies, including sexual coercion, deceptive mating strategies, and infidelity (Altgelt et al., 2023; Buss, 2024).

The *Oxford Handbook* claims that dark triads are more likely to mate guard, but Machiavellian women are also more likely to *resist* mate guarding, suggesting a taker strategy of ensuring faithfulness without giving it back (Chegeni et al., 2018; Abell & Brewer, 2016).
David Buss states that dark triads are more likely to use cost-inflicting mate guarding strategies, including triangulation, emotional manipulation, and aggression.

Dark triad women are also more manipulative, including faking orgasms, luring men away from relationships, and lying about their partner's count. Women who pursue a short-term sexual strategy are also more likely to signal sexual exploitability.

The combination of Dark Triad personality traits and short-term mating strategy increases the odds of sexual assault, and while this may be even truer for psychopathy, sexual coercion relates to the whole dark triad (Lalumiere et al., 2005; Figueredo and Salmon, 2022).

Learn more:

- Psychopaths' sexual strategy

Evolutionary Logic: Why Dark Triads Stay

From an evolutionary psychology perspective, the Dark Triad is not a 'mental disorder', but an evolved, alternative survival and mating strategy.

Jonason and colleagues proposed that the dark triad facilitates a short-term mating strategy focusing on quantity of offspring over quality (r-selection, Pianka, 1970).

Psychopathy in particular may boost reproduction odds in unstable and risky environments as a 'fast life strategy'. But the other two traits can equally boost mating and reproductive odds, even when only indirectly. For example, narcissism may boost status, and Machiavellianism may boost goal-attainment.
These two traits can also boost 'mating returns' through cheating (valid for sexual narcissists more than narcissists in general, McNulty & Widman, 2014). Machiavellian women, for example, cheat more without breaking up, suggesting a more strategic approach to gain benefits while keeping their main relationship (Gottlieb and Schmitt, 2023).

Evolution is amoral, and what survives and procreates spreads and stays in the gene pool.

TPM Takeaways for Agentic Men's Dating

The upsides of certain dark triad traits in dating success are too big to ignore.
Helpful dark triad traits in dating are:

- ✅ **Dress well and catch attention**
- ✅ **Develop healthy entitlement**: Patrick states that the most attractive narcissists have an entitlement mentality (Back et al., 2010). BUT match it with high-value, or you won't go far
- ❌ **Avoid value-taking retention tactics**: it's the worst of both worlds. Dishonorable value-taking, and low-power neediness

The advanced level: Lucio's video example ↗

Effective Dark Triad™

Effective Dark Triad™ refers to an adaptive profile of traits associated with the dark triad, such as boldness, positive calculativeness, effective grandiosity, etc., while removing maladaptive tendencies like psychopathic short-term orientation and criminal tendencies, narcissistic neediness, and Machiavellian alienation.

Strategic Dark Triad™ is the process of cultivating the traits and learning the skills, without the downsides.
Finally, at TPM we also advise an **Honorable Dark Triad™** approach. It consists of placing strategic honor and a preference for win–win as the baseline, while still advancing and achieving goals.

- **Strategic Narcissism**: How to be a good narcissist
- **Strategic Psychopathy**: How to be a good psychopath

Trait to adopt	Effective Dark Triad
Agency & self-sufficiency	Keep both, but remain flexible and able to seek support when useful
Strategic predisposition (Mach), with 'positive cynicism', positive calculativeness, and self-defense	Add some activities just for pleasure, fun, and 'flow' to unwind and boost life quality

Trait to adopt	Effective Dark Triad
Extraversion: approach, talk, and lead in new groups and networking events	**Switch it on when needed**, you don't need to be extraverted
Emotional detachment	**Switch it on for work and 'missions'** but use empathy for closer bonds
High confidence and self-belief	**Combine with antifragility** for psychological resilience (antifragile ego & grandiosity)
Power awareness and power motivation. Ensure respect and always look for second motives and WIIFT	**Warmth + dominance** for cooperation & leadership. Develop meaning ('effective spirituality')
Provocability and capacity for meanness	Keep for dealing with toxic people, but develop a reputation as an honorable man

We focus on the how-to in our flagship course:

NOTES

About the Author:
Andrea L. Glenn is a psychologist and researcher known for her work on the biological and cognitive mechanisms underlying psychopathy and antisocial behavior.
Adrian Raine is a neurocriminologist whose research on brain structure, physiology, and genetics has shaped the modern understanding of antisocial and violent behavior.

Intro

Factor structure of psychopathy as defined by the Psychopathy Checklist–Revised (Hare, 2003).

Psychopathy vs. Antisocial Personality

ASPD is a broad and heterogeneous DSM diagnosis defined mainly by persistent antisocial and criminal behavior: law-breaking, aggression, deception, and impulsivity. It captures about 75% of inmates, far more than psychopathy, and most research on "antisocial" samples does not distinguish which individuals are actually psychopathic.

The key difference:

- **Psychopathy includes the Interpersonal–Affective (Factor 1) traits**—callousness, shallow affect, lack of empathy, manipulativeness.
- **ASPD does not require these traits** and largely overlaps only with the Lifestyle–Antisocial (Factor 2) aspects of psychopathy.

Aggression also differs:

- Psychopaths show **instrumental (planned, goal-directed) aggression**, in addition to some reactive aggression.
- Individuals with ASPD or other disorders linked to aggression tend to show **more reactive** aggression.

In sum: psychopathy is a **narrower, more specific construct** centered on interpersonal–affective deficits, not merely antisocial behavior or criminality. ASPD is **broader** and captures many individuals who are not psychopathic. Psychopathy can—but does not have to—include criminal behavior.

Subtypes of Psychopathy: Primary & Secondary

Research suggests that psychopathy is not a single uniform pattern but includes **distinct subtypes**. Early theorists proposed etiologically different forms of psychopathy (Lykken 1957; Karpman 1941), and modern studies support

this view. Personality-based models consistently identify **two groups among individuals with high psychopathy scores**:

1. an *emotionally stable*, low-stress-reactive subgroup, and
2. a subgroup marked by *negative emotionality, impulsivity, and hostility* (Hicks et al. 2004; Hicks, Vaidyanathan, and Patrick 2010).

These are commonly referred to as **primary** and **secondary** psychopaths. Secondary psychopathy is linked to **higher anxiety** (e.g., Newman and Schmitt 1998; Skeem et al. 2007) and **poorer interpersonal functioning**—greater irritability, social withdrawal, and lower assertiveness—while both subtypes show **similar levels of antisocial behavior** (Skeem et al. 2007). Evidence also indicates that their **developmental pathways differ** (Kimonis et al. 2011; Skeem et al. 2003), and each group may involve **distinct neurobiological abnormalities**.

Chapter 1. Genetics

By analyzing twin and adoption studies, the authors conclude that psychopathy, like most personality disorders, has a significant genetic component, meaning a substantial portion of the variation in psychopathic traits is explained by inherited factors.

Key Findings:

- **Substantial Heritability:** *the main findings from these studies are that psychopathic traits appear to be moderately to highly heritable* and *share some common genetic factors with antisocial behavior more generally, but they are also attributable to unique genetic factors*
- **Stability is also partially genetic**: *Genetic factors have also been found to contribute to the stability of psychopathic traits over time. Several studies have established that psychopathic personality is stable (Loney et al. 2007, Lynam et al. 2007). A study by Forsman et al. (2008) found that genetic factors contribute to this stability. In contrast, changes in psychopathic traits over time were found to result primarily from environmental factors*
- **Different facets of psychopathy share common genetic factors** *The finding that there are common genetic factors infuencing the distinct aspects of psychopathy suggests that it is indeed a unified construct. Two studies have found that some of the same genetic factors contribute to the different facets of psychopathy (Taylor et al. 2003, Larsson, Andershed, and Lichtenstein 2006), finding sizable genetic correlations between the different factors of psychopathy, including callous-unemotional features and impulsive-antisocial features. These studies suggest that there is a strong relationship among the genetic factors that are associated with the different aspects of psychopathy*
  - But there are also unique genetic factors for different facets: *Blonigen at al. (2005) found no genetic correlation between the Fearless Dominance and Impulsive Antisocial factors of psychopathy, suggesting that the two factors may derive from independent etiological processes. Also Taylor et al. (2003) and Larsson, Andershed, and Lichtenstein (2006) found that unique genetic effects that are important for the different psychopathy factors (i.e., there are unique genetic effects that influence the different psychopathy factors over and above the genetic influence from the latent psychopathy factor)*
- **Psychopathy shares common genetic factors with antisocial/externalizing behavior**: Taken together, the results from behavioral genetics studies indicate that genetic and nonshared environmental factors account for individual differences in psychopathic traits from childhood through adulthood
- **Nonshared rather than shared environment accounts for the rest of the variance**: *Studies of antisocial behavior have most often found that the environment that is shared between twins has an effect on antisocial behavior (Rhee and Waldman 2002, Larsson et al. 2007). However, across all the studies reviewed here on psychopathic personality traits, the influence of shared environmental factors was negligible*
- **Gender may play a role**: For example, Fontaine et al. (2010) found that in youth with stable, high levels of callous-unemotional traits, boys demonstrated stronger genetic influences, whereas girls demonstrated stronger

shared environmental influences <— ⍰⍰♂**Lucio's note**: could this be related to women's higher interdependence?

Heritability studies provide *averages*

It is also important to keep in mind that this figure represents an average across a large number of people, and that in some individuals, genes may have a stronger influence on the development of psychopathic traits than the environment, and in other individuals, the opposite may be true

Domain	Psychopathic individuals relative to controls
Amygdala responsivity to negative stimuli	Reduced
Connectivity between amygdala and VMPFC –	Reduced
Error processing in the prefrontal cortex	Reduced error-related negativity; Reduced positive ERP amplitude (Pe)
Heart rate (resting)	Reduced
Heart rate variability	Increased
Fear potentiated startle	Reduced
Reduced skin conductance responding during fear conditioning	Reduced
Cortisol response to the Trier Social Stress Test	Reduced
Central serotonin functioning (fenfluramine challenge)	Elevated
Attention to negative stimuli in the periphery	Reduced
Passive avoidance learning	Poor
Risk taking (Balloon Analog Risk Task)	Increased risk taking
Decisions based on reward and punishment	Poor

When it comes to specific genes or polymorphisms:

Polymorphism/Gene	Sample	Main finding
TaqIA & B SNP	58 male inmates with substance abuse	No association with total psychopathy scores
TaqIA & B SNP	137 alcohol dependent males	A+ genotype associated with Factor 1, but not total scores
TaqIA & B SNP	176 alcohol dependent males; 150 controls	A+ genotype associated with Factor 1, but not total scores
C957T (DRD2)	176 alcohol dependent males; 150 controls	CC genotype associated with total, Factor 1, and Factor 2 scores
SLC6A3 (dopamine transporter)	137 alcohol dependent males	No association with total or factor scores
CNR1 (cannabinoid receptor)	137 alcohol dependent males	Associated with Factor 1, but not total scores
5-HTTLPR (serotonin transporter)	89 adolescents previously diagnosed with ADHD	Higher psychopathy scores in carriers of the short allele, driven by the affective factor
5-HTTLPR (serotonin transporter)	Youth from treatment/legal agencies and controls; male and female	Higher scores on the impulsivity dimension of psychopathy in short allele carriers; higher scores on the callous-unemotional dimension in individuals homozygous for the long allele of lower socioeconomic status

Polymorphism/Gene	Sample	Main finding
5-HTTLPR (serotonin transporter)	862 alcohol dependent males and females	Higher psychopathy scores in males homozygous for the long allele; higher psychopathy scores in females homozygous for the short allele
OXTR	Psychopathy screening device	Associated with the A allele of the OXTR_rs237885 gene
FAAH	137 alcohol dependent males	Associated with Factor 1, but not total scores
COMT	99 adolescents previously diagnosed with ADHD	Val/Val genotype associated with higher Factor 1 scores
MAO-A	88 adolescent males previously diagnosed with ADHD	Low activity allele associated with higher total and affective factor scores

The additive effects of different genes:

Hoenicka et al. (2007).

Chapter 2. Hormones

> The two primary hormones that have been associated with psychopathy are cortisol and testosterone

- **Findings linking testosterone with psychopathy are inconsistent**: *Despite the strong theoretical evidence that psychopathy may be associated with high levels of testosterone, only a few studies have tested the hypothesis and results are inconsistent.*
  - *One study found testosterone levels to be associated with scores on the Lifestyle-Antisocial Factor 2 of the PCL-R in forensic psychiatric patients, although results may be confounded by comorbid substance abuse and other psychiatric disorders (Stalenheim et al. 1998).*
  - *A more recent study in a large sample of individuals recruited from temporary employment agencies found no*

relationship between psychopathy (or its factors) and testosterone (Glenn, Raine, Schug, et al. 2011). Similarly…
  - *Another study found that testosterone levels were not different in boys with callous-unemotional traits compared to healthy controls (Loney et al. 2006).*
  - *In other antisocial and aggressive groups, higher testosterone levels have been observed in girls with conduct disorder (Pajer et al. 2006), adolescent boys with externalizing behaviors (Maras et al. 2003), young criminals (Kreuz and Rose 1972; Dabbs, Frady, and Carr 1987; Dabbs, Jurkovic*
- **Findings of lower cortisol are inconsistent**: *Low resting cortisol levels have been associated with impaired fear reactivity in young children (Kagan, Reznick, and Snidman 1988), increased sensation seeking in men (Rosenblitt et al. 2002), and increased monetary risk taking (van Honk et al. 2003). A few recent studies have found relationships between cortisol and psychopathy. However, others have failed to replicate this finding (van Honk et al. 2003; Glenn, Raine, Schug, et al. 2011)*
- **Hypothesis: T + other hormones**: Although a direct link between testosterone and psychopathic traits has not been established, some evidence suggests that testosterone may interact with other hormones to predispose to psychopathy
  - The testosterone/cortisol ratio hypothesis: *In a large sample of individuals Glenn, Raine, Schug, et al. (2011) found that psychopathy was associated with the ratio of baseline testosterone to cortisol reactivity to a stressor; this accounted for 5 percent of the variance in psychopathic traits. No significant relationships were observed between psychopathy and individual hormone measures, which included baseline testosterone and cortisol, and cortisol reactivity to a stressor; it appeared that only when both hormones were taken into consideration did a significant relationship emerge.*
- **Burnout hypothesis**: *One hypothesis is that there may be some type of "burnout" effect, where chronic stress or other environmental factors overwork the stress response system to the point that it no longer responds properly.*

The similarities between testosterone and psychopathy

High testosterone levels associated with	Psychopathy associated with
Impulsivity	Impulsivity
Sensation seeking	Stimulation seeking
Sociability	Sociability
Disinhibition	Poor behavioral controls
Showing off	Grandiose sense of self-worth
Forwardness	Promiscuous sexual behavior; increased number of sexual partners
More criminal violence	More criminal violence
Not marrying; marital instability; poor marital quality	Many short-term marital relationships
Law breaking	Law breaking
Reckless driving	Poor behavioral controls, risk-taking behavior
Failure to plan ahead	Impulsivity/failure to plan ahead
Judged more harshly by parole board; violate prison rules more often	Revocation of conditional release
Juvenile delinquency	Juvenile delinquency
Reduced emotional response to fearful faces	Reduced brain activity to fearful faces
Reduced empathetic behavior (facial mimicry)	Callous/lack of empathy

High testosterone levels associated with	Psychopathy associated with
Reduced fear-potentiated startle	Deficient fear-potentiated startle
Reduced skin conductance responding to affective stimuli	Reduced skin conductance responding to affective stimuli

Chapter 3. Psychophysiology

> Psychophysiological research involves the study of two overarching systems: the autonomic nervous system, which controls mostly visceral functions and is measured by skin conductance and heart rate, and the central nervous system, which consists of the brain and spinal cord and is measured by electroencephalogram (EEG)

- **Lower response to cues of aversive stimuli, not the stimuli itself**: *When examining the startle refex, aversive conditioning, or the response to aversive stimuli, one interesting fnding is that psychopaths do not appear to have reduced physiological responses to the actual aversive stimulus such as the shock or loud noise blast (exceptions include Hare and Quinn 1971, Lykken 1957, Fung et al. 2005). Instead, the deficits appear to be primarily in the ability to respond to cues that signal that an aversive event will occur*
- **Impaired Fear Conditioning:** Psychopathic individuals exhibit a deficit in **fear conditioning**. When exposed to a neutral stimulus (e.g., a tone) that is repeatedly paired with an aversive outcome (e.g., a shock), non-psychopathic individuals develop a fear response (measured by **skin conductance/electrodermal activity**). Psychopaths typically show a dramatically blunted or absent skin conductance response, demonstrating a fundamental deficit in learning to fear aversive consequences.
- **Blunted Startle Response:** They show reduced **startle reflex potentiation** when anticipating or viewing negative emotional stimuli (like threatening pictures or fearful faces). This suggests a failure to engage the normal, defensive physiological system, which contributes to their **Boldness** and lack of anxiety.
- **Orienting Responses:** Conversely, psychopaths sometimes show enhanced orienting responses to pleasant or reward-related stimuli, suggesting an imbalance where their attention is strongly biased toward **reward** but insensitive to **punishment**.

Chapter 4. Neuropsychology

This chapter links psychopathy to specific cognitive and executive function deficits, offering a bridge between brain structure and observable behavior.

- **Avoidance as a goal works, but avoidance with a reward doesn't**: *psychopathic individuals display normal abilities to avoid monetary punishment when this is their only goal. However, they exhibit deficits in the ability to avoid monetary punishment when the task also involves a goal of earning monetary rewards. It is suggested that when their primary goal is earning reward, they are unable to reallocate attention to cues of potential punishment (Newman and Kosson 1986)*
- Both neurological case studies and neuropsychological testing suggest that psychopathy likely involves **deficits in the ventromedial PFC and amygdala**

Chapter 5. Brain Imaging

> Brain imaging fndings, for the most part, have been able to confrm what has been hypothesized based on psychophysiological, neuropsychological, and behavioral data regarding the brain regions that are implicated in psychopathy. Tese regions include the amygdala and parts of the frontal lobe. In addition, brain imaging research has identifed several additional regions that may function diferently in psychopathic individuals, or that may indicate abnormal development of the brain.

- **Amygdala Dysfunction:** This is the most consistent finding, strongly linked to the **Meanness/Callous-Unemotional** traits. Studies show:
  - **Structural Abnormalities:** Reduced gray matter volume in the amygdala.
  - **Functional Abnormalities:** Hypoactivity (reduced activation) of the amygdala when processing fearful and sad facial expressions (distress cues) and during moral decision-making. This may explain the observed emotional blunting and lack of empathy.
- **Ventromedial Prefrontal Cortex (vmPFC):** This region, which is critical for integrating emotion into decision-making and regulating the amygdala, also shows:
  - **Structural Abnormalities:** Reduced gray matter volume and white matter integrity.
  - **Functional Abnormalities:** Reduced activity during tasks involving emotional regulation, moral judgment, and reversal learning (learning to switch responses after an outcome changes). This links to poor judgment and impulsivity (**Disinhibition**).
- **Limbic System Connectivity:** Psychopathy is also viewed not as a deficit in a single area but as a **disconnection** between the limbic system (emotion centers like the amygdala) and the frontal lobes (control centers like the PFC).

Chapter 6. Biosocial and Environmental Influences

This chapter moves from purely biological factors to the crucial interaction between biology and the environment (Biosocial perspective).

- **Parenting matters**: *Numerous studies of antisocial behavior and crime have identified parenting practices such as harsh or erratic discipline, poor parental supervision, and distant, cold, and rejecting parenting styles as risk factors for antisocial behavior. In the Cambridge Study, poor parental supervision in youth significantly predicted psychopathy scores in adulthood, but this was true only for the Lifestyle-Antisocial*
  - Fathers matter: *One of the strongest predictors of the affective features of psychopathy was having an uninvolved father, although this is likely to be mediated by a number of other factors*
  - Parents' relationship quality matters: *Family conflict is another factor that has been associated with psychopathy. The Cambridge Study found a significant relationship between having a disrupted family at age 8 and psychopathy scores at age 48*
- **Maternal smoking *may* matter**: *psychopathic traits were associated with maternal smoking during pregnancy (…) Controlling for these factors, in addition to genetic factors, the effects of maternal smoking were reduced by between 75 percent and 100 percent. Thus, it is not clear whether maternal smoking itself (as a toxin that may damage the fetus) actually predisposes for psychopathic traits*
- **Gene-Environment (GxE) Interaction:** The expression of genetic vulnerabilities (e.g., MAOA low-activity allele) may depend on the level of environmental adversity experienced, such as **childhood maltreatment**. A high-risk genotype combined with a high-risk environment significantly amplifies the likelihood of psychopathic outcomes.

Chapter 7. Successful Psychopaths

This chapter addresses the controversial concept of “successful” psychopaths—individuals high in psychopathic traits but who avoid criminal detection and achieve societal success (e.g., in business or politics).

- **Biological Comparison:** Early research suggests that successful psychopaths may possess biological advantages that unsuccessful psychopaths lack. For example, they may have **intact executive function** and PFC activity, allowing them to regulate the *expression* of their antisocial impulses. They are better at engaging their frontal regions to control their amygdala-driven emotional deficits.
- **Mask of sanity:** This concept validates Cleckley’s original idea of the “mask of sanity,” where high intelligence and strategic control (functional biology) mask the core, underlying affective pathology.

Chapter 8. Ethical Issues

This chapter addresses the moral, legal, and societal implications of a biological model of psychopathy, including

- **Free Will vs. Determinism & responsibility:** If psychopathy is demonstrably linked to brain abnormalities (e.g., a damaged vmPFC), does this mitigate an individual’s **criminal responsibility**?
- **Neuro-Prediction and Dangerousness:** Using neurobiological or genetic markers to predict future violent or criminal behavior raises serious civil liberties concerns regarding preventative detention, especially for juveniles.
- **Labeling Effects & Bias:** The term “psychopath” is highly pejorative in forensic settings and can unfairly bias legal decisions (e.g., parole, death penalty sentencing), often leading to a presumption of incorrigibility, regardless of current evidence. **<— ⍰⍰♂ Lucio’s note: the opposite is also true**, though. The correct diagnosis though also allows society to reduce the costs of crime and spare many innocent victims

Chapter 9. Prevention, Intervention, and Treatment

- **Early Intervention:** Treatment is most effective for **youth** high in **CU traits** because their brains are still developing. Interventions include specialized parent training to increase warmth and consistent reinforcement, and programs targeting emotional recognition (e.g., training children to recognize fear/sadness in others).
- **Nutritional supplementation**: *Several studies have found that nutritional deficiencies predispose for antisocial behavior (…) Neugebauer, Hoek, and Susser (1999) found that male offspring of mothers who were severely malnourished during the first and second trimesters of pregnancy had 2.5 times the normal rate of antisocial personality disorder in adulthood. Poor nutrition in the first three years of life has also been associated with long-term antisocial behavior throughout childhood and late adolescence (Liu et al. 2004)*
- **Relieving maternal stress and depression**: *maternal stress and depression are factors that have been found to affect the developing brain and that are associated with psychopathic traits*
  - Sleeping patterns: *Another form of maternal stress is disrupted sleep patterns that result from shif work. Ramlau-Hansen et al. (2011) found that maternal shift work was associated with an 11 percent increase in testosterone levels in male offspring at ages 18 to 21*
- **Pharmacological Intervention:** Future treatments may involve medications to target specific neurobiological deficits, such as:

  - **Serotonin/Dopamine Agents:** To reduce impulsivity and aggression (Disinhibition).
  - **Oxytocin:** To potentially enhance social cognition and empathy (Meanness).
- **Neurobiological Intervention:** Emerging, though speculative, methods like **neurofeedback** or **transcranial magnetic stimulation (TMS)** could one day be used to functionally "re-tune" dysfunctional brain regions (e.g., to increase vmPFC activity or connectivity).
- **Treatment may also contribute**: a review found that treatment results for adult psychopaths range from low-moderate to poor with three of eight studies demonstrating that psychopathic individuals benefited from treatment (Salekin, Worley, and Grimes 2010). But findings are mixed for psychological treatment like cognitive behavioral therapy, group therapy, family therapy,

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Is Successful Psychopathy Even A Thing?

A story described by Cleckley can make us reflect on what 'successful' truly means:

> Cleckley describes a middle-aged man who came from a well-regarded family and who made his way through three years at a prestigious university by utilizing the work of his friends and cheating on exams.
> He dressed in nice clothes and was popular at social gatherings. Although he had not paid his fraternity fees, he was tolerated because of his entertaining style and his ability to easily recruit new freshmen to join.
> By age 50, a survey of his life revealed that he had consistently been supported by wealthy women who repeatedly loaned him money and would help him find new positions when he lost a job. He had no difficulty having several women at his beck and call. When one relationship would go sour, he had no trouble finding another woman to raise money for a new venture or find him a new position. He was also able to make valuable business associations by loitering at the country club, and these associations enabled him to make a good living for brief periods, but his ventures always failed. Such individuals are sometimes referred to as successful psychopaths—individuals with high levels of psychopathic traits who are able to get by in society, often taking advantage of others, without ever coming into contact with the law.

Look at this:

- ***Tolerated***, not admired
- Possible **lower value women** that supported him, not quality ones
- **No work/business success**

This is certainly leagues above the psychopaths who languish in prison, but I wouldn't call this 'successful' either.

QUOTES

The cost of psychopathy on society:

> The prevalence of psychopathic personality traits takes a major toll on society. In criminal populations, offenders with psychopathic traits are responsible for a disproportionate amount of crime, particularly violent crime. In the rest of society, psychopathic traits are a driving force behind much of the corruption, exploitation, manipulation, and deception that occurs on both large and small scales. Psychopathy causes undue

> physical, emotional, and fnancial trauma in the lives of countless individuals

On ‘successful’ psychopathy being an even higher cost:

> Much of the research we have discussed thus far has focused on psychopathic individuals in forensic populations and may not be generalizable to psychopaths in the general population. However, noninstitutionalized individuals with psychopathic traits not only may outnumber the institutionalized psychopathic population, but also may in the long run be more dangerous and destructive to society (Gao and Raine 2010

⍰⍰♂ Lucio’s Analysis

I’d Like Less Defensive: Findings Over Morals

One reminder that ‘genes are not destiny’ is important, but many of them feel like defensiveness, and I felt there were too many.
A book for scholars and researchers should focus on findings, not on moral and ethical concerns.

Also, some passages feel defensively negative about what we may be able to do in the future, like this one:

> There is no “crime gene.”
> By no means is there a single gene, or even a small group of genes, that will enable us to predict which individuals will commit crime in the future
> Genes confer risk for traits such as those observed in psychopathy, which may heighten the risk for criminal behavior, but we will never be able to use genes to predict which individuals will become psychopathic or persistent criminals. In reality, hundreds and maybe thousands of genes are involved, each of which makes a small contribution by coding for proteins and enzymes that in turn affect brain functioning, psychological processes, and ultimately behavior

There is no single gene, of course, but the tone feels like discounting the importance of genes. Or, worse, that mapping the hundreds or thousands of risk-related genes is a futile effort in terms of predictive power.
Instead, I believe that understanding these polygenic contributions could be **extremely valuable for prevention, early intervention, and tailored corrective strategies**.

There is no ‘single gene’ of course, but being able to map those hundreds or thousands may still be able to help with prevention and correction.

REVIEW

Psychopathy: An Introduction to Biological Findings is a valuable introductory text to understand the genetic, biological, but also cultural factors that contribute to psychopathy.

Since the book is meant for academics, it can be a bit dry at times, and you may have to dig or research separately to understand some concepts—but that’s an added opportunity to learn more.

Check the best books on psychopathy or our **most recommended books**.

David DeAngelo: Dating Advice, Cocky Funny, and Program Reviews

Lucio Buffalmano · 17 May 2026 · Archived copy · Original

David DeAngelo was an early and influential figure in the 'pick-up movement' who popularized the "Cocky Funny" style.

This page brings together TPM's analysis of David DeAngelo, two of his products — *Advanced Dating Techniques* and *Sexual Communication* — and the effectiveness of his work and approach.

Contents

- Who Is David DeAngelo?
- Cocky & Funny (C&F)
  - Reading Compliance
  - Limitations of Cocky-Funny
- DeAngelo Reviews
  - Review: Advanced Dating Techniques
  - Review: Sexual Communication
- Is David DeAngelo Still Worth Studying?

Who Is David DeAngelo?

David DeAngelo is the pen name of Eben Pagan, arguably the "Godfather" of modern commercialized dating advice. Before the market was flooded with generic "life coaches," DeAngelo's **Double Your Dating** was the first to bridge the gap between niche PUA (Pickup Artist) movement and mass-market dating advice and self-help.

DeAngelo's main contributions include:

- **Double Your Dating**, a popular dating program turned into a website, catchphrase and brand, and probably the biggest-selling PUA-inspired product
- **Cocky Funny**, a style based on high confidence and teasing. Compared to early PU canned lines, gimmicks, and 'magic tricks' Cocky Funny was revolutionary: simpler, more natural, and higher power all at once
- ***Attraction is not a choice***, a mantra-quote suggesting that attraction is involuntary and subconscious, not something you can negotiate rationally or that she can decide whether to have or not have. It also means: become an attractive man, and women's attraction becomes automatic

The Marketing Genius

DeAngelo's story is a classic case of a smart marketer turning a movement into a business opportunity.
As Eben Pagan, he was a real estate and marketing professional. He seemingly first entered the PUA niche for learning and free contributions in the sosuave.net forum together with folks like Mystery and Neil Strauss. DeAngelo came up with "Cocky & Funny", a principle he associated with his name and which gave him credibility, and then stopped posting and started selling instead.

He applied marketing principles—scarcity, branding, and psychological triggers—in a new blue ocean market with lots of interested men, but few teachers. And he reaped the benefits creating a high-turnover business.

Cocky & Funny (C&F)

This is DeAngelo's signature idea and still the most memorable part of his work, balancing arrogance and humor.

- **The logic:** "Nice guys" over-invest and signal low value. "Assholes" under-invest but push others away
- **Why it works**: cockiness signals power, while funny makes you social and draws people in
- **How to do it**: get in a 'let's have a good time' mood. Be playful, lightly teasing, and self-assured. Do not overexplain yourself if she asks for clarification, and instead lean into sexual tension
  - Push-pull technique: pull-pull is a specific form of 'cocky-funny', consisting of giving a compliment but 'taking it away'. For example, '*I like you, you're good fun. But you're too much trouble*'

C&F is a playful form of our 'power and warmth model'. By being "cocky," you signal confidence, high status, and a lack of neediness. By being "funny" you take some of the edge off and become more engaging and relatable.

Reading Compliance

It also works as a compliance test.
By teasing a woman, you are checking if she will accept your frame and leadership:

- ✅ **She laughs** = she accepts your leadership
- ❓ **Teases back** = high confidence woman, doesn't yet see you as 'above her', but you're in the game
- ❓ **She pushes back** = she doesn't see you as 'above her' yet. But you're still in the game and with good skills you can turn it around
- ❓ **She gets offended** = you overdid it and must learn proper calibration. It's still salvageable, but it requires advanced skills to walk back, without losing power

Limitations of Cocky-Funny

Cocky funny is most suitable in high-energy and/or hangout places. Think parties, night venues, but potentially also social circles.

It can also work in chiller contexts like day game, of course, but **in daytime you must eventually snap out of cocky funny mode** and present yourself as a real human being. Even if you're 'successful', if all you provide is a

mood boost and she walks out thinking 'that guy is funny' but nothing else, chances are that you won't see her again. High-value women don't meet 'funny guys' they haven't bonded with.

This also links to the main risk of cocky funny. Cocky funny often requires more, especially solid foundations. If on a date, it also requires some bonding and connection.

Finally, the concept can also be taken too far, turning into high-energy 'jestering' that undermines power and masculinity.

Read more:

- **When high energy undermines attraction**: don't become a jester

DeAngelo Reviews

DeAngelo's principles of not chasing, going out and meeting women, and progressing interactions forward are all valid.

At the level of personal authority, DeAngelo looked more like a smart marketer than a man who embodied top-tier seduction outcomes. Although his contributions were valuable in the budding PUA movement, his biggest edge was packaging attraction principles into a scalable business.

As for his products, we reviewed some of his work some years ago and we'll share our takes here.

The programs have disappeared since
Since we first released our reviews, DeAngelo programs have been removed. This may be due to lower demand over time.

Review: Advanced Dating Techniques

Advanced Dating Techniques is David DeAngelo's ultimate and most advanced dating program, aiming to build attraction, move interactions forward, and signal high value.

The central ideas are still valid: confidence matters, chasing undermines aggression, and supplicating men turn women off.
A large portion of the program is dedicated to 'inner game' or the mental aspects of self-development. But he also shares some advice on approaching women, being a 'good asshole', and gaining status with sub-communication and body language.

The problem is that the material is more basic than 'advanced', lacking how-tos, real-life examples, and deeper frameworks. For example, the advice of 'not stopping the behavior she reprimands right away' is about displaying power and not being controlled. But it lacks a deeper framework that could help men internalize the concept and apply it in all other areas of both dating and life.
It also missed decades of development and doesn't fully leverage research.

It's more like random DeAngelo talks than a true dating system that drives results.

Review: Sexual Communication

Sexual Communication is another David DeAngelo program, focused on flirtatious communication and sexual tension.

The core idea is that normal communication rules get reversed in dating. Instead of being nice, explanatory, or compliant, a man should lead, tease, stay selective, and build tension.
There are four steps:

1. **Directness:** Stop hiding intent and be more assertive

2. **Psychological Arousal:** Using “future pacing” and suggestive language to jiggle the target’s imagination
3. **Physical Escalation:** Touch women appropriately and early on to get used to your physical presence. Use the “Two Steps Forward, One Step Back” approach for escalation.
   See sexual escalation
4. **Handling Resistance:** Don’t get discouraged by initial rejection, and build comfort instead. See ‘handling resistance’

DeAngelo goes through a few core concepts like displaying high power, passing women’s tests, and his trademark ‘cocky funny’.
While there are valid insights, we frankly found the program fluffy and disorganized, with a few decent examples but too much filler around them (and some less than stellar examples).

Is David DeAngelo Still Worth Studying?

If you’re looking for high ROI, **there is better material** to help you succeed in dating.

DeAngelo deserves credit for helping men move away from desperate pursuit and from silly, jester-like early PUA tactics like carrying pictures and doing magic tricks.
He was revolutionary back then, but what’s revolutionary in the early days of a new movement often becomes outdated as the discipline moves forward.

But most men today can benefit from better programs that are high-power, more masculine, and ultimately more effective.

For men who want a more complete and updated framework, you can look into **Seduction University**, a more structured and practical program aligned with a modern understanding of attraction, social dynamics, and what works with attractive women.

Join Seduction University

The Hero’s Journey: Why Most Men Never Become Dangerous

Lucio Buffalmano · 18 May 2026 · Archived copy · Original

Most men in self-help chase healthy routines and pep talks, but struggle to get deeper confidence. It’s because real confidence isn’t built by habits alone; **deep confidence is earned when you survive real risk and conquer real-life challenges.**

Skip that trial by fire and you stay a boy, not a man.

In this post, I’ll show you what a man’s hero’s journey actually is, why it works, and how to start one without gambling away your life.

Intro: What's A Hero's Journey

> A hero's journey is a phase of life that pushes a man beyond comfort and safety, forcing him to face real risk, struggle, and uncertainty that change his psychology and mindsets

A hero's journey is **high stakes**, both mentally and practically.
Failing the journey carries real costs, so the psychological intensity, including fear, is well-motivated.

If the journey is successful, the hero acquires agency, wisdom, competence, and confidence.

What's not a hero's journey

Here's a table to help differentiate general self-help advice vs. a hero's journey:

Self-Help Challenges	Hero's Journey
Acting beyond one's comfort zone	Fully outside one's comfort zone, no respite back in comfort
Facing what scares you (social anxiety, cold approach, fear of confrontation, etc.)	Existential challenge, beyond individual fears. Potentially, fear for life
Physical challenges in controlled and safer environments	Life itself becomes a challenge
Confidence you can follow habits, push yourself, and improve	Confidence you can handle *life*

Another important difference is between real-life heroes' journeys and mythical journeys. Myths and movies often entail a fight for a good ideal, or for the well-being of others (Campbell, 1988).
While these stories make good myths and movies, many real-life heroes' journeys are about individuation, growth, and self-advancement. In more extreme cases, also about survival.

Standard Self-Help vs. Hero's Journey

Good habits are crucial: they make you disciplined, healthy, and effective.

However, by themselves, habits seldom give you advanced skills and unshakable, antifragile confidence.
Normal self-help is also easy advice because it's safe: gym, sleep, no booze, meditation. These are all undoubtedly good for you, and everyone approves of them.

Unfortunately, they're also all comparatively easier than a true life test, so they're not as effective for inner growth.
No matter how much money you make or how much you bench, **if you haven't truly been tested, you are fragile.**

This is why pursuing a hero's journey is important for the most ambitious men.

Modern Men Are Missing a Hero's Journey

For most of history, life forced the test. When life was tough, simply surviving was a hero's journey that required boys to become men.

Even until recently, army drafts, early marriages, and little social safety provided external stressors and responsibility.

Today, those built-in trials are gone.
Modern society solved survival — and accidentally removed the developmental pressure that used to turn boys into men.

Today, only men who actively pursue a hero's journey may get to experience one.

⍰ Example: My Father Forced Into The Journey

I used to think my father was so attached to his service because of over-romanticism and some old-school nationalism/conservatism.

Today, I see it differently. Service was my father's hero's journey.

My father shared more than once when he mentioned to my grandmother that he might go back.
His mother didn't deny him, but told him that 'there was nothing back home for him'.
That letter was his mother's ultimate gift: she severed the umbilical cord with the truth: Montefion, his tiny boyhood village, was a dead end for an ambitious man. The only way forward is not backward, but through the storm.

My father left at 17. An inexperienced boy, including, I suspect, sexually.
Through rough seas and seasickness, he graduated from boyhood to manhood. And he was then ready to go talk to my mother and form a family.

My Hero's Journey

Much of my early life was a subconscious craving for a hero's journey.

I was a different kind of rebel.
Instead of resenting non-existent control, I resented their *support.*
I resented a too-easy life that wasn't allowing me the tough tests I craved to grow and earn my own self-respect.

My fantasy of the ultimate test was being a dumpster baby. The real-life equivalent of being alone at the foot of the mountain. No tools, no oxygen, no help. *Now climb.*

Solo travels, hitchhiking, and risky experiments were all smaller-scale attempts to test myself and earn my own respect.

Movie Example: 'I Must Go'

This scene from Fellini's work always struck me hard:

> **Kid**: Where are you going
>
> **Him**: I don't know, I go <— It's not about the destination, it's about the journey of growth
>
> **Kid**: What are you going to do
>
> **Him**: I don't know, but I must go <— It's not about knowing what to do, it's about the experiences and hardships along the way
>
> **Kid**: Weren't you OK here? <— The different mindset of those who stay: 'if you're fine, then you stay'
>
> **Him**: … <— Doesn't yet understand his own inner drive. He was OK there, and he's afraid to go. But he must go to become the man he wants to be
>
> (scenes of those who stay) <— The small reality he felt he had to outgrow

It was such a powerful scene, even when I didn't fully understand it. The movie was a light-hearted movie about enjoying a fun life in the periphery.

This scene seemed odd in that context. But it stuck with me the most from the first time I saw it.
It took me decades to truly understand the significance behind it. That man was looking for his hero's journey. That man was me.

Starting & Enduring

Despite my subconscious cravings for life tests, my strategic predisposition made life too effortless. But eventually, finally, the test I craved found me.

I found myself struggling, alone, and desperate.

I was renting a small guest room from a gay couple, and even that was temporary.
I'm still grateful one of them was nice to me. But his niceness may have caused his partner's hostility. He avoided eye contact and refused to speak English with me.
One day I heard him call me 'asshole' for putting his laundry out, something he'd always do with mine. And I had to take it because I needed their cheap room.
The internship I had taken hoping to turn it into a job ended without an offer. I was jobless and struggling with accommodation, employment, money, social life, and life direction.

I remember one day I just wanted to talk to somebody, and thought of my parents. I took the phone, I looked at it… And I put it back down (this was a key moment similar to my grandmother's letter to my father).
I was worried I couldn't manage to fake that all was OK, and didn't want to put that worry on my parents.

Another day, after another job rejection, I just crouched down on the floor, and cried.
I looked at the window, and I got scared. For the first time in my life, I truly worried about myself and my future.
For the first time in my life, I wasn't sure I'd find a way.
Maybe I still had a glimmer of optimism, but on that day, I could barely see any light at the end of the tunnel.

But one good thing I did is that I never stopped trying and moving. I kept going. And slowly, I climbed back up.

The Transformation

That experience changed me.
It was the watershed phase: I went in a boy, and came out a man. In truth, some of that boy in me died. But it was

for the better.

This is the part some men miss.
Not the suffering, but what suffering *produces* when you don't escape it, or numb it.

1. Upgraded Confidence and Self-Trust

Before, I had a naïve, boyish optimism, kind of *"Yeah, it's going to work out, because… Why not"*. That optimism was empty though, it wasn't backed by any life test.

After that journey, my agentic self-belief evolved into a more realistic, resilient, and **antifragile self-trust.**
Today, I accept and *embrace* limitations. Neither I nor anyone can guarantee success. Only boys believe in assured victory.
I'm comfortable with uncertainty and the possibility of failure.
And while I accept that, I also **deeply trust myself that I would at least give it a fucking good shot.** And if I were an outsider looking in, I'd never bet against myself.

That combination of life-tested self-trust and outcome independence is the foundation of my self-confidence.

2. Upgraded Self-Respect

I always had a good opinion of myself.
But before, it was only based on certain traits I had.

After, it evolved into **life-tested self-respect**.
I respected myself as a man who found himself at the bottom of the mountain of life, on his own, and managed to climb back up.

3. Upgraded, Honorable Mindsets & Work Ethics

My mindsets also shifted.
In the past, my idea of a good life meant little input, for maximum outcomes (highest ROI). Coasting through life like old royalty.

There is a book by a French employee who had a life of no work, for a good salary.
I wanted that, but better. Doing little, but while advancing. And the scariest thing is that I may have succeeded.

Fortunately, my hero's journey taught me to put hard work front and center. Today, I swung the opposite direction and seek maximum contribution.

How to Start A Hero's Journey

1. Set A Life-Relevant Goal, and Aim High

Aiming high will naturally place challenging demands on your life.

Life-relevant means that it must be central to you and what you want out of life. A hero's journey must have consequences for your present and future self.
Controlled environments don't cut it.

2. Move Physically

Moving uproots you, removes your social support, and forces you to build a new life on your own.

Paradoxically, ambitious country boys have an advantage because they *must* move. Circumstances quickly separate journey-takers from safety-seekers.
Urbanites, with opportunities nearby, may miss this opportunity.

⍰♂Lucio's Experience: **The day I realized I was gone for good**

Lucio:
I remember when my dad drove me to the bus stop.

I had already left for university, but I was still close and supported by my parents.
My first job felt different. I knew I'd seldom come back. And when I did, it wouldn't be going back 'home' anymore.

My father took a camera. He probably knew as well.

Once the bus took me out of sight, I got misty-eyed.
I was leaving boyhood behind me. Then, I stopped looking back and started looking forward to the new life chapter. Prague, here I come.

3. Go Solo

A hero's journey is a path of self-discovery.
But not so much about 'who you really are' like many think. It's more about discovering of what you're really *capable* of.

You can have a team if you're the leader taking responsibility for all.
But bar that, go solo.

4. Remove Family Support, Rely On Yourself

You're safer in your tribe, but too safe is the enemy of the hero's journey.

This is not to say you must cut contact, of course. But it is to say that your problems are yours only to face. And never bring your struggle to your parents: it's not honorable.

⍰⍰♂ Lucio's example: my brother stayed, I went
And the difference is stark. Also, as much as I like him, respect, well… That's another thing.

5. String Journeys For A Hero's Life (Infinite Game)

The main hero's journey takes you from boyhood to manhood. But you can string several journeys that add new skills, and bring new challenges.

The ambitious man's life is often a series of overlapping and sequential journeys.
Looking at my life, besides moving and pulling myself back up, there were also ambitious dating goals that kept testing me. And then entrepreneurship with TPM and PU as my missions.

⍰⍰♂Lucio's take: I see civilization as a string of great men who move us forward.
Men who made their whole lives a hero's journey. Our job is to join them, and do our part.

6. Strategic Risk-Taking: Limit the Downsides

Even successful journeys can be costly.
And some failures can cost mental health, and potentially more.

Here are five steps for a challenging, but not stupid hero's journey:

1. **Have a 'safety valve contact' if things get dark**. A good friend or a therapist, if you can afford
2. **Have an emergency fund** for food or medical emergencies
   - Emergency roof to avoid homelessness
3. **Learn power dynamics and social strategies**: these are the main skills that provided me a lifeline and boosted my climb. And once you acquire them, nobody can ever take them away from you

How Power University Prepares You

This is why Power University isn't about motivation or routines. It's about building personal power, strategy, and social competence that keep you functional even when life gets tough.

Best Books On Narcissism

Lucio Buffalmano · 25 May 2026 · Archived copy · Original

The market is flooded with books on **narcissism**. Most of them are written with limited expertise. Some are written by hurt people for hurt people. They are well-meaning, but without deep expertise they can devolve into "victim porn" that validates your pain but keeps you stuck in a cycle of complaining.

To master the dynamics of narcissism—both to defend yourself against the toxic types and to harness the high-energy traits for your own success—you need science, psychological depth, and actionable strategy.

This ranked list moves from specific recovery guides to the absolute highest-authority texts available today.

Why This List is Different
Unlike most narcissism book lists picked at random or from bestsellers list, Lucio personally reviewed each title. He checked them against the latest research, analyzed them through TPM's power-dynamics lens, and picked the best ones that teach real-world strategy, insight, and defense.

6. Will I Ever Be Good Enough?

By Karyl McBride

Summary

This is an important guide for a very specific demographic: daughters of narcissistic mothers (but it can also apply to *sons*).
It addresses the unique, insidious damage caused when the primary caregiver views their child not as an individual, but as an extension of themselves.

The author states that narcissistic daughters end up on two paths:

- **Self-destruction**, feeling unworthy, or rebelling against a narcissistic mother
- **Perfectionism**, trying to be everything their mother wanted to be and measuring up to her impossible standards

Pros

- **Empathic**, with the author providing almost a mother-figure role
- **Helpful for a precise demographic** of perfectionists and rebels, since understanding the dynamics can also help move past them. But helpful to all for learning more about human nature and power dynamics

Cons

- **Fewer practical strategies:** It focuses heavily on the emotional legacy and internal feeling of unworthiness. While critical for healing, it offers fewer “real-world” power strategies for handling the narcissist in the moment compared to Bernstein or Campbell
- **Little research backing**, relying mostly on the author’s clinical experience. It’s possible that there are plenty of daughters of narcissistic mothers who aren’t self-destructive or perfectionists, but who don’t show up for therapy
- **Doesn’t consider genetic** and ascribes everything to parental influence. Research tends to suggest though that parenting has limited effect on children’s personalities

5. Too Much and Never Enough

By Mary Lea Trump

Summary

This is a different type of book on narcissism, and it's **not for those looking for high research or clinical authority**.
However, it's still an incredible resource. Instead of focusing on narcissism as a psychothology, it provides the behind-the-scenes story of a potentially highly narcissistic man. Think of it as a big case study on one of the most prominent figures in the world.

Pros

- **Captivating**, the most entertaining read on this list
- **Historically relevant**
- **Big case study** on the difference of public persona vs. 'behind the scenes', but also on wealthy family dynamics

Cons

- **Partisan & personal bias:** Trump sympathizers will dislike it on principle. However, even as a non-supporter, I could spot some possible bias
- **Psychoanalytic conjectures and poorer scientific grounding**. For example, in the etiology of narcissism and psychopathology it leaves out genetic influence. And refers to the 'mask hypothesis' of low self-esteem, as a given, which is not
- **No how-to:** It doesn't offer general or specific advice on narcissism

4. It's Not You

By Ramani Durvasula
Summary

Dr. Ramani is effectively **the face of pop-psychology** regarding narcissism today but, although sometimes I wished for more rigorous empirical depth, she is a generally knowledgeable, capable, and even authoritative science popularizer.

It feels like Ramani writes from the **point of view of someone who has been hurt by narcissistic** relationship dynamics, and *It's Not You* is her manifesto for all the victims of narcissism. It can serve as a (helpful) validation engine for those who have been gaslit into believing they are the problem.
It's mostly aimed at recovering victims, women, and people who want to spot and avoid narcissists.

As a website on men's agency and power, we see narcissism as a double-edged sword: it can be harmful indeed. But it also includes key empowering and adaptive mindsets and traits that boost the odds of success that one may model, while eliminating the negatives.
Ramani instead stated that 'healthy narcissism doesn't exist'. That, on paper, should put us in opposite corners. Instead, we liked Ramani's work; we appreciate how vocal she is in warning her audience that few narcissists 'recover', and she's a perfect teacher for her demographic.

Pros

- **Wake up call against the hope for change,** something that several other popular books on narcissism imply is possible with narcissists, but that in truth rarely happens
- **Capable author**, with good firsthand experience as well as research knowledge

⍰ Cons

- **Black and white 'monsters and saints':** In typical Ramani fashion, the book tends to paint narcissists as unchangeable monsters and partners as pure victims. While helpful for breaking trauma bonds, it lacks the nuance of evolutionary psychology and power dynamics (e.g., *why* narcissists are attractive and successful).
- **Defensive tactics only:** It teaches you how to survive and leave, but not necessarily how to negotiate, manage, or outmaneuver a narcissist if you are forced to stay (e.g., in a workplace or co-parenting situation).
- **Discourages self-reflection and ownership** of possible contributions in the toxic dynamic. Not everyone is *100%* victim, and relationship dynamics may see both partners contribute. Research also suggests homophily in narcissists, such as picking other narcissists in relationships
  - May discourage agentic solution-seeking: research also shows that partners who can elicit communal values in narcissists can lower their partner's selfishness. This could be a good strategy, but it first requires looking at one's own behavior

---

3. Emotional Vampires

by Albert Bernstein

Summary

A heavily underrated masterpiece that simplifies five personality disorders for the general public, but coming from a scientifically rigorous author.
Bernstein doesn't just describe clinical disorders in a clinical fashion; he looks at how these personality types function in the wild (and how they drain you to feed their own needs).

⍰ Pros

- **Descriptions of everyday behavior** simplify the pathology for everyone to understand

- **Amoral**, describing both the pros and cons of each personality, how they help succeed, and even in which areas they may contribute to society (N.B.: 'amoral' is not the same as immoral)
- **Practical**, not for people 'looking to heal', but for people looking to understand and handle these personalities

⍰ Cons

- **Not focused on narcissism only**, so if you're looking for a book on narcissism only, this is a con. On the plus side, it helps you put narcissism in perspective

---

2. The New Science of Narcissism

By Keith Campbell

Summary

Dr. Campbell is one of the leading researchers in the field, making this book a bridge between dry academia and readable non-fiction. It strips away the internet "mythology" of narcissism and replaces it with research.

Crucially, it also includes the *advantages* of narcissism. Such as, with mating, initial leadership emergence, and confidence. The book explains why the trait exists evolutionarily and how it can become a trap for the narcissist themselves.

⍰ Pros

- **Narcissism as trade-offs of pros and cons**: It admits what few 'healing books' will: that narcissism has benefits.
- **Practical steps:** This is an in-between and self-help, with practical lists of 'steps' to take to become a 'healthier narcissist', or what to 'copy' from narcissists to become a more successful man

Cons

- **Examples from movies and series can get lost on you** if you're not familiar with series and Hollywood movies (still wondering how Campbell manages to have a top career as a leading researcher, a full-time job teaching, a family… And still enjoy Game of Thrones, Iron Man movies, HBO series, and more)

1. Handbook of Trait Narcissism

Various authors (Edited by A.D. Hermann, A.B. Brunell, J.D. Foster)

Summary

An edited academic volume collecting the latest empirical work on narcissism. We pick it because it provides a broad overview with all major aspects of narcissism, it includes recent findings, and it enjoys high-quality editing.

The other available handbooks on narcissism are also enlightening, including parts that are not covered in this one:

- *The Handbook of the Psychology of Narcissism* covers narcissistic perfectionism, heroical fantasies, fragility of invulnerable beliefs when faced with trauma, and issues related to long-term growth (goal orientation, performance-avoidance orientation, etc.)
- *The Handbook of Narcissism and Narcissistic Personality Disorder*: the first handbook dedicated to narcissism, including the evolution of narcissism/short-term mating, narcissism and spirituality, narcissism and attachment styles, etc.

Pros

- **Ultimate authority on narcissism**, no pop-psychology of 'narcissists lack self-esteem', 'love bombing', etc. (as a matter of fact, you will learn that it's challenging to find correlations between narcissism and infidelity, and that narcissists can have good relationships if their partners can play up their communal side)

⍰ Cons

- **For researchers and scholars**: if you're more into lighter books, pop-psychology, or self-helpy titles with neat takeaways, 'laws' or 'steps for implementation…. This isn't it, and may not be for you

Next Steps

- How to be a healthy narcissist
- Best books on dark triads
- Best books on Machiavellianism

Bonus: Leveraging Adaptive Narcissistic Traits

Lucio Buffalmano
Overview

Learning about narcissism is the foundational starting point.
But **mastering the adaptive aspects of narcissism is what gives you an edge.**

First, most books teach you how to spot a narcissist so you can run away or defend yourself. But you cannot always run, and defending yourself is passive. Sometimes you must stand your ground, negotiate, and win. Most importantly, **"healthy narcissism" traits—high confidence, drive, and assertiveness—are a prerequisite for high-level success**.

Power University is where you go to stop being a victim and start being a player. It teaches you how to:

1. **Win** against toxic narcissists using positive Machiavellianism.
2. **Develop** the honorable, high-power traits of the "enlightened narcissist" to advance your career and life.

The Evolution of Cooperation: Summary & Review

Lucio Buffalmano · 31 May 2026 · Archived copy · Original

The Evolution of Cooperation (1984) explains how cooperation can emerge and persist among self-interested individuals—even when defection is the dominant short-term strategy. Using the iterated Prisoner's Dilemma tested via computer tournaments, it shows that cooperation becomes rational when interactions repeat and future consequences matter.

Core Principles of Cooperation

- **Cooperation beats defection in long-term exchanges**
- **The longer the time horizon, the more cooperation outperforms**
- **Cooperation needs power and 'retaliatory capacity' to keep cheaters in check**
- **One-off encounters & impending relationship dissolution boost the risks of cheating**: future value-giving is the best promoter of cooperation ('shadow of the future')

Core insight: Cooperation can evolve spontaneously among self-interested actors if interaction is repeated because cooperation satisfies both parties' self-interest.

Notes

About the Authors:
Robert Axelrod is an American political scientist, he holds a B.A. in mathematics and a Ph.D. in political science (Yale University).
William D. Hamilton is a Darwinian evolutionary biologist famous for **inclusive fitness** theory (ie.: altruism weighed by genetic relatedness and benefit/cost calculations (Hamilton, 1964 part I and part II).

Foreword (by Richard Dawkins)

Dawkins, author of The Selfish Gene, wrote the foreword.

> THIS IS A BOOK OF OPTIMISM. But it is a believable optimism, more satisfying than naive, unrealistic hopes of pie in the sky (or rapture in the revolution).
> To be believable, an optimism must first acknowledge fundamental reality, including the reality of human nature, but also the nature of all life. Life as we know it, and probably throughout the universe if there is life elsewhere, means Darwinian life. In a Darwinian world, that which survives survives, and the world becomes full of whatever qualities it takes to survive. As Darwinians, we start pessimistically by assuming deep selfishness at the level of natural selection, pitiless indifference to suffering, ruthless attention to individual success at the expense of others. And yet from such warped beginnings, something can come that is in effect, if not necessarily in intention, close to amicable brotherhood and sisterhood. This is the uplifting message of Robert Axelrod's remarkable book.

Chapter 1: The Problem of Cooperation

Core problem: In life, selfish individuals find it hard to cooperate even if it is in their collective best interest.

Question: Under what conditions will cooperation emerge in a world of egoists without central authority?

The book seeks to answer this question with mathematical models derived from the Prisoner's Dilemma, a model where individual rationality leads to a collectively inferior outcome. In this game, two players face a choice between cooperation and defection:

	Cooperate	Defect
Cooperate	3 Years Each Reward / Reward	You: 5 Years Them: Go Free
Defect	You: Go Free Them: 5 Years	2 Years Each Punish / Punish

In order of what's best for the selfish individual:

- **T (Temptation to Defect):** The highest payoff, when you defect and the other cooperates.
- **R (Reward for Mutual Cooperation):** What you get if both cooperate.
- **P (Punishment for Mutual Defection):** What you get if both defect.
- **S (Sucker's Payoff):** The lowest payoff, when you cooperate and the other defects.

For the game to be a true Prisoner's Dilemma, the payoffs must satisfy two conditions:

- Condition 1: **T > R > P > S**
- Condition 2: **R > (T + S) / 2**

Because defection provides a higher individual payoff regardless of the opponent's choice, "rational" egoists are driven to defect, resulting in mutual punishment (P) rather than the superior mutual reward (R). Cooperation can only emerge when the game is iterated, allowing for the development of stable patterns based on future expectations.

Chapter 2: The Success of TIT FOR TAT (The 4 Properties for Success)

The effectiveness of various strategies was evaluated through a computer tournament involving a round-robin format of the iterated Prisoner's Dilemma, and the TIT FOR TAT was the winning strategy.

TIT FOR TAT won with a simple policy: cooperate on the first move and subsequently mimic the opponent's previous action.

The success of this strategy is derived from four robust functional properties:

1. **Niceness: never defect first.** This prevents the initiation of unnecessary and costly conflict, ensuring that the maximum possible "Reward" for mutual cooperation is maintained as long as the opponent remains cooperative.
2. **Provocability to retaliate immediately:** This serves as a deterrent, signaling that exploitation will not be tolerated and will be met with a "Punishment" payoff
3. **Forgiveness to resume win-win:** After retaliating for a defection, the strategy immediately returns to cooperation if the opponent does. This can prevent the relationship from collapsing into a permanent cycle of mutual defection (but it needs the other strategy to make the first step)
4. **Clarity to help recognize reciprocity and cooperate:** The strategy is transparent and predictable. This allows the opponent to easily recognize the pattern of reciprocity, making it easier for them to adapt their own behavior toward mutual cooperation for their own self-interest

TPM Note: Utilitarian thinking
This approach aligns well with our concepts of 'power intelligence', Machiavellianism, and 'successful psychopathy' (removing the destructive and predatory aspects of psychopathy).

A Nicer Strategy Would Have Won Round 1, But Get Exploited In Round 2

TIT FOR TWO TATS defects only if the other player defected on the previous *two* moves. It is a more forgiving version of TIT FOR TAT in that it does not punish isolated defections.

Says the author:

> The excellent performance of this TIT FOR TWO TATS rule highlights the fact that a common error of the contestants was to expect that gains could be made from being relatively less forgiving than TIT FOR TAT, whereas in fact there were big gains to be made from being even more forgiving. The implication of this finding is striking, since it suggests that even expert strategists do not give sufficient weight to the importance of forgiveness.

Two other rules that would have won were 'LOOK AHEAD' and 'OPTIMISTIC DOWNING'.

However, the first tournament environment was relatively simple. TESTER, a strategy designed to probe and exploit overly forgiving opponents, would have exploited TIT FOR TWO TATS. Because TESTER never defects twice in a row, TIT FOR TWO TATS never triggers retaliation. As a result, it continues cooperating while TESTER periodically defects and gains the temptation payoff.

Round 2 Shows It Pays to Cooperate, But Not to Be Too Nice

> What seems to have happened is an interesting interaction between people who drew one lesson and people who drew another from the first round. Lesson One was: "Be nice and forgiving." Lesson Two was more exploitative: "If others are going to be nice and forgiving, it pays to try to take advantage of them." The people who drew Lesson One suffered in the second round from those who drew Lesson Two.

This confirms what Machiavelli said: 'those who are nice are ruined among the many who are not'

Best Quotes:

- *Even expert strategists do not give sufficient weight to the importance of forgiveness.*
- *Even expert strategists (…) made the systematic errors of being too competitive for their own good, not being forgiving enough, and being too pessimistic about the responsiveness of the other side.*

Chapter 3: The Chronology of Cooperation

The emergence and maintenance of cooperation are governed by three distinct evolutionary phases:

1. **Initial Viability:** In a population of individuals who always defect, cooperation cannot emerge through isolated individuals. However, it can take hold if it starts in "clusters" of individuals who use reciprocity (like TIT FOR TAT) and have a significant proportion of their interactions with each other.
2. **Robustness:** Once a strategy is present, its robustness is measured by how well it performs in a diverse environment containing many different types of strategies. Reciprocity is robust because it can elicit cooperation from many other strategies and protect itself against exploitation.
3. **Stability:** A strategy is "collectively stable" if it can resist invasion by a rare mutant or a small group of individuals using a different strategy.
   - TIT FOR TAT STABILITY**:** In an evolutionary sense, TIT FOR TAT is stable because it prevents "mean" mutations from gaining a foothold, as it immediately punishes defection while rewarding the cooperation of its own "kin" or similar strategists.

A critical requirement for this stability is the **"Shadow of the Future."** This is mathematically represented by the discount parameter (w), which reflects the importance of the next interaction relative to the current one. If the probability of meeting again is sufficiently high, the long-term gains of cooperation outweigh the short-term gains of defection.

Chapter 4: The Live-and-Let-Live System in Trench Warfare

The "Live-and-Let-Live" system during World War I provides a historical demonstration of cooperation emerging in a high-stakes, hostile environment without formal agreements. In the static environment of trench warfare, the months-long time spent in close quartiers with the enemies created an iterated game. The author refers to high "**shadow of the future**", meaning that **the anticipation of future interactions drives current cooperation**.

Cooperation manifested through several mechanisms:

- **Mutual Restraint:** Units would refrain from firing on specific supply lines or during mealtimes, provided the other side reciprocated.
- **Ritualization:** Artillery and snipers would demonstrate their accuracy by hitting specific, non-human targets (like a specific brick in a wall) at predictable times. This signaled that they *could* kill, but chose not to, as long as the peace was maintained.
- **The Role of Retaliation:** Immediate, proportional response also maintained the truce. If one side broke the informal truce, the other side would respond with an equal or greater volume of fire to restore the "balance of terror."

⍰⍰♂**Lucio's Note**: This is a highly relevant example, and it's important to contextualize it and remember that cooperation was the exception rather than the norm

Chapter 5: The Evolution of Cooperation in Biological Systems

Chapter 5 is written in cooperation with William D. Hamilton, providing his experitse on biology and evolution.

To account for cooperation, evolutionary theory proposes two approaches that could facilitate cooperation:

- **Genetical kinship theory**: Close relatedness of players permits true altruism—sacrifice of fitness by one individual for the benefit of another.
- **Reciprocity theory** by superior payoffs among cooperators

Cooperation does not require intelligence or conscious intent and it can evolve through the mechanical process of

natural selection. In biological terms, a strategy's "payoff" is reflected in the fitness boost it provides: increasing the odds of survival and reproduction.

The authors claim that reciprocity should start with clusters. A cluster provides a nontrivial proportion of the interactions with other cooperators.

Key biological insights include:

- **Discrimination is necessary for cooperation:** For cooperation to evolve, individuals must be able to recognize each other and remember the outcomes of past interactions. This prevents "cheaters" from exploiting the population indefinitely.
- **Repeated interactions increase win-win (Mutualism):** Inter-species cooperation (such as cleaner fish and their hosts) relies on the fact that both parties receive a higher fitness benefit from the interaction than they would from defection.
- **One-off interactions increase the odds of defection and predation (Impermanence):** impermanence of association tends to destabilize symbiosis and promote win-lose and predation
- **Cooperation collapses and turn exploitative when future interactions are unlikely:** Partners and parasites—including microbes—shift from mutualism to exploitation when the probability of continued interaction drops, such as during illness, injury, or aging.
  Example: pathogens are highly aggressive and exploitative during the "infectious stage" to maximize spreading to new hosts, but are less aggressive during a "chronic phase" once they are settled in, keeping the host alive only as long as a continued association remains profitable.

Also read:

- ***The Origins of Virtue***, a more recent account focused on evolution by Matt Ridley

Chapter 6: How to Choose Effectively (Advice for Players)

Based on the findings of the computer tournaments, four strategic principles are recommended for individuals in reciprocal situations:

- **Don't be envious:** Avoid comparing your score to the other player's score. TIT FOR TAT never actually "wins" a single game (it either ties or loses slightly), yet it wins the tournament overall because it maximizes its total absolute score by encouraging mutual cooperation.
- **Don't be the first to defect:** Maintaining a "nice" reputation is functionally superior because it avoids the heavy costs associated with mutual punishment.
  Exception: when the future is not important enough compared to immediate gains, or when the other player is likely to never be seen again
- **Reciprocate both cooperation and defection:** A strategy must be "provocable" to prevent exploitation. Pure cooperation (being a "Sucker") is not a stable strategy because it invites aggression.
- **Don't be too clever:** Overly complex strategies are often perceived as random or "shifty" by others. Simplicity allows the other player to understand your reciprocity and coordinate with you effectively.

Don't Be Envious

On the importance of not letting envy stand in the way of win-win:

> TIT FOR TAT achieves either the same score as the other player, or a little less. **TIT FOR TAT won the tournament, not by beating the other player, but by eliciting behavior from the other player which allowed both to do well**. TIT FOR TAT was so consistent at eliciting mutually rewarding outcomes that it attained a higher overall score than any other strategy.

> **So in a non-zero-sum world you do not have to do better than the other player to do well for yourself**. This is especially true when you are interacting with many different players. Letting each of them do the same or a little better than you is fine, as long as you tend to do well yourself. There is no point in being envious of the success of the other player, since in an iterated Prisoner's Dilemma of long duration the other's success is virtually a prerequisite of your doing well for yourself.

Note that the behavior still allowed TIT FOR TAT to win *overall*, even when not always scoring more tha various individual strategies it engaged with.

Reciprocate Both Cooperation and Defection

Best insights and takeaways:

- **Reciprocity is a necessity:** *The extraordinary success of TIT FOR TAT leads to some simple, but powerful advice: practice reciprocity.*
- **Provocability is necessary for nice approaches**: *Proposition 4 demonstrates that being provocable is actually required for a nice rule like TIT FOR TAT to resist invasion.*
- **Retaliation optimum balance**: *What is clear is that extracting more than one defection for each defection of the other risks escalation. On the other hand, extracting less than one-for-one risks exploitation*. (…) *While the exact balance will be hard to determine in a given environment, the evidence of the tournament suggests that something approaching a one-for-one response to defection is likely to be quite efFective in a wide range of settings.*
- **Retaliate calibrating to the environment:** *the precise level of forgiveness that is optimal depends upon the environment. In particular, if the main danger is unending mutual recriminations, then a generous level of forgiveness is appropriate. But, if the main danger is from strategies that are good at exploiting easygoing rules, then an excess of forgiveness is costly.*
  Later on, the author acknowledges that 'limited provocability' enhances returns when stable cooperation is the goal

Don't be too clever

- **Make it easy to predict cooperation:** *In chess, it is useful to keep the other player guessing about your intentions (…) the less efficient will be his strategy (…) to your benefit. But in a non-zero-sum setting (…) you benefit from the other player's cooperation. The trick is to encourage that cooperation. A good way to do it is to make it clear that you will reciprocate. Words can help (…) but actions speak louder than words.*
- **Don't be too calculative**: *unlike the chess opponent, the other player in a Prisoner's Dilemma should not be regarded as someone who is out to defeat you. The other player will be watching your behavior for signs of whether you will reciprocate cooperation or not, and therefore your own behavior is likely to be echoed back to you.*

This is why some of the popular literature on power and manipulation is often misleading when it states among its laws of 'keeping others in suspended terror' as a leadership tactic.

Chapter 7: How to Promote Cooperation (Advice for Reformers)

For those in positions of authority or systemic design, cooperation can be encouraged by altering the environment of the interaction:

- **Enlarge the shadow of the future:** Make the future more important relative to the present. Ie..: Make interactions more frequent, durable, and predictable. When players know they will interact many times, the incentive to cooperate increases. The two main strategies are:
  - More durable: for example, marriage

  - More frequent: when the next interaction happens sooner, the next move looms larger
- **Change the payoffs:** Use regulations or incentives to make the Reward (R) for cooperation more attractive or the Punishment (P) for defection more severe.
- **Teach people to care about each other:** While not strictly necessary for cooperation, social norms that value the other's well-being can supplement the strategic incentives.
- **Teach reciprocity:** Explicitly promoting TIT FOR TAT-like behavior helps individuals realize that cooperation is in their long-term self-interest.
- **Improve recognition abilities:** Systems that increase transparency and allow for the easy identification of defectors (such as credit ratings or reputations) make it harder for exploitation to occur.

Chapter 8: The Social Structure of Cooperation

Social structures provide additional layers of stability or conflict to cooperative systems. These include:

- **Labels/Stereotypes:** Stereotypes or observable traits (race, gender, status) can be used as proxies for expected behavior. This can lead to self-fulfilling prophecies where certain groups are discriminated against or where hierarchies of "dominance" and "deference" are maintained through the threat of retaliation.
- **Reputation for provocability:** A player's history with *others* affects how a new partner will treat them. This makes it vital to maintain a reputation for being provocable but nice.
- **Territoriality:** When players interact mostly with their neighbors, cooperative clusters can survive even if the global environment is hostile. This "local" reinforcement allows cooperation to spread outward like a wave.
  - The advantage of great success when diffusion by imitation rules: *in a social system based on diffusion by imitation, there is a great advantage to being able to attain outstanding success, even if it means that the average rate of success is not outstanding. This is because the occasions of outstanding success win many converts.*
- **Regulation is most effective when obedience is convenient:** Governments cannot enforce any rule it chooses and must instead elicit compliance from the majority. So they are most effective when they align with the natural incentives for reciprocity already present in the system.

The author here touches upon social power dynamics and status classes/castes (see 'Social Dominance Theory' for more).
He says that marginalized minorities who are short-changed by the majority may be better seeking defensive isolation and sticking to cooperation against isolated defections rather than facing unending punishment.

A Bully's Reputation to Stave Off Defection & 'Maximum Return's Defection Rate'

> Having a firm reputation for using TIT FOR TAT is advantageous to a player, but it is not actually the best reputation to have. The best reputation to have is the reputation for being a bully. The best kind of bully to be is one who has a reputation for squeezing the most out of the other player while not tolerating any defections at all from the other.

Note that this may not apply to humans because of social dynamics that create push-backs against bullying (see Lucio's analysis below).
Even then, a bully reputation is not easy says the author because it requires lots of defection, escalations (including with other wannabe bullies), and costs:

> Fortunately, it is not easy to establish a reputation as a bully. To become known as a bully you have to defect a lot, which means that you are likely to provoke the other player into retaliation. Until your reputation is well established, you are likely to have to get into a lot of very unrewarding contests of will. For example, if the other player defects even once, you will be torn between acting as tough as the reputation you want to establish

> requires and attempting to restore amicable relations in the current interaction.

But this Machiavellian approach makes sense from a perspective of pure maximization of returns:

> The way to squeeze the most out of the other is to defect so often that the other player just barely prefers cooperating all the time to defecting all the time. And the best way to encourage cooperation from the other is to be known as someone who will never cooperate again if the other defects even once.

And the author ends again with the advantages of TIT FOR TAT's 'assertiveness':

> Using TIT FOR TAT is an effective way of holding still and letting the other player do the adaptation. It refuses to be bullied, but does not do any bullying of its own.

Chapter 9: The Robustness of Reciprocity

The study of cooperation leads to a cautiously optimistic conclusion. Cooperation based on reciprocity can emerge from small clusters, thrive in diverse environments, and protect itself once established.
This "ratchet effect" suggests that once the conditions for reciprocity are met—primarily a sufficiently long "shadow of the future"—cooperation can become a stable and dominant feature of a system. This logic applies across scales, from the micro-level of biological cells to the macro-level of international relations, proving that mutual gain is possible even among individuals who are purely self-interested.

The Risk of Eliminating or Bankrupting Your Opponent

Axelrod seems to refer to US policy towards the former USSR here:

> Occasionally a political leader gets the idea that cooperation with another major power should not be sought because a better plan would be to drive them into bankruptcy. This is an extraordinarily risky enterprise because the target (…) would also have a strong incentive to escalate the conflict before it was irreversibly weakened.
> Japan's desperate gamble at Pearl Harbor, for example, was a response to powerful American economic sanctions aimed at stopping Japanese intervention in China (Ike 1967; Ho-soya 1968). Rather than give up what it regarded as a vital sphere, Japan decided to attack America before becoming even further weakened. Japan (…) decided that the cumulative effects of the sanctions made it better to attack rather than to wait for the situation to get even more desperate.

More Win-Win Games Than Competitions?

> We are used to thinking about competitions in which there is only one winner, competitions such as football or chess. But the world is rarely like that. In a vast range of situations mutual cooperation can be better for *both* sides than mutual defection. The key to doing well lies not in overcoming others, but in eliciting their cooperation.

Propositions

Proposition	Explanation

Proposition	Explanation
1: If the discount parameter, w, is sufficiently high, there is no best strategy independent of the strategy used by the other player.	When the future is important enough (large w), the best choice always depends on what the other player is doing. Assuming the opponent will always defect leads to endless mutual punishment, while permanent retaliation makes initial cooperation optimal. No single strategy dominates regardless of the opponent.
2: TIT FOR TAT is collectively stable if and only if w is large enough. This critical value of w is a function of the four payoff parameters, T, R, P, and S.	TIT FOR TAT cannot be invaded when the next move is sufficiently important relative to the current one. Specifically, w must exceed the larger of (T−R)/(T−P) and (T−R)/(R−S) so that neither ALL D nor alternating defection-cooperation can outperform the population average of mutual cooperation.
3: Any strategy which may be the first to cooperate can be collectively stable only when w is sufficiently large.	For a strategy to be collectively stable it must protect itself from invasion by any challenger, including the strategy which always defects. If it ever cooperates, ALL D gains the temptation payoff T on that move; only a large w nullifies this one-time gain against the long-run population average.
4: For a nice strategy to be collectively stable, it must be provoked by the very first defection of the other player.	If a nice strategy (never first to defect) were not provoked by a defection on move n, then it would not be collectively stable because it could be invaded by a rule that defected only on move
5: ALL D is always collectively stable.	If the other player is certain to defect, there is no point in ever cooperating. A population of players using ALL D will each get P per move, and no player can do any better than this if no one else will ever cooperate.
6: The strategies which can invade ALL D in a cluster with the smallest value of p are those which are maximally discriminating, such as TIT FOR TAT.	A maximally discriminating strategy cooperates on its first move even against a never-cooperator, then never cooperates again with ALL D while always cooperating with identical copies. This maximizes the cluster's internal score relative to its score against natives, allowing invasion with the smallest proportion p of within-cluster interactions.
7: If a nice strategy cannot be invaded by a single individual, it cannot be invaded by any cluster of individuals either.	Nice rules achieve the highest possible population average R/(1−w) when paired with themselves. Any cluster invader must therefore score higher against the native population than the natives do among themselves, which is impossible for a nice rule that is already uninvadable by single individuals.
8: If a rule is collectively stable, it is territorially stable.	In a territorial system (players interact only with neighbors and copy the highest-scoring neighbor each generation), any collectively stable rule cannot be invaded even when a single mutant is introduced into one location. The proof holds for any not-too-highly-connected grid because every point has a neighbor-of-a-neighbor that is not its own neighbor.

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Cooperation Requires Power & Continued Value-Provisioning

From chapter 3, on cooperation requiring future interactions and 'the ability to provide value':

> if the other player is unlikely to be around much longer because of apparent weakness, then the perceived value of w falls and the reciprocity of TIT FOR TAT is no longer stable.

And the author tightly links it to a real-life scenario from a historical power struggle:

> We have Caesar's explanation of why Pompey's allies stopped cooperating with him. "They regarded his [Pompey's] prospects as hopeless and acted according to the common rule by which a man's friends become his enemies in adversity" [translated by Warner 1960, p. 328].

And to a modern business scenario:

> Another example is the case where a business is on the edge of bankruptcy and sells its accounts receivable to an outsider called a factor. This sale is made at a very substantial discount because once a manufacturer begins to go under, even his best customers begin refusing payment for merchandise, claiming defects in quality, failure to meet specifications, tardy delivery, or what-have-you. **The great enforcer of morality in commerce is the continuing relationship, the belief that one will have to do business again with this customer**, or this supplier, and when a failing company loses this automatic enforcer, not even a strong-arm factor is likely to find a substitute. (Mayer, 1974, p. 280)

And the author, with one final example from politics:

> Similarly, any member of Congress who is perceived as likely to be defeated in the next election may have some difficulty doing legislative business with colleagues on the usual basis of trust and good credit

The author ends by adding that cooperation is also easier in smaller towns or ethnic neighborhoods, although I believe ethnicity is a confounding factor.

Cooperation Is Often Good... Unless It's For a Clique, to Society's Detriment

Smaller alliances within larger society can promote a small group's interest at the cost of everyone else:

> There are times when one wants to retard, rather than foster, cooperation between players. Collusive business practices are good for the businesses involved but not so good for the rest of society. In fact, most forms of corruption are welcome instances of cooperation for the participants but are unwelcome to everyone else. So, on occasion, the theory will be used in reverse to show how to prevent, rather than to promote, cooperation.

This is also the case with mafias and various 'secret societies'.

Reciprocity is Honorable & Supports Societal Functioning

> Unconditional cooperation can not only hurt you, but it can hurt other innocent bystanders with whom the successful exploiters will interact later. Unconditional cooperation tends to spoil the other player; it leaves a burden on the rest of the community to reform the spoiled player, suggesting that reciprocity is a better foundation for morality than is unconditional cooperation.

And then a crucial point we wholeheartedly agree with here at TPM:

> Reciprocity is certainly not a good basis for a morality of aspiration. Yet it is more than just the morality of egoism. It actually helps not only oneself, but others as well. It helps others by making it hard for exploitative strategies to survive.

But there is also a return for the self:

> But you also have a private advantage from another person using reciprocity even if you never interact with

> that person: the other's reciprocity helps to police the entire community by punishing those who try to be exploitive. And this decreases the number of uncooperative individuals you will have to deal with in the future.

QUOTES

It's value exchanges above trust:

> **The foundation of cooperation is not really trust, but the durability of the relationship.**

On the importance of continued interaction for cooperation to emerge and yield benefits:

> The very possibility of achieving stable mutual cooperation depends upon there being a good chance of a continuing interaction

On the four basic strategies of successful cooperation:

> The analysis of the data from these tournaments reveals four properties which tend to make a decision rule successful: avoidance of unnecessary conflict by cooperating as long as the other player does, provocability in the face of an uncalled for defection by the other, forgiveness after responding to a provocation, and clarity of behavior so that the other player can adapt to your pattern of action.

On the 'power of kindness':

> in fact there were big gains to be made from being even more forgiving. The implication of this finding is striking, since it suggests that even expert strategists do not give sufficient weight to the importance of forgiveness.

On the importance of starting off cooperative:

> The lesson is that not being nice may look promising at first, but in the long run it can destroy the very environment it needs for its own success.

⍰⍰♂ Lucio's Analysis

Sometimes Over-extends Prisoner's Dilemma Implications Without Considering Alternative Dynamics (Psychology, Biases, etc.)

I've noticed this a few times.
As an example, providing real-life applications of how weakness and non-repeated interactions boost the odds of defection, the author writes:

> Conversely, a visiting professor is likely to receive poor treatment by other faculty members compared to the way these same people treat their regular colleagues.

This is often not the case because of different psychological and social-psychological dynamics.
For example, many people, and especially men with a strong ingroup-outgroup psychology, want to show the best possible time to high-value outsiders because it reflects well on their ingroup. It's a status boost if others think well about 'their' group/university/country.

Short-term visits also allow people to present their best selves in those brief interactions, and there are no considerations about possible competition for promotion.

Example 2: Shooting Back / Not Shooting is Also Tied to Psychology

For example, the author writes that people in war shoot back because 'mutual defection is preferred to unilateral restraint'. That is a good point, but there are also basic psychological dynamics at play, like self-defense and, as the author later also notes, revenge-seeking.

Conversely, not shooting is most certainly in good part because mutual restraint is better, but also because many people are uncomfortable with causing harm and killing. It's a well-known phenomenon that many soldiers don't shoot in situations where it makes little difference and they can freeride on other shooters.

Conflates Mobility as Cause of Defection Instead of Mobility As Enabler of Defection

Writes the author:

> Therefore, if the other player is not likely to be seen again, defecting right away is better than being nice. This fact has unfortunate implications for groups who are known to move from one place to another. An anthropologist finds that a Gypsy approaches a non-Gypsy expecting trouble, and a non-Gypsy approaches a Gypsy suspiciously, expecting double-dealing.

However, rather than being forced into a defector strategy because of moving, some cheater strategies may move *because* they adopt a cheater strategy.

For example, psychopathy has been linked to frequent moving, and I doubt that moving is the cause of psychopathy.

Unaccounted Costs for Bully's Reputation?

The author writes:

> The best reputation to have is the reputation for being a bully. The best kind of bully to be is one who has a reputation for squeezing the most out of the other player while not tolerating any defections at all from the other.

While this may apply to digital programs, the considerations are different with humans.
The author is correct in acknowledging later that creating such a reputation is costly, but I believe it goes beyond simple 'loss of returns from defection'.
The reputation for a bully may also decrease *future* cooperation once the reputation is established because other cooperators *avoid* the bully. And it may boost escalations and power showdowns as others approach him ready for an escalation and a fight, rather than cooperation.

It may also encouarage what have been called 'leveling coalitions', or coalitions of smaller players who 'gang up' against the bully.

We have seen similar dynamics in real world politics, see for example:

- US foreign policy analysis: How US forceful approach strengthens others and decreases US global influence

Chapter 5 Forgets About the Need For Power/Retaliation

This crucially important concept is directionally, but in my opinion, it could have been better fleshed out and misses an important mechanism of power dynamics:

> Other mutualisms are also characteristic of situations where continued association is likely, and normally they involve quasi-permanent pairing of individuals, or of inbred or asexual stocks, or of individuals with such stocks (Hamilton 1972 and 1978). Conversely, conditions of free-mixing, and transitory pairing conditions where recognition is impossible, are much more likely to result in exploitation—parasitism, disease, and the like.
> (…)
> Again, it is seen that impermanence of association tends to destabilize symbiosis.

Axelrod and Hamilton's argument is generally correct, particularly in cases where interests perfectly converge, such as vertical transmission through the egg and when the host's health boosts the parasite's own survival and reproduction.
In these specific scenarios, the guest's future is biologically tied to the host's reproductive success, making any defection or "cheating" self-harming and potentially self-destructive for the parasite in case of the host's death.

However, the logic fails to account for power asymmetry and the importance of retaliation.

If a host lacks the mechanical ability to retaliate or expel a parasite/predator, it becomes a permanent "Sucker," allowing the parasite to stabilize an equilibrium of **optimized exploitation**, rather than neutrality or optimized win-win.
Since the payoff for the temptation to defect (T) can be higher in real life than the reward for mutual cooperation (R), an unpunished parasite may evolve to extract the maximum sustainable resources rather than transition to a win-win outcome.

In these power-asymmetric relationships, permanence does not facilitate cooperation but only provide a longer timeline for one-sided extraction.

REVIEW

The Evolution of Cooperation is a seminal work on strategy and a foundational text for The Power Moves. It formalizes how cooperation, retaliation, and long-term incentives shape outcomes in repeated interactions.

While such an important work would have benefited from tighter editing, we are grateful to the author because it remains a core resource for understanding strategic interaction and supports many of this website's frameworks, strategies, and principles.

Exchange and Power in Social Life: 5 Laws of Social Power (Review)

Lucio Buffalmano · 1 June 2026 · Archived copy · Original

Exchange and Power in Social Life (1964) establishes a rigorous sociological framework explaining how micro-level interpersonal exchanges of rewards and obligations generate power, status, and legitimate authority.

Key Mechanics of Power & Exchange

1. **People interact to get returns and achieve goals:** Social interaction is largely driven by expected rewards—material, social, or psychological.
2. **Unreciprocated value creates power:** When one party gives benefits that cannot be matched, the imbalance is repaid through **compliance**.
3. **Power = absence of alternatives to compliance:** A has power over B when B cannot reciprocate, cannot find alternatives, cannot coerce, and cannot do without the benefit.
4. **Dependence disempowers:** The more B values what A controls relative to alternatives, the more power A has over B
5. **Power must be legitimized to be stable:** Fair use of power generates **approval and authority**; perceived exploitation generates **resentment and opposition**.
   See: leadership 101 and leadership power dynamics

Core insight: Social life runs on exchanges, and power emerges naturally from asymmetric dependence in social exchange.

NOTES

About the Author:
Peter M. Blau (1918–2002) was a leading sociologist who developed exchange theory into a framework for explaining power, social structure, and institutional organization.
His work bridges micro-level interactions and macro-level systems, making him a foundational figure in modern sociology.

Introduction: What's Included in 'Social Exchange'

Social exchange is the process of voluntary actions that are contingent on rewarding reactions from others, and that

tend to cease when these expected reactions are not forthcoming

Blau specifies two conditions for behavior to constitute social exchange:

1. Oriented toward ends achievable through interaction with others
2. Involve an attempt to adapt means to those ends

Blau explicitly excludes coercion and conformity to internalized moral norms from the definition.
Social exchange covers the broad swath of voluntary, goal-oriented social interaction.

To avoid making exchange theory unfalsifiable, the author restricts the concept to actions that are contingent on rewarding reactions from others and that cease when those reactions are not forthcoming, and he commits to deriving operationally testable hypotheses.

The Introduction also announces the book's structural argument in advance:

- Social attraction generates exchange;
- Unreciprocated exchange generates power;
- The exercise of power generates either legitimation and organization or opposition and change depending on how fairly it is exercised.

And, central to his macro theory, the same forces that restore equilibrium in one respect are disequilibrating in others.

1. The Structure of Social Associations

Most human pleasures are rooted in social life, and most suffering originates from the actions of others. This elementary observation explains why people seek to prove themselves attractive to others: because association with others is the primary medium through which human ends are achieved.

The basic causal chain Blau outlines is:

- **Social life is governed by the reciprocal flow of rewards**—ranging from instrumental services to social approval—and that power emerges specifically when these exchanges become imbalanced
- **Unilateral giving create power imbalances and subordination:** When one party cannot reciprocate in kind, because the person who supplies needed services that cannot be matched obtains the compliance of the other as a substitute currency
  - Power differentials equilibrate the exchange because people give power to those who are giving them value
- **People seek a balance in their favor**: *Individuals and groups are interested in, at least, maintaining a balance between inputs and outputs and staying out of debt in their social transactions; hence the strain toward reciprocity. Their aspirations, however, are to achieve a balance in their favor and accumulate credit that makes their status superior to that of others; hence the strain toward imbalance*
  - Imbalances are experienced negatively, as shown for example by people's tendency to escape from domination if they can
- **Fair use of power elicits approval and legitimacy:** The fair exercise of power gives rise to approval of the superior, whereas unfair exploitation promotes disapproval.
  If followers agree that the demands are fair and just in view of the rewards delivered, feelings of obligation and loyalty bestow legitimating approval on authority, strengthening and extending the leaders' influence
  - Legitimate authority obviates the need for coercive measures
  - Unfair use of power promotes opposition: if the demands of those in power are experienced as exploitative and oppressive, frustrations promotes disapproval and antagonism. Communication among followers justifies and reinforces the negative orientation toward the oppressors, increasing hostility and potentially opposition.

- **People try to be attractive to others** to realize the expected rewards of association. This prompts impression management, but how impressive people try to be also depends on roles (later)
- **Gratitude helps but it's not enough to sustain exchanges without mutual benefits**: *While the other may be sufficiently rewarded by expressions of gratitude to help him a few times, he can hardly be expected regularly to devote time and effort to providing help without receiving any return to compensate him for his troubles.*

Social exchanges are inherently competitive

> The same human acts that cause pleasure to some typically cause displeasure to others. For one boy to enjoy the love of a girl who has committed herself to be his steady date, other boys who had gone out with her must suffer the pain of having been rejected. The satisfaction a man derives from exercising power over others requires that they endure the deprivation of being subject to his power (…) In short, the rewards individuals obtain in social associations tend to entail a cost to other individuals.

However it's important to note that social exchanges are not zero-sum games:

> This does not mean that most social associations involve zero-sum games in which the gains of some rest on the losses of others. Quite the contrary, individuals associate with one another because they all profit from their association. But they do not necessarily all profit equally, nor do they share the cost of providing the benefits equally, and even if there are no direct costs to participants, there are often indirect costs born by those excluded from the association, as the case of the rejected suitors illustrates.

Macrostructures vs. microstructures

Macrostructures differ from microstructures along 3 key mechanisms:

- **Value consensus** is the mediating mechanism because direct social interaction among all members is impossible. Shared values serve as functional substitutes for personal attraction
- Complex interplay between the forces within substructures and the forces connecting those substructures develop
- **Enduring institutions** perpetuate social arrangements beyond the life span of any individual participant.

Social Attraction

> Social attraction is the force that induces human beings to establish social associations on their own initiative and to expand the scope of their associations once they have been formed.

Blau states that an individual is attracted to another if he expects associating with him to be in some way rewarding for himself. Such as, **attraction is driven by the possibility of getting value**, and driven by a 'what's in it for me' motive.

Blau also differentiates between two types of attraction:

- **Intrinsic attraction** In its narrower sense, social attraction refers to liking another person intrinsically and having positive feelings toward him <— TPM Note: in the Social Investment Model this is based on 'personal value'
- **Broader attraction** refers to being drawn to another person for any reason whatsoever <— TPM Note: This includes what at TPM we called 'exchange value', or 'extrinsic value'

Processes of social attraction, in turn, are likely to lead to processes of social exchange as attracted people spend more time together and interact.

2. Social Integration

When people enter a new group or form one from scratch, they seek to impress others with their abilities to become valuable associates and command respect.
Yet impressive people also put others on the defensive, because acknowledging someone's high value means accepting a subordinate position relative to them. This creates what Blau calls a **competition for social recognition** that functions as a screening test for leadership: those with genuine competence prove it under competitive pressure, and others discover that competitive tactics like incessant self-promotion become self-defeating.

- **People seek to impress others** to gain status and acceptance
  - Good impressions must be well done: Self-conscious concern with impressing others can become self-defeating. Awkwardness and being seen as 'putting up a front' leave a poor impression. Creating a good first impression is a subtle form of bragging, but its success depends on its being so natural that it does not appear to be bragging at all.
- **Excessive modesty only works in combination with power:** *Hence, unless the weaknesses to which a group member calls attention are less significant than the attractive qualities he has exhibited, he will not have succeeded in demonstrating to others that he is approachable as a peer as well as attractive but only in convincing them that he is fundamentally not an attractive associate at all.*
- **People bond when they're not competing for status:** *the discovery of common links is essential for the development of social integration, and this discovery tends to be made when group members withdraw from the competition for status*
- **Most relationships are both intrinsic and extrinsic**. For example, workers participate in unions to improve their employment conditions but also to enjoy the union's fellowship and the pleasure of helping others.
  - Rewards are 'fused': It is not so much a specific kind of social reward as the fusion of a variety of rewards in a given association that makes these fused rewards inseparable from the associate who is their source and hence creates intrinsic attraction to him
  - Even intrinsic attraction is initially based on extrinsic comparisons of rewards: *the initial attraction of individuals to others always rests on extrinsic factors that permit comparisons. Even falling in love is the result of implicit, and partly unconscious, comparisons of specific traits of various girls*
- **Exchange in intimate relationships serves to maintain the bond**, whereas in other social relations the association is a means for obtaining extrinsic rewards
  - But there is expectation for (continued) devotion: Although there is no quid pro quo of explicit services, partners expect their devotion be rewarded by the other's enduring commitment

2.2. Social Status & Power

- **High value makes someone attractive and a threat at the same time** (Paradox of integration): *impressive qualities make a person attractive in one sense and unattractive in another, because they (…) pose a status threat for the rest of the group*
  - People prefer not to show their social attraction: Fear of dependence and subordination lead to a defensive reluctance to let oneself be easily impressed, which is part of the competition for social recognition in early stages of group formation
  - Social status is a competition of impressing others: *The more successful A is in impressing B and earning B's high regard, the more displeasure he causes to C whose relative standing in the eyes of B has suffered.*

	A's choice	
B's choice	*Expressing regard*	*Withholding regard*
Expressing regard	Peer relation (2nd choice of both)	A superior to B (A's first choice)
Withholding regard	B superior to A (B's first choice)	No relation (Last choice of both)

People prefer *getting* high regard, but both prefer reciprocal regard to no regard

- **High-power & high-warmth may be the best mix to gain status**: *The inference derived from the theory presented, in contrast, is that group members who have positive characteristics on a salient attribute, which make them attractive, but negative ones on a less salient attribute, which also make them approachable, have the best chance to win informal acceptance*
- **High status men don't compromise (on important issues):** *in matters irrelevant to the status hierarchy, then, superiors were willing to compromise their own beliefs in a conciliatory gesture of moving toward closer, although not full, agreement with subordinates. High status requires firm judgments on issues that directly pertain to the basis of the superior position (…) To compensate for this insistence on contradicting their ideas, superiors made concessions to subordinates in other areas, modifying their opinions to bring them into greater harmony with that of subordinates, and modestly depreciated their own important as well as unimportant qualities in response to the pressure to win the approval of subordinates.*

See more in:

- High-power and high-warmth social strategy

Confident People Seek Status, Unconfident Ones Seek Acceptance

> The newcomer to an established group tends to employ (…) unthreatening strategies, such as ingratiating himself through flattering remarks, to gain social acceptance. Such strategies, however, can only succeed in eliciting a bare minimum of social attraction.
> Whereas the insecure newcomer may feel constrained to confine himself to them, the members of a newly forming group, none of whose social position is more insecure than that of the rest (although psychological differences in feelings of security exist, of course), often resort to more aggressive tactics to establish themselves as valuable associates.

Low-Status People Seek Support

The concept is that people with low status and power seek social and psychological support:

> differentiation of status in the group intensifies the need for integrative bonds, particularly for those who do

> not command respect for their ability to make important contributions.

Blau says this is especially the case during group formation, when people must still gain full social acceptance.

Vulnerability is a Sign of Submission

At TPM we long cautioned men against vulnerability, which some years ago seemed to have become a new hype. One of the reasons, as Blau confirms, is that vulnerability signals withdrawals from status competitions, which ambitious men may not want to signal:

> By calling attention to his weaknesses, a person gives public notice that he withdraws from the competition for superior standing in the group and that he considers acceptance as a peer sufficient reward for his attractive qualities and for whatever contribution they enable him to make.

People who initially tried to impress others and gain status but failed turn to self-depreciation to gain support. But don't overdo it. Blau also shrewdly points out that overdoing self-deprecation does not always promote sympathy and social acceptance, but discomfort and rejection.

Read more in:

- How to be vulnerable without losing power

> How to Be Vulnerable As A Man, Without Looking Weak

3. Social Support

The central **dilemma of approval** is: people need approval and therefore want others to express it, yet approval expressed too freely depreciates in value because it ceases to be reliable evidence of genuine judgment.

The dilemma manifests across several social domains:

- A person of high status whose approval is rare and selective provides the most valuable approval; one who praises everything provides little signal value
- Respect and social approval are related but distinct: respect is unilateral acknowledgment of superior ability, while approval is broader and can be mutual. Giving too much approval risks losing respect; withholding it risks antagonism
- People are far more willing to express approval than disapproval, partly because of social pressure and partly because the social cost of being wrong in one's criticism is higher
- **People are freer to express approval when in power:** *A leader whose expertness is widely acknowledged does not endanger respect for his judgment by praising the performance of followers, but a man whose status is not so secure does.*
- **Respect is necessary for status and social power:** social approval of a person's beliefs and values and his conformity does not help raise him to a superordinate position; only respect for his superior qualities raise status

The **dilemma of love** parallels the dilemma of approval: both parties want to encourage the other's affection by providing rewards, yet providing those rewards too generously deflates their significance. The key insight is that commitments must keep pace—if one lover is considerably more committed than the other, the imbalance either invites exploitation or provokes withdrawal. A lasting attachment requires that devotion expand at roughly the same pace on both sides.

- **Success in social and sexual exchanges determines one's self-esteem**: In dating an individual places the

attractiveness of his own self on the market, which makes success of extreme importance for his self-conception. Success validates attractiveness in their own eyes as well as those of others <— TPM's note: Blau refers to sexual market value

- **Professing love works if she already has feelings:** *man's expressions of affection that meet a woman's suppressed desires tend to intensify her love for him, but if his affection far exceeds her feelings and desires it is likely to alienate her.*

4. Social Exchange

This is the definitional core of the book, where Blau establishes the concept of social exchange and distinguishes it from both purely economic transactions for entailing unspecified obligations that require trust.

- **Social exchange** refers to voluntary actions of individuals that are motivated by the returns they are expected to bring and typically do in fact bring from others
- **Process of exchange**: Processes of social association can be conceptualized, following Homans' lead, "as an exchange of activity, tangible or intangible, and more or less rewarding or costly, between at least two persons."
- **Rewards and costs:** Rewards are what we can provide others, at a cost.
  - *The cost incurred In providing social rewards in exchange for others may be thought of as "Investment cost," "direct cost," and "opportunity cost.*
- **Obligation**: An individual who supplies rewarding services to another obligates him. To discharge this obligation, the second must furnish benefits to the first in turn.

Blau identifies six types of social rewards distributed across two analytical dimensions (spontaneous evaluations vs. calculated actions; intrinsic vs. extrinsic vs. unilateral):

- **Personal attraction** (intrinsic, spontaneous)
- **Social acceptance** (intrinsic, calculated)
- **Social approval** (extrinsic, spontaneous)
- **Instrumental services** (extrinsic, calculated)
- **Respect/prestige** (unilateral, spontaneous)
- **Compliance/power** (unilateral, calculated)

	Intrinsic	*Extrinsic*	*Unilateral*
Spontaneous Evaluations	Personal attraction	Social approval*	Respect-prestige†
Calculated Actions	Social acceptance*	Instrumental services*	Compliance-power‡

The six types of rewards listed by Blau

- **People seek to obtain extra returns from social exchanges ('social scalping' and manipulation)**:
  - Covert questions: *consulting others indirectly by telling them about difficult problems is a more economical method of receiving help with decision-making than directly asking for advice, but only experts whose discussions of problems others find stimulating can avail themselves of this method of obtaining help without becoming obligated to reciprocate for it*
    See: manipulation tactics
  - *individual can cut his costs by obtaining rewards from actions of others that are profitable rather than costly to them, if this is possible*
  - *Social exchange can also be made less costly and more profitable by supplying social rewards that simultaneously benefit and obligate several others. The person who makes important contributions to an entire group illustrates this way of multiplying the benefits produced by one's actions*

  - Mediating disagreements
- **Exchanged benefits are sometimes tokens of support**: *the specific benefits exchanged are sometimes primarily valued as symbols of the supportiveness and friendliness they express, and it is the exchange of the underlying mutual support that is the main concern of the participants*
- **Exchanges are mixed games of cooperation/competition:** *with some common and some conflicting interests—the common ones in the partnership and the conflicting ones concerning who makes the greater commitment.*
- **Excessive reciprocation may be a power move**, 'emberessing' says Blau because it is a bid for a more extensive exchange relation than one may be willing to enter <— It's also a power move /social exchange scalping though, because it seeks to create a bigger debt for the receiver
- **Too fast reciprocation signals distance:** *Generally, posthaste reciprocation of favors, which implies a refusal to stay indebted for a while and hence an insistence on a more businesslike relationship, is condemned as improper, "Excessive eagerness to discharge an obligation is a form of ingratitude."*
- **Time is a significant cost in social exchanges:** *The most general cost incurred in supplying any social reward is the time required to do so in social associations* <— TPM Note: this is true for higher value men mostly. High value and busy people give simply with their time. But lower value people take that time, rather than give it
- **The first step carries opportunity and risks**: The initial offer of a favor entails the risk of rejection of favor and overture, and it can turn into cordiality or hostility because the offer cannot be refused without being insulting <— TPM Note: this is why we stress 'power protecting'

5. Differentiation of Power

- **Unilateral value-giving creates power:** *By supplying services in demand to others, a person establishes power over them. If*
  - Regular rewards allow for coercive power: *The only difference between punishments and rewards is in relation to this initial baseline, whether he is worse or better off than he was before the transaction started (…) Regular rewards make recipients dependent on the supplier and subject to his power, since they engender expectations that make their discontinuation a punishment.*
    For example, receiving a salary from work employment.
- **The ability to provide rare or superior benefits empowers:** *The ability to provide superior benefits than are available elsewhere, in a situation where these benefits are needed and cannot be extracted by force, constitutes a very strong claim to power, although not a completely inescapable one.*
  - But the 'ask' for those benefits must be commensurate: *If the power demands are too severe, relinquishing these benefits may be preferable to yielding to the demands.*
- **Unilateral dependence creates subordination:** *unless they can furnish other benefits to him that produce interdependence by making him equally dependent on them, their unilateral dependence obligates them to comply with his requests lest he cease to continue to meet their needs.*
  - The second-best option determines the leverage: *The degree of dependence of individuals on a person who supplies valued services is a function of the difference between their value and that of the second-best alternative open to them.* This is why coercive force is also important
- **Status enables making demands, but demands can deplete power**: *Superior status that empowers a person to command a variety of services from others enables him to gain many advantages. But if securing these advantages requires making too stringent demands, he depletes his power and endangers his status for several reasons. The costly services he forces others to supply to him may make it profitable for them to relinquish the benefits on which his power rests in favor of the lesser benefits that can be had from another person at lesser cost.*
  - Highest power doesn't get depleted: *The distinctive asset of vast power is that it obviates the need for making excessive demands that undermine power. This means not merely that individuals or groups with much power*

still have a great deal left after using some of it, by commanding services, but that their exercise of power usually does not deplete it at all and often actually helps them further to enhance it.

- **Coercive force is a last-resort compliance tool**, *coercive force, which can hardly be resisted, is important as a last resort for exercising power over individuals who cannot otherwise be made to yield.*
  - But it's an imperfect tool, since people may still resist or choose death

The **fourfold schema of power conditions** is the chapter's most important analytical contribution. A person or group has power over others when those others cannot:

1. **Reciprocate** with equally valued services (they lack strategic resources). Strategic resources explain exchange and the distribution of assets
2. **Obtain the needed benefits elsewhere** (the power holder has monopoly over the service). Available alternatives explain competition and the emergence of going rates;
3. **Take the benefits by force** (they lack coercive capacity). Coercive capacity explains organizational differentiation and political processes
4. **Do without the benefits** (they cannot lower their needs through ideology or self-sufficiency). Ideals lessening needs explain value formation and ideology <— TPM Note: this is where 'effective spirituality' can help by freeing people from material needs

Blau summarizes them with this schema:

Alternatives to Compliance	Conditions of Independence	Requirements of Power	Structural Implications
1. Supply Inducements	**Strategic Resources**	**Indifference to what others offer**	**Exchange and distribution of resources**
2. Obtain Elsewhere	**Available Alternatives**	**Monopoly over what others need**	**Competition and exchange rates**
3. Take by Force	**Coercive Force**	**Law and Order**	**Organization and differentiation**
4. Do Without	**Ideals Lessening Needs**	**Materialistic and other relevant values**	**Ideology Formation**

Or more detailed for strategic uses:

Leverage	Subordinate Strategies (For Independence)	Superior Strategies (To Sustain Power)
1. Strategic Resources (Reciprocity)	**Supply a Return Benefit**: Accumulate resources (money, specialized skills, or services) to pay for what you need in kind, ensuring the exchange remains balanced.	**Maintain Indifference**: Prevent the subordinate from gaining access to resources you actually need. Secure your own benefits from outside sources so you remain "un-bribable" and disinterested in what they offer.
2. Alternatives (Monopoly)	**Market Mobility**: Seek out alternative suppliers or employers to break the provider's monopoly. Reduce your "investment" in a single relationship to lower the cost of switching.	**Monopolization**: Bar access to alternative suppliers. Become the "only game in town" (the only firm, the only savior, the only source of security) to ensure the subordinate has nowhere else to turn.
3. Coercion (Force)	**Coalition Building**: Form unions, parties, or groups to create "strength in numbers." Use collective force or social pressure to compel the provider to deliver services without your compliance.	**Divide and Conquer**: Obstruct the formation of coalitions or unions. Support "law and order" to protect existing exchange processes from being disrupted by the "coercive" power of the masses or the state.

Leverage	Subordinate Strategies (For Independence)	Superior Strategies (To Sustain Power)
4. Values (Ideology)	**Asceticism / Resignation**: Re-evaluate your needs to "do without" the service. Adopt religious or revolutionary ideologies that make material or social rewards from the superior seem unimportant.	**Value Perpetuation**: Spread and fortify social values that make your resources essential (e.g., materialism for employers, patriotism for governments). Oppose "counter-ideologies" that would make your rewards seem less valuable.

Further notes:

- **Advice giving creates social capital, orders deplete it:** *giving advice and issuing orders have opposite consequences; advising another creates obligations, while ordering him to do something uses them up, as it were, by enabling him to discharge his obligations through his compliance*
- **Everyone is a social climber, the secret is to not look like one:** *the individual who appears a striver is a poor one indeed, but few of us are entirely free of it*
  See: signs of (poor) social climbing
- **It's mid-status who form the 'core' of groups:** *The middle stratum in a collectivity, therefore, tends to constitute its solid core of members who neither have much reason for wanting to leave it nor much tempting potential for doing so*
- **Climbers must initially 'pay respect' upon joining the upper status:** *the deferential role individuals who have recently moved up into a higher social stratum generally must assume in interaction with its established members, to gain full social acceptance, is a significant source of social reward for the established members. This deference fortifies the superiority of the higher stratum by furnishing continual evidence of the high price others are willing to pay for acceptance in this stratum.*
- **Having suggestions followed by others boosts status**, *while others' social standing simultaneously suffers for two reasons, because they often follow his suggestions and because their own are rarely accepted*
- **Moving to visit someone implies lower status**: *since inferiors usually take the initiative in approaching superiors, "if you can get another man, hitherto considered your equal, to come to your office rather than your going to his, to discuss some problem, you are to that extent one-up on him.*
  Also see: making someone wait
- **Higher status people expect a return to associate with lower status ones:** *The fact that many people find it rewarding to associate with superiors means that those of superior status can furnish rewards, and expect a return for them, merely by associating with others of lower status.* **<– TPM Note**: that return is often in exchange value, rather than personal value. This replicates the exchange between high personal value people and lower value people, who must 'pay the difference' to associate with them, including in dating. See the social investment model for more:

> The Social Investment Model: A Unified Theory of Value, Investment, and Power

- **High-status men enjoy socializing with lower status ones**: *Superiors obtain much satisfaction from associating with inferiors, who usually look up to them and follow their suggestions. The rewards that high status yields are undoubtedly an incentive for engaging in social Intercourse*
  - But associating with lower status people risks lowering one's status: *Insecure superior status, which can be jeopardized by social contacts with others of lower status, puts pressure on individuals to forego these satisfactions. Only firmly grounded social standing enables a person to benefit from such social contacts without the risk of losing his superior status or some of it.*

Status is a layered competition

In simple social structures, everyone competes with everyone else for rewards, recognition, and social approval. As status differences emerge, the more competent and respected individuals increasingly compete among themselves for leadership and dominance, while lower-status members, having already accepted a subordinate role, are effectively excluded from that higher-level competition.

At that stage, exchange and competition diverge. High-status individuals provide guidance, competence, and instrumental value to lower-status members, who repay them with respect, support, and compliance. That support, in turn, strengthens the high-status individuals in their competition for greater power within the group.

Meaning: the high status people exchange and reward the low status ones in exchange for social support that 'pushes them upward'.

Status is expandable capital

Superior social status resembles capital in that it is depleted in use (exercising power draws down obligations), can be invested at risk for greater returns (taking leadership risks to earn greater power), and provides compounding advantages when substantial (the person with great power can take risks that the person with little power cannot afford).

Making demands on others enables them to discharge their obligations and therefore diminishes one's power over them; but successfully coordinating their activities to produce collective benefits replenishes power by creating new obligations.

Tolerance as a sign of strength (and intolerance as an admission of weakness)

Only people whose power is not threatened by the actions of others can afford to view those actions with equanimity.

For example, lower-class Southern white is more racist than the upper-class Southerner because his social standing is genuinely threatened by Black advancement. Similarly, intolerant suppression of a political opposition publicly acknowledges that it poses a real threat, which may itself strengthen it.

Ideologies and patriotic values are tools of control

Blau confirms our observation that patriotism is a tool to build empires and that, in general, ideologies are promoted to serve a group or channel the power needed to accomplish a goal:

> Patriotic ideals, which identify people with the success of their country in war and peace, fortify the power of the government, Religious convictions, which make the blessings of a church and the spiritual counsel of its representatives rewards of great saliency, reinforce the power of church dignitaries. Revolutionary ideologies, which define the progress of a radical movement as inherently valuable for its members, bestow power on the movement's leadership.

Also see:

- Great leadership is great manipulation
- Political manipulation

Coercive force is the ultimate escalation layer, yet not a silver bullet

> For these reasons coercive force, which can hardly be resisted, is important as a last resort for exercising power over individuals who cannot otherwise be made to yield. Whereas physical force is a perfect protection against power, killing a man or incarcerating him disposes of his threat—it is an imperfect tool for exercising

> power, since people can choose even death over compliance. Hence, coercive force differs only in degree from the power that rests on the supply of needed benefits, albeit an important degree.

6. Expectations

How people react to social rewards depends not just on the rewards themselves but on the expectations they have.

Blau distinguishes several types of expectations:

- **General expectations**: overall achievement needs and aspirations, governed by cultural values and past attainments
  - Cultures place general expectations and can set up frustrations: *A strong cultural emphasis on achievement, such as that manifest in the ideology that any good man can achieve financial success and should try to do so, creates high general expectations, with impending frustrations for many whose achievements might have been satisfactory had it not been for their high expectations.*
- **Particular expectations**: what an individual anticipates from a specific associate, based on the impressions that person has made
- **Comparative expectations**: the ratio of rewards to costs (profit) that an individual expects from social associations, which constitutes a common standard for comparing different potential associations
  - Inequitable treatment betrays moral expectations and is costly: *Inequitable treatment and, particularly, exploitative use of power, therefore, evoke social disapproval, which makes it costly to take such unfair advantage of others.*
- **Social comparisons:** rewards tend to be more significant if they're unique or if they elevate the receiver above others, as compared to being common, given to all, and without raising the receiver above others (relative deprivation and principle of diminishing collective marginal utility)

The **principle of eventually diminishing marginal utility** applies to social as well as economic rewards. Increasing amounts of a given benefit produce ever-declining increments of value. Attaining rewards raises the expectation baseline, meaning that what was once a gratifying surplus becomes the new minimum. These two forces (diminishing marginal utility pushing value down, rising expectations pushing it back up) operate in tension, which is why the relationship between reward quantity and satisfaction is not simple.

Fair exchange and reference groups

The going rate of exchange in a group—how much compliance advice commands, for example—is governed by supply and demand.
The fair rate of exchange instead is governed by social norms calibrated to the long-run investments required to supply the benefit.

Norms of fairness function somewhat like the "normal price" in economic theory: they set a long-run standard that the going rate tends toward but frequently departs from. When the going rate falls short of the fair rate, individuals experience exploitation.

A secondary exchange of fairness for social approval is superimposed on primary exchanges: treating others fairly earns community approval, while exploitative treatment earns disapproval.

7. The Dynamics of Change and Adjustment in Groups

This chapter demonstrates that the theoretical framework can generate specific, testable predictions applying economic marginal analysis to the exchange of advice for status in work groups.

The main analytical contribution is the concept of elasticity applied to the supply and demand for advice. Advice is

seen as a trade between status benefits and costs in time and opportunity, with the initial status being more valuable and then decreasing progressively in value.

- When demand for advice is **elastic** (the task is easy, substitutes exist, status concerns dominate task concerns), a change in the number of experts primarily changes the *volume* of consultation rather than the going rate of compliance, so status differences are relatively unaffected
- When demand is **inelastic** (complex tasks, no substitutes, high task stakes), a reduction in expert supply intensifies status differences rather than reducing consultation volume
- When supply is **elastic** (experts are not under time pressure, near-experts exist who can join the consultant ranks), increased demand produces more consultation without inflating status differences
- When supply is **inelastic**, increased demand inflates the rate of compliance required, sharpening hierarchical differentiation without much change in consultation volume

Empirical data from twelve welfare agency work groups confirm the key prediction.
The analysis reveals a **self-perpetuating element of power**: once superior status has been established through furnishing needed services, it can be sustained without continuing to furnish those same services at the same rate, because the accumulated capital of obligations maintains power even as the original service supply diminishes.

8. Legitimation and Organization

Stable coordination requires **legitimazed power**. Meaning, to go from coercive or obligation-based force into **authority commanding willing compliance** that doesn't require continuous enforcement because the subordinates themselves enforce it through their own norms.

The compliance with a superior's commands is enforced by the collectivity of subordinates (or its dominant subgroups). Authority in Blau's theory is thus a social norm among followers. This distinguishes authority from personal mere influence (where the follower complies because they respect the individual) and from coercion (where compliance is compelled by external force).

Legitimation originates in the **social approval** that followers grant to leaders. Social approval is foundational to leadership because compliance can be enforced with sufficient power, but approval cannot be forced, regardless of how great the power. And **the effectiveness and stability of leadership depend on social approval.**
To boost the odds of social approval, a leader must ensure that:

1. **The leader's demands are fair**
2. **The leader provides excess benefits** compared to the expectations of what a fair return for submission requires

The leader's own power can help gain approval, as Blau notes that 'Small needs for power as well as great power make it easy for a man to exercise his power in ways that elicit legitimating approval from subordinates'.
This approval, when communicated among followers, generates shared norms that enforce compliance with the leader's directives.

- **The dilemma of leadership** is that attaining power over others requires furnishing services that make them dependent, while remaining independent of any services they might offer in return. But to legitimate power and leadership he must earn followers' social approval, which requires not maintaining total independence from them <— **TPM Note**: However, this is not always the case and pertains more to smaller and more egalitarian formal groups. The author also later says that when the followers are many the leader naturally becomes more independent
  - Approval is important, but a leader can't be too preoccupied with being liked: *preoccupation with the approval of followers interferes with a leader's ability to command their respect and compliance by making the greatest contribution to their welfare he can, because concern with being liked prevents him from basing his decisions consistently on criteria of effectiveness alone.*

- **Managers 'have it easier' with contracts and rank supporting them**: managers in a structurally advantaged starting position. They can earn legitimating approval not by furnishing outstanding personal leadership but simply by refraining from exercising the full force of their official powers
  See: the manager's guide to leadership

Followers may 'self-manipulate' to escape the reality of subordination

> To resolve this cognitive dissonance, individuals are under pressure to appreciate the value of the benefits and depreciate the cost of compliance. They may extol the abilities of the superior and their respect for him and stress that following the guidance of such an expert is objectively the best course of action. They may emphasize that issuing directives is the manager's duty, not his privilege, and that their compliance with these directives does not constitute submission to his will but is simply part of their freely accepted responsibilities, just as issuing the directives is part of his.

9. Opposition

> One of the most potent remedies that a prince has against conspiracies, is that of not being hated by the mass of people
>
> *Machiavelli*

Exploitative power, depriving people of resources and autonomy, can also generate a social surplus of oppositional resources.

The conversion of private grievance into collective opposition requires:

1. A **collective situation** in which many people share the experience of deprivation
2. **Communication among members** to share grievances and organize action
3. A degree of **social isolation** from the larger community to protect intragroup communication from community values that legitimate and 'defend' existing powers
4. A **revolutionary ideology** that transforms the personal desire for revenge into a noble collective cause

Revolutionary ideologies turn aggression into a noble pursuit. Revenge, aggression, and violence are culturally tabooed and evoke guilt feelings, especially when pursuing personal gains. A revolutionary ideology converts these base tendencies into noble and prosocial ideals.
Also see populism power dynamics.

Intensity-appeal tradeoff

A radical ideology that unites a core ingroup of disenfranchised generates intense commitment from within but also makes it more repulsive to outsiders.

Appealing to broadly shared values (universalistic features) like fairness or prosperity would expand its appeal but dilute the ideological purity that sustains member devotion.

Blau talks about idealists and realists on each side, and parliamentarians and idealists tend to be on opposite sides of this tradeoff. Parliament members need to make concessions in the give and take and politics and want re-election, which they may get with a broader appeal. That makes them more realistic.

10. Mediating Values in Complex Structures

Common values mediate the lack of direct interaction among most members.

Conformity to norms often requires individuals to forgo direct exchange advantages (the girl who does not grant sexual favors for short-term rewards; the professional who refuses gratuities from clients) in exchange for approval and status from the community. Norms transform the incentive structure so that behaviors harmful to the collective interest become costly to individuals through social disapproval.

Institutionalization is the mechanism by which some value-mediated social patterns are perpetuated across generations.
Three conditions are required for institutionalization:

- Organizing principles must become **formalized** in external, historically transmitted arrangements (written documents, laws, organizational structures)
- The legitimating values that give these external forms meaning must be **transmitted through socialization** and internalized as part of individuals' personalities
- The **dominant groups** in society must be sufficiently identified with these institutions to use their power in defense of them

Interesting notes:

- **Moral principles protect the collective against rational but selfish individual choices:** Moral standards develop against behavior that is harmful to the collective, and become internalized and socially enforced, changing the rewards and costs. Social disapproval and guilty feelings are real costs that can outweigh the rewards, turning selfish but rational choices into costly choices that would be irrational to pursue. Hence, men who forego the advantages made possible by cheating do not act contrary to their self-interest if the peace of mind and social approval they obtain for their honesty is more rewarding to them than the gains they could make by cheating.

11. The Dynamics of Substructures

The elements of macrostructures are not individuals but other social structures.

Blau traces nine relationships between integration, differentiation, and organization at the substructure and macrostructure levels. Among the most important:

- The internal differentiation of substructures generates **crosscutting ties** between similarly situated members of different substructures (e.g., class solidarity among workers across communities), which in turn create new integrative links in the broader macrostructure
- **Relative-absolute status tradeoff:** vertical mobility between differently ranked substructures offers the dilemma between superordinate position within a lower-status group versus a subordinate position within a higher-status group. The rewards of each differ—daily social dominance and immediate recognition versus the prestige and privileges of higher-class affiliation

12. Dialectical Forces (the Macro Theory)

🤔Lucio's Take: **The most insightful contribution is the *micro* description**

Lucio:
While the macro model is interesting and thought-provoking, I find it less incisive, less convincing, and less empirical than the micro-analyses relating to interpersonal and smaller group dynamics.

The true genius of this work—and its primary practical value for the TPM framework—lies in the granular mechanics of social exchange (reciprocity, indebtedness, and power dynamics).

In the final chapter, Blau presents 'dialectical sociology', his theoretical framework to reconcile interpersonal exchanges with macrostructures.

Two Main Types of Exchanges

Two main types of exchanges exist, depending on whether people are intrinsically attracted and whether they provide unilateral benefits:

	Intrinsic	Extrinsic
Reciprocal	Mutual attraction	Exchange
Unilateral	One-sided attachment	Power

Social Dilemmas

The most interesting dilemmas listed are:

- **Relationships are mixed games of conflicting and shared interests:** *aside from their common interest in assuring that there is sufficient commitment, the two partners also have conflicting interests, because each is interested in having the other make the greater commitment. This situation poses the dilemma for each partner that*

he must put pressure on the other to make the greater commitment by withholding his own commitment up to the point where it would endanger the relationship but not beyond this point

- Giving vs. withholding: *Lovers, too, are under cross pressure to furnish emotional support and express affection for one another, on the one hand, and to withhold excessive demonstrations of affection and premature commitments, on the other, because the free expression of affection and commitment depreciates their value.*
- Conflicting first choices but shared last choices: *coexistence of conflicting and common interests in all these social associations means that associates always have first choices that conflict but last choices that are identical, and the first choice of either is the second-last of the other, though it may still be preferable to any available alternative*
- Relationships develop best when feelings and investment go at the same pace: *If one lover is considerably more involved than the other, his greater commitment invites exploitation or provokes feelings of entrapment, both of which obliterate love. Whereas rewards experienced in the relationship may lead to its continuation for a while, the weak interest of the less committed or the frustrations of the more committed probably will sooner or later prompt one or the other to terminate it. Only when two lovers' affection for and commitment to one another expand at roughly the same pace do they tend mutually to reinforce their love.*
  See win-win dating
- Common interest is keeping the bond, but diverging interest as to wants it more: *aside from their common interest in assuring that there is sufficient commitment, the two partners also have conflicting interests, because each is interested in having the other make the greater commitment. This situation poses the dilemma for each partner that he must put pressure on the other to make the greater commitment by withholding his own commitment up to the point where it would endanger the relationship but not beyond this point.*

- **Leadership requires a position of dominance and the legitimating approval of followers**, but achieving dominance over others frequently inspires more fear than love, as Machiavelli noted
- **Approval and respect dilemmas**: *People seek the approval of those they respect, and they also seek their help with improving their own performance. But the two are not compatible, inasmuch as supportive approval fails to furnish an instrumental basis for improvements and critical appraisals imply disapproval. By being supportive through his praise of others, a person gains their appreciation but fails to earn their respect, and by offering incisive criticisms, he earns their respect but often also their dislike, since they are predisposed to consider his criticism too severe.*

Many of these dilemmas disappear once status is firmly grounded.

Dialectical theory

The author's macro-theory dynamics are emergent properties from the core principles of social exchange. This is how it looks in a chart:

The dialectical model posits that social structures form through exchange, but produce contradictions that lead to constant restructuring, rather than reaching a final equilibrium.

- **Exchange generates integration** (bonds of mutual trust acquire intrinsic significance) and **differentiation** (unilateral services produce status hierarchies)
- Integration and differentiation together create the conditions for **formal organization**
- Organized collectivities engage in **exchange and competition** with each other; success in competition creates hierarchical differentiation among organizations;
- Dominant organizations seek **political organization** to maintain order and protect existing power distributions
- The **restraints** exerted by established organizations provoke **opposition forces**, which serve as the catalysts of social reorganization

Social change goes through intermittent reorganizations driven by antagonizing forces of stability (institutionalization, legitimate authority, integrative values) and the forces of change (exploitation, opposition ideologies, structural rigidities that accumulate intolerably).

SHARPEST INSIGHTS

While we use the authors' quotes and research, these represent our own TPM's interpretations.

Judge emotional dynamics help maintain social exchanges

Social exchanges aren't just governed by self-interest, but also by the need for approval and fitting in. This is power that others, and the collective, exercise on each individual.

> the tendency to help others is frequently motivated by the expectation that doing so will bring social rewards. Beyond this selfinterested concern with profiting from social associations, however, there is again an "altruistic" element or, at least, one that removes social transactions from simple egoism or psychological hedonism. A basic reward people seek in their associations is social approval, and selfish disregard for others makes it impossible to obtain this important reward.

The power that others have to make us feel 'approved of' is a foundational element of the 'judge', a concept we mapped here at TPM.
See more:

- Judge power dynamics

Assessing others = judge power move

Interesting to see that Blau reached the same conclusions we reached at TPM decades earlier:

> positive evaluations of another's abilities, however, may imply either that the evaluator has a superordinate status that qualifies him as a judge, as is the case when an instructor praises the talent of a student

Subcommunication of power

Social exchanges are largely based on sub-communication.

For example, Blau says that being tolerant sub-communicates power and confidence in one's own status, while intolerance sub-communicates precarious status and lower confidence.

How we treat others also sub-communicates how seriously we take them, and it also applies to the *threats* of others:

> By treating the juvenile delinquent as a boy in need of rehabilitation, we deny his claim to being a strong man through our condescending tolerance. We cannot remain equally permissive in the face of the gangster or

> fascist hoodlum, who poses a more serious threat to our lives and fortunes and freedom, yet our intolerant opposition to him in attempts to suppress him serves to validate the power that he craves.

Physical coercion is the ultimate source of power, but it's limited in scope

> unilateral services that meet basic needs are the penultimate source of power. Its ultimate source, of course, is physical coercion. While the power that rests on coercion is more absolute, however, it is also more limited in scope than the power that derives from met needs.

In unity and coordination lies power

> The weakness of the isolated subordinate limits the significance of his approval or disapproval of the superior. The agreement that emerges in a collectivity of subordinates concerning their judgment of the superior, on the other hand, has far-reaching implications for developments in the social structure.

In turn, collective disapproval of power engenders opposition. When the group is cohesive and coordinated, that opposition can be turned into bargaining power, including shows of force like strikes, or potentially even rebellions and ousting of the leader.
This is also a dynamic we leverage in our guide on 'how to handle a poor boss'.

Power underpins communion

And some power, listed by Blau in the form of competence, is also necessary to form friendships:

> although men may want to associate together exclusively for the sake of sociable fellowship and have no interest in deriving any extrinsic advantage from their social relations, they must prove themselves attractive to each other by demonstrating qualities that make them preferable to other possible associates, qualities that must be comparable and that consequently are, in a relative sense, extrinsic.

This is something that many guys who first stumble on TPM often miss. They believe that 'love' or 'communion' is independent of power. It's not.
Also see:

- Social skills vs. power skills: approval is social skills, and power is status

> Social Skills vs Power Skills: Why Likability Alone Won't Get You Ahead

Sprezzatura vs. visible effort: value-signaling requires calibration

Blau draws on Goffman's concept of role distance, but takes it a step forward by adding calibration.
Contrary to Greene's '*48 Laws of Power*', you don't always impress others by making your actions appear effortless. Instead, if the audience is clueless, a display of strain impresses more than total ease:

> Whether exhibiting strain or ease makes a difficult performance still more impressive depends on the sophistication of the audience and ultimately on whether the fact that the performance is difficult must be established or can be taken for granted. If others do not know how very difficult a performance is, manifesting tense concentration and strain in the course of it provides this knowledge and increases their admiration. If they already realize the difficulties involved, however, it is the great ease with which such a hard task can be

> mastered that is most impressive.

Social pressures are sexual manipulation

Once again, Blau and TPM reached similar conclusions when it comes to social manipulation dynamics to handicap the competition:

> The interest of girls in protecting the value of sexual favors against depreciation gives rise to social pressures among girls not to grant these favors readily.

We diverge though as Blau then sees perfect complementarity with men, while thanks to evolutionary psychology research we could better refine our foundational models of manipulation.

He is correct though that men's shaming of other over-investing men is probably related to social manipulation against deflating the value of courtship and value exchanges (see 'simping dynamics').

Speaking time affords power, cracking jokes affords acceptance

> The unequal distribution of speaking time produces an initial differentiation that gives some an advantage (…) The group member who makes lesser contributions—for instance, relieving the tensions generated by conflicts of opinions through his good humor and congeniality—is likely to earn the approval and acceptance of others, though not their high respect.

Modern men aren't dependent on status from any specific group

As we mentioned in our core article 'pursue power over status', modern men are free to join or leave countless different groups, which in turn frees them from being dependent on the status of any single one of them.

Blau draws the same conclusions, but focuses on societal costs, rather than individual empowerment:

> Multigroup affiliation entails social costs, as shown by the last illustration, particularly. It enables individuals in modern society to make the informal and partly even the formal, sanctions of the community at large ineffective by organizing themselves into subcollectivities whose social approval alone is considered important

Lean more here:

- **Why power beats status for modern men**

> Pursue POWER, Not Status: Big Fish in Litte Pond Syndrome

⚠ … But this means that societies may need stronger guardrails

> Social approval has less pervasive significance as a restraining force in complex societies than in simpler ones, because the multiplicity of groups and the possible mobility between them in complex societies enables deviants of nearly all sorts to escape from the impact of community disapproval by finding a subgroup of like-minded persons where they can gain approval. Impersonal restraints are, therefore, of special importance in modern societies, and a basic source of impersonal restraint is power.

This is a crucial insight and it's a possible risk factor we often considered here at TPM.
It means that **modern society may provide a more fertile terrain for dark triads, including psychopathy**.

QUOTES

On the pervasiveness of the social exchange:

Not all human behavior is guided by considerations of exchange, though much of it is

On the selfishness behind the selflessness:

An apparent “altruism” pervades social life; people are anxious to benefit one another and to reciprocate for the benefits they receive. But beneath this seeming selflessness an underlying “egoism” can be discovered; the tendency to help others is frequently motivated by the expectation that doing so will bring social rewards.

On the ‘power of tolerance’:

Intolerance is an admission of weakness that acknowledges the power of another, just as tolerance is a sign of strength that confirms the other’s inferiority.

??♂ Lucio’s Analysis

A seminal text with just a few minor tweaks that could further upgrade it:

Misses more advanced power dynamics

For example, talking about dating, Blau implies that a man courting and trying hard to please a woman may win her attraction by rebalancing the exchange.

In truth, **rebalancing the exchange with over-investment sub-communicates lower personal value which is likely to lower attraction**, instead of increasing it (Buffalmano, 2026).
The woman may still accept the relationship, but it will be on her terms and because of the benefits, not because of honest, intrinsic attraction and desire. Exceptions apply for smart and power aware men, of course, but that’s not the general principle.

Read more:

- Dating power dynamics
- Principle of dating dynamics

> The 5 Principles of Dating Power Dynamics: Effective Dating

Integration of psychology & evolutionary psychology would improve it

For example, the author seems to frame a mother’s devotion as the example of pure selflessness, but evolutionary psychology suggests that the motivation is genetic.

He also lists little exceptions to the general propensity for repaying rewards, while in truth people differ. For example, dark triads and men high in psychopathic traits are less likely to repay, and have been specifically described as embracing a cheater’s approach to social exchanges.

Sometimes dated in its treatment of female agency and mate choice

For example, he writes of attractive men who earn their women’s love:

> Although he can take advantage of her greater commitment to obtain sexual favors from her, his exploitative orientation in doing so is not likely to stimulate an intrinsic attachment; and if his superego prevents him from exploiting her, he is likely to terminate the relationship under these circumstances.

This passage frames men as the active side and underplays women's role as active choosers, missing bidirectional mate choice and women's own motives and returns in engaging in sexual activities.
The Freudian reference (superego) also reflects a dated theoretical lens.

Group evolution?

In this passage, the author seems to place the group's interest above the individual's interest, which goes against evolutionary forces as understood by most modern researchers:

> Exchange processes utilize, as it were, the self-interests of individuals to produce a differentiated social structure within which norms tend to develop that require individuals to set aside some of their personal interests for the sake of those of the collectivity.

However, selfish individuals rarely 'set aside their personal interest' for the sake of the collectivity. Although exceptions certainly apply, I wouldn't make group-first a foundational piece of the theory.

Status competition is only seen through the lens of prestige, not dominance

For example, writes Blau:

> The obligations of group members to those who make such benefits possible are discharged by according them superior status. They command respect and compliance, which serve as rewards for having made contributions in the past and as incentives for continuing to make them in the future.

This textbook prestige by being competent, giving to others, and getting status/prestige in exchange.
However, more modern research also highlighted that people can gain status with dominance.

Social exchanges have "social slack" (limits of mechanistic interpretation)

Blau's exchange is often described in quasi-mechanistic terms (credits, obligations, reciprocity), which is analytically useful but can be overextended.

In practice, social exchange involves social slack. Such as, social debts/credits and **obligations create a *tendency* toward repayment, but not precise balancing**. Debts are often only partially repaid—or not repaid at all—without necessarily breaking the relationship.

In real life, many social debts/credits aren't repaid or fully repaid, without harming the relationship.
This is especially true for smaller debits, and when accounting for 'social inflation'.

Inflation & time discount of social debit and credits deserved a mention

The credits and debits that social exchange tend to create follow a time discount. They're stronger right after the 'give'—especially during the same interaction and in the ones immediately following—but tend to decay over time.

As time passes, the perceived obligation weakens as both givers and takers forget and move on. This also explains why many social debts are only partially repaid—or not repaid at all.

> 9 Laws of Social Success From Social Exchange Theory

REVIEW

Exchange and Power in Social Life is a seminal book of both sociological theory and TPM's power-driven approach to men's self-development.

Not so much in its macro-theory that was more speculative and less practical, but for its description of social exchange dynamics between individuals and smaller groups (reciprocity, indebtedness, and power dynamics).

The central theme of exchange among individuals who seek to maximize returns is a deceptively simple insight, yet it's an enlightening realization for many and a foundational concept for ambitious men to succeed and advance in life.
At TPM, we build and expand on social exchange with related concepts to boost men's success, including:

- **Effective calculativeness**, a foundational orientation to succeed in exchanges
- **Strategic cooperation**, with foundational approaches and mindsets to succeed in exchanges and in life

Female Dating Literature Explained: Psychology, Strategies, & Power

Lucio Buffalmano · 8 June 2026 · Archived copy · Original

In this article, we analyze the major dating books, coaches, and schools of thought for women to uncover the core strategies they promote, what actually works in the real world, and what it means for men seeking quality women and win-win relationships.

Strategy A is supportive and interdependent, often encouraged by men. Strategy B is more libertine and individualistic, somewhat closer to a male approach, but may struggle to reconcile personal power with relationship success.

Contents

- Main Strategies
  - Strategy A: Feminine & Supportive (Win-Win)

  - TPM’s Take: the Best Strategy (for women)
- Takeaways for Men

Main Strategies

Looking broadly at the literature for women, we can isolate 4 main strategies, all potentially valid depending on her goals, but not all equally effective for finding quality men and relationships.

Goal	Strategic Focus
Relationship	Femininity, kindness, timing, and family
Power	Independence, sexual gratification, personal returns, success
Attraction	Sex appeal, leverage over men, 'game'
Extraction	Target-selection, manipulation, control

Before proceedings, note that some strategies may overlap, and be executed with different 'modes'.
For example, the feminine woman may use a more 'active mode', going out and socializing, and she may even approach. But she'd approach within her main strategy of choice—for example, asking for help. Or she may have a good career, but still prefer the feminine approach—for example, think of Dolly Parton.

Strategy A: Feminine & Supportive (Win-Win)

The Concept: Traditional woman who seeks a man to lead, provide, and protect. She embraces traditional feminine roles and prioritizes being a good partner or mother over career.

Resources: *Act Like a Lady, Think Like a Man*; *The Rules*; *The Surrendered Wife*;

Examples: Kate Middleton

Common Tactics: Delaying sex; ask to be picked up; let him take the bill; etc.

⍰ PROS

- **Attracts relationship-minded men**, including quality men who can be effective providers
- **Potentially easier and simpler life** IF he is a good man and leader
- **Undersupplied niche** in today's Western society, boosting mate value

⍰ CONS

- **Dependence = high risk**. Some men can turn overly controlling or even abusive
- **Must protect reputation** as a 'wife material'. That may mean skipping formative dating experiences or fully enjoying one's sexuality
- **Can create Madonna-whore dichotomies** in some men

Best Match: Providers; dominant men

⚠ **Careful renouncing this approach: most women (and men) still prefer a loving relationship**
Modern dating culture reviles this approach, but it remains highly effective to get relationships (keep reading)

Strategy B: Power & Independence (Feminist/Egalitarian)

The Concept: An independent, assertive, and empowered woman who prioritizes her well-being and will walk away from men or relationships that serve her best interests. Pursuing her own goals and career, she doesn't prioritize her partner.

Resources: *The Power of The Pussy*; *Why Men Love Bitches*, *Fu*k Him*

Examples: Taylor Swift; Sex and the City (Samantha and Miranda)

Common Tactics: Focus on your goals and don't develop feelings; under-invest to maintain power; think of relationships transactionally; lead the interaction; control the frame; etc.

⍰ PROS

- **High agency life**, pursuing her own goals. In a way, more similar to a successful man
- **Relationship control** since she often pairs up with meeker men who are OK with egalitarian or women-led relationships
- **Possible 'power couple'**, though that's rarer since high-power men often prefer a supportive woman

⍰ CONS

- **Less effective with other high-agency men** who often prefer warmer and more traditional women (see 'submissive vs. strong')
  - Loses to warmer women for relationship, who enjoy broader appeal at parity of attractiveness (including conservative men)
- **Sometimes includes (power) games** that escalate conflict for control, undermine intimacy and turn off high-power men
- **Lower raw attraction** because it can lose the masculine/feminine polarity (especially when pairing up with meeker men)

Best Match: Meeker men; younger men; lower SMV men; open-minded men

⚠ **Beware the hurt woman on the revenge path**

Some women started out overly naive and got hurt, potentially by narcissists or dark triad men. They then swing the opposite side with the 'don't need a man' approach (sometimes with a child from the previous guy). While her pain is understandable, these dating coaches can pass hidden resentment onto other women (same dynamics apply with men, of course).

Strategy C: Attractiveness & 'Sexual Pull'

The Concept: Sexuality and seduction are the tools of power, using both psychology and physicality. Depending on the style, she can be demure/exploitable (Marlyn Monroe) or more assertive (Madonna).

Resources: Seduction University, *The Art of Seduction*, *Kamasutra*, *Seductresses*

Examples: Mae West; Marilyn Monroe; La Païva; Cleopatra;

Common Tactics: Sexual innuendos; baby talk; provocative clothes; sexual confidence; flirting; etc.

⍰ PROS

- **Strong pull**, especially when paired with physical attractiveness
- **Can niche down** and appeal to men with specific sexual kinks, potentially transcending looks

⍰ CONS

- **Social and reputational risk**, with added risk of evoking pity when trying to be overly sexual later in life
- **Retention risks** as sexual appeal fades and men wise up to psychological influence

Strategy D: Gold-Digging (Most Manipulative)

The Concept: Use men to extract resources. A strange of mix of 'financial dependence on men', while maintaining psychological independence

Resources: *A Goal Digger's Guide*; *Ho Tactics*

Examples: Hugh Hefner's girlfriends

Common Tactics: Feign attraction; withhold sex as a bargaining chip; lingering touches; pick an expensive restaurant; drop hints of 'enjoying shopping', etc. See: Tactics women use to drive men crazy ↗

⍰ PROS

- **Attracts high-investing men** and filters out low-investment men
- **Sets her up as the prize** to be wined, dined, and maintained

⍰ CONS

- **Repels quality men** (unless for the ease of sex without strings attached,
- **Stigma lasts forever** and she may have to hide her past for future relationships

⚠ Modern Cultural Dissonance: Will to Power vs. Wish for Intimacy

Contemporary Western women have grown up in cultures that encourage independence and may discourage traditional roles.

This culture has shrunk support and market for the 'strategy A'-but women's will for a relationship has not shrunk nearly as much (genes only partially 'bend' to culture).
This has led to a self-harming phenomenon in both dating advice and women's psychological health.

Dating Advice: The ‘Bitch Who Gets Men’ (Lie)

Much ‘Strategy B’ modern dating advice is framed as high independence, while also promising to deliver genuine relationships.
For example, *Why Men Love Bitches* leads with the high power ‘bitch’, promises to attract men and relationships, and winks at the popular but low-agency law of attraction.

Unfortunately, this approach sells well, but offers a mismatch of incompatible goals. It would require advanced social IQ and ‘compartmentalization’ to pull off.

⍰ Example: Parading Strength, While Signaling Neediness

Culturally, this phenomenon is observable in songs such as ‘I can buy myself flowers’.

In the lyrics, author Miley Cyrus claims she can treat herself better than any man can, appealing to the ‘will for power’ and ‘not needing a man’.
Yet, looking deeper it betrays a wish for emotional intimacy. Starting from a high-dependence broken heart, her self-love activities relate not to high-agency independence, but to interdependent emotional intimacy (see analysis here).

This is neediness masked as strength. A truly independent woman wouldn’t have written that song at all. And a mentally healthier woman may be better off by simply owning up to her emotions and wishes (‘high power vulnerability’).

⍰♂Lucio’s Experience: **The guilt of wanting a man**

Lucio:
Dating in northern Europe, I’ve encountered this phenomenon more than once.

An ex-girlfriend felt bad for ‘needing’ a relationship and ‘failing’ the independent woman’s goal.

Meanwhile, her friends egged her own that ‘no, she is fine single’.

Darker Motives Behind Dating Advice

Men tend to advise and support 'Strategy A', while it's almost only women who advise Strategy B.
With a power-aware lens, it's easy to spot possible evolutionary and sexual strategy reasons.

Gendered advice	Men's Darker Motive	Women's Darker Motive
♀ Be independent ♂ Let him protect/provide	Boost partner control; strengthen social power	Undermine the competition; shape the culture; disempower controlling men
♀ Pursue education & career ♂ You don't need education & career	Maintain & strengthen social power; boost control with naive, lower SES women	Influence society with policies that empower women; recruit allies
♀ Embrace your sexuality ♂ Be chaste	Boost fidelity & paternity; boost social power with sexual repression	Enjoy dating around; prevent 'slut shaming' with cultural changes
♀ Embrace 'body positivity' ♂ Mind your body	Maintain larger choice of attractive women; Confine women to 'just be pretty' roles	Undermine the competition; relieve social stigma for themselves

In brief, women often encourage high power 'Strategy B'. And men advise for supportive, warm and, although they may not say it, the more submissive 'Strategy A'.

The different incentives can explain the vastly different takes.

Men's (Darker) Motives

Most men's incentive is to have lower status, more submissive women because it boosts their dating choice, decreases the risks of celibacy, and maximizes their relationship satisfaction and 'safety'.
This also works socially, because the lower status a group is compared to yours, the more comparative benefits you gain (Sidanius and Pratto, 1999).

Women's (Darker) Motives

Women as a whole gain when women as a whole gain social power.
Individual independence though goes both ways: it protects against controlling men, but it can be a liability compared to more submissive women.

So **women's high-independence advice may be a subconscious manipulation tactic to harm the competition**.
The more independent women around, the stronger the social benefits for all women, and the less competitive the sexual marketplace becomes. Then, she may instead defect and be submissive to a man she likes.

The advice can be manipulative, even when from genuinely independent women. The 'independent woman' approach attracts flak from men who fear that a society of independent women will leave them celibates.
So independent women need more independent women to protect themselves as a group.

These motives cast doubt on much of Strategy B, at least when it comes to dating effectiveness.

TPM's Take: the Best Strategy (for women)

The best strategy was already shown in the thumbnail and opening infographic: it's the combination of both, with an optimum balance, and leveraging each in the most appropriate context

The best strategy is almost always situation and goal-dependent.

If a woman has no interest in relationships, she doesn't even need to bother with dating advice.
But if she'd prefer a relationship, then we can tease out a good general principle:

⚖️ **Be independent in life, selective and strategically more submissive in dating, and ready to let a high-quality man provide and lead in relationships**.

This approach covers the downsides of high dependence, a crucial aspect in a world where too many men turn out controlling and value-taking.
But it also maximizes her market reach, appealing to the many quality men who value feminine, kind, and supportive women.

Embrace Reality, Reject PC

Across the board, much of dating advice ignores or plays down basic social exchange dynamics and mate value considerations.
Solid advice based on these foundations includes:

- **Boost Sexual Market Value (SMV):** For women, this is heavily weighted toward youth, beauty, femininity, and social grace
- **Time Your Relationship to Peak Value**: The 20's is most women's peak SMV, a good decade to pair up with a high-value man
- **Plan Your Reproduction:** and look into reproductive tech options (freezing eggs as contingency, for example)

Takeaways for Men

For men, this literature also offers a useful screening lens. What women read and what strategy they adopt signals their dating strategy, values, and 'relational value'.

In general, many quality women won't be consuming much dating advice, especially outside of Strategy A. First, because they believe in honest win-win, rather than seeking 'strategies and tactics'. Second, because they need it less. At parity of value and quality, men benefit from dating advice more than women because men are expected to initiate, lead, and signal value. Women, less so.

In simple terms, this is how you assess women based on the literature they consume:

- ✅ **Red flags literature** (eg, 'signs you're dating a sociopath') <— It's a good sign because it often means she wants a good guy
- ❌ **Gaining power literature** can signal a Machiavellian, selfish, and 'taker approach' (strategy B, C, D & E)
  - Feminist literature can signal an antagonistic approach and distrust of men.
    See more dating red flags ↗

In general, **most men interested in win-win dating and relationships with a supportive woman are better off with women following the traditional Strategy A**.

But to be more precise, as always, what's best depends on your goals.

She reads...	Best For
Nothing	Beginners, marriage, family
The Rules / Act Like a Lady / Men Are From Mars	Relationships; traditional men; provider-type men
The Power of The Pussy	Player types
Kamasutra / Seductresses	Sex lovers; open-minded men; advanced operators
Ho Tactics	MGTOW men, 'pay per play and move on'

🤔Lucio's Experience: **High-power women & gold diggers = advanced learning**

Lucio:
Some men revile 'gold diggers' and profess never to get close.

It's understandable, yet some dominant women and even sex workers offer the biggest learning opportunities for

more advanced men.

High-power women test your frame and leadership harder. And sex workers may unleash their full tactical toolbox to extract resources, even while they're falling for you.
It's an advanced game of seduction that taught me a lot.

NOTES

About the Authors:
Viren Swami and Adrian Furnham are psychologists known for their research on physical attractiveness, body image, and individual differences. Their work combines evolutionary psychology with social and cultural perspectives, and they have published extensively in academic journals and books on attractiveness, personality, and human behavior.
We also previously reviewed Swami's 'Attraction Explained'.

Chapter 1: What Pythagoras unleashed upon the world

Modern psychology approaches physical attraction through two distinct but intersecting lenses:

- **Social psychology** emphasizes how attraction is shaped by dynamic social interactions and cultural contexts.
- **Evolutionary psychology**: focus on universal, adaptationist traits that define human nature across millennia

The authors position the book as an integration of evolutionary, social, and cultural perspectives to explain both why attractiveness exists and how it operates in real-world contexts.

- **Lookism:** The documented phenomenon where physical appearance profoundly impacts how individuals are treated by society and how they view themselves, confirming that beauty is a highly consequential social factor rather than a triviality (Patzer, 2002; Mann, 2003).

Chapter 2: What is beautiful is good

A diagram of impression formation (Swami and Furnham, 2007)

Physical appearance is the most accessible human trait and plays a dominant role in impression formation, boosting personal value in social exchanges without even having to do anything.

- **Impression Formation:** The instant, cognitive process of categorizing individuals based heavily on non-verbal cues and physical appearance, which dictates expectations about their behavior and personality (Asch, 1946;

Park, 1986).

- **The Attractiveness Bias:** *Attractive individuals are judged as more honest (Yarmouk 2000), less maladjusted and disturbed (Cash et al. 1977; Dion 1972), happier, more successful and more sociable than less attractive individuals (Dion et al. 1972). Attractive people are also reported to be afforded more personal space, more likely to win arguments, more trusted with secrets and generally considered better at everything in comparison with less attractive individuals (Cash and Soloway 1975; Horai et al. 1974; Patzer 1985).*
- **Courtroom and Employment Leniency:** The phenomenon where attractive defendants receive more lenient sentencing and mock-juror verdicts (Castellow et al., 1990; Stewart, 1980), and attractive applicants are more likely to be hired and receive higher starting salaries (Dipboye et al., 1975).
  - Exceptions for using beauty: *when the defendant 'used' her attractiveness in the crime (a swindle), the advantages of attractiveness in sentencing were lost* (Sigall and Ostrove 1975; but see Wuensch et al. 1991)
  - Exception with 'lazy' stereotype: *Shahani-Denning and Plumitallo (1993) showed that when an employee had committed a mistake, supervisors were more likely to perceive those who were attractive as failing because of a lack of effort.*
- **Beauty Matters More in Individualistic Cultures**: *Rosenblatt and Cozby (1972) found that the function that attractiveness plays varies with the cultural context. Other cross-cultural research suggests that the attractiveness bias may be more pronounced in cultures that emphasise individualism over group-oriented values (Dion 1986). In their review of various cultural dimensions, Fiske et al. (1998) referred to two culturally patterned social systems or 'psyches': the individualistic, Euro-American (sometimes referred to as 'Western') cultural dimension and the collectivist, East Asian (or 'Eastern') dimension.*
- **Implicit Personality Theory:** The framework explaining the attractiveness bias as a set of learned knowledge structures where social categories of "attractive" are mentally linked with specific positive evaluative dimensions, primarily social competence (Eagly et al., 1991; Ashmore, 1981).
- **The Dark Side of Beauty:** A counter-bias where highly attractive individuals are occasionally penalized or perceived as vain, egotistical, or using their looks for manipulation (Cash and Janda, 1984; Sigall and Ostrove, 1975).

Physical Attractiveness Matters Less In Real-Life Interactions & Long-Term (Compared to Pictures & Short-Term)

> Eagly and colleagues' (1991) meta-analysis showed that the strength of the physical attractiveness stereotype was affected by
> information other than physical attractiveness. That is, the attractiveness bias was weaker when participants received individuating information along with attractiveness cues.
> Other research supports this idea: in a celebrated study, Argyle and McHenry (1971) showed that when shown photographs as stimuli, participants rated individuals wearing spectacles as more intelligent than those not wearing spectacles. However, this effect disappeared when the same individuals were shown communicating on video-recordings, suggesting that the individuating information provided by such recordings allowed participations to be more discriminating in their perceptions. This would seems to suggest that physical attractiveness may be less important in the perception of friends, family members and co-workers than in the perception of strangers, because we have considerable additional, 'moderating' information about people close to us.

Chapter 3: Darwin, sexual selection and the peacock's tail

Evolutionary psychology is based on Charles Darwin's theory of sexual selection to explain why certain physical traits are considered universally attractive. Attractive features are biological ornaments that evolved to signal an individual's underlying genetic quality, health, and reproductive value to potential mates. Due to the differing

biological costs of reproduction, men and women have evolved distinct mate-selection strategies and preferences.

- **Sexual Selection:** Darwin's evolutionary mechanism explaining how traits that hinder survival (like a peacock's bright tail) evolve because they provide significant advantages in attracting mates and outcompeting same-sex rivals (Darwin, 1871).
- **Parental Investment Theory:** The principle that the sex investing the most physiological resources into offspring (typically females) will evolve to be choosier in selecting mates, forcing the lesser-investing sex (males) to compete for access (Trivers, 1972; Bateman, 1948).
- **Runaway Selection and Sensory Bias:** Evolutionary models suggesting mate preferences can originate from arbitrary perceptual biases (e.g., a bias for a specific color to find food) that become genetically linked to exaggerated physical traits in the opposite sex (Fisher, 1930; Kirkpatrick and Ryan, 1991).
- **Good Genes Hypothesis:** The dominant evolutionary theory asserting that physical attractiveness serves as an "honest signal" of an individual's immunocompetence, parasite resistance, and overall physiological condition (Hamilton and Zuk, 1982; Zahavi, 1975).
- **Men and Women Value the Same Thing But With Different Weights**: *while both men and women may value the same characteristics (such as attractiveness, status, emotional stability and so on), they weigh these characteristics differently as a result of their evolutionary endowments.*
- **Quality Detection Varies in Evolutionarily Predictable Fashion in Men and Women:** The evolutionary proposition that men prioritize cues of youth and peak reproductive potential (fecundity) in women, while women prioritize cues indicating a man's ability and willingness to provide resources and parental care (Buss, 1989; Symons, 1979).

Chapter 4: The naked woman and man

Evolutionary psychologists argue that features such as youthfulness, facial sexual dimorphism, symmetry, and height act as observable markers of a potential partner's underlying genetic fitness, developmental stability, and reproductive value. However, preferences for these traits often reveal complex interactions between biological signaling and socio-cultural modification.

- **Women Use More Cues, Men Fewer***: Grammer (1989) found that women use more cues than men when evaluating prospective mates. Men typically prioritise physical attractiveness, while women consider many different traits including both social and economic status. Similar findings have been found by ethnographers and anthropologists: men in many tribal societies prize youth above all else in their prospective brides (Borgerhoff Mulder 1988).*
- **Masculinity Holds Longer Than Femininity**: *Studies have shown that ratings of physical attractiveness for men and women decline with age (McLellan and McKelvie 1993), although these effects are more pronounced for the latter. While women are rated as less feminine with increasing age (Arking 1998), ratings of male masculinity do not appear to be affected to the same degree (Deutsch et al. 1986).*
- **Facial Sexual Dimorphism is Attractive:** The preference for hormone-driven facial differences; female facial femininity (driven by estrogen) signals reproductive condition, while male facial masculinity (driven by testosterone) signals immunocompetence, though female preferences for the latter fluctuate based on the menstrual cycle (Penton-Voak et al., 1999b; Gangestad and Scheyd, 2005).
  - Facial masculinity as costly ornament: For example, a broad jaw is thought to be a costly ornament, insofar as increasingly masculine features reduce men's resistance to disease and parasites (Folstad and Karter 1992)
- **Rarity is Attractive** (for female hair, at least) *Thelen (1983) showed that for the same brunette, preference increased significantly from the first to the third series. In other words, preference for the brunette increased in proportion to the rarity of her hair colour. More recently, Schweder (1994) reported that women tend to change their hair colour and style to a type that is less common in the general population.*
- **Symmetry is Attractive:** Small, random deviations from perfect bilateral symmetry in the face and body; high

symmetry is theoretically perceived as attractive because it signals “good genes” and the ability to resist environmental pathogens during development (Thornhill and Gangestad, 1993; Moller, 1992).

- **Vocal Attractiveness:** The “vocal attractiveness stereotype” where pitch and vocal quality communicate biological information (like symmetry and hormone levels) and are linked to perceived personality traits and sexual behavior (Hughes et al., 2004; Zuckerman and Driver, 1989).
- **Height, Stature, and Leg Length:** Taller men enjoy greater reproductive, social, and economic success, leading to women’s generalized preference for tallness as a cue for genetic quality and resource access (Pawlowski et al., 2000; Judge and Cable, 2004). Higher leg-to-body ratios (LBR) are generally preferred in women as a dimorphic signal of stable childhood development, but not in men (Swami et al., 2006)

Figures used to test leg-to-body ratio preferences (ratios are noted below each image) (from Swami et al. 2006)

Facial Masculinity Isn’t Universally More Attractive

Across cultures, men with masculine faces are perceived as being more socially dominant (Mazur et al. 1984).

But social dominance doesn’t equal attraction. Says the author:

> Some studies have also found that feminine features are sometimes attractive on male faces (Little et al. 2001), while others show no consistency in sexually dimorphic features that are considered attractive (Scheib et al. 1999).

And the authors explain it as a tradeoff:

> Perrett et al. (1998) have proposed that women actually seek a ‘tradeoff between good mates and good fathers, and that more feminine faces suggest better fathering abilities. As this view hypothesises, men with feminine faces are perceived to be warmer, more agreeable and more honest than men with masculine faces (Fink and Penton-Voak 2002).

All in all, the consensus seems to be this that the “winning” male face is:

- **moderately masculine**
- **high in averageness**
- **not overly dominant-looking**
- **not too feminized either**

Mix of Neonate-Maturity-Expressivity For Women's Face

Early research seemed to suggest that neotenous features like large, widely spaced eyes and a small nose and chin are important for female facial attractiveness. Cross-cultural support for this was provided by studies with African-American, Asian, Hispanic and Taiwanese participants, whose judgements of women from their own cultural background gave the same result (Cunningham et al. 1995; Zebrowitz et al. 1993).

But later criticism noticed that high cheekbones in attractive female faces is in marked contrast to the protruding, puffy cheeks of babies (Grammer and Atzwanger 1994).
Modern evidence indicates that feminization, or the presence of features shaped by estrogen during puberty, is a more reliable predictor of attractiveness than mere youthfulness (Little et al., 2011; Perrett et al., 1998). These markers include high cheekbones, a narrow lower face, and full lips. Unlike neoteny (which just signals "young"), these traits signal fertility and immunocompetence.

The most recent meta-analyses and studies suggest that attractiveness is a "composite" signal. The highest-rated faces typically possess:

- **Neotenous "Baby" Features:** Large eyes and a relatively small nose/lower face. These act as a "first-pass filter" signaling youth and high reproductive value (fecundity).
- **Sexually Mature "Adult" Features:** Prominent cheekbones and a narrow chin. These provide the "second-pass" signal, proving the individual is a fertile, post-pubescent adult
- **Expressive Cues:** High eyebrows and a wide smile, which signal social competence and accessibility.

Chapter 5: Of hourglasses and triangles: human body weight and shape

While male attractiveness is heavily dependent on an upper-body "V-shape," the debate surrounding female attractiveness centers on whether the waist-to-hip ratio (WHR) or overall Body Mass Index (BMI) is the dominant cue for health and fertility.

- **Male Body Shape (The Inverted Triangle):** Women generally prefer men with a mesomorphic physique featuring broad shoulders and a narrow waist—a low waist-to-chest ratio (WCR)—which signals physical strength and upper-body muscle development, combined with a normal BMI (Maisey et al., 1999; Dixson et al., 2003).
- **Female Body Shape (The Waist-to-Hip Ratio):** Singh's (1993a) hypothesis posits that a low WHR (around 0.70) evolved as a universal "first-pass filter" for female attractiveness because it reliably signals optimal fat distribution, fertility, and resistance to major diseases.
- **Body Mass Index (BMI) vs. WHR:** Extensive methodological critiques using photorealistic stimuli demonstrate that overall body weight (BMI) accounts for vastly more variance in female attractiveness ratings than WHR, serving as a more accurate visual proxy for health, nutrition, and reproductive potential (Tovee et al., 1998, 1999)
    - *BMI was a far more important factor than WHR (Tovée and Cornelissen 2001; Tovée et al. 1998, 1999). In their studies, BMI accounted for more than 70 per cent of the variance in attractiveness ratings, whereas WHR accounts for little more than 2 per cent.*

Stimuli used by Swami and Furnham (2008)

Chapter 6: The Venus of Willendorf, Rubens and milking huts

Attractiveness ideals for body weight and shape are demonstrably malleable and vary significantly across history and cultures, varying based on socio-economic conditions, environmental resource security, and cultural practices.

- **Historical Relativity of Beauty:** Ideals of female beauty have fluctuated drastically over time, from the robust, statuesque ideals of the Victorian era and the plumpness celebrated by painters like Rubens, to the tubular thinness idealized in contemporary Western media (Freese and Meland, 2002; Mazur, 1986; Eco, 2004).
- **Socioeconomic Status (SES) and Body Weight:** Cross-cultural findings show an inverse relationship between societal wealth and preferred body weight.
  - Poorer cultures prefer larger women: In resource-scarce, low-SES environments, heavier female bodies are idealized as symbols of health, fertility, and status, whereas resource-rich, high-SES environments idolize thinness (Swami and Tovee, 2005b; Tovee et al., 2006).
- **Adjustments Are Evolutionary Predicted:** The evolutionary counter-argument that human mate preference mechanisms are not fixed to one absolute standard, but are designed to recalibrate to local environmental and nutritional conditions, resulting in a preference for a WHR or weight that is simply optimal for that specific locality (Sugiyama, 2004)

Chapter 7: Welcome to the mating market

Mating market dynamics, Swami and Furnham (2007)

Individuals do not form attractiveness judgments in a vacuum, but actively negotiate the "mating market" based on their own mate value, relationship goals, and shifting environmental circumstances. Humans deploy conditional strategies that adapt to social exchanges.

- **Mating Strategies:** Preferences shift based on intent; individuals prioritize physical attractiveness when pursuing short-term casual relationships, but compromise on physical traits in favor of interpersonal responsiveness and resources for long-term partnerships (Buss and Schmitt, 1993; Regan, 1998).
- **Assortative Mating:** "Like prefers like" and people tend to form relationships with partners who closely match their own level of physical attractiveness, social background, and market value, functioning as a stabilizing evolutionary strategy (Pawlowski and Dunbar, 1999; Berscheid et al., 1973).
- **Social Exchange Theory:** A framework viewing attraction as a dynamic negotiation where partners assess the costs and rewards of the interaction against their own subjective "comparison levels" built from past experiences and societal norms (Thibaut and Kelley, 1959; Rusbult et al., 1991).
- **The Environmental Security Hypothesis:** The theory that immediate physiological and socioeconomic threats (such as financial scarcity or physical hunger) cause individuals to temporarily shift their preferences toward heavier, more mature partners who signal stability and resource access (Nelson and Morrison, 2005; Pettijohn and Tesser, 1999)
  - Hungry men prefer larger women: *hungry men preferred heavier women than did satiated men. Nelson and Morrison (2005) proposed that the construct of hunger is more universal than financial satisfaction, and suggest that their findings, therefore, lend support to the idea that implicit cues are used when stating preferences for potential partners. Moreover, when Swami and Tovée (2006a) replicated their study using photographic stimuli, using hunger as a proxy for personal resources, they found the same result: hungry men found a slightly heavier female body weight more attractive than satiated men.*
- **Power Motive Can Boost Results:** *The power motive refers to the predisposition to strive for status and power, which some studies have shown provides men with access to fertile women as well as making them more attractive to women* (Kenrick et al. 2003; Li et al. 2002; Simpson and Orina 2003).
  Note: this is why dark triad may have a 'dating advantage' (see psychopathy, narcissism, Machiavellianism)

- **Lovers and Providers Have Different Strategies**: *Men too showed a corresponding tendency: those who were unlikely to invest favoured flaunting their sexuality to women, while those were likely to invest emphasised chastity and fidelity (Cashdan 1993). Pawtowski and Dunbar (1999) have also considered how an individual's market value affects her or his willingness to make demands of a preferred partner.*

Chapter 8: No one is an island

(by Swami and Furnham, adapted from Kim and Markus 1999).

Attractiveness ideals are also constructed and maintained through a process of mutual constitution between the individual and their surrounding socio-cultural environment. Gender roles, subcultural affiliations, and social learning mechanisms continually script what individuals perceive as beautiful, demonstrating that biology alone cannot account for human aesthetic preferences.

- **Mutual Constitution:** The continuous feedback loop where historical values, cultural institutions (like media), and daily social practices shape individual psychological preferences, which in turn reinforce those societal structures (Kim and Markus, 1999).
- **Gender Roles and Ideals:** Traditional gender role socialization deeply impacts physical preferences; individuals subscribing to rigid gender norms generally prefer highly dimorphic body shapes (muscular men, hourglass women), whereas liberated roles correlate with less stereotyped preferences (Courtenay, 2000; Swami et al., 2006a).
- **Subcultural Divergence:** Specific communities actively construct their own beauty norms that defy mainstream ideals. For example, the lesbian community often rejects the patriarchal "thin ideal" in favor of heavier body weights, while gay male culture places a hyper-focus on extreme upper-body muscularity (Siever, 1994; Swami and Tovee, 2006b).
- **Sources of Learning and Fetishes:** Beauty standards are learned early via parental modeling and pervasive mass media messaging (Bandura, 1973; Levine and Smolak, 1996). Furthermore, classical conditioning and imprinting can explain the development of highly specific, non-adaptive sexual fetishes (Staats and Staats, 1957).

Also see:

- **Sexual Market Value tactics** that leverage these 'market differences'

Traditional Gender Beliefs Impact People's Ideals of Attractiveness

> In one early study, for instance, Wiggins et al. (1968) found that men who were very 'masculine' according to the traditional sense (that is, had a high need for independence and dated frequently) showed a greater preference for large-breasted women than did less masculine men. Similarly, Beck et al. (1976) showed that women who preferred a large bust had an interest pattern which could be considered as traditionally feminine. Unfortunately, such studies have used definitions of gender roles that are today considered quite imprecise. In another study, Lavrakas (1975) reported that women who adopted a traditionally feminine gender role had a greater preference for masculine male physiques (a tapering V-shape) than did less 'traditional' women. In conjunction with more recent work (Swami et al. 20071), this study suggests that individuals adopting traditional (that is, more strongly masculine or feminine) gender roles tend to have preferences for body shapes that are defined as attractive in the 'traditional' sense, namely hourglass shapes for women and muscular V-shapes for men. In contrast, individuals adopting 'liberated' gender roles have less stereotyped preferences (Furnham and Greaves 1994; Maier and Lavrakas 1984).

Chapter 9: Getting to know you

Beyond static morphological features, the actual process of interpersonal attraction involves dynamic, non-physical variables. Factors such as physical proximity, behavioral reciprocity, shared values, and expressive communication skills ultimately dictate whether people end up dating or not.

- **Proximity and the Mere Exposure Effect:** The foundational social psychological finding that geographical closeness and repetitive visual exposure to a person significantly increase familiarity and subsequent liking (Festinger et al., 1950; Zajonc, 1968).
- **Extraversion and Exhibition Can Boost Attraction**: *Certain personality dimensions, most notably extraversion and exhibition, have been shown to be positively related to both increased display of expressive behaviour and attraction ratings in initial encounters (Friedman et al. 1988; Riggio et al. 1981; Riggio and Friedman 1986).*
- **Reciprocity and Similarity:** Attraction is heavily driven by mutual reinforcement (liking those who explicitly like us) and the "law of attraction," where relational bonds strengthen linearly with the proportion of shared attitudes, beliefs, and demographic traits (Byrne, 1971; Dittes and Kelley, 1956).
- **Dynamic Attractiveness and Self-Disclosure:** Overall physical attractiveness is a composite that includes dynamic expressive styles, conversational skills, and the building of trust through reciprocal self-disclosure, which can permanently alter how a partner's physical form is perceived (Riggio et al., 1991; Altman and Taylor, 1973).
- **Non-Verbal Communication:** The powerful role of covert cues—such as mutual gaze, interpersonal distance, and touch—in regulating intimacy and signaling romantic interest outside of conscious awareness (Argyle and Ingham, 1972; Hall, 1966).
- **The Love is Blind Bias:** A positive psychological illusion where individuals in established romantic relationships rate their partners as significantly more physically attractive than themselves, a mechanism that enhances relationship stability and personal well-being (Swami et al., 2007b).

⍰♂Lucio's Take: **Familiarity and 'liking' ≠ attraction**

Lucio:
It seems that this chapter sometimes may conflate liking, dating, and attraction.
It's normal and expected that people tend to date people who live close by. But that is not the same as someone's level of attractiveness, or what others find attractive.

Riggio et al. (1991) Model

Riggio's model of attractiveness (1991), as conceptualized by Swami and Furnham

The model breaks “Attractiveness” down into an equation of several different variables rather than a single source of attractiveness. It argues that overall attractiveness is the sum of them all:

1. Static Components

These are the fixed physical traits that evolutionary psychologists focus on.

- **Facial Attractiveness:** Symmetry, neoteny, and sexual dimorphism.
- **Body Attractiveness:** BMI, WHR (women), and WCR (men).
- **The Role:** This provides the “first-pass” filter. It sets the baseline for the “Halo Effect.”

2. Adornment Components

These are the elements of self-presentation that an individual chooses.

- **Dress Sense & Grooming:** Clothing, hairstyles, and cosmetics (Cash et al., 1985).
- **The Role:** These signal **Socio-Economic Status (SES)**, subcultural belonging, and conscientiousness (effort). They can compensate for lower static attractiveness by signaling high “mate value” in other domains.

Also see:

- **Value-signaling**: the full framework
- How to signal value on a date (value-sequence model)

3. Dynamic Expressive Style

This is the core of Riggio’s contribution. It consists of individual differences in social and emotional skills:

- **Emotional Expressiveness:** The ability to spontaneously and accurately communicate emotions through facial expressions and gestures.
- **Social Sensitivity:** The ability to read the room and adjust one’s behavior (Self-Monitoring).
- **Social Control:** Skill in formal self-presentation and verbal fluency.
- **The Role: This is the “Multiplier.”** Riggio found that people with high “Dynamic Expressivity” are rated as more attractive than those with identical physical features but “flat” or “awkward” expressions.

TPM Note: A model that highlights the importance of traits beyond pure looks
This model, and supporting research, should be encouraging to less attractive men about their dating prospects (Schneider et al. 1979; Byrne 1971). Also see our article on ‘escaping the black pill‘

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors’ quotes and research, but the titles and interpretations are our own—and may not reflect the authors’ intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Reciprocity Is Most Attractive to Low Self-Esteem

> But the effects of reciprocity may not be the same for everyone: positive interpersonal feedback may be more important for those individuals who have a higher need for interpersonal security (Sperling and Borgaro 1995). Similarly, Dittes (1959) found that people with low self-esteem showed stronger positive and negative reactions to group feedback; by contrast, people with high self-esteem did not seem to be affected by acceptance or rejection.

⍰⍰♂ Lucio's Analysis

Possible Bias Against Evolutionary Psychology

The authors present their position as straddling social and evolutionary psychology, and they're not wholly wrong, both angles are covered.

Yet, I find them leaning towards the social aspect, including a tendency to criticize evolutionary psychology that at times feels unwarranted and may oversimplify evolutionary psychology.
For example, quoting from the book:

- *We remain unconvinced that evolutionary psychology will be able to explain all facets of human behaviour.*
- *Despite the proclamations of some evolutionary psychologists, it is clear that the 'ideal' female body has not remained static*

I doubt most evolutionary psychologists would claim that they explain *all* facets of human behavior. It's not its goal. It can, however, provide the foundation for understanding most of the general tendencies related to attraction, mating, survival, and reproduction.
And I don't think that many evolutionary psychologists would proclaim that the 'ideal' female body has remained static.

Exaggerates Cultural Relativity

For example:

> In some cultures, the advantages of plumpness or obesity can be significant, and individuals of extreme size such as Sumo wrestlers in Japan can become cultural icons.

This is misleading because:

1. Sumo wrestlers can absolutely be a cultural icon without being sexually or romantically attractive (and I'd bet they're not very attractive to most women)
2. Japan may actually be a counterexample, because one of the lowest obesity rates in the developed world may suggest that low body fat is the dominant attractiveness standard, not the opposite.
3. Almost no overweight person becomes a cultural icon in Japan if we account for the total number of overweight people and high-status sumo wrestlers

Sometimes Shies Away From Unpopular Truths

For example, the authors say that studies show that mock jurors consider sexual harassment more likely when the defendant is less attractive, or when the plaintiff is attractive (Castellow et al. 1990; Wuensch and Moore 2004).

However, a deeper analysis should look at the actual numbers, or at least raise some questions, rather than treating these findings as a sure perceptual bias.

REVIEW

The Psychology of Physical Attraction offers a solid, science-based approach to attraction.

It would have benefited from some editing, trimming for example, the history of waist-to-hip ratio research and focusing more on later research and emerging consensus. And I would have liked a stronger focus on the universals of attraction, while the authors instead focused more on the equally valid cultural variations.

The authors and TPM may have slightly different perspectives. TPM favors a slightly more evolutionary angle

because we believe it sets stronger foundations of attraction common to many, though not all, people. The authors instead, at least in this book, slightly favor a cultural approach. But the commonalities are stronger than the differences, we enjoyed the book, and it has served as a reference for refining several of our science-driven articles. And that's always the biggest compliment we can provide to anyone.

The Strategy of Conflict: Summary and Review

Lucio Buffalmano · 22 June 2026 · Archived copy · Original

The Strategy of Conflict (1960) is a seminal reorientation of game theory that treats strategy not as the application of force in win-lose games, but as a theory of interdependent decision in “mixed-motive” situations where conflict is inextricably linked with mutual dependence and the need for coordination.

Takeaways

- Most situations are mixed motives
- Pure conflict and pure cooperation are rarer

Core insight: Most real conflicts are not pure conflicts, but mixed-motive situations where you cooperate and compete simultaneously. And limiting one's own freedom can sometimes create the largest leverage because power comes from shaping expectations.

NOTES

About the Author:
Thomas C. Schelling (1921–2016) was an American economist and professor best known for applying game theory logic to the messy, psychological world of international relations and nuclear standoff during the Cold War. He was awarded the Nobel Prize in Economic Sciences in 2005.

Preface

This book analyzes situations where player share both conflicting and common interests in negotiations, war threats, deterrence, and extortion.
Schelling states that the same logic applies to disparate situations like limited war, jockeying in traffic, deterring international enemies, abd disciplining children. And 'old' customs like exchanging hostages solved real issues by leveraging principles that we should learn from to also solve modern issues.

- **Most competitive situations contain mutual dependence**. Your goal is often not annihilation but favorable terms within a shared framework. When negotiating salary, promotion, or business deals, identify what the other party needs from you and structure your position around that interdependence rather than pure confrontation

1 – The Retarded Science of International Strategy

Most conflicts are not zero-sum—the total gains are not fixed, so both parties can lose or both can gain depending on outcomes.
A central problem is that each participant's best choice depends on what the other will do, creating an infinite regress of expectations. Rationality can be a strategic disability, because predictable rationality makes you exploitable, while demonstrated irrationality, obstinacy, or inability to receive communication can strengthen your bargaining position.

- **Pure conflict is rare**: i*n international affairs, there is mutual dependence as well as opposition. Pure conflict, in which the interests of two antagonists are completely opposed, is a special case; it would arise in a war of complete extermination, otherwise not even in war. For this reason, "winning" in a conflict does not have a strictly competitive meaning; it is not winning relative to one's adversary. It means gaining relative to one's own value system; and this may be done by bargaining, by mutual accommodation, and by the avoidance of mutually damaging behavior*
- **Most situations benefit from cooperation:** *most interesting international conflicts are not "constant-sum games"*

but "variable-sum games": the sum of the gains of the participants involved is not fixed so that more for one inexorably means less for the other. There is a common interest in reaching outcomes that are mutually advantageous.

- **Limited war also benefits from some coordination between temporary warrying factions:** *To characterize the maneuvers and actions of limited war as a bargaining process is to emphasize that, in addition to the divergence of interest over the variables in dispute, there is a powerful common interest in reaching an outcome that is not enormously destructive of values to both sides. A "successful" employees' strike is not one that destroys the employer financially, it may even be one that never takes place. Something similar can be true of war.*
- **Deterrence works only through credibility**, which requires committing oneself in ways that make backing down impossible or more costly than following through.
  - Burning bridges behind you, plate glass windows that shatter noisily, "trip wires" that automatically triggers response—these are tools for proving commitments.
- **The strategic value of irrationality**: A person who visibly cannot control his temper, cannot hear threats, or has an inconsistent value system becomes harder to coerce.

Practical applications:

- **Reduce your own flexibility deliberately** when facing an adversary. Announce positions publicly so retreat becomes costly. Use third parties or automatic mechanisms to remove your own choice.
- **When threatened, make yourself unavailable for communication** or demonstrate that you cannot understand the threat. The child who cries too loudly to hear the parent's warning, the leader who is "out of town" when the ultimatum arrives, gains immunity.
- **Mind your reputation to strengthen your commitments**: future negotiations may depend on not backing down now. This is why losing power is genuinely costly—it reduces your future bargaining power across all relationships.
- **Demonstrate that conceding is not possible**, for example with too high costs of of reputation or losing face

2 – An Essay on Bargaining

Pure bargaining situations have no logical resting point—each party would accept less than they demand rather than reach no agreement, yet each knows the other knows this. The solution lies in tactics that voluntarily and irreversibly sacrifice freedom of choice to set a strong, visible boundary that the other party must take the limited gain or leave it and lose.

- **Examples**: Union negotiators stir up membership to the point where they cannot accept less than the demand, diplomats who arouse public opinion that permits no concessions, executives who exhaust their budget early so the need for more funds becomes irresistible—all use self-binding to win.

Threats and promises distinguished: A threat is a commitment to do something you would prefer not to do, designed to deter the other party. Its efficacy depends entirely on credibility—the threatened party must believe you would actually carry it out despite the cost. Since you have no incentive to fulfill after the threat fails, you must arrange incentives or penalties that make fulfillment unavoidable. A promise is a commitment to the second party, required whenever agreement leaves incentive to cheat. Promises are credible if there are costs associated to not following through (ie., the "right to be sued" in legal frameworks).

Practical applications:

- **Belegate authority to someone who cannot change instructions.**
- **Use threats that leave something to chance**: create a shared risk rather than a certainty. It's more credible than absolute threats because you don't need to convince the other you would deliberately choose disaster, only

that disaster might happen inadvertently.

- **Devise threats that leave the final decision to them to maintain a good reputation:** *Similar to decomposing a threat into a series is starting a threat with a punitive act that grows in severity with the passage of time. Where a threat of death by violence might not be credited, cutting off the food supply might bring submission. For moral or public relations purposes, this device may in fact leave the "last clear chance" to the other, whose demise is then blamed on his stubbornness if the threat fails.*
- **Use peacemeal bargaining to gain trust and leverage long-term gains with cooperative players:** . *What makes many agreements enforceable is only the recognition of future opportunities for agreement that will be eliminated if mutual trust is not created and maintained, and whose value outweighs the momentary gain from cheating in the present instance. Each party must be confident that the other will not jeopardize future opportunities by destroying trust at the outset. This confidence does not always exist; and one of the purposes of piecemeal bargains is to cultivate the necessary mutual expectations.*
  This is textbook smart cooperation
- **Persuade others that you cannot concede**. eg. "*If I conceded to you here, you would revise your estimate of me in our other negotiations; to protect my reputation with you I must stand firm*"
- **Help others out of their commitments** through casuistry—offer reinterpretations that let them save face while conceding. Help them find an "excuse" to retreat that preserves their reputation.
  This is where strategic thinking, Machiavellianism and frame control help

3 – Bargaining, Communication, and Limited War

When communication is impossible or incomplete, parties can still coordinate through focal point. These are conspicuous features of the situation that each expects the other to notice and, hence, to be likely choices.

In pure coordination (common interests), people can for example often find each other by going to prominent spots (eg, 'info point' in station, or the mall's main entrance).
In mixed-motive situations (conflicting interests), the need for coordination can override the conflict at the focal point—the party disadvantaged by the obvious focal point may still accept it because no other point can be mutually recognized.

The power of the first and last offer: When someone makes a concrete proposal before communication is cut off, that proposal becomes the only available focal point. Even without acceptance, the other party knows you know it exists, and thus offer may coordinate expectations by default.
 Example: parachutist saying "I'll head for the highest hill" before jumping determines where both will meet up, even if the other thinks it's stupid.

Practical applications:

- **In ambiguous situations, be the first to propose a specific, salient solution**. Name a number, suggest a meeting point, propose a deadline. The "if not here, where?" argument is powerful when there is no other focal point.
- **Commit to a principle**: *commitments usually have to be qualitative rather than quantitative, and to rest on some rationale. It may be difficult to conceive of a really firm commitment to $2.07½; why not $2.02¼? The numerical scale is too continuous to provide good resting places, except at nice round numbers like $2.00. But a commitment to the principle of "profit sharing," "cost-of-living increases," or any other basis for a numerical calculation that comes out at $2.07½, may provide a foothold for a commitment.*
- **Leverage precedents and be careful of the precedents you set:** *Precedent seems to exercise an influence that greatly exceeds its logical importance or legal force.*
- **Justify your concession to avoid losing reputation**: *Concession not only may be construed as capitulation, it may mark a prior commitment as a fraud, and make the adversary skeptical of any new pretense at commitment.*

One, therefore, needs an "excuse" for accommodating his opponent, preferably a rationalized reinterpretation of the original commitment, one that is persuasive to the adversary himself.

- **Qualitative distinctions matter more than quantitative ones**. In negotiations, seek principles and clear lines in the sand rather than sliding scales—"profit sharing" is ambiguous; 50/50 is not.
  eg., "No gas" works as a limit on war because it's simple and unambiguous; "some gas" cannot be coordinated.
- **Use natural boundaries to crystallize convenient agreements**. Say '10' instead of '9.7'. Natural boundaries, round numbers, historical precedents, and cultural conventions all serve as focal points. The river, the 50-yard line, the 50-50 split, the previous year's price—these are not necessarily fair, but they are recognizable.

4 – Toward a Theory of Interdependent Decision

In games of pure coordination (identical interests) players can converge on the same choices without communication. The intellectual process is a recursive problem: what does he expect me to expect him to expect me to do?

For example, the number 1 wins in "pick a positive number" because it's the first positive number. Labels, connotations, and symbolic details can also transcend the mathematical structure to become the shared choice.

Contrast with zero-sum games: In coordination, you want to avoid randomization and look for shared logic. In pure conflict, randomization prevents the enemy from anticipating your move.

- **Pure cooperation may be rare since all options must be equally preferable:** *the zero-sum game is the limiting case of pure conflict, what is the other extreme? It must be the "pure-collaboration" game in which the players win or lose together, having identical preferences regarding the outcome. Whether they win fixed shares of the total or shares that vary with the joint total, they must rank all possible outcomes identically, in their separate preference scales. (And, to avoid any initial conflict, it has to be evident to the players that the preferences are identical, so that there is no conflict of interest in the information or misinformation that they try to convey to each other.)*
- **Accommodation requires some honesty, but deceiving can still provide an advantage:** *Mutual accommodation ultimately requires, if the outcome is to be efficient, that the division of gains be in accordance with "comparative advantage"; that is, the things a player concedes should be those that he wants less than the other player, relative to the things he trades for. Each needs, therefore, to communicate his value system with some truth, although each can also gain by deceiving.*
  TPM Note: this can make some of the literature on negotiation naive, as it ignores the possible advantages of deception and manipulation. See for example the otherwise valid '*Getting to Yes*'

Practical applications:

- **Look for uniqueness when you need to align with allies**, not what is optimal. The most prominent meeting point beats the most convenient one if prominence is what others will notice.
- **Label options to set frames and control the outcome**: If you control how choices are presented, you control what becomes focal. Ordering options alphabetically, putting yours first, or framing the decision in terms of your preferred analogy all shift expectations.

5 – Enforcement, Communication, and Strategic Moves

A strategic move influences another's choice by affecting their expectations of your behavior.

Schelling describes how constraining your own behavior can leave the other a simple maximization problem whose solution benefits you. Threats, promises, commitments, delegations, and destruction of communication can all serve to constrain your behavior or affect expectations.

The power of limited freedom: constraining your choices can improve your strategic position. A penalty that makes you unable to pay blackmail protects you from extortion. Burning bridges behind you disheartens the enemy.

Putting your assets in forms that cannot be transferred makes you immune to threats against your family. Delegating decisions to agents with different incentive structures (insurance companies, sadistic guards, foreign troops who cannot receive threats) changes the game by making certain responses automatic or certain communications impossible.

The power of being attacked, sued, and pursued: The power of being identified and sued (legal enforceability) is the power to make promises. If you could not be made to pay for a breach of agreement, your word would carry little weight.

The power of secrecy against intimidation: The secret ballot goes both ways. Voters cannot reliably sell votes, but they also cannot be intimidated. <— TPM Note: This only works in a perfect game theory scenario. In real life, there have been plenty of votes that have been traded

- **Trust is required when there is no outside authority, but it's not a given:** *Enforcement schemes. Agreements are unenforceable if no outside authority exists to enforce them or if noncompliance would be inherently undetectable. The problem arises, then, of finding forms of agreement, or terms to agree on, that provide no incentive to cheat or that make noncompliance automatically visible or that incur the penalties on which the possibility of enforcement rests. While the possibility of "trust" between two partners need not be ruled out, it should also not be taken for granted*
- **A strategic move influences the other party's move:** *If the essence of a game of strategy is the dependence of each person's proper choice of action on what he expects the other to do, it may be useful to define a "strategic move" as follows: A strategic move is one that influences the other person's choice, in a manner favorable to one's self, by affecting the other person's expectations on how one's self will behave.*
- **Disarmament may work better by removing defensive weapons only:** *the hostage idea is logically identical with the notion that a disarmament agreement between the major powers might be more efficacious (and probably more subject to technical control) if it related to defensive weapons and structures. To eschew defense is, in effect, to make hostages of your entire population without bothering to put them physically into the other's possession.*
- **Trust rests on the continuation of win-win**: *Trust is often achieved simply by the continuity of the relation between parties and the recognition by each that what he might gain by cheating in a given instance is outweighed by the value of the tradition of trust that makes possible a long sequence of future agreement.* **<— TPM Note:** This is the 'shadow of the future' into the present as well explained by Axelrod in *The Evolution of Cooperation*

Practical applications:

- **Build cooperation and trust by leveraging the possibility of long-term win-win**, a strategy that we expand in Power University
- **Reduce your own options to make the threat credible**. Station troops where they cannot retreat. Give authority to someone else with proven resolve. Create automatic response mechanisms that cannot be countermanded.
- **To resist threats, make yourself unavailable for communication** or incapable of understanding. Turn off communication channels. Demonstrate ignorance of the threat's content. Delegate authority to intermediaries.
- **Use third parties strategically**. Delegating authority can free you from pressure and costs in case you decide against the request. A hostage (literal or figurative) can guarantee compliance when trust is absent.

Twenty VS. 1 Guman

Schelling uses the example of twenty unarmed men facing a gunman with six bullets to show that power in conflict depends less on raw numbers than on coordination, credibility, and commitment.

The group could overpower him, but only if they can agree on how to share the risk, credibly commit to acting together, and reassure the gunman that surrender will not lead to punishment.

Meanwhile, the gunman retains power if he can divide them, prevent communication, undermine their promises, or credibly commit to retaliation.

The broader lesson is that domination by a minority or a single actor often persists not because the majority lacks strength, but because it lacks the tools to channel the power of numbers (coordination, trust, and mechanisms for credible collective action).

6 – Game Theory and Experimental Research

Mixed-motive games among humans entail psychology. People must achieve a meeting of minds that cannot be deduced analytically.
Taking hints, perceiving patterns, and coordinating expectations are fundamentally social phenomena that depend on shared culture, context, and experience.

The role of context, culture, and psychology: Coordinating an efficient outcome often depends on familiar patterns, historical precedents, and cultural conventions. Players with similar backgrounds coordinate more easily. Practice and how the game evolves also matter. The opening moves shape what rules are later recognized. And when there are no precedents, players create their own boundaries and rules as they go.

Practical applications:

- **Learn about the other player**: When entering any strategic interaction, understand the other party's cultural frame. What precedents do they recognize? What analogies will they see? What focal points exist in their mental landscape?
- **Slow things down to boost coordination**: The tempo of interactions matters. Incremental moves with time for response allow mutual accommodation to develop. Rapid, irreversible moves preempt the learning process and make coordination harder.
- **Build traditions of trust** through small preparatory bargains before tackling large issues. Each party risking a small investment to demonstrate good faith creates the mutual expectation that trust is available and valuable

> You cannot demand trust; you can only demonstrate that you appreciate it and can be trusted

TPM Note: Schelling turned out to be right
Future research found out that humans are often *conditionally* cooperative, that fairness matters, and generally that humans are far less rational than original game theory posited

7 – Randomization of Promises and Threats

A threat of certain mutual destruction may be incredible because you would never actually choose it, but a threat to create a 10% chance of mutual destruction may be both credible and sufficient. The probability of fulfillment scales down too-large promises or threats and makes it more credible.

Smaller threat = smaller cost of following through: If a threat might fail to change behavior because of misjudgment, miscommunication, or the other party's irrationality, your costs to maintain reputation are high when you must followup. A smaller threat reduces your losses when it fails.

Optimal threat fine-tuning: The optimal threat is the smallest that still meets the minimum deterrence threshold. Fractional threats—threats with probability π of fulfillment—allow fine-tuning that pure threats prohibit.

Practical applications:

- **Threaten probabilities when certitude is not credible:** Warning that your dog that might bite can be more intimidating than it certainly will because the certainty threat raises doubts. The risk of accident, the chance of escalation, the possibility of third-party intervention—all can create higher-credibility probabilistic threats.

- **Use lotteries to overcome impasses**: In negotiations, use lotteries to make indivisible objects divisible. “We flip a coin for it” is often superior to either “you get it” or “I get it” when both want it and neither can concede.
- **Use ‘increased risk with time threats’ to pile up pressure:** A threat that starts fulfilling itself creates urgency for the other party to comply before the risk materializes, or before the risks become too large (ie.: speeding up a car which boosts the risks of a crash; pulling the trigger of a Russian roulette game)

8 – The Threat That Leaves Something to Chance

Since threats are costly to execute, the most credible threats are those where fulfillment is not entirely under your control. If you can demonstrate that the probability of war, accident, or disaster rises when the other party takes certain actions, and that you cannot fully prevent that escalation, you create a threat that works even if you obviously prefer to avoid the outcome.

The threat that leaves something to chance does not require you to prove you would choose disaster, but only that ‘disaster might happen’. This is more credible because it doesn’t depend on your resolve, only on the uncontrollable elements of the situation.
Says Schelling:

> The threat is not quite of the form “I may or may not, according as I choose,” but, has an element of, “I may or may not, and even I can’t be altogether sure.”

Limited war is effective as deterrence partly because it generates a shared risk of general war—a risk neither side can completely control.

Brinkmanship explained: The brink is not a sharp change from 0 to 1, but a curved slope where the risk of slipping increases as you advance. Brinkmanship as defined by Schelling means getting onto that slope, creating a recognizable risk that you may fall in spite of your own best efforts, and dragging the adversary with you. The ideal deployment of brinkmanship tactics is to let the situation get somewhat out of hand because its being out of hand is intolerable to the other party.

Practical applications:

- **Threaten to create conditions where punishment might occur inadvertently** whenever you cannot credibly threaten a deliberate action. The risk itself becomes the sanction.
- **Play the crazy game for intimidation**: In escalating conflicts, the other party’s perception of risk may be more influential than your actual intentions. Actions that signal “this is getting out of control” can be more persuasive than explicit threats.

9 – The Reciprocal Fear of Surprise Attack

When striking first carries an advantage, each party fears the other might strike preemptively out of fear of being struck first. This creates an infinite regress of suspicion: he fears I might strike because I fear he might strike because he fears I might strike… The problem pertains to all partners who distrust each other (for example, each tempted to steal or consume joint assets, each fearing the other might do so first or faster).

The threshold condition: The spiral only leads to a first attack if at least one party’s basic probability of “irrational” attack exceeds a critical threshold. Below that threshold, the regress stabilizes—each knows the other will not attack, so fear of fear does not generate additional motive. Above the threshold, the situation collapses into certain attack.
The multiplier effect does not produce intermediate probabilities, but an all-or-none outcome.

The same applies to warning systems that trigger processes of counter-attack.
So sometimes the best way to prevent surprise attacks is to be visibly incapable of surprising: making your own first

strike impossible rather than trying to detect the other's.

Practical applications:

- **Assess whether fear and supiscion is dangerously high:** In any relationship where preemption is possible (business partnerships, alliances, competitive markets), assess whether the temptation to defect exceeds the threshold. If it does, expect defection or attack; if it does not, focus on increasing trust to boost cooperation to

10 – Surprise Attack and Disarmament

Stable deterrence requires that a first strike cannot destroy the other's ability to retaliate (ie.: the balance is stable only when neither, in striking first, can destroy the other's ability to strike back).

This means that the balance of terror is stable only when retaliatory forces are invulnerable. This leads to counterintuitive conclusions: weapons that are good at killing people but bad at killing other weapons are stabilizing; weapons designed to destroy enemy missiles and bombers are destabilizing because they create first-strike advantage.

The hostage-defense paradox: A stable balance of terror is a modern form of massive exchange of hostages. Each side holds the other side's population under the threat of nuclear war. Civil defense that protects populations actually destabilizes deterrence because it reduces the hostage value. "Dirty" bombs that maximize civilian casualties can be more stabilizing than "clean" bombs that target military forces.

The disarmament paradox: Sometimes more weapons increase stability. If each side needs to destroy a certain percentage of the other's forces to prevent retaliation, larger starting numbers require larger proportional advantages to achieve dominance, making arms racing less attractive.

Practical applications:

- **Distinguish between offensive and defensive capabilities** when evaluating competitive situations. The ability to neutralize the other's ability to respond is destabilizing; the ability to absorb punishment and still respond is stabilizing.
- **Seek arrangements where both parties can always strike back** in business, partnerships, or any mutual deterrence situation (and neither party can preempt the other's ability to respond).
  Escrow accounts, automatic renewal clauses, reciprocal hostages create stable cooperation by making first-move advantage disappear.

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Much of 'Negotiation Skills' is in The Preframe

> This conclusion may seem to reduce the scope for bargaining skill, if the outcome is already determined by the configuration of the problem itself and where the focal point lies. But perhaps what it does is shift the locus where skill is effective. The "obvious" outcome depends greatly on how the problem is formulated, on what analogies or precedents the definition of the bargaining issue calls to mind, on the kinds of data that may be available to bear on the question in dispute. (…) Much of the skill has already been applied when the formal negotiations begin.

And when the frame is already set, the skill is in undoing it. The author proposes to approach with confusion, but which in truth can be done with even more effective approaches:

> Perhaps another role for skill is contained in this general approach. If one is unsuccessful in getting the problem so formulated that the "obvious" outcome is near his own preferred position, he can proceed to confuse the issue. Find multiple definitions for all the terms and add "noise" to drown out the strong signal contained in the original formulation. The technique may not succeed, but in the variant of our income-tax problem mentioned above it certainly did.

Learn more about these skills:

- Frame control techniques
- Basics of frame control

Strengthening or Weakening Frames

The author talks about the shared belief of nuclear weapons as completely different from other weapons or as 'just another weapon'.
But these dynamics apply to most beliefs and frames:

> It is a distinction that to some extent we can strengthen or weaken, clarify or blur. We can strengthen the tradition, and enhance the symbolic significance of this distinction, by talking and acting in a way that is dramatically consistent with it; we can erode the distinction—but not readily destroy it—by acting as though we do not believe in it, by emphasizing the "just-another-weapon" argument and by making it evident that we in fact have little compunction about using nuclears.

Mafia & International Relations Are Similar

> Gang war and international war have a lot in common. Nations and outlaws both lack enforceable legal systems to help them govern their affairs. Both engage in the ultimate in violence. Both have an interest in avoiding violence, but the threat of violence is continually on call. It is interesting that racketeers, as well as gangs of delinquents, engage in limited war, disarmament and disengagement, surprise attack, retaliation and threat of retaliation; they worry about "appeasement" and loss of face; and they make alliances and agreements with the same disability that nations are subject to—the inability to appeal to higher authority in the interest of contract enforcement.

Splitting the Difference Works

Contrary to popular books on negotiation, splitting the difference actually works well:

> The frequency with which final agreement is precipitated by an offer to "split the difference" illustrates the same point, and the difference that is split is by no means always trivial. More impressive, perhaps, is the remarkable frequency with which long negotiations over complicated quantitative formulas or ad hoc shares in some costs or benefits converge ultimately on something as crudely simple as equal shares, shares proportionate to some common magnitude (gross national product, population, foreign-exchange deficit, and so forth), or the shares agreed on in some previous but logically irrelevant negotiation.

QUOTES

On learning from Mafia, *The Art of War*, Machiavelli, and Machiavellianism instead of ‘good people’:

Here perhaps we perceive a disadvantage peculiar to civilized modern students of international affairs, by contrast with, say, Machiavelli or the ancient Chinese. We tend to identify peace, stability, and the quiescence of conflict with notions like trust, good faith, and mutual respect. To the extent that this point of view actually encourages trust and respect it is good. But where trust and good faith do not exist and cannot be made to by our acting as though they did, we may wish to solicit advice from the underworld, or from ancient despotisms, on how to make agreements work when trust and good faith are lacking and there is no legal recourse for breach of contract.

On concessions coming from strength and resolve:

A bargain is struck when somebody makes a final, sufficient concession. Why does he concede? Because he thinks the other will not.

When troops are really hostages:

the American divisions that were stationed in Europe principally to demonstrate that America could not avoid becoming engaged in a European conflict can probably be viewed as hostages; if they cannot, their wives and children can

⍰⍰♂ Lucio’s Analysis

The Premise of Rational Players is Limited in Real-World Applications

Although the author adds plenty of caveats, overall it still feel like most of the situations imply rational player maximizing for self interest, without human emotions like anger, stubborness, or pride getting in the way.
For example, he writes:

> But if B can link the projects together, offering to carry out one while A carries out the other, and can effectively threaten to abandon both unless A carries out one of them, A is left an option with a gain of four and a cost of three, which he takes, and B cuts his cost in half.

However, in the real world A may get angry and force B out of his plot. Or he may get angry and simply refuse to deal with B, preferring to walk away with a loss but his ‘honor’ intact, rather than submitting to blackmail. This would not be uncommon.

I had similar reservations across several scenarios. For example, the author also says that:

- The threat is not credible unless the threatener shows that he has an incentive to carry it out **<— TPM Note:** However, most threats that are carried out in interpersonal relationships are fueled by anger and vengeance
- The wife ‘wins’ the argument if she yells her favorite restaurant and then hungs up. **<— TPM Note:** But only a pushover man would go meet her after such a power move
- To be credible in your threat to capsize the boat, you have to risk capsizing it **<— TPM Note:** This really depends on the personality of the players. A fearful man in the company of a crazy man may be persuaded by the simple mention of capsizing

Some Games Simplify Reality

Just as an example, the twenty men held up for robbery by a single man who has a gun and six bullets scenario takes for granted that 6 men would die if they all attacked.

In truth, ‘one shot equals not one kill’.

Even more relevant, a mass simultaneous attack would likely lead to no shooting at all since the armed robber's faith would be much worse if he inflicted maximum damage before being overrun (ie., he prefers being captured as a 'good guy' rather than a murderer).

Finally, in many real-life scenarios, most captives may be better off not to attack at all, since most hostages are eventually released.

REVIEW

The Strategy of Conflict is a seminal book that moved attention beyond simpler and math-focused win–lose games to the more common and more real-life practical mixed-motive conflicts, where cooperation and competition coexist.

This is also an important milestone in game theory for the work we do at The Power Moves, learning from the science with the goal to boost real life effectiveness.
We agree and support Schelling's criticism that the previous mathematically elegant version of game theory, including Nash's work, was incomplete for the kinds of strategic situations that matter most in real life.

Schelling first opened the door to a messier world, including a world where psychology first started playing a role.

On the downside, some parts still remain somewhat abstract. While Schelling is credited for moving beyond pure mathematical models, we believe that real-world decision-making is even more deeply governed by psychology and irrationality.
This could mean that in the real world, a strategically minded man who thinks with psychology-first may often outperform a game theorist armed with equations, but with less understanding of human nature.

- REVIEW

Takeaways

- **Narcissists don't change**. Change is rare, plan for things staying the same, rather than positive change
- **Narcissists cannot bond**, they focus on them and their needs, and take more than they give
- ***You* must change and become narcissist-resistant**. Once you accept reality and regain self-esteem, you can then better decide whether to leave or make the most with what you have

NOTES

About the Author:
Dr. Ramani Durvasula is a licensed clinical psychologist, professor (emerita) of psychology, media mental-health expert, and founder of LUNA Education who has built a reputation for translating academic insight on narcissism and personality disorders into accessible, research-informed guidance for everyday relationships.

Preface

Dr. Ramani shares a personal story of hiding herself as a child to introduce a core theme: survivors of narcissistic abuse often learn early to silence their needs and desires. But healing means reclaiming visibility, voice, and self-worth.

Introduction

The introduction reframes narcissistic abuse as a widespread, invisible issue that leaves victims confused and blaming themselves. The book's goal is to provide clarity, validation, and tools to heal from that fog.

> The person who holds the narrative holds the power.

Narcissistic vs Antagonistic

The author consciously chooses to use the term 'antagonistic' to cover larger ground and overlapping personality types and disorders:

> I prefer to characterize the behavior of the psychologically harmful person in my clients' lives as antagonistic, which is a broader and less stigmatized term than narcissistic. This is the term I use when teaching other professionals about these patterns, because it captures the breadth of antagonistic behaviors and tactics that we observe in narcissism—manipulation, attention-seeking, exploitativeness, hostility, arrogance—but also in other antagonistic personality styles, such as psychopathy, and positions it as a unique stress that antagonistic relationships evoke.

⍰⍰♂ **Lucio's note: I agree and like this. We use the term 'value taker' for an even broader categorization**
In our community, as in most other places, people tend to use labels like 'narcissism' and over-apply them to people or behaviors that may not be typical of narcissism or some other specific personality type. Instead, we like the term 'value taker' here because v**alue taker and value-taking behavior covers ANY behavior we want to avoid.** And little later, she adds:

> don't get lost in naming the personality, but instead allow yourself to clearly observe the behavior.

100%.
Labels don't matter. Just focus on their behavior: good for your, or not?

Why Narcissistic Abuse is So Confusing

- **It's not dramatic** Narcissistic abuse is often chronic and subtle, not explosive.
- **It's not your fault** The narcissist trains you to think everything is your fault.
- **It's invisible to others** Outsiders rarely see what's happening behind closed doors.

1. Clarifying Narcissism

This chapter breaks down what narcissism is—and how it manifests in real life.
It debunks myths around narcissism and shows how it manifests—not always as arrogance and 'alpha male grandiosity', but often **many narcissists appear kind, helpful, or even insecure**. What makes someone narcissistic isn't superficial traits—it's a consistent, damaging pattern rooted in **lack of empathy, emotional manipulation, and a chronic need for control**.

Through real-life vignettes like Carlos (who cheated but felt shame) and Adam (who is dismissive and controlling but performs grand gestures), Dr. Ramani demonstrates that narcissists often confuse others because of the mix of harm and charm.
Understanding narcissism requires looking beyond labels and observing how someone consistently makes others feel: devalued, invisible, confused, and guilty.

What Narcissism Really Is

- **A maladaptive personality style** built around insecurity, control, and lack of empathy. <— ⍰⍰♂ **Lucio's note**: it may not be maladaptive for many narcissists. See below
- **A pattern, not a phase** It's consistent across relationships and time.
- **Protective mechanism** Narcissists use domination, charm, or victimhood to avoid vulnerability.

Core Traits That Define Narcissism

- **Inconsistent empathy** They may show caring behaviors occasionally, but it's unreliable and often performative.
- **Need for control** Narcissists must dominate the emotional tone of relationships—through criticism, praise, silence, or volatility.
- **Hyperreactivity to criticism** They often lash out, sulk, or retaliate when confronted, even gently.
- **Sense of entitlement** They believe their needs matter more, and they shouldn't be held to the same standards.
- **Superficial charm** Many narcissists are socially likable or charismatic—but only on the surface.
- **Low self-awareness** They rarely reflect on their impact or take responsibility.

Types of Narcissism

- **Grandiose narcissist** Bold, controlling, dismissive of others, needs admiration.
- **Vulnerable narcissist** Plays the victim, emotionally fragile, craves sympathy.
- **Communal narcissist** Uses "good deeds" or spirituality to gain superiority and praise.
- **Malignant narcissist** Combines narcissism with aggression or cruelty—often overlaps with antisocial traits.

Why It's Hard to Spot

- **They confuse you** One moment they're cruel, the next they're affectionate.
- **They gaslight and blur the moral line** You feel guilty even when you're mistreated.
- **They weaponize your empathy** against you

> Unlike people who have personality styles that are more uniformly dysregulated and will yell at you in front of your friends, clients, and strangers alike, narcissistic people tend to be much more tactical and less disorganized.
> Narcissistic people know what looks good and bad, and how to choose their audience to maintain a public image while privately using those closest to them as punching bags and pacifiers.

2. Death by a Thousand Cuts

Narcissistic abuse isn't usually explosive. It's slow erosion—constant micro-abuses that break down your confidence, identity, and perception of reality. The abuser chips away at you over time while presenting a different face to the world.

> "What does the narcissistic person need?" The answer is control, domination, power, admiration, and validation. How they go about getting that is where the narcissistic abuse comes in.

Subtle Yet Damaging Tactics

- **Invalidation** Your feelings are dismissed or mocked.
- **Control masked as concern** "I just worry about you" = I don't want you to have autonomy.
- **Hot-cold behavior** Keeps you emotionally unstable.
- **Public charm, private cruelty** You're the only one who sees the real side.
- **Gaslighting**, a systematic pattern of generating doubt about your experiences, memory, perception, judgment, and emotions. Gaslighting isn't lying or a difference of opinion. It's designed to confuse you and undermine your autonomy and sense of who you are.
  It can include denying events that occurred, behaviors that were engaged in, experiences you are having, or words that were said. It causes you to question reality, and it qualifies as emotional abuse.

?️?♂ Lucio's note: good analysis on gaslighting patterns and frame control tactics I haven't seen in other sources. It suggested me the author has a good power awareness ??

Learn more on gaslighting signs here:

> Galisghting: 17 Signs You're Being Manipulated

3. The Fallout

After narcissistic abuse, survivors often feel worse than ever—confused, ashamed, depressed, and unsure of what even happened. This chapter outlines the psychological and emotional scars narcissists leave behind.

> where you are hoping for connection and attachment, they are working from control and selfishness.
> As a result, they are emotionally investing far less and deriving much more.

Long-Term Consequences

- **CPTSD-like symptoms** Flashbacks, hypervigilance, avoidance.
- **Shame and self-doubt** You think their abuse was your fault.
- **Loss of trust** Both in others and in yourself.

How It Affects Behavior

- **People-pleasing** You try to prevent further rejection.
- **Isolation** You withdraw to avoid judgment or gaslighting.
- **Overcompensation** You strive to prove your worth in relationships or work.

Internal Beliefs That Must Be Challenged

- **"I'm too sensitive"** ➡ You were reacting to real harm.
- **"I should have known better"** ➡ Narcissists are skilled at hiding red flags.
- **"I failed the relationship"** ➡ It wasn't a relationship, it was control.
- **"It's me because he's so awesome"** ➡ It's not me

Crucial for the mental power dynamics:

> Narcissistic people are often so resolute in the belief of their goodness, warmth, empathy, and all-around awesomeness that if you already have a devalued sense of your own worth, you are more likely to take the blame (*They are saying they are awesome, and I don't see myself as awesome, so maybe it IS me?*)

4. Understand Your Backstory

To fully heal, you must understand how your own background made you vulnerable.
Many survivors grew up in environments where love was conditional, emotions were invalidated, or boundaries were blurred.

The Narcissistic Family Systems & Roles

- **The Golden Child**: Favored for being a source of narcissistic supply, this child is idealized for traits that reflect the parent's ego (e.g., looks, obedience, talent), but their value is conditional—if they stop performing, the affection disappears, leaving them trapped in a lifelong quest for approval and unable to freely pursue their own identity.
- **The Scapegoat**: Blamed for everything wrong in the family, this child becomes the emotional punching bag and target of projected shame, often enduring the harshest treatment and growing up with low self-worth, chronic anxiety, and a painful sense of exclusion that may persist into adult relationships.
- **The Helper**: Cast into the role of caretaker, this child gains a fragile sense of control and visibility by constantly serving the narcissistic parent—cleaning, soothing, and managing others' needs—but at the cost of their own development, often growing into adults who over-function and can't stop giving.
  - Moving beyond: learn to say 'no'. If someone is angling for help, it's a manipulation tactic to take without asking. Never volunteer help!
- **The Fixer / Peacekeeper**: Constantly on high alert, this child tries to prevent explosions and manage family tensions by mediating, appeasing, or distracting the narcissistic parent, which leads to chronic anxiety, conflict avoidance, and a tendency to enable abusive behavior in adulthood under the guise of "keeping the peace."
- **The Invisible Child**: Ignored and emotionally abandoned, this child receives no validation or engagement, which leaves deep wounds of unworthiness and invisibility; they may drift through life with low self-esteem,

vulnerable to toxic relationships that mimic the same neglect.
  - Moving beyond: Find your way of being seen that is authentic to you. Stop sharing your achievements, joys, and experiences with your family of origin; it dampens the joy to have them unacknowledged and repeats the cycle of wanting to be noticed by people who can't see you.

- **The Truth Seer / Teller**: The one who perceives and sometimes speaks the truth about the dysfunction, this child is often punished, scapegoated, or discarded for breaking the family's code of silence—yet they often grow into insightful adults with strong boundaries and the potential to break free, though often burdened by grief and isolation.

Patterns to Identify

- **Fawning** You appease to stay safe.
- **Over-functioning** You take responsibility for everything.
- **Overtolerance** You normalize mistreatment.
- **Over-justifying** You find too many excuses or blame yourself, which can be self-gaslighting (e.g., justifying narcissistic behavior on the basis that you are always being too sensitive).

5. Embrace Radical Acceptance

This chapter centers on a hard truth: narcissists won't change. Hoping, fixing, or waiting keeps you stuck. The only path to healing is accepting who they are, not who you wish they'd become.

What Radical Acceptance Means

- **Giving up hope for change** You stop clinging to the fantasy.
- **Seeing the full pattern** Even the good moments were part of the manipulation.
- **Letting go of control** You stop trying to manage their moods or image.

> Realistic expectations are also about information management. This means not sharing good news with them because they will minimize and take the joy out of it or behave in a victimized and passive-aggressive manner. It also means not sharing bad news with them because they may rage and criticize and make it worse. What's left? Indifferent topics: the weather, the neighbor's cat, the taste of the chocolate cake.

What It Allows You to Do

- **Make empowered choices** You act based on facts, not illusions.
- **Set strong boundaries** You stop justifying your limits.
  TIP: to set strong boundaries you must learn address what fear to enforce them
- **Reclaim your peace** Mental space opens up when you stop spinning in "what-ifs."

Test for Narcissism

Communicate a real need directly (closeness, help, behavior change, feedback, etc.).

Observe the response:

- ✅ **Healthy response:** empathy, acknowledgment, and genuine effort to address it → likely not narcissistic abuse.
- ❌ **Toxic response:** gaslighting, manipulation, rage, or abuse → strong confirmation of narcissistic abuse.

6. Grief and Healing

Grieving a narcissistic relationship is complex because you're mourning an illusion. You grieve what you wanted it to be, not what it was. This chapter helps you move through that grief without guilt.

What You're Really Grieving

- **The fantasy** Who they pretended to be.
- **Your time and effort** Years spent trying to fix something that never could work.
- **Lost self** You mourn the parts of yourself you abandoned.
- **Loss of innocence**. But 'positive cynicism' isn't bad and can empower you

How to Heal

- **Allow all feelings** Rage, sadness, even nostalgia are normal.
- **Avoid false closure** Narcissists rarely give you honest endings.
- **Rebuild slowly** Your identity, joy, and safety will return over time.

As a bonus for peace of life: spend less time on social media:

> in an ideal world, spend less time on social media. Something about the validation seeking, the rants, the comparisons, the cruel clickbait, and the egocentricity of social media just isn't good for healing, so try to reduce your exposure. Once again, the less of this you are dealing with, the better you will feel, and this fosters radical acceptance.

7. Become More Narcissist Resistant

Once you see the patterns, you can learn to protect yourself. This chapter teaches practical tools for spotting red flags, enforcing boundaries, and trusting your intuition.

Red Flags to Watch Early

- **Entitlement** They expect special treatment from the start.
- **Love bombing** Fast intimacy, excessive praise, "soulmate" talk.
- **Disrespect in disguise** Jokes that belittle you, "honesty" that's cruel.

10 Resistance Tactics

- **Set limits early** Don't wait for proof they're harmful.
- **Stop falling for charisma and charm.**
  - Stop being impressesd by superficial qualities such as intelligence or education—or appearance, wealth, and success
- **Learn their tells**, how they act when stressed, or how they treat others
- **Stop giving multiple second chances**
- **Find solace in solitude** It's not about being 'isolated', it's about holding space for yourself, stop reacting and chasing or over-helping. It's about finding your own voice
- **Don't explain too much** Narcissists twist your words.
- **Trust your discomfort** Your gut notices what your brain tries to excuse.
- **Trust your reality**. To become more narcissist resistant, you also need to become more gaslight resistant.
  - Quit over-apologizing: Over-apologizing can be a response to gaslighting, causing you to gaslight yourself.

Apologies are for when you do something wrong. Having a feeling, an experience, or not agreeing with someone's distortion of your reality does *not* call for an apology.

> The best way to turn off the gaslights is to avoid them in the first place by owning your reality, recognizing it as reality, and not sacrificing your experience and perception in the process, even while acknowledging that someone can have a different experience from you. Resisting gaslighting early on in a new relationship can result in the gaslighter becoming frustrated and moving on to a target they can more easily dominate. If you're currently in a relationship with a narcissistic person, your resistance may result in the person escalating the gaslighting and rage. But simply knowing what gaslighting looks like can help you know when it's happening and remain aware of your subjective reality instead of capitulating or falling into self-blame and self-doubt.

8. Heal and Grow When You Stay

Sometimes you can't (or won't) leave—this chapter offers strategies for emotional survival if you stay connected (e.g., co-parenting, family).

> The primary challenge of healing while staying in the toxic situation is that narcissistic people don't really want you to heal. It's not that they care about your healing per se, but rather that your healing means they get less supply. Your healing means that you are experiencing yourself separate from them, which defies their expectation for domination and control.

Key Principles

- **Lower expectations** Don't look for empathy or growth.
- **Stick to neutral topics** Avoid emotional engagement.
- **Document everything** Especially in legal or parenting scenarios.

Tools to Stay Sane

- **Gray rock technique** Be uninteresting, unemotional, brief.
- **Limit exposure** Physically and emotionally.
- **Find emotional refuge** From friends, therapy, routines, or hobbies.

Grey rock vs yellow rock techniques

Gray Rock

- Be boring, flat, and unemotional.
- Keep responses short, factual, and minimal ("yes," "no").
- Don't feed arguments, drama, or validation.
- Expect the narcissist to escalate at first before eventually losing interest.
- ⍰ Example: When Gloria's mother asked at dinner if she had remembered to congratulate her sister on her new home, Gloria flatly replied: *"Yes."*

Yellow Rock

- A warmer, more polite version of gray rock.
- Still concise and boundaried, but with civility and basic warmth.
- Useful in co-parenting, family, or work settings where gray rock is too cold.
- Looks "normal" to outsiders while still protecting boundaries.

- ⍰ Example: Same situation, but with warmth and brevity: *"Yes, I responded yesterday when I saw the picture of her house."*

9. Rewrite Your Story

The final healing step is reclaiming your identity and rewriting your narrative. Abuse distorts your self-view—healing reclaims it.

> The true act of rebellion is to live a life that is not a response to them but a life as an authentic person with wants, needs, aspirations, mistakes, strengths, vulnerabilities, hopes, and feelings that are completely yours.

How to Reclaim Your Voice

- **Name what happened** Truth-telling breaks shame.
- **Reframe your identity** You are not broken—you adapted to survive.
- **Celebrate strength** Even staying too long taught you what you won't accept again.

What Growth Looks Like

- **Trusting yourself again** You learn to believe your gut.
- **Living by values** Not fear, people-pleasing, or self-erasure.
- **Helping others (if you want)** Turning pain into wisdom, not your purpose.

Don't force forgiveness. If it comes later, great. But if you don't, it's OK

Slightly paraphrasing for brevity:

> It seems that every single self-help book, healing practice, and spiritual scripture talks about the value of forgiveness (…) in healthy relationships it has tremendous value. But **narcissistic relationships are not healthy, so all the conventional wisdom about forgiveness goes out the window.**
> (…)
> In most cases, narcissistic people didn't recognize forgiveness as the gift that it is (…) Instead, they likely saw it as permission to keep on doing what they were doing. **Forgiveness is narcissistic supply**, one more thing that emboldens the narcissistic person's entitlement (…)
> Multiple studies suggest that forgiveness is not good if it is not followed by an attempt to make amends or foster safety.

The author correctly calls out the literature we called here 'naive self-help'. She says that most most of what is written about the virtues of forgiveness does not account for narcissism and antagonism.
Forgiving someone who doesn't change or doesn't deserve it may instead only lower your self-respect (the 'doormat effect').
When we do account for repeat offenders and disagreeable personalities, research suggests that it would be better for your well-being if you didn't forgive.

And she shares:

> Embracing my non-forgiveness has significantly helped my healing and brought the volume down on my an

Think of yourself like a hero in a hero's journey

> Have you ever heard of the hero's journey? It provides an outline for many myths and biographies across time

> and cultures. The framework is pretty simple: A heroic person is called to an adventure, faces down a critical crisis, often considers giving up, and returns home, permanently transformed. Along the way, the heroic person wanders through the unknown and is met with helpers, mentors, fellow travelers, threats, and existential crises, and upon returning is not only changed but also does good for others.
> **You are the heroic person in this journey.**

How does that journey end?
With your blossoming:

> This journey culminates in the private and public launch of your authentic self, and that will be a gift to yourself, to the people who love you, and to the world at large.

SHARPEST INSIGHTS

These are the insights that struck us the most.
We use the authors' quotes and research, but the titles and interpretations are our own—and may not reflect the authors' intent.
Credit for the insight goes to them; blame for the interpretation is on us.

Should Narcissism As A Diagnosis Be Disbanded?

A provocative and thought-provokign take:

> I personally believe the diagnosis should be disbanded altogether, because there is little substantial evidence for accessible treatment, and because there is little reliability across clinicians in assigning this diagnosis
> (…)
> but this term *narcissistic personality disorder* has muddied the waters of the conversation on narcissism. We all have a personality; some are just easier to get along with than others.

I felt similarly, but for different reasons.
Specifically, after learning more about grandiose and vulnerable narcissism because they seem to be two very different personality profiles.

QUOTES

On the fantasy of 'change' and the reality of most narcissists NOT changing:

> If a narcissistic person does not believe there is a reason to change—and in fact, they may believe it would hurt them or take away their "edge"—they will be no more likely or able to make that switch to agreeableness or to become self-aware than you would be able to switch over from agreeableness to disagreeableness.

On narcissists needing you below them:

narcissistic people make you feel small so they can feel safe.

On the win-lose nature of narcissistic relationships and the ultimate frame battle it entails (what's true/not true):

for a narcissistic relationship to last, you must submit to their reality

On 'flying higher' negative people, a concept we also espoused here with the allegory of an eagle flying higher the petty turkey games:

Arguing gives them another way to get supply, let out some steam, air their grievances, and remain dominant. It's like the aphorism "Never wrestle with a pig—you end up dirty, and the pig likes it."

On removing toxic people:

If cleaning out a closet is supposed to bring joy to a person's life, cleaning out toxic people should bring ecstasy.

⍰⍰♂ Lucio's Analysis

Is narcissism maladaptive? I think it can be very *adaptive*

People may confuse the word 'adapative' with 'good' or 'nice'. And maladaptive with 'bad' or 'creating problems'.

But 'maladaptive' only refers to harming an organism's chances for survival and reproduction.

Causing problems is not in itself maladaptive, especially if the issues are *for others*.

The author, like most others in the narcissism self-help literature, claims that narcissism is an 'interpersonally *maladaptive* personality style'.
However, the only clear cases of maladaptivity I see are in the *victims*.

Whether narcissism is maladaptive is far from certain.
An evolutionary perspective may claim that **narcissism is adaptive in certain contexts and environments, and especially the grandiose aspect of narcissism.**

A clue may even come from the book itself, referring to narcissists' beliefs:

> If a narcissistic person does not believe there is a reason to change—and in fact, t**hey may believe it would hurt them or take away their "edge"**—they will be no more likely or able to make that switch to agreeableness or to become self-aware than you would be able to switch over from agreeableness to disagreeableness.

Truth is, they may have a point.
Grandiose narcissism may indeed provide an edge to achieve certain life-relevant results like fame, dating success, or pursuing opportunities others wouldn't.

Infidelity is not a feature of narcissism; it's a *human* evolutionary tactic

The author mentions a couple of times 'narcissistic infidelity'.
Referring to a client, she says that 'she was now experiencing the sting of narcissistic infidelity' and she adds later:

> For too long we have viewed betrayal as an unfortunate occurrence that can happen in a relationship, but that misses how devastating this common dynamic of narcissistic relationships can be.

This is where I feel the book may have gained with some evolutionary perspective.
Betrayal *is* an unfortunate occurrence that can happen, and happens relatively frequently in the West.

Narcissists may engage more in infidelity, but it's not nearly as clear-cut as one may think.
The *Oxford Handbook of Infidelity* says that findings are mixed, and only replicate specifically for *sexual* narcissism, not for *general* narcissism.
Plus, Foster and Brunell explain based on empirical evidence that narcissists in happy relationships don't necessarily cheat more, narcissists with spouses who elicit their communal feelings are also more communal themselves. Plus, without over-generalizing or blaming victims of course, but it's also true that narcissists tend to pair up with other narcissists.

Ultimately, and contrary to what one may feel reading about 'narcissistic infidelity', **narcissism is not defined by infidelity because infidelity is endemic to any pair-forming species.**

Infidelity is a specific case of defection from a collaborative endeavor. Defecting is an attempt to gain an extra payoff, and humans often seek to get the highest payoff possible (like any other form of life).

Do all relationships follow a cycle with love bombing?

The author writes:

> Narcissistic relationships follow a cycle. This cycle often begins with charm, intensity, idealization, or the patterns we call *love bombing* that draw us in. Then gradually, the "idealized" mask falls off and the expectable patterns of devaluation and discard kick in. (…) These phases show up differently depending on the nature of the relationship, but the cycle is universal across all narcissistic relationships.

That is a strong claim and it was surprising from such an otherwise careful author.

Not only do I not think that love bombing is present in *all* narcissistic relationships, but **there is no evidence for narcissists using love bombing (Campbell, 2020)**.
This follows basic value exchange and power dynamics principles. First off, strategically aware narcissists don't love bomb because love bombing, just like any other high-investment strategy, gives lots of power away (and that's also why it's not very effective).

Second, the author claims includes the victim's idealization in 'love bombing'. But that's a very different dynamic in my opinion. That's *attachment* (or *love* in the case of relationships). It's categorically different from love bombing.

Sometimes misses the realities of mate value & sexual market dynamics

The author never considers that people end up or stay with narcissists because maybe they're also exciting ('chocolate cake model'), or provide genetic benefits ('sexy sons hypothesis').

Sure, many of these relationships are toxic and people may indeed be better off ending them.
But is that *always* the case?
I doubt it.

Some people enter the relationship or stay because… It's still better than the alternatives.
For example, the author writes:

> "I know this relationship is bad for me, but I don't have time to go back out there, find someone new, get married, and have a child before it is too late."
> (…) The reality is, we rarely make our best decisions under pressure.

But maybe staying *was* the best decision for her client.
At least from an evolutionary point of view, her client may be totally right.

Even more clear-cut cases apply to relationships with very high mate value narcissists.

Should we mention for example the case of women married to narcissistic CEO or presidents?
Still not a textbook great relationship maybe. But **a narcissistic but wealthy or exciting man may be better than a poor nice guy for many women.**
That's the reality that self-help books rarely indulge.

REVIEW

It's Not You is a great book for anyone living with a narcissist and looking to disengage, heal, and move forward. Ramani is a clinically experienced voice in the field, and shares strategies and mindsets that are practical, realistic, and genuinely useful.

It's not a perfect match with the TPM approach. The book is primarily focused on self-defense and recovery, while at TPM we place more emphasis on active goal achievement, growth, and integrating the more functional traits of narcissism into an honorable man framework. The book's "victim-focus" also speaks more directly to women, while we'd stress more personal empowerment and positive dominance as a way to recovery.

The criticisms we've raised above also remain valid.
Still, t**his is a high-quality work** that reflects core TPM values in its critical thinking, rejection of naive advice, and good scientific grounding.

Bottom line: while TPM readers may find our handbooks and articles on narcissism more closely aligned with ambitious men's goals, *It's Not You* remains a highly recommended resource.

Check the **best books** to read or **best books on narcissism**.

Notes

About the Author:
Wendy T. Behary is a licensed clinical social worker, expert in schema therapy, and founder of The Cognitive Therapy Center of New Jersey.

1. Framing The Situation: Understanding Narcissism

Narcissists are not just arrogant; they often have deep insecurities masked by defensive patterns and emotional armor.

> the truth is that he actually longs for a deeper and much more profound connection—a need that he simply cannot realize, comprehend, or accept. He's likely to view the idea of an emotionally intimate connection as weak and pathetic. As a consequence of his unrealized longings, which he considers unacceptable, his needs are misguided, so he can only seek your attention through charming yet unnerving behaviors.

⍰⍰♂ **Lucio's note: I'm unconvinced this is 100% accurate**
While it may be true for some narcissists, I also feel it's a mix of pop-psychologizing, 'naive take', and potentially subconscious revenge-seeking that seeks to frame the dominant narcissist as weak.
The authoritative *Handbook of Trait Narcissism* for example states that grandiose narcissists are 'low on need for intimacy', suggesting the opposite is true.

Core Characteristics of Narcissists

- **Grandiosity and entitlement** – They believe they're superior and deserve special treatment.
- **Lack of empathy** – They struggle to connect with others' emotions.
- **Sensitivity to criticism** – Even mild feedback feels like a deep wound.
- **Control and manipulation** – They exert power over others to maintain superiority.

Healthy Narcissism.

Healthy narcissism supports self-respect, assertiveness, and the ability to express needs without trampling on others.

In childhood, narcissistic traits like demanding attention or acting out are developmentally normal, helping the child secure care and protection.

As adults, people with healthy narcissism are confident, driven, and often influential—but they remain grounded. They may seek recognition, but their goals are guided by empathy, integrity, and purpose.

They can lead, confront, and stand up for themselves—without arrogance or cruelty. At their best, they inspire others, form deep connections, and make a lasting positive impact.

2. The Impact on You

- **Self-doubt and confusion** – Victims often question their own worth and reality.
- **Walking on eggshells** – Avoiding topics that may provoke narcissistic rage.
- **Loss of identity** – Constant accommodation leads to self-erasure.
- **Sense of loneliness**

> A client who was married to a narcissistic man said that she found herself less lonely when he traveled (…) his inability to be emotionally available left her feeling far more lonely and deprived.
> He was immersed in an evasive strategy of emotional silence. To him, any exposure of his vulnerability would feel like a fusing of the two of them in some needy and dependent way. This is unthinkable for the narcissist,

> whose mission is one of sovereign self-reliance.

2. Schemas and The Brain

This chapter explores how narcissism develops from unmet childhood needs and early relational traumas. Narcissists often had inconsistent or conditional caregiving, leading to intense inner pain they mask with false superiority.

Developmental Roots

- **Unmet emotional needs** – Especially for empathy, validation, and safety.
- **Conditional love** – Praised only for achievements, not authentic self.
- **Insecure attachment** – Alternating between craving closeness and fearing it.

Schemas: Definition & Common Narcissistic Schemas

Behary introduces the main "schemas" (deep mental patterns) that drive narcissistic behavior and defenses.

- **Entitlement/Grandiosity** – Belief in being above rules and others.
- **Insufficient self-control** – Poor frustration tolerance; seeks instant gratification.
- **Mistrust/Abuse** – Assumes others will hurt, manipulate, or deceive.
- **Defectiveness/Shame** – Hidden sense of being unlovable or broken.
- **Unrelenting Standards** – Perfectionism used to gain approval and avoid shame.

Full Schemas List

- **Emotional Deprivation**: The belief that one's emotional needs will never be met by others — that no one will truly care, listen, or understand.
- **Abandonment**: The fear that significant others will leave, die, or abandon them — emotionally or physically.
- **Mistrust/Abuse**: The expectation that others will intentionally hurt, abuse, cheat, or take advantage.
- **Social Exclusion**: Feeling fundamentally different from others and not fitting in socially or emotionally.
- **Defectiveness/Shame**: A core belief of being flawed, unlovable, or bad — often tied to deep shame and fear of rejection.
- **Failure**: The belief that one is fundamentally inadequate and will fail in achievement-based domains like work or school.
- **Dependence/Incompetence**: Feeling unable to handle everyday responsibilities or solve problems without help.
- **Vulnerability to Harm or Illness**: A chronic fear that disaster (medical, financial, natural) is always looming and that one cannot prevent it.
- **Enmeshment/Undeveloped Self**: Feeling overly involved with or emotionally dependent on others — to the point of losing one's own identity.
- **Subjugation**: The belief that one's needs or desires must always be suppressed to avoid anger, retaliation, or abandonment.
- **Self-Sacrifice**: An excessive focus on meeting others' needs at the expense of one's own, often driven by guilt.
- **Approval-Seeking/Recognition-Seeking**: Placing excessive importance on gaining approval, recognition, or attention — often at the cost of authenticity.
- **Negativity/Pessimism**: A pervasive focus on the negative aspects of life — expecting disappointment or failure.
- **Emotional Inhibition**: Suppressing emotions to avoid disapproval, embarrassment, or loss of control.

- **Unrelenting Standards/Hypercriticalness**: The belief that one must meet high internalized standards to avoid criticism or failure — often resulting in perfectionism.
- **Punitiveness**: The belief that mistakes should be harshly punished — both for oneself and others — with little room for forgiveness.

Why Schemas Matter

- **Schemas shape reactions –** The narcissist's behavior is predictable once you know their schemas.
- **Schemas are targetable –** You can interact differently based on the schema driving the moment.

5. Empathic Confrontation: Disarming the Narcissist

This chapter introduces the book's core strategy: using empathic confrontation to get through narcissistic defenses and promote healthier interactions.

Empathic Confrontation Defined

- **Validating emotion + holding accountability –** *"I understand that was hard for you, but that doesn't make it okay."*
- **Speaking to the pain behind the armor–** Address the wounded inner child, not just the inflated outer self. <— ??♂ **Lucio's note**: I found these formats stereotypical 'therapist talk', they felt overly scripted for normal life and 'fake'. Also, they wouldn't always be effective in my opinion
  - Acknowledge the mode – Identify if the narcissist is in Angry Child, Detached Protector, etc. <— ??♂ **Lucio's note**: these felt very power-movey and I think they'd annoy most people, especially dominant personalities. I also think they wouldn't be wrong to be annoyied as they felt 'pscyhologizing power moves'

Goals of Confrontation

- **Protect your boundaries –** Assert yourself without hostility.
- **Break defensive cycles –** Interrupt power struggles or shutdowns.
- **Encourage self-awareness –** Gently highlight distorted thinking or unfair behavior.

Sample Scripts

- *"I get that this feels unfair to you, and I want to understand your reaction. But yelling shuts down the conversation."*
- *"You seem hurt underneath the anger. Can we talk about that without blaming?"*

6. Parenting with a Narcissist

This chapter provides specific strategies for co-parenting or parallel parenting with a narcissistic partner or ex-partner. The priority becomes the child's well-being and your own sanity.

Key Principles

- **Use structure and predictability –** Kids need consistency even if the narcissist is erratic.
- **Don't engage in drama –** Keep communication minimal and fact-based.
- **Protect the child's experience –** Avoid speaking negatively about the narcissistic parent, but validate what the child feels.
- **Protect the child from the burden of performance –** Some narcissists will push children too hard, and starve

them for love.
  - Narcissists may ‘Subjugate children to a legacy-driven future‘, ie. “you will join my law firm one day, of course”

Legal and Emotional Safety

- **Keep records** – Document exchanges and incidents neutrally.
- **Use third-party apps** – Tools like OurFamilyWizard reduce conflict.
- **Educate the child** – Age-appropriate conversations about emotions and boundaries.

7. When to Leave

This chapter reframes the narcissistic relationship as a dysfunctional “dance” and in some cases, the narcissistic relationship is too toxic to repair. This chapter explores how to know when to leave and how to do it safely.

You must make the move because, the author says, narcissists do not typically end the relationship, despite threats of doing so.

Signs It’s Time to Go

- **Repeated boundary violations** – Even after clear confrontation.
- **Escalating emotional or physical harm** – Safety becomes the top priority.
- **Complete emotional depletion** – You feel numb, trapped, or broken.

More Wisdom

How male and female narcissists differ

> Women can be narcissistic too, but they tend to express these traits mostly within the domains of personal appearance or vanity, the status of their children or household, and their value as caregivers. In addition, narcissistic women are inclined toward more covert manifestations of this syndrome. They are likely to show up as martyrs, whiners, and gratuitous victims.
> Of course, you will also meet grand dames and divas, who look more like their male counterparts in their aggressive quest for attention and admiration.

Spot a narcissist based on his reaction to your isssues

> When my dad was very ill and eventually dying, my selfsacrificing clients actually felt guilty coming in for their sessions, despite my repeated reassurance that I really wanted to be there for them. On the other hand, my narcissistic clients often seemed visibly annoyed if I arrived at a session a little late after leaving the hospital.

QUOTES

On preparing yourself before responding to a narcissistic mother:

> Before responding, you remind yourself that you love your mother, though you’re not always sure why <—
> ⍰⍰♂ **Lucio’s note**: This made me smile :D. But I also don’t see why you should be loving, love her, or seek your mother’s love and quality time with her, if you don’t even see why

Funny quote on narcissism's big business:

> In the process, terms and phrases such as "narcissism," "sex addiction," and "lack of empathy" have boldly appeared in the headline of many an article or broadcast (boosting my book sales, thank you very much).

⍰⍰♂ Lucio's Analysis

Overall, I wished for more scientific grounding, for a broader breadth of resources, and for more strategies and tactics based on power dynamics and personal empowerment.

Potentially naive

Says the author in the first chapter:

> Most narcissists are not "evil" or "bad" at a deeper level, no matter how they treat us. If you can learn to assert your rights while simultaneously working hard to reach the vulnerable, lonely core of the narcissist in your life, you stand a much better chance of bringing out the side of your partner that can love and care for you.

The whole book is built on its premise: talk to that poor little child inside, and you may turn your narcissist into a loving man.

Most narcissists are not evil, but I still couldn't help to feel this premise was naive. And that, despite the good intention, it could lead some readers to dealing with narcissists from a position of low power that may only make them bigger victims.

Sometimes ineffectively low power & too 'vulnerable'

This is what the author offers as a script example talking to a supervisor:

> Here's another example, this time using an interaction with a supervisor: "It's not very easy for me to say this because I'm aware of my long-standing tendency to do what I'm told, <— ⍰⍰♂ **Lucio's note**: Unecessary, potentially disempowering
> even if I don't agree or if I have another, possibly better solution.
> Sometimes I'm overly invested in your approval of me. <— ⍰⍰♂ **Lucio's note**: Unnecessary in many business organizations
> However, I want to propose that we improve our marketing efforts in this way… I also think that you and I should have regularly scheduled meetings to measure the progress on this project. <— ⍰⍰♂ **Lucio's note**: Lacks power protection, many bosses would push back on this just because it oversteps authority boundaries
> The current process leaves me feeling invisible and sometimes unfairly criticized, <— ⍰⍰♂ **Lucio's note**: Therapist talk, can feel weak. If goals are priority, you must frame your requet based more achieving goals, and less based on how you feel
> even though I'm sure that isn't your intention." <— ⍰⍰♂ **Lucio's note**: Unnecessary

It's the perfect 'therapist talk', and may work great talking to your schema therapy supervisor. But it can be miscalibrated in most organizations.
I wouldn't recommend this approach, and especially not for men and in private organizations. In many private organizations, and especially in competitive or masculine environments, this style can lower perceived status or authority.

Ignores evolutionary roots of narcissism

Like many popular books on narcissism, *Disarming the Narcissist* misses out on the insight that evolutionary psychology provides.

Contrary to what the book suggests, narcissism may not be maladaptive for the narcissist.
In many cases there may be no 'wounded little child' inside, but a darker core of power hunger, and callous selfishness because… That may work better from an evolutionary perspective.
See:

- Advantages of narcissism, and how to use it

Schema therapy alone is limiting

The book uses schema therapy and psychotherapeutic frameworks.
While these can be helpful, it's also limiting to put all your eggs on a single approach.

REVIEW

Disarming the Narcissists is a book developed around a specific clinical approach and largely built on the premise that narcissists can change, and those are both its strengths and its main limitations.

While the author is not naive and clearly states many narcissists don't want to change and will laugh at your empathic communication, the book still largely relies on that approach.
I have some reservations about a book developed to change 2% of narcissists who want and will change, when 98% won't.

Finally, although I may agree with the author that this book can work for both men and women, it seems to me better suited for women.
And I wouldn't necessarily recommend men, and especially the type of ambitious and smart men reading TPM, to copy the book's communication scripts.

FULL SUMMARY

About the Author:
Dr. Craig Malkin is a clinical psychologist, lecturer at Harvard Medical School, and best known for his work on narcissism and emotional intelligence.

1. Rethinking Narcissism: Old Assumptions, New Ideas

Malkin opens the book by challenging common assumptions about narcissism.
He argues that narcissism is not inherently bad — in fact, a healthy dose of it is essential for well-being. Rather than being a binary (you are or aren't a narcissist), it exists on a spectrum. At one end is echoism (self-effacement), in the middle is healthy self-worth, and at the far end lies pathological narcissism.

2. Confusion and Controversy: How Narcissism Became a Dirty Word and We Found an Epidemic

Here Malkin traces how the cultural narrative around narcissism evolved. He critiques pop psychology and media-driven panic about a supposed "narcissism epidemic." He argues that many signs mistaken for narcissism (like selfies or self-promotion) are not inherently pathological. He also criticies the idea that Millennials are more narcissistic, citing more nuanced research. The real problem, he argues, is our misunderstanding of narcissism — and our failure to differentiate between healthy self-regard and harmful behaviors.

⍰⍰♂ **Lucio's note**: the data is clear that there has been an increase in narcissism scores.

3. From 0 to 10: Understanding the Spectrum

This chapter introduces the narcissism spectrum in detail with the author's own model and measures.

At "0" is the echoist — someone who avoids the spotlight, struggles to assert needs, and fears being seen as special. At "10" is the extreme narcissist — entitled, exploitative, and lacking empathy. In between lies the healthy range, where people enjoy admiration without needing it.

4. The Narcissism Test: How Narcissistic Are You?

Malkin introduces the Narcissism Spectrum Scale (NSS), a self-assessment tool designed to help people understand where they fall on the narcissism continuum.

Unlike older tools that emphasize grandiosity, the NSS also captures low narcissism (echoism) and healthy narcissism. This chapter walks readers through the test and shows how recognizing one's position on the spectrum can offer insight into relationships, behaviors, and self-image. The test is meant to encourage self-awareness, not judgment.

⍰⍰♂ **Lucio's note**: I wished for a simpler online test and I may have taken it. For readers, keep in mind that the author's assessment is not nearly as validated and tested as the NPI or the other popular measurements.

5. Root Causes: The Making of Echoists and Narcissists

This chapter explores the environmental and developmental origins of narcissism and echoism.

I found it a bit more on the psychoanalytical side at times, and sometimes overly downplaying the role of genes and biology.

6. Echoism and Narcissism: From Bad to Worse

Echoism and narcissism can fuel one another in toxic relationship dynamics. Echoists — afraid to seem "needy" — often attract narcissists, who dominate the emotional space. The more the echoist retreats, the more the narcissist demands. This chapter describes how these pairings create painful cycles of emotional neglect, control, and resentment. Malkin warns that untreated echoism can become just as harmful as narcissism, leading people to tolerate abuse, ignore their own needs, or lose their sense of self entirely.

7. Warning Signs: Staying Alert for Narcissists

> One crucial sign: narcissists dodge normal feelings of vulnerability, including sadness, fear, loneliness, and worry

Malkin outlines the key behaviors that help you spot narcissists early. These include emotional hot-and-cold behavior, hypersensitivity to criticism, entitlement, and a tendency to idealize others before devaluing them.

He emphasizes that early charm and intensity (especially in dating or friendship) can mask these traits. The real red flag isn't confidence — it's emotional manipulation and a pattern of exploiting others.

8. Change and Recovery: Dealing with Lovers, Family, and Friends

This chapter focuses on navigating relationships with narcissistic partners, parents, or close friends. Malkin explains that some narcissists — particularly those on the mild to moderate end of the spectrum — can improve with feedback and therapy. He offers tools for prompting change, like empathy prompts, boundary setting, and emotional mirroring. But he also stresses the limits: some individuals won't change, and in those cases, protecting your well-being must come first.

9. Coping and Thriving: Dealing with Colleagues and Bosses

Narcissism in the workplace presents a different set of challenges. Narcissistic bosses or coworkers may take credit for others' work, gaslight colleagues, or manipulate social dynamics.
Malkin offers tactics for managing these relationships, such as depersonalizing attacks, documenting interactions, and avoiding unnecessary conflict. I found some of the scripts good, but some too low power for dealing with dominant narcissists.

10. Advice for Parents: Raising a Confident, Caring Child

Malkin draws on parenting psychology to help readers raise children with healthy narcissism — meaning kids who feel special, but not superior.

He recommends authoritative parenting: high warmth, clear boundaries, and emotional responsiveness. Overpraising leads to entitlement; underpraising to echoism. Instead, parents should mirror children's emotions, model vulnerability, and reward empathy. The goal is to nurture both confidence and compassion — the heart of healthy self-worth.

11. SoWe: The Healthy Use of Social Media

"SoWe" stands for "social wellness," Malkin's framework for using social media in a psychologically healthy way. Rather than chasing likes for external validation, users should engage to connect meaningfully with others.

Malkin warns that narcissistic use of platforms (posting for admiration, obsessing over followers) reinforces dependency on approval. By contrast, intentional, relationship-focused use of social media can support emotional well-being and reduce isolation.

12. A Passionate Life: The Ultimate Gift of Healthy Narcissism

The final chapter ties everything together: when people embrace healthy narcissism, they feel worthy, pursue passions, and remain open to love and feedback.
They live "a passionate life," not one governed by fear, avoidance, or manipulation. Malkin ends by reaffirming that narcissism isn't inherently bad — only when distorted does it cause harm. With self-awareness and the right environment, we can all move toward the center of the spectrum, where confidence and connection coexist.

Learn how to be a healthy narcissist:

Honorable narcissism: win at life, without toxicity

> How to Be a Strategic Narcissist: Achieve Power Without Toxicity

QUOTES

> The truth is a slightly outsized ego has its benefits. In fact, numerous studies have found that people who see themselves as better than average are happier, more sociable, and often more physically healthy than their humbler peers.

A good Machiavellian take:

> Do not trust HR. They work for management and *are* management

⍰⍰♂ Lucio's Analysis

Narcissists Don't Steal?

Writes the author:

> A boastful narcissist might lie, claiming to be a graduate of Harvard when he's really a high school dropout, but it wouldn't dawn on him to steal.

I wouldn't be too sure about that.

Not All Narcissists Are Psychopaths, But All Psychopaths Are Narcissists?

That's what the author claims, but I'm not too sure about that one.
Some psychopaths display narcissistic traits, but the expression of narcissistic traits between the two can also look rather different.

Some Criticism of NPI Feels Misplaced

Writes the author:

> The NPI, on which Twenge draws so heavily, is a deeply flawed measure. Under its design, agreeing with statements that reflect even admirable traits can inch people higher up the narcissism scale. For example, **picking "I am assertive" and "I would prefer to be a leader" counts as unhealthy** even though these qualities have been linked repeatedly in decades of research to high self-esteem and happy relationships. People who simply enjoy speaking their mind or being in charge are clearly different from narcissists who enjoy manipulation and lies. But the NPI makes no distinction. More people checking these salutary statements could easily account for millennials' rising NPI scores through the years, and that's what some studies indicate has happened.

I don't fully disagree; the NPI is an imperfect tool.
But I think this criticism could be better leveled. I don't think it's correct to say that 'picking I am assertive' necessarily 'counts as unhealthy'. It's well recognized in the literature that the authoritativeness facet is adaptive.

Are We Back With The Mask Model?

Writes the author:

> Human interaction poses a scary problem for narcissists who are, deep down, extraordinarily insecure people.

Again, I remain doubtful about that. And I can't help but remember what Campbell wrote: clinical psychologists only get a biased sample from the struggling narcissists. The successful ones don't show up for therapy.

Therapist Talk Is Low Power Sometimes

One of the scripts provided:

> *Mia, you mean the world to me. When you show up hours late for our dates, I feel sad, like I'm not important to you.*

Not the approach I'd recommend for our readers.

REVIEW

Rethinking Narcissism is an interesting book with a key insight that we agree on: narcissism in the right doses is healthy.
We also take one step further, adding that narcissism can be adaptive at higher doses, as long as it's calibrated, and as long as it's in the *adaptive* facets.

Get it on Amazon, check the **best books on narcissism**, or check our most recommended books.

Value Signaling: The Complete Guide to Signaling High Value

Lucio Buffalmano · 19 July 2026 · Archived copy · Original

Your success depends equally on your objective value and how effectively you signal it — but most men are clueless about the latter.

Signaling is a fundamental feature of life. Animals constantly send and interpret signals to achieve life-relevant goals, and humans do it with far greater complexity and strategy.
When it comes to social and life success, one of the most important classes of signaling relates to value, be it social value, job value, or mate value.
In general, **the higher value you signal, the more successful you will be** in life.

This article presents a framework for understanding the different sources of value signals, their relative credibility, and how to communicate your value accurately and effectively.

Verbally professing value with visibly low objective value is weakest and repels people

The Value Signaling Framework™

The Value Signaling Framework™ explains how people assess your value, and how value is communicated.

In simple words, **value signaling is the communication of value to others**. Value is an umbrella term that includes anything that increases someone's social or mate value. It includes and is not limited to, signaling confidence, social dominance, virtue ('virtue signaling'), intelligence, status, or lower comparative investment.

Broadly, value signaling includes not only deliberate self-promotion, but also signals from visible underlying value, environment, and reputation. In common parlance, value signaling refers more often to active communication, and in this article, we focus more on *active* signaling strategies.

Active signaling is crucial because it carries real weight and because it's in the signaler's full control. Active signaling reinforces already visible value, showcases semi-visible value, and is completely responsible for presenting the sizable non-directly accessible value like past history, mental faculties, character, etc.

Value, Signaling, & Perceived Value

People evaluate others on a combination of visible value, which they can assess without relying on the signaler's trustworthiness, and the signaler's active communication.

The key elements of value-signaling are:

- **Objective visible value**, including personal value foundations such as body language, confidence, and looks, and exchange value such as wealth and status. Total value ranges on a continuum of invisible to visible
- **Active signaling strategies**, controlled by the signalers to best showcase value (or undermine it when poor, and potentially manipulate it)
- **Perceived value** is the value others assign to us based on the visible portion of one's personal value, and their assessment of signals they receive

In marketing speak, objective value is the 'product' and active signaling is the 'marketing' for the promotion of that product.
Honest self-development work tends to address more the 'underlying value', while strategies address more the presentation.

Perceived value is the most important, true bottom line of success because others assess and behave based on their perception, rather than 'what truly is'. As Machiavelli said, everyone sees what you appear to be.

Genuine vs. Manipulative Signals: Self-Serving Bias

The **self-serving bias principle** states that signalers have an incentive to manipulate signals and communicate higher value than their objective value to boost their odds of survival and reproduction

- **Genuine signaling** (value-backed) reflects the true underlying value
- **Manipulative signaling** does not reflect true underlying value. It can signal non-existing value, inflate existing value, or hide negative value to present a higher total value than what's objectively true

Manipulation is common in both nature and human socialization, although most everyday signaling is a mix of genuine and manipulative.

Manipulability: The Evolutionary Arms' Race

Strategic and manipulative signaling can certainly sway perceived value, which advantages more Machiavellian players.

However, that's not to say that everything's fake or 'easily fakable'.
Others can more reliably assess the visible parts of objective value. And we can expect organisms to evolve to be more discriminating of easy-to-manipulate information. Meaning, most humans naturally favor reliable, hard-to-fake signals while discounting cheap, easily manipulated signals.

The Perceived Value Formula™: Objective Value x Signaling

Both objective value and signaling matter.

- **Objective value is the raw material**, and it shows: it's partly visible, tends to 'leak out' when people fake higher value, and tends to 'surface' over the long run
- **Signaling showcases value**, is fully responsible for non-visible value, and it's especially impactful in the short-term.

So perceived value comes down to:

Perceived Value=Visible Value×Signaling\text{Perceived Value} = \text{Visible Value} \times \text{Signaling}
Both are crucial and improvable, but The Power Moves, we stress working on objective value with honest self-development.
Higher personal value makes value signaling easier and more effective. Just look at the math:

8 (High Value) × 7 (Good Signaling)=**56**3 (Low Value) × 9 (Excellent Signaling) =**27**\begin{aligned} \text{8 (High Value) } \times \text{ 7 (Good Signaling)} &= \color{darkgreen}{\mathbf{56}} \\ \text{3 (Low Value) } \times \text{ 9 (Excellent Signaling) } &= \color{red}{\mathbf{27}} \end{aligned}

Signaling well is a skill you can improve, and it works even better if you also work on the foundations of objective value. High value men may not even need much active signaling

High value also allows for more genuine self-presentation, less manipulation, and more win-win.

What to Signal

Based on the signal dynamics we explained, this is what to prioritize for value-signaling:

Signal What's Costly, Hard to Fake, & Unbiased

Reliable signals are...	Examples
Costly	**Costly**: Conspicuous consumption **Cheap**: Bragging about income
Hard to fake	**Hard**: Calm under pressure **Easy**: Power poses
Unbiased	**Unbiased**: Boss' praise **Biased**: Mother's praise

Overt verbal bragging without proof, what most men do, is sub-optimal because it's cheap, easy to replicate by low-value individuals, easy to fake by anyone, and inherently biased.

Similar dynamics have been studied in nature.
Economist Michael Spence and biologist Amotz Zahavi both focused on costs, and reached the same conclusion.
Signals that seek to convey value but that are cheap to produce are unreliable because anyone can fake them.

Costly signals are reliable because only high-value animals can produce them. The cost itself is the proof.
The common example is the peacock's tail: it's costly to produce and maintain, and only genetically gifted peacocks can boast the largest and most colorful tails.

And Dawkins and Krebs (1978) reached the same conclusion about speakers' bias: signalers have an inherent interest in appearing higher value than they are, incentivizing manipulation, and making self-reports structurally unreliable.

⁉ **Takeaway**: avoid talking without showing, prioritize harder-to-fake signals

Value Credibility Hierarchy™: Signal From the Bottom-Up

A simplified value display hierarchy. Verbal claims are least credible, results and behavior are credible, and consistent value displays over time are most credible

1. **First-hand observation**: Others discover your value directly
2. **Contextual signals**: Status and wealth cues, clothes, house/office
3. **Third-party signals:** Others praise you, defer to you, introduce you as an expert, etc. Their credibility also depends on the interest alignment between praiser and praised (ie.: family and allies vs. strangers and competitors)
4. **Personal sub-communication**: Value inferred from your words or behavior. Can be subconscious and unintentional or conscious and strategic (signaling, without looking like you are)
   - **Nonverbal sub-communication**: including body language, social dominance, and behavioral leadership
   - **Verbal sub-communication**: conversational leadership, thread-expanding, name drops, humblebrags, stories, signals nested inside unrelated conversation, etc.
5. **Direct verbal claims** are the least credible because they're cheap, easy to fake and replicate, and biased
   Ie.: "I'm great"

Promote Invisible Value, Let Visible Value Speak for Itself

Some men brag about what's already visible because they think that visible value makes their bragging credible. While the logic is valid, it's a sub-optimal strategy. Bragging about what's already visible trades little added signaling value for a reputation of an obnoxious bragger.

The smart strategist instead uses high visible value to self-efface, gain a reputation for humility, and use that social capital for promoting invisible value, or canceling flaws.

This is a similar tactic that launched the first viral get-rich guy in Web 2.0:

⍰ How this marketer used this strategy

This popular 2010s marketer first displayed value with a supercar, then self-effaced by stating to be more proud of his knowledge, which he later sold (as a way to achieve the supercar value, implied)

Visibility-informed Strategies

Visibility and value form a quadrant that can guide your signaling strategies:

	Low Visibility	High Visibility
High Value	**Hidden gems** Bring in sight, sub-communicate	**PR Assets** Thread-expand, but never brag about it
Low Value	**Hidden weaknesses** Ignore and never mention	**PR Liabilities** Work on it as high prio, reframe it, or own it with confidence

How to Signal: Strategies

First, a reminder on why the foundations are so important:

Be Congruent: Posers & The Leakage Principle™

The congruence principle™ states that people trust signals most when they are congruent, and trust the more credible signals when they're incongruent.
Corollary (Leakage Principle™): Because the self-serving bias incentivizes inflating one's own value and faking high-value signals, unintentional lower-value signals tend to be more credible, and therefore often dominate perception.

In simple words:
⚖ **When you mix low and high-value signals, people trust the low-value ones**

This is because, as a self-interested source, you have an incentive to fake high-value signals, while hiding lower-value ones.
And it's often visible in real life. Men can consciously send socially dominant cues, for example, striking open and confident body language poses even when not feeling confident.
However, without true underlying confidence, most men struggle to be 100% congruent.
Instead, **low-confidence behavior tends to leak out**. And, people trust those tiny leaks to spot a 'poser'.

Hence, if in strategy the name of the game is calibration, in signaling it's congruence.

This is why on The Power Moves we propose the 'source approach' solution based on mental empowerment as the foundation. Set the foundations of a strong and resilient mind, and everything else flows downstream naturally and congruently.
See:

- Foundations of self-empowerment, starting with the mind
- **Power University**, built to internalize these principles from most foundational to advanced

Focus on *Sub*-Communication First

Effective sub-communication signaling is the art of signaling, without looking like you are.

Sub-communication is extremely powerful. As active signaling, it's fully within your control. Yet, **effective sub-communication is perceived as honest and reliable** because it doesn't look like active promotion.
Since it's never perceived as active self-advocacy, it's as credible as first-hand observation when well-executed.

Yet, few men truly master it, falling back on the simpler but less credible direct self-promotion.
Thus, the social strategist gains an immense advantage mastering the *sub*-communication.

⍰ Example: sub-communicating high value

> **You**: Love a good wine <— Staying fit without over-sacrificing is a costly signal. Wine frames it as 'classy' but alcohol is on pause because I'm on a massive project sprint and training for a personal best <—⍰⍰ I'm ambitious, fit and health-conscious, without being a nut/bore

Calibrate to Audience: Opportunity Meets Detection Risk

Inflated or exaggerated signaling can undermine credibility and rapport, diminish signaling effectiveness, and may even signal *lower* value.

However, the risks and opportunities of detection largely depend on context, goals, and audience.

Principle:
⚖ **The more empowered the audience is, the more signaling nuance is required.**
Conversely, the more naive and low-power the audience, the more obvious your signals can be.

Similar dynamics apply with influence, status gaining, and leadership.
Nevicka in *The Handbook of Trait Narcissism* suggests that narcissistic leaders fit better with submissive followers (Grijalva & Harms, 2014).
Similarly, bragging bravado attracts disempowered men and repels more empowered ones (Kakkar and Sivanathan, 2017), who are more likely to find it weak and annoying and, potentially, an affront to their own power (Willer et al., 2013)

This principle is also seen in self-help and 'guru' dynamics, including our previous example.
Blatant signaling of supercars or cocky arrogance attracted beginners and less power-aware men. However, it only *lost* the trust of more power-aware and successful men.

Target	Strategy
Naive audience	**Flashy displays** of cars, luxury, and models
Low power and insecure audience	**Bragging bravado** impresses them
Smart audience	**Higher logic**, medium authority signaling, zero brags
High-power audience	**Power+warmth** for respect and win-win, without competitive hostility

- Humblebrags examples from Tony Robbins

When to Signal

Calibrating to Time: Frontload Value

Principle:
⚖ **The briefer the interaction is, the earlier and more actively you must signal value**

Early signaling in first impressions helps because people weigh the benefits of long-term associations based on future extrapolation of present sampling ('sampling principle', see Thibaut and Kelley, 1959).

The Sequence Value Model (Dating)

Principle:
⚖ **The more credible value you display over time, the more backing you have for verbal signaling**

Especially valid in dating, value-backed displays of high confidence can boost attraction, rather than competition.
It may not be a coincidence that narcissists, known for grandiosity and value displays, are the most attractive of the dark triads (Rauthmann and Denissen, 2014; Rauthmann & Kolar, 2013).

A framework we introduced and that I've personally found very effective on multiple occasions:

- **Phase 1: Display nonverbal foundations** with leadership and social confidence
- **Phase 2: Indirect Verbal displays** as you move to the date location, move to conversational leadership and high-value sub-communication

- **Phase 3: 'Positive arrogance'**: Verbal self-promotion works better once there is proof of it (O'Mara et al., 2018). Then, bursts of direct brags confirm her belief, thread-expand, and display a rare excess of confidence that's often attractive. Even borderline arrogance can turn into a positive 'yes, he's a bit haughty… But he's right'.
- **Phase 4: Reminder bursts**: If things progress and you set good win-win relationships, direct value displays are more welcomed and more believable when interests align (Farrell and Rabin, 1996)

Read more:

- Value sequence model: How to demonstrate high value in dates
- ⍰ How to DHV on dates

⍰ Advanced: Countersignal to Display Maximum Value

It's often not the lowest or highest value men who signal the most, but the mid-level tiers:

1. **Low value** possess no major assets to signal about
2. **Medium value (The "Try-Hard" Trap)**: terrified of appearing low value and hopeful they can climb to the upper tier, they're the busiest signaling and managing impressions
3. **High value (The Countersignalers)**: having visible value, structural status, and brand name visibility, they intentionally withhold information, dress down, self-deprecate, or follow a different signaling code than the masses

This phenomenon has been referred to as **countersignaling** (Feltovich, Harbaugh, and To, 1999).

Lowest value has no value to signal; medium value signals as much as possible; highest value differentiates himself from the masses by not signaling at all

Risks of Over-signaling: The Needy Jester Trap

Signaling value is effortful and betrays the intent to impress, which is needy.
For this reason, signaling follows the social investment model, meaning that oversignaling displays:

- **Neediness for approval**

- ***Lower* value**, trying to make up the difference (compensatory investment principle)
- ***Lower* confidence**, driven by feelings of not being enough

As per our social investment model, high value signaling with less (visible) signaling effort is higher power nad more effective:

The Signaling-Return Matrix measures the returns on signaling effort (self-promotion) in terms of perceived value, applying the same principle as the Social ROI Matrix™, which measures the returns on social investment.

Also read:

- Social climbing: the leader's mistake

⍰ Advanced: Value Stacking

The pinnacle of sub-communication is to seamlessly stack multiple high-value signals while remaining high warmth.
Consider this response to a date complaining about work:

> Yeah, I hear you.
> It was the same for me. I hated the alarm. The moment it rang, I started the day alraedy pissed off (smiles to nonverbally offset the verbal negativity).
> So for a character like mine, and maybe you too, doing my own thing wasn't even an aspiration, it was a *necessity*.
> But the true blessing is not just doing your thing, but doing what you're passionate about. So you're not just getting money and freedom, but doing what you love doing.

Look what this single moment sub-communicates:

- **Peak personal success**, succeeding in entrepreneurship while working on one's passion: most people's dream
- **Virtue & wealth-signaling combined**: saying 'not just money' puts passion first, while suggesting *also* making

money (this is positive virtue signaling)
- **No brags**, there is on 'I' in there. It's implied he did it, but he never says so
- **Less about him, more about her**, and ends shifting the focus completely to her
- **Similarity and understanding**, deepening the bond
- **Inspirational**: she's led to imagine doing the same, disarming her from even registering there is any signaling intention (and later potentially empowering her to believe she can)

Now imagine a guy with these skills across a full date, or across a lifetime of social exchanges, and you may start to understand the upsides of being an advanced social strategist.

How to Signal: Tactics

Humblebrag

A signal that on the surface may seem neutral, low-value self-deprecating, or querulous, but designed to boost the speaker's perceived value with the sub-communication

The humblebragger uses neutral or lower-value covers to hide the higher-value signal.

If effective, people won't even consider it a humblebrag—they may simply see a joke, a self-effacing remark, a complaint, or a neutral statement.
But if people see through it, as it frequently happens, the high-value signal loses effectiveness. The speaker loses trust and likability, and the move may even turn net-negative (Sezer et al., 2017). Sezer's research points to complaint-based humblebrags as most likely to backfire.

Lowest Power	Medium Power	Max Power
Inept striver: Obvious cover + weak value signal	**Grifter**: Obvious humble cover + high-value signal	**High quality**: Honest humility + high personal value
Low power: Disempowering cover + weak value signal	**Social climber**: Credible humble cover + medium value signal	**Machiavellian**: Credible cover + high-value signal

Example of a generally poor humblebrag:

> **Her**: I am so tired of these men coming after me wherever I go, can't a woman just be left alone once? <— Common tactic, seemingly a complaing, but signals being in demand and, supposedly, attractive

See more:

- ⍰ Tony Robbins humblebrags

Time Scarcity

While rather banal, busyness signaling is such a common status signal in Western cultures that it deserves its own entry (Bellezza et al., 2017).

Busyness signals ambition, high agency, and competence and, importantly, boosts scarcity. Busyness for work also implies wealth accumulation potential.
However, notice the important difference:

Low Power Busyness	High Power Busyness
Imposed by others (errand boy frame)	**Chosen** (high agency frame)

Low Power Busyness	High Power Busyness
Without valuable practical returns (OCD & performative)	**With concrete returns** (mover and shaker)

Mentor's Frame & Growth Mindset

> **Mentor**: I have made all these mistakes, so that you don't have to <— It's power-protecting because teaching is not based on personal superiority like genetics or IQ, only on *experience*, which you can also achieve

However, it still signals success, and it also happens to be a power move because it empowers the speaker, while disempowering the listener.
If the listener accepts this frame, he becomes a lower-value learner who must learn from the speaker to avoid costly mistakes he'd otherwise commit (says who?).

More Value-Signaling Tactics

- **The "Casually Dropping Gold" Move:**
  Nonchalantly drop references, data, or quotes to signal authority. Bonus point if you do it as an aside, signaling an overflowing well of knowledge
- **Bamboozling Technique**
  Start high complexity to signal expertise, then cut to practical takeaways to maintain attention. Frame it as 'for the sake of time' or 'to skip the science and focus on the practicality'
- **The Frame Reversal**
  Imply or state that generally higher power parties are pursuing you. For example, imply the woman or the employer wants you, flipping the usual frame of men and interviewees courting and seeking jobs.
- **Onion self-description**
  To give brief self-descriptions and answers, prompting others to ask more and thus evoking a sense of first-hand discovery.
  Casanova used this tactic
- **The Story Embed**
  The early 'pick-up artist' approach to 'demonstrating higher value' by telling a story that made them look cool and high value.
  The formula: trait you want to convey → achievement that demonstrates it → story that makes it vivid.
- **Eliciting Compliments** (for dating)
  For example, misrepresenting a positive general observation of her as if it was for you, and openly asking if it doesn't indeed apply to you if she corrects you. Or complimenting her for something you have in common, which calls for the same compliment back.
  See more here.
- **The Giver Frame**
  Signaling value generation or value-giving, which implies having high value, and adds a pro-social and 'kind' signal.
- **Thread expanding** (fame control)
  Expert value signalers do not just initiate novel signals, but maximize external signals, which is lower effort and more credible. It can be done in many ways, from asking a question, to commenting on a positive observation, to laughing about an empowering joke.
  See basics of frame control

- Covert bragging tactics

Applying it For Top 1%

The highest-value people rarely need to convince others they're valuable.
They build lives and internalize skills that naturally generate evidence of value.

Their signaling simply helps others notice what's already true. We teach how in Power University:

Check Power University

Animal Signals: Information or Manipulation (Research Review)

Lucio Buffalmano · 17 August 2026 · Archived copy · Original

Animal Signals: Information or Manipulation? (1978) by Richard Dawkins & John R. Krebs is the 10th chapter of *Behavioural Ecology: An Evolutionary Approach* (J.R. Krebs & N.B. Davies), arguing that communication in nature should not be assumed to have evolved to share honest information, but can instead be selected to manipulate others.

Contents

  - Slut-Shaming: for all species with male parental investment?
  - Typical intensity challenges the "honest information" view, but…
  - Deceit works best when rare
- Quotes
- Takeaways

Overview

> We are contrasting two attitudes to the evolution of animal signals.
> One attitude, which we (…) called classical, emphasises cooperation (…) actors make it easy for reactors to 'read' their internal state.
> The other attitude, which we espouse, emphasises the struggle between individuals. If information is shared at all it is likely to be false information.
>
> - **Information shared is likely manipulative** because individuals are in constant competition
> - **Manipulation is higher ROI than coercion:** instead of physically forcing others, manipulators gets the same result having another animal do the work
> - **It's an arms' race to who manipulates best**: Communication is a coevolutionary arms race between signalers and receivers, with each side continually trying to outwit the other.
> - Receivers evolve to be skpetical: We can expect receivers to evolve counter-measures to detect and resist manipulation.

Core insight: Manipulation evolves 'naturally' and unavoidably with communication. This means that manipulation is part and parcel of biological life just as much as communication is.

Notes

“Classical” Cooperation vs. “Manipulation”

Dawkins and Krebs trace the “classical ethology” position to Tinbergen (1952), Morris (1956), Marler (1959), assuming that communication evolved for shared benefit.

Dawkins & Krebs instead assume that **communication evolved to promote *self*-interest** rather than the species’ interest, and thus naturally includes manipulation.

Cooperation is not excluded, but survives only when it’s the individually optimal strategy.

Communication as a Substitute for Physical Force

Following Dawkins’s *The Selfish Gene* (1976), the chapter frames every animal as a machine built to preserve and propagate the genes that ride inside it. To get what it needs, that machine has to manipulate the objects around it — including other animals (themselves selfish replicators pursuing their own agendas).

> When an animal seeks to manipulate an inanimate object, it has only one recourse: physical power. But when the object it seeks to manipulate is itself another live animal there is an alternative way […] communication is energetically more efficient than trying to take her by force.

This produces the chapter’s central — almost cynical — definition of communication:

> Communication […] could be characterized as a means by which one animal makes use of another animal’s muscle power.

Quick takeaways:

- **Manipulation is more effective than force** — you don’t need to physically move someone if you can get their own body to move for you.
- **Reframes persuasion, charisma, and courtship as remote-control tools**: the goal isn’t mutual understanding, it’s getting the other party’s own effort working for you.

Selection for Subversion, Not Sharing

Dawkins and Krebs note that animals are already selected to respond to their environment in whatever way benefits them on average. That responsiveness is exactly what a signaler can exploit:

> As an inevitable byproduct of the fact that animals are selected to respond to their environment in ways that are on average beneficial to themselves, other animals can be selected to subvert this responsiveness for their own benefit. This is communication.

Information ≠ honesty ≠ cooperation & manipulation ≠ harm

However, this communication/manipulation is not necessarily harmful (though it can be):

> It may happen that both parties benefit by the arrangement, in which case the word “subvert” will seem inappropriate. But as far as our definition of communication is concerned, whether the reactor benefits or not is incidental.

A signal can:

- contain accurate information,
- be useful to the receiver,
- and still have evolved because producing it benefits the signaler.

Likewise, a signal can be manipulative without being false.
Also see:

- **Manipulation vs persuasion**

Cooperation Is the Exception — Even Between Mates and Kin

Cooperation shouldn't be the null hypothesis.
Citing Robert Trivers's work on parental investment and parent-offspring conflict, the authors point out that even the closest relationships carry built-in genetic conflicts of interest.

> Cooperation, if it occurs, should be regarded as something surprising, demanding special explanation, rather than as something automatically to be expected. Even mates (Trivers 1972), and parents and offspring (Trivers 1974, Trivers & Hare 1976) often have divergent genetic interests, and must be expected to conflict with each other rather than to cooperate.

Lucio's Take: **This section may understate the case for cooperation's own power and pervasiveness**

Lucio: The authors write that cooperation "should be regarded as something surprising, demanding special explanation". This is a useful 'positively cynical' correction to naive group-selection thinking, but as for many corrections, you don't want to go overboard in the opposite direction.

Cooperation is not so exceptional if we posit that it's relatively common for two or more parties to both benefit from it.

Dawkins himself later commended Robert Axelrod's work on cooperation, even providing the foreword of its seminal book *The Evolution of Cooperation*.

Axelrod's work shows that cooperation is likely to evolve even among selfish players whenever it benefits both (a likely not-rare occurrence).

Quick takeaways:

- Don't assume alignment of interest just because a relationship looks close (mates, family, partners) — divergent interests are the default, not the exception.
- Cooperation must be justified by self-interest, rather than assumed

Why Manipulation Cannot Take Over (Communication Survives)

Deception cannot become universal.
Deceit within a species turns out to be rarer than deceit between species (predator-prey mimicry, for instance) for two reasons:

- The deceit has to stay **relatively rare**, so that on average it still pays the receiver to trust and react to the signal (if he doesn't, he would stop responding)
- The receiver has to be, at least sometimes, **unable to tell the fake from the real thing**.

Plus, the authors may highlight in a different section a third reason:

Probing and assessment also limit manipulation

> "The general conclusion is that bluff and deceit are always advantageous, but they are limited by probing and assessment."

Remember that manipulation is an arms race; hence **manipulation creates the selection pressure for manipulation resistance.**

Quick takeaways:

- Deceit is always individually advantageous in principle. What limits it isn't morality, it's detectability and base rate.
- The countermeasure to manipulation isn't refusing to communicate — it's probing and assessment, i.e., verifying rather than taking signals at face value.

Ritualized Contests: Hawk-Mouse Game & The Logic of (Not) Fighting

Animals usually settle disputes with conventional displays and smaller-scale fights rather than all-out combat. Often, the loser gives up without a struggle, and even the winner doesn't go for the kill (Lorenz 1966, with exceptions noted by Geist 1971).

For example, in red deer:

> The stags compete for hinds to add to their harems, and contests consist of prolonged roaring duels. Escalated contests are rare, and they are costly because of the high risk of injury and because subordinate males, known as sneaky fuckers, may steal matings during a prolonged fight.

That raises a real problem for a "selfish gene" view — ritualized combat is obviously good for the species, since it saves lives, but is it good for the genes of the individuals to back off?

Maynard Smith and Price (1973), building on earlier sex-ratio theory (Fisher 1930, Hamilton 1967), showed that the best strategy for an individual to adopt depends on what everyone else in the population is doing — a game-theoretic, frequency-dependent strategy.

Imagine a population that only ever displays and retreats at the first sign of real danger. A mutant "hawk," who fights viciously in every contest, would prosper: it always wins, and never risks injury. But once hawk spreads, most contests are hawk-vs-hawk, and each hawk now risks serious injury. If the cost of that injury outweighs the value of winning, a retreating "mouse" strategist does better on average than the now-common hawks. **Both aggressive and retreating strategies do well when rare and get punished when common —** this is a frequency-dependent, evolutionarily stable mix rather than a single winning strategy.

The authors formalize this as a payoff matrix:

	Against a Hawk	Against a Mouse
Payoff to Hawk	(V – W) / 2	V
Payoff to Mouse	0	V/2 – T

Where **V** = the value of the resource (benefit of winning), **W** = the fitness cost of injury, and **T** = the fitness cost of time wasted in conventional display.

Setting the average payoff to hawk equal to the average payoff to mouse, for p = the proportion of hawks in the population, gives the stable ("ESS") proportion of hawks:

p* = (V + 2T) / (W + 2T)

This mixed equilibrium only holds when injury costs more than the resource is worth (W > V). But *"if the cost of injury is bigger than the value of victory (W > V) then hawk does worse than mouse in a population of hawks*". If instead the value of winning is large relative to injury risk, hawk should sweep as a pure strategy (ie.: full, permanent escalation for all).

The chapter's own conclusion from this:

> "we would not expect to observe animals using purely escalated fighting, if costs of injury are high relative to benefits from winning. They should use predominantly conventional displays, and escalate only in retaliation."

⍰♂Lucio's Take: **Do 'display costs' even count?**

Lucio:
The authors charge a 'cost of display', but I had to wonder if that even amounts to anything significant. And if so, the model doesn't charge Hawk any time cost at all, only injury risk (W), and only in Hawk-vs-Hawk contests. Mouse is the only strategy priced for time (T), win or lose.

I understand the authors may imply that hawks start fighting right away, but even escalated fights most often include some posturing preceding it

Conventions: Win or Lose Based on Customs & Rules

The authors list several species where members of the species give in immediately based on random rules, like for example, who arrived at the location first.

These rules work when resources are abundant and one can easily move somewhere else.
It also works when the costs of losing are high.

For example, a worked numeric example appears later in the chapter (Table 10.3), using V=60, W=100, T=10, in the context of an arbitrary tie-breaking convention (see the next section):

- Hawk vs. Hawk: (60 – 100) / 2 = **–20**
- Hawk vs. Mouse: **+60**
- Mouse vs. Hawk: **0**
- Mouse vs. Mouse: 60/2 – 10 = **+20**

A strategy of "owner wins, intruder loses" (average payoff 30 against itself, since each contestant is owner half the time) resists invasion by any mutant that ignores the ownership convention and plays hawk some of the time instead — the mutant does worse than 30 no matter what probability it picks.

Quick takeaways:

- **Fighting only works when rare**: It isn't inherently favored by selection, it wins only while rare, and gets punished once common, because injury risk compounds within a population of fighters.

- **The stable outcome is a mix** ($p^* = (V+2T)/(W+2T)$), not a single "correct" strategy — how much escalation persists in a population is set entirely by the ratio of stakes to injury risk.
- **Ritualized display is best for all**: not just a 'peace treaty' — it's what a genetically self-interested population lands on once fighting risk outweighs the prize.

P.S.:

- While the dominant males are locked in a costly, high-stakes display, lower-status "sneaky" males exploit the distraction to mate opportunistically — direct competition isn't the only path to reproductive success.

The Hypnosis Parallel: Manipulation as a Human Continuum Too

Near the end of the chapter, Dawkins and Krebs explicitly extend the manipulation framework beyond animal signaling into human persuasion:

> There may be a continuum between hypnosis as it is commonly understood and ordinary verbal persuasion, with the 'spellbinding' oratory of a Hitler or a Billy Graham falling between

Quick takeaways:

- The authors themselves draw the line from biology to human persuasion and manipulation
- If hypnosis and ordinary persuasion sit on the same continuum, the interesting question for any given interaction isn't "is this manipulation or not" — it's "how far along the continuum is it."

⍰⍰♂ Lucio's Analysis

Learning manipulation dynamics is crucial so as not to fall behind the evolutionary arms race

It's a principle we've long held on TPM, and it's one of the reasons why this chapter is so crucial for us. **Ambitious men must learn manipulation dynamics if they don't want to be at a comparative disadvantage** in all areas of life, including business and mating.

See this video here:

This is also why we have a full module on manipulation and dark triads in Power University.

Slut-Shaming: for all species with male parental investment?

The chapter's discussion of barbary dove courtship gives an evolutionary account of a very human-sounding behavior:

> If the female goes into the bow posture (an advanced stage of courtship) too quickly during courtship, the male starts to attack her.
> In Erickson's and Zenone's experiment, the 'eager' females were produced by a pretreatment of stimulating them with the courtship of another male, so the reaction of the test males makes very good sense: they rejected females which showed signs of having philandered.
> The male barbary dove contributes considerably to the care of nestlings, so that assessment of mate fidelity and avoidance of cuckoldry are of great importance to him.

Typical intensity challenges the “honest information” view, but...

> Morris (1957) noted that many displays are performed in a rather constant manner (‘typical intensity’) regardless of the strength of motivation of the performer. This is just what one would expect if these displays have evolved as a means of winning contests and not as a way of providing opponents with as much information as possible about the subtle variations in motivation of the signaller (Morton 1977).

Fixed-intensity displays are evidence against the “honest broadcast” theory of signaling. If displays existed to inform, you’d expect them to scale with true internal state.

But then I must wonder, wouldn’t a powerful, motivated signaler who’s likely to win stand to gain more from displaying with extra intensity, rather than capping it?
What stops selection from favoring signalers who “turn it up”? I can imagine that weaker actors may still assess formidability even with baseline typical intensity, but the original text could have been clearer here.

Deceit works best when rare

Bluffing and exaggeration are always advantageous in principle, but only work if they stay rare and if the receiver can’t always detect them — which is why deceit within a species is rarer than deceit between species.

Quotes

On manipulation and selection:

Natural selection favours individuals who successfully manipulate the behaviour of other individuals, whether or not this is to the advantage of the manipulated individuals.

On fighters losing to more strategic Machiavellians:

Escalated contests are rare, and they are costly because of the high risk of injury and because subordinate males, known as sneaky fuckers, may steal matings during a prolonged fight.

Takeaways

Richard Dawkins & John R. Krebs’s chapter provides foundational theory for The Power Moves frameworks and strategies.
It explains why manipulation is not an exception to communication, but part of its structural default. In practical terms, it means that learning manipulation dynamics is not optional but a must for ambitious men.
And from a singular’s perspective, it also explains why effective signaling must be reliable to be trusted and accepted.

Some of our foundational resources build directly on this insight:

- **Manipulation in humans**: the overview
- **Effective cooperation**: how to maintain cooperation despite the reality of endemic manipulation and self-interest
- **Value signaling**: how to signal value effectively and reliably

Or check out our training program where we turn these foundational principles into applied strategies and tactics for men’s success:
